A

GENERAL HISTORY

OF THE

DICHLAMYDEOUS PLANTS,

COMPRISING COMPLETE

DESCRIPTIONS OF THE DIFFERENT ORDERS;

TOGETHER WITH THE

CHARACTERS OF THE GENERA AND SPECIES, AND AN ENUMERATION OF THE CULTIVATED VARIETIES;

THEIR PLACES OF GROWTH, TIME OF FLOWERING, MODE OF CULTURE, AND

USES IN MEDICINE AND DOMESTIC ECONOMY;

THE SCIENTIFIC NAMES ACCENTUATED, THEIR ETYMOLOGIES EXPLAINED, AND THE CLASSES AND ORDERS

ILLUSTRATED BY ENGRAVINGS,

AND PRECEDED BY INTRODUCTIONS TO THE LINNÆAN AND NATURAL SYSTEMS,

AND A GLOSSARY OF THE TERMS USED:

THE WHOLE

ARRANGED ACCORDING TO THE NATURAL SYSTEM.

INTRODUCTION.

In consequence of the increasing demand which has for some time existed for standard works upon Botany, Horticulture, and Agriculture, occasioned by the growing taste of the age for the study of these sciences, the proprietors of "Miller's Gardener's and Botanist's Dictionary" have caused to be prepared the "General System of Gardening and Botany" contained in the following pages, which, together with the information comprised in the Dictionary of Miller, will combine the improvements and discoveries which the labours of modern writers have so amply contributed to the advancement of these sciences.

In the formation of this work it was found necessary to deviate from the alphabetical arrangement adopted in the Dictionary of Miller, in consequence of the numerous and almost daily changes which have taken place in the Botanical Nomenclature of late years, which have rendered that arrangement wholly useless as a mode of reference. It only remained, therefore, to choose between the Linnæan artificial method, and the Natural System of Jussieu; but the numerous advantages of the latter, particularly in an extensive work like the present, were too apparent to leave any doubt in the mind of the Editor as to which he ought to adopt. In a work, professedly intended to form a *Complete System of Vegetables*, including the practical parts of Gardening and Agriculture, that plan of arrangement must undoubtedly be the best which brings under one view the genera and species of plants according to their relations of affinity, and therefore of their properties. In the Linnæan artificial method, it often happens, that genera, intimately related, are separated far apart into different classes and orders, merely on account of the difference in the number of their stamens and pistils; a circumstance now found in many instances scarcely to be of sufficient importance, even to separate species, still less genera; and with regard to an alphabetical arrangement, it must be evident to every one conversant with the subject, that it cannot be employed with advantage in any branch of Natural History. The plan of the present work is founded on that of M. de Candolle, in his invaluable works entitled *Regni Vegetabilis Systema Naturale* and *Prodromus*, with such alterations as were rendered necessary by the rapid increase of science, and with numerous additions of new genera and species, amounting to more than a third of those enumerated by that learned botanist; so that, when finished, the work will be found to be the most complete system of Vegetables yet

published; comprehending, besides all the genera and species which have been published up to the present time, descriptions of numerous plants *never before published,* and derived chiefly from the *Lambertian Herbarium.* The characters of all the genera and species are derived either from the plants themselves, or from the original authorities where authentic specimens could not be procured.

The object of the present work is to give a complete history and description of every species of plant hitherto known, in an easy and intelligible form, so as to enable even beginners in the science to understand it fully, and to ascertain without difficulty not only the name and history, but also the characters and affinities of any genus or species, together with its properties and best modes of culture and propagation. The first two pages of the present volume contain an outline of the System, with explanatory drawings by Mr. Hart, engraved on wood by Mr. Sly; and a complete account of each order will be found in its proper place, illustrated also by drawings; while the peculiar features which separate the different families, genera, and species from each other have been carefully pointed out, with their respective qualities and properties. A synopsis of the genera, with their essential characters, follows the description of each order, and where the genera are numerous, they have been divided into tribes, which will greatly assist the reader in his examination of them. In a subsequent part of the work, a full and comprehensive description of each genus will be found, including the derivation of the names; and when these are derived from the Greek language, the original is given both in Greek and Roman letters, for the assistance of such of our readers as are unacquainted with the Greek characters. The proper accentuation of each name is also given. Where the species are numerous, they have, for the sake of convenience, been distributed into sections marked thus, Sect. I. Sect. II. &c.: they are occasionally divided again into subsections, marked thus, § 1., § 2., &c.: and sometimes they are still further distinguished by sub-divisions marked by stars, thus, * * * signifying 1, 2, &c. The names of the species are given with their original authorities, which are followed by their distinguishing characters, and with the usual signs indicative of the habit or duration of each species, whether tree, shrub, perennial, biennial, or annual; their habitation in the garden, whether hardy, frame, greenhouse, or stove, &c.; their native countries, and, as far as possible, the districts in which they are found, are noticed; followed by the synonymes, and any other particulars which are likely to assist the student, such as the colour of the flower, &c. The description of each species is followed by a line containing the literal translation of the name in italic characters, and the English name (where such exists); the time of flowering; and the date of the introduction of such as are grown in the British gardens; the height to which the plant, shrub, or tree commonly grows, and if a climber or twiner; thus:

Long-leaved Rock-rose. Fl. June, August. Clt. 1790. Shrub 3 feet high.

The culture and propagation is given at the end of each genus, while the culinary and agricultural plants, and those employed in medicine or used for economical purposes, together with the fruits, are treated at large under their respective species.

According to the system now universally followed of natural affinity, all plants are separated into two great divisions, namely, the *Vasculares* and *Cellulares*. The first of these divisions is again separated into two classes, the *Dicotyledoneæ* and the *Monocotyledoneæ*, distinctions which refer to the number of *cotyledons* of the *embryo*. The second division also comprehends two classes, the *Foliaceæ* and the *Aphyllæ*, characterised, as their names import, by their *leafy* or *leafless* habit. The first class, *Dicotyledoneæ*, is divided into four subclasses, namely, the *Thalamifloræ*, *Calyciflorœ*, *Corolliflorœ*, and *Monochlamydeæ*; of which the three first are distinguished by a *double floral envelope*, that is, by their flowers having both a *calyx* and *corolla*; and also by the insertion or situation of the *stamens*; while the fourth is distinguished by a *simple floral envelope*, which, by later writers, has been denominated a *perianth*, and frequently rivals a *corolla* in its colour. For farther details on these points the reader is referred to the first pages of the present volume. In the subclass *Thalamifloræ* the orders or families are subdivided into four groups or sections, depending on the number of the *carpels* and the situation of the *placentas*, see pages 2. 127. 379. and 814 of the present volume. By attending to these particulars the student will readily acquire a knowledge of the class, subclass, order, genus, and, finally, the species, to which any plant belongs. A beginner should first ascertain the volume comprising the *subclass* in which the plant he wishes to know is included, by dissecting a flower and observing the situation or insertion of the *stamens*; as, for instance, if a plant belongs to the *Dicotyledoneæ*, and possesses both *calyx* and *corolla*, and has its *stamens* inserted in the *receptacle*, the plant will be found in the First Volume; if the stamens are fixed in the *calyx*, or in a *disk* which adheres to the *calyx*, in the Second Volume; if in the tube of the *corolla*, in the Third Volume, which will also contain those plants possessing a *simple floral envelope*, with the *stamens* inserted in it. The second class, *Monocotyledoneæ*, comprising the Grasses, Reeds, Palms, Lilies, Pine-apples, Orchideous and Scitamineous plants, and all those having the veins of their leaves *simple (see page* 1. *f.* 1. 7-8.) and not branched, as in the *Dicotyledoneæ (see page* 1. *f.* 1. 3.) will be found in the Fourth Volume; which will also include the Ferns, the only family of the *Cellulares*, or *Cryptogamia*, which will be included in the work. Therefore, when the name and history of any particular plant are wanted, the *grand division* to which it belongs should be ascertained first; next the *class*, *sub-class*, *order*, and *genus*, and, finally, the *species*; for which purpose the numerous wood-cuts inserted throughout the work will be found of great assistance, as giving the peculiar features of the plants contained in the different orders.

Having thus endeavoured to give some idea of the nature of the arrangement adopted in the following pages, it now only remains for us to point out the nature of those characters on which the distinctions of ORDERS, GENERA, and SPECIES depend. The *orders* or *families* are founded on the same principles as the genera, being merely genera of a more comprehensive nature, as a genus is a group of species having a close relationship or affinity to each other, but whose characters are of a less important nature, than the order itself. When the *genera* of a particular order are numerous, they have been grouped into *sub-orders* or *tribes*, whose characters are of less importance than those of the *orders*, but greater than those of the *genera;* the characters on which all these are founded, are usually derived from the fruit, flowers, and seed, and the appearance of the leaves, whether *stipulate* or *exstipulate*, *alternate*, or *opposite;* but *species* differ from each other in the shape, nature, or position of the *leaves*, *petals*, *bracteas*, &c., and in the situation and disposition of the flowers. *Genera*, whereof the species are numerous, have been separated into sections and divisions, which may be termed *sub-genera*, being distinguished by characters of a lesser importance. *Varieties* are either minor distinctions depending upon soil, situation, habitation, culture, or colour of the flowers, but when they possess features of a more permanent nature they have been termed *sub-species*. ***Hybrids*** are plants arising from the commixture of two species, and which by impregnation partake of the nature and properties of both parents.

We shall conclude these introductory observations with an outline of the Linnæan artificial method, a knowledge of which may be of advantage to some readers of the system, as the Linnæan class and order are given at the beginning of each generic character in the body of the work: and with instructions for the management of hothouse plants, &c.

INTRODUCTION TO THE ARTIFICIAL SYSTEM OF LINNÆUS.

CLASSES.

FIRST GRAND DIVISION.

PLANTS with conspicuous flowers, that is to say, having the parts of fructification evident.

§ 1. Flowers hermaphrodite.

* *Stamens not united.*

Class I. MONANDRIA (from *μονος, one*, and *ανηρ ανδρος, a male*). Stamen one. Example *Canna.*

Class II. DIANDRIA (from *δις, twice*). Stamens two. Example *Veronica.*

Class III. TRIANDRIA (from *τρεις, three*). Stamens three. Example *Crocus* and *Valeriana.*

Class IV. TETRANDRIA (from *τετρας, four*). Stamens four. Example *Galium.*

Class V. PENTANDRIA (from *πεντε, five*). Stamens five. Example *Solanum.*

Class VI. HEXANDRIA (*ἕξ, six*). Stamens six. Example *Narcissus.*

Class VII. HEPTANDRIA (from *ἑπτα, seven*). Stamens seven. Example *Æsculus.*

Class VIII. OCTANDRIA (from *οκτω, eight*). Stamens eight. Example *Erica* and *Fuchsia.*

Class IX. ENNEANDRIA (from *εννεα, nine*). Stamens nine. Example *Rheum.*

Class X. DECANDRIA (from *δεκα, ten*). Stamens ten. Example *Rhododendron* and *Baptisia.*

Class XI. DODECANDRIA (from δωδεκα, *twelve*). Stamens twelve. Example *Sempervivum*.

Class XII. ICOSANDRIA (from εικοσι, *twenty*). Stamens indefinite, but usually twenty, inserted in the calyx. Examples *Prunus* and *Pyrus*.

Class XIII. POLYANDRIA (from πολυ, *many*). Stamens indefinite, inserted in the receptacle. Examples *Papaver* and *Ranunculus*.

Class XIV. DIDYNAMIA (from δις, *twice*, δυο, *two*, and νημα, *a filament*). Stamens twice two, four, two long, and two short. Examples *Lamium* and *Digitalis*.

Class XV. TETRADYNAMIA (from τετρα, *four*, δυο, *two*, and νημα, *a filament*). Stamens six, four long, and two short. Examples *Brassica* and *Sinapis*.

* * *Stamens united by the filaments.*

Class XVI. MONADELPHIA (from μονος, *one*, and αδελφος, *a brother*). Stamens united by the filaments in one body. Example *Malva*.

Class XVII. DIADELPHIA (from δις, *twice*, and αδελφος, *a brother*). Stamens united by the filaments into two bodies; in diadelphous pea-flowers the whole are usually connected in one body, with a single one only free. Examples *Fumaria* and *Pisum*.

Class XVIII. POLYADELPHIA (from πολυ, *many*, and αδελφος, *a brother*). Stamens united by the filaments into more than two bodies. Example *Hypericum*.

* * * *Stamens united by the anthers or tops into a cylinder.*

Class XIX. SYNGENESIA (from συν, *together*, and γενεσις, *origin;* in allusion to the flowers rising from a common receptacle.) Example *Leontodon*.

* * * * *Stamens attached to, and standing upon the pistil.*

Class XX. GYNANDRIA (from γυνη, *a female*, and ανηρ, *a male;* in allusion to the stamens being attached to the pistil). Example *Orchis*.

§ 2. Flowers of distinct sexes.

Class XXI. MONŒCIA (from μονος, *one*, and οικος, *a house*). Male and female flowers on the same plant. Examples *Begonia* and *Quercus*.

Class XXII. DIŒCIA (from δις, *twice*, and οικος, *a house*). Male and female flowers on different plants. Examples *Populus* and *Bryonia*.

Class XXIII. POLYGAMIA (from πολυ, *many*, and γαμος, *a marriage*). Male and female flowers on the same or on different plants along with hermaphrodite ones. Examples *Atriplex Acacia* and *Fraxinus*.

SECOND GRAND DIVISION.

Plants with inconspicuous flowers, that is to say, with the parts of fructification not evident.

Class XXIV. CRYPTOGAMIA (from κρυπτος, *concealed*, and γαμος, *marriage*). Reproductive organs hardly visible. Examples *Polypodium*, *Hypnum*, *Jungermannia*, *Conferva*, *Fucus*, *Lichen*, *Agaricus*, &c.

ORDERS.

Orders are principally formed from the number of styles, as the Classes are from the number of stamens, especially those in the first thirteen Classes, viz. MONOGYNIA, from μονος, *one*, and γυνη, *a female*, (and so on with the other orders). Style one. DIGYNIA, Styles two. TRIGYNIA, Styles three. TETRAGYNIA, Styles four. PENTAGYNIA, Styles five. HEXAGYNIA, Styles six. HEPTAGYNIA, Styles seven. OCTOGYNIA, Styles eight, &c. POLYGYNIA, Styles numerous.

The 14th Class, DIDYNAMIA contains two orders; the first is called GYMNOSPERMIA (from γυμνος, *naked*, and σπερμα, *a seed*). Seeds naked, not inclosed in a capsule. Example *Lamium*. The second ANGIOSPERMIA (from αγγειον, *a vessel*, and σπερμα, *a seed*). Seeds inclosed in a capsule. Example *Digitalis*.

The 15th Class, TETRADYNAMIA, also contains two orders. First, SILIQUOSA (from *siliqua*, a long pod). Pods long, as those of *Sinapis* and *Brassica*. The second SILICULOSA (from *silicula*, a short pod). Pods short, as those of *Lepidium* and *Biscutella*.

The 16th, 17th, 18th, 20th, 21st, and 22nd classes have their order formed from the number of stamens, exactly upon the same principles as those of the first thirteen classes, as MONANDRIA, DIANDRIA, TRIANDRIA, TETRANDRIA, PENTANDRIA, HEXANDRIA, HEPTANDRIA, OCTANDRIA, DECANDRIA, DODECANDRIA, and POLYANDRIA.

The 19th class, SYNGENESIA, contains five orders. First ÆQUALIS (from *æqualis*, equal). Florets of the disk and ray all hermaphrodite. Second SUPERFLUA (from *superfluus*, superfluous). Florets of the disk hermaphrodite, of the ray female. Third FRUSTRANEA (from *frustra*, in vain). Florets of the disk fertile, of the ray sterile. Fourth NECESSARIA (from *necessarius*, necessary). Florets of the ray female, of the disk male. Fifth

SEGREGATA (from *segregatus*, separated). Each floret having its own peculiar involucrum.

The 23rd class, POLYGAMIA, contains two orders, formed exactly on the same principles as the 21st and 22nd classes, called MONŒCIA and DIŒCIA.

The 24th class, CRYPTOGAMIA, contains nine orders, chiefly formed from the reproductive organs, which it is unnecessary to describe here further than to give the names and examples. First, FILICES, Ferns. Examples, *Polypodium*, *Osmunda*, *Aneimia*, *Ophioglossum*, &c. Second, EQUISETACEÆ, Horsetails. Example, *Equisetum*. Third, LYCOPODINEÆ, Club-mosses. Example, *Lycopodium*. Fourth, MARSILEACEÆ. Examples, *Isoetes* and *Pilularia*. Fifth, MUSCI, Mosses. Examples, *Phascum Hypnum*, &c. Sixth, HEPATICÆ. Examples, *Jangermannia* and *Marchantia*. Seventh, ALGÆ, Sea-weeds. Examples, *Exilaria*, *Nostoc*, *Conferva*, *Ulva*, *Sphærococcus*, *Fucus*, &c. Eighth, LICHENES. Example, *Lichens*. Ninth, FUNGI. Examples, *Agaricus*, *Clavaria*, *Morchella*, *Peziza*, *Sphæria*, &c.

GENERAL MANAGEMENT OF PLANTS GROWN UNDER GLASS.

Although we have given an account of the propagation and culture of the various GENERA in the body of the work, we think it expedient to describe the general management of ornamental plants grown under glass, such as *greenhouse*, *stove*, or *hothouse*, as well as *alpine plants*.

1. *Alpine plants* are such as will not grow in the open ground to any perfection, and must be protected during winter by a frame; they are mostly natives of high situations, among rocks and on the tops of mountains, and consequently of low growth, seldom, if ever, exceeding six inches. They should be grown in small pots, and will all thrive well in a mixture of loam, peat, and sand, the pots to be always well drained with potsherds; they should be shifted at least twice every season, and divided if the plant has grown too large; the mould which has been shaken from the pots, if not exhausted, to be mixed with new earth, and the plants potted afresh, after which they require a little water. If these instructions are attended to, alpine plants will always look healthy and neat.

2. *Greenhouse plants* are such as are natives of the Canary Islands, New Holland, and the Cape of Good Hope, and other countries in the same latitudes, which only require to be protected from frost in this country; therefore they are kept under glass during the winter. No fire is requisite, unless a strong frost is expected during the night. In winter they should have plenty of air given them upon fine days, as early in the day as the weather will permit; the house to be shut up very early in the afternoon, if cold. If the weather continues damp and wet, then a little fire is requisite to expel the damp, as greenhouse plants are more likely to be injured by damp than cold. The plants should be looked over every day, taking off any dead leaves, and watering those that are dry; this should be done early in the forenoon, and if the surface of the mould in the pots becomes green, it should be removed with a flat stick, but not so deep as to injure the roots, and a little fresh mould laid on instead. Towards spring they require a more plentiful supply of air and water, and when frost is not apprehended some of the sashes should be left a little open all night, and the air gradually admitted as the weather advances towards summer, until the time of setting the plants out of doors: in some seasons this may be about the middle of May, in others not until the end. Calm cloudy weather is the best time for setting them out, when the most sheltered situation should be chosen, where a bed of ashes should be previously prepared for them. There are various opinions as to the best time of shifting greenhouse plants into fresh pots and mould, but we think that the earliest spring time should be pre-

ferred; some shift them before they are set out of doors, some when they first set them out, others in the autumn, which last time is of all the most improper. The pots should be always well drained with sherds. If any of the plants have grown too straggling or tall, they should be cut back early in the spring, that they may become good bushy plants before autumn. In summer, while the plants are out of doors, if the weather is dry, they should be regularly and plentifully supplied with water, as late as possible every afternoon. The mould intended for shifting or potting off plants should never be sifted, but merely chopped up finely with a spade with the turf, for the turf and its roots are the best parts of the mould, keeping the soil light and loose, and allowing the roots of the plants to spread and the water to penetrate; sifted mould, on the other hand, hardens and becomes sour. The cuttings of greenhouse plants require to be put in at various seasons. From Christmas to the end of May is generally the best time, but this will depend entirely upon the state of the shoots required to make cuttings; for instance, if the cuttings require to be ripened, they should be planted early in the spring; but if they require to be young, the time to plant them is when the shoots have grown a sufficient length for that purpose. In potting off plants raised from cuttings, care is requisite not to injure the young fibres; at first they should be placed in very small pots, and afterwards shifted into pots of increasing size, as they grow, but care should be taken not to plant them in too large pots, or to give them too much water. The seeds of greenhouse plants should always be sown in pots as early as possible in the spring, placed in a little bottom heat; and the seedlings should be potted off separately when they have grown about an inch in height.

3. *Frame plants* require exactly the same treatment as greenhouse plants, excepting that they do not require any fire during winter, but only to be protected by mats from the frost.

4. *Stove plants* are such as are natives within the tropics, therefore require a great degree of heat and plenty of moisture at certain seasons of the year. They are usually of easy culture. The house in which they are grown should be very closely glazed, in order that the temperature may be very regular during winter, or in cold windy nights. The temperature of the house should never be allowed to fall below 60° of Fahrenheit in winter; and in fine days, when it rises to 70°, a little air may be given; but early in the afternoon it should be shut up close. Formerly the pots of stove plants were plunged in tan, but this method is now entirely exploded, and a bed of gravel or sand is substituted, which is greatly preferable for the health of the plants, as well as the diminution of expense. The houses may be either heated with hot water, or with steam conveyed through pipes, or by means of fires; but we consider the two first methods preferable, as giving a more congenial heat. As stove plants are apt to be infested by insects, such as the green fly, the red spider, and the mealy bug, the first may be destroyed by the smoke of tobacco, the second by sulphur-vivum, mixed up in a pail of quick lime, with which the flues should be washed all over, which is a certain means of exterminating them. The mealy bug and scaly bug are only to be got rid of by removing them with a small hair brush; for this purpose the plants should be examined as often as possible. The plants should be washed from an engine in fine weather, and the house kept warm, by which means they will be always kept clean and healthy. Air should be admitted as early as possible in the morning, in warm weather, taking care to shut up early in the afternoon, that the house may be kept to a proper temperature during the night. The time for re-potting them is early in the spring, and the pots always require to be drained with sherds, which keeps the mould loose and free from being soddened with water. The time at which cuttings should be planted is

the same as that for greenhouse plants when the wood is fit, but these require heat. Seeds of stove plants should be sown immediately on their arrival from abroad, although the general time of sowing should be early in spring. A gentle hot-bed is the best for raising tropical seeds, but some few will come up better on a shelf or flue in the hothouse, and the sooner seedlings are potted off separately the better.

5. *Succulent* plants, so called, are such as have a fleshy nature; these are called dry greenhouse or dry stove plants, and consequently require to be grown in the same temperature as greenhouse and stove plants, being natives of the same latitudes. In some gardens there are houses entirely appropriated for these plants, where they are placed on stages or shelves, and kept rather dry throughout the winter; but in gardens where there are not houses entirely appropriated for them, they should be kept on shelves erected for this purpose in a stove or greenhouse.

6. *Cuttings* are slips cut from the mother plant for the purpose of setting, in order that they may make roots, and form young plants. A small house should be appropriated to the propagation of these, but if this cannot be had, a frame may be used, situated so as to have the morning sun only; otherwise, shading with mats will be necessary. Those requiring heat should be plunged in a bed of tan, or placed in a hot-bed. Cuttings of woody plants take root best in fine sand, as they both strike more freely in it, and are safer to pot off after being rooted, as the sand shakes clean from their roots, which is not the case when they have been planted in mould. But some of the soft wooded kinds will not strike well in sand, therefore they must be planted in mould. In making cuttings no leaves should be taken off or shortened, except in that part which is to be buried in the ground, where they should be cut off as close to the stem as possible. The more leaves a cutting has on it the sooner it will root, and the shallower they are planted the better, but they must be well fastened in the ground. The pots in which they are planted should be well drained with sherds, and kept rather moist, but not too wet, and the hand or bell-glasses with which they are covered, should be taken off and wiped occasionally. When the cuttings are rooted and have been potted off, they require to be placed in a frame for a few days and shaded; after this they should be hardened by degrees.

Where plants cannot be easily raised from cuttings or layers, budding, inarching, and grafting must be resorted to, on some other plant nearly related. To describe all the different methods of grafting, budding, inarching, and layering, would occupy considerable space, and would be of little service, since all practical men are acquainted with the most useful methods, and it would be quite impossible to describe these to others without drawings.

In procuring loam and peat for potting plants, the top spit is always to be preferred, with the turf on it, and as fresh as possible. Where peat cannot be had, decayed leaves or wood may be substituted. The lighter and more sandy loam is the better, as it will require to have less peat and sand mixed with it. A certain quantity of sand is always a proper ingredient in mould intended to be used in potting or shifting plants.

The culture and propagation of hardy trees and shrubs, herbaceous, perennial, biennial, and annual plants, epiphytes and bulbs, are amply detailed at the end of their respective genera.

A LIST OF THE ABBREVIATIONS AND SIGNS USED.

Cult. Culture and propagation.
Clt. Cultivated since.
Fl. Flowering.
Tr. Tree.
Sh. Shrub.
Pl. Plant.
Var. Variety.
cl. climbing.
tw. twining.
ft. foot or feet.
fl. floating on water.
tr. or *trail.* trailing.
pr. procumbent.
Lin. syst. Linnæan system.
Hort. or *Hortul.* signifying of the gardens or of gardeners.
Sect. Section, a division of species.
v. s. herb. Lamb. See Specimen in the Lambertian herbarium.
l. c. in loco citato, signifying in the place or work cited above.

D. Dry, succulent plants requiring a dry atmosphere.
S. Stove or hothouse.
G. Greenhouse.
F. Frame.
H. Hardy.
W. Aquatic.
B. Bog.
ħ. Tree or shrub.
♃. Perennial herbaceous.
♂. Biennial.
⊙. Annual.
◡. Climber.
◠. Twiner.
† Doubtful, not ascertained.
?. Expresses a doubt.
§ Indicating subsections or divisions of orders, genera, and species.
* Stars indicate divisions of species founded on slight characters.

GLOSSARY

OF

BOTANICAL AND MEDICAL TERMS USED THROUGHOUT THE WORK.

A.

A in composition signifies without, as aphyllus, without leaves; acaulis without a stem.

Abbreviate, used in comparative descriptions, indicates that one part is shorter than another.

Aberrant, deviating from the natural or direct way; applied in natural history to species or genera that deviate from the usual characters of their neighbours.

Abortion, signifies an imperfect development.

Abruptly-pinnate, leaves pinnate without a terminal or odd leaflet.

Abstergent, cleansing; having a cleansing quality.

Accessory, something added to the usual number of organs.

Accrete, grown together.

Accumbent, lying on, prostrate, supine; this term is employed in *Cruciferæ* to signify a radicle which lies upon the edge of the cotyledons.

Acerose, needle-pointed, fine, and slender, with a sharp point.

Acetarious, any thing belonging to the salad tribe of vegetables.

Acicular, needle-shaped, shaped like a needle.

Acinaciform, shaped like a scimitar.

Acutangular, having sharp or acute angles.

Acumen, a taper point.

Acuminate, acuminated, having a taper point.

Acuminately-cuspidate, taper-pointed, and ending in a bristle.

Adglutinated, glued together, or to any thing else; usually applied to filaments and anthers.

Adnate, adhering to any thing; anthers are said to be adnate when they are attached to the filament by their whole length.

Adult, the full grown of any thing; full grown leaves are adult leaves.

Æruginous, having a colour like that of ærugo, or verdigris.

Æstivation. The calyx and corolla of a flower is said to be in æstivation when in the bud, before expansion.

Agglomerate, *Agglomerated*, collected into a heap or head.

Aggregate, *Aggregated*, gathered together, usually applied to the inflorescence.

Agrumi, a name given by the Italians to any kind of lemons.

Akenium, an indehiscent pericarp, containing a single seed, which does not adhere to it; it is synonymous with seed in the Linnæan language.

Albumen, the substance under the inner coat of the testa of seeds, surrounding the embryo; it is sometimes absent.

Albuminous, furnished with albumen; see that term.

Alburnum, the young wood before it comes to a proper consistence.

Alembick, a vessel used in distilling, or acting like a still.

Alkalescent, having the properties or effects of alkali.

Alkali, any substance which, when mingled with acid, produces fermentation.

Alternating, alternate with any thing mentioned.

Alveolate, resembling a honey-comb.

Alvine, of or belonging to the intestines.

Ament, *Amentum*, a catkin, mode of inflorescence, as the hazel and the willow.

Amylaceous, having the properties of starch.

Anastomosing, uniting of vessels, veins, or nerves.

Androgynous, producing both male and female blossoms on the same plant, or in the same spike or head.

Anfractuous, full of turning and winding passages.

Angular, having angles, or forming angles.

Angularly-toothed, being toothed in such a manner as to form angles.

Annulations, rings or circles.

Annular, circular, producing a ring or circle.

Anterior, growing in front of some other thing.

Anthelmintic, capable of killing worms.

Antheriferous, bearing anthers.

Anthophorum, an elongated receptacle on which the petals, stamens, and ovary are seated.

Anthers, the male parts of a flower containing the fecundating matter.

Anti-pestilential, efficacious against pestilence.

Anti-phrasis, the use of words in a sense opposite to that of some neighbouring parallel sentence.

Anti-scrophulous, anti-scorbutic, efficacious against scurvy.

Anti-septic, efficacious against putrefaction.

Aperient, having a slight purgative quality.

Apetalous, without petals.

Apex, the summit of any thing.

Aphthous, resembling something covered with little ulcers.

Apiculate, *Apiculated*, terminating in a little point, terminated.

Apophysis, a swelling beneath the theca of mosses.

Appendages, that which is attached, in *Caryophylleæ*, the crown of the petals.

Appendent, *Appendant*, hanging, an approach to pendulous.

Appendiculate, *Appendiculated*, having appendages.

Appendix, any thing that is attached, a process.

Appressed, *Adpressed*, pressed close to any thing. When hairs lie flat upon the surface of a leaf or stem, they are said to be appressed.

Approximate, *Approximated*, *Approximating*, near together.

Apterous, without wings, or the membranous margins, which botanists call wings.

Aquatic, growing in water.

Arboreous, being a tree as distinguished from frutescent.

Arborescent, having a tendency to become a tree.

Arcuate, *Arcuated*, curved or bent like a bow, forming an arch.

Arched. See *Arcuate*.

Areolæ, little spaces or areas on the surface of any thing; the spaces between the cracks in lichens are the areolæ.

Areolate, *Areolated*, having areolæ; the adjective of the last word.

Aridity, dryness.

Aril, *Arillus*, a process of the placenta adhering to the hilum of seeds, and sometimes enveloping them; a peculiar substance covering the seeds.

Arillate, having that peculiar appendage called arillus; the term is only applied to seeds.

Aristate, *Aristated*, having a beard or awn, as the glumes of barley.

Aroma, the spicy quality of a thing.

Articulate, *Articulated*, jointed, having joints.

Articulations, the places where one thing is jointed with another; another word for joints.

Ascendant, *Ascendent*, *Ascending*, at first trailing on the ground, then rising erect, forming a curve.

Asci, small tubes in which the sporules of cryptogamic plants are placed.

Ascigerous, having asci.

Assurgent, rising upwards.

Attenuate, *Attenuated*, tapering gradually to a point.

Auriculate, *Auriculated*, *Auricled*, having ear-like appendages.

Auricles, ear-like appendages.

Auriculately-sagittate, eared at the base, so as to give the leaf the appearance of the head of an arrow.

Auriculately-stem-clasping, having auricles at the base clasping the stem; applied to leaves.

Awl-shaped, narrow-pointed, resembling an awl.

Awned, terminating in an awn or sharp point.

Awnedly-acuminated, tapering to a point, and terminating in an awn.

Awns, the beard of corn or any thing else.

Axil, *Axillæ*, literally the arm-pit; in plants applied to the angle formed by the union of the leaf and stem.

Axil-flowering, flowering in the axils of the leaves.

Axillary, placed in the axils or axillæ.

Axis, the line, real or imaginary, that passes through any thing, usually applied to the central placenta of fruit; the axis of a spike of flowers is the stem to which the flowers are attached.

B.

Baccate, berried, fleshy.
Barred, crossed by a paler colour in spaces resembling bars.
Basilar, situated at the base of any thing, usually applied to the embryo when situated at the bottom of the seed.
Beak, any thing which resembles the beak of a bird, hard, sharp points; in *Aconitum* the point which ends the helmet or upper sepal.
Beaked, having a beak.
Bearded, having long hair like a beard.
Beardless, destitute of a beard.
Berry, a fleshy fruit, containing many seeds, as the gooseberry and grape.
Biauriculate, having two auricles.
Bibracteolate, furnished with two small bracteas; which see.
Bibracteate, furnished with two bracteas. See *Bracteas*.
Bicallose, *Bicallous*, having two small callosities or protuberances.
Bicrenate, twice crenate. See *Crenate*.
Bicuspidate, having two points.
Bidentate, having two teeth.
Biennial, a plant is biennial, which requires two years to bear its fruit, and then dies.
Bifarious, any thing placed in two opposite rows.
Bifariously-imbricated, any thing placed in two opposite rows, as well as being laid over each other, like the tiles of a house.
Bifid, divided at the top in two parts, two cleft.
Bifidly-umbelliferous, having an umbel of flowers divided into two parts or divisions.
Bifoliate, having two leaves or leaflets.
Bifoveolate, having two hollows.
Bifurcation, the division of a stem when it is divided like a fork into two branches.
Bifurcate, twice forked, or having two forks.
Bigeminate, twin, each division bearing a pair of leaflets.
Bigibbous, *Bigibbose*, having two protuberances.
Biglandular, having two glands.
Biglobose, formed into two round heads.
Bilabiate, having two lips.
Bilamellate, *Bilammellate*, having two plates or divided into two parts.
Biligulate, having two ligulæ, or strap-shaped appendages.
Bilocular, containing two cells, or divided into two cells, or departments.
Bimaculate, having two spots of any colour.
Binate, having two leaflets, twin.
Biovulate, containing two ova, or young seeds; seeds before they are mature are called ova.
Bipartite, divided into two parts.
Bipinnate, twice pinnate. See *Pinnate*.
Bipinnate-parted, divided in a bipinnate manner but not to the base.
Bipinnatifid, twice pinnatifid. See *Pinnatifid*.
Biplicate, having two plaits.
Birimose, having two longitudinal chinks, or fissures.
Bisaccate, having two little sacks, bags, or pouches.
Biscutate, resembling two bucklers.
Biserrate, *Biserrate-toothed*, twice cut, like the teeth of a saw.
Bistipulate, furnished with two stipulas. See *Stipulas*.
Bisulcate, having two furrows.
Biternate, twice ternate. See *Ternate*.
Bivalved, two valved. See *Valved*.
Blanching, made white by being grown in a dark place, or by being covered with any thing.
Bland, fair, beautiful.
Blight, a vague term, signifying a pestilence among plants, caused by the attack of insects, or of parasitical fungi.
Blistered, having the surface raised, as the skin is when blistered.
Brachiate, having arms or branches, usually placed opposite to each other nearly at right angles with the main stem, and crossing each other alternately.
Bracteate, having bracteas.
Bracteolate, having small bracteas.
Bracteoles, small bracteas.
Bracteas, small leaves placed near the calyx on the peduncle or pedicel.
Bractless, destitute of bracteas.
Branchlets, small branches.
Bristles, stiff hairs.
Bristly, covered with stiff hairs.
Bristly-toothed, having teeth like bristles, or with the teeth ending each in a bristle.
Bud, the flower or leaves before expansion are said to be in the bud.
Bulbiferous, bearing bulbs.
Bulbs, underground buds, resembling roots, consisting of numerous fleshy scales, placed one over the other.
Burry, covered with hooked stiff hairs, like the heads of the burdock.

C.

Caducous, falling off soon.
Cæsious, grey.
Cæspitose, growing in little tufts.
Calcarate, spurred, or having a spur.
Calceiform, formed like a little shoe.
Calli, small callosities, or little protuberances.
Callose, callous, hardened.
Callously-glandular, having hardened glands.
Callously-serrated, having hardened serratures.
Calyciform, formed like a calyx.
Calycine, of or belonging to the calyx.
Calyculate, *Calyculated*, having bracteas so placed as to resemble an external or additional calyx.
Calyptra, literally an extinguisher, applied to the body which covers the theca in mosses; any thing in the shape of an extinguisher.
Calyptrate, resembling an extinguisher.
Calyptriform, shaped like an extinguisher.
Calyx, the outer envelope of a flower, as the corolla is the inner.
Campanulate, shaped like a bell.
Canaliculate, channelled or furrowed.
Cancellate, latticed, resembling lattice-work.
Canescent, hoary, approaching to white.
Capillary, very slender, resembling a hair.
Capillaceous, very slender, resembling a hair.
Capillaceously-multifid, *Capillary-multifid*, divided into many slender hair-like segments.
Capitate, growing in a head; a stigma is said to be capitate when it is large, round, and blunt.
Capitately-glomerate, growing in a clustered head.
Capitellate, *Capitular*, *Capitulate*, growing in small heads; a stigma is said to be so when it is small, round, and blunt.
Capituli, small heads.
Capsule, a dry fruit.
Capsular, like a capsule.
Carbonized, burned to coal.
Carina, a keel like that of a boat; also the lower petal of a pea-flower.
Carinate, keel-shaped.
Carinately-winged, having a wing resembling a keel.
Carinately-concave, hollowed in such a manner as to resemble a keel externally.
Cariopsis, or *Cariopsides*, a 1-celled, small, indehiscent pericarp, adhering to the seed which it contains, as the grain of grasses and clematis.
Carminative, medicines which promote perspiration.
Carnose, fleshy, thick substance.
Carpel, *Carpels*, *Carpella*, the small parts of which compound fruits are formed, as those of *Ranúnculus*, *Pæònia*, and *Aconìtum*.
Carpelled, having carpels.
Carpology, the science which treats of the structure of fruits and seeds.
Cartilaginous, gristly.
Cartilaginously-toothed, having gristly teeth.
Cartilaginously-serrated, having gristly serratures.
Caruncle, a small protuberance.
Carunculate, having a caruncle.
Cataplasm, a plaster.
Catarrhal, of or belonging to a cold.
Cathartic, purgative.
Catkin, inflorescence of the natural order *Amentàceæ*, as the willow.
Caudate, tailed, having a process like a tail.
Caudex, the trunk or stem of palms and ferns.
Caudicula, a small membranous process, on which the pollen of orchideous plants are fixed.
Caulescent, acquiring a stem, having a kind of stem.
Caulicule, the little stem in the embryo which unites the cotyledons with the radicle.
Cauline, of or belonging to the stem.
Caustic, having a burning quality.
Cautery, that which burns.
Cellular, composed of cells.
Cell, the hollow part of a capsule, in which the seeds are lodged, and the part of anthers which contains the pollen.
Celled, having cells, 1-2-3 or 4-celled, having 1-2-3- or 4 cells or departments, and so forth.
Central-angle, *Central-axis*, *Central-column*, the column in the centre of fruits to which the seeds are sometimes attached, and sometimes the partitions.
Central-placenta, the column in the centre of fruits to which the seeds are attached.
Cephalic, medicinal to the head.
Ceraceous, wax-like.
Cernuous, nodding, drooping, or pendulous.
Chaffy, bearing processes resembling chaff.
Chalaza, a spot on the seed, indicating where the vessels of the raphe terminate.
Channel-leaved, folded together, so as to resemble a channel for conducting water.
Channelled, having a channel or channels.
Charred, blackened by fire.
Chlorosis, the green sickness, a disease so called.
Chinks, longitudinal fissures.
Chinked, having longitudinal fissures.
Chrysalis-like, like the chrysalis of an insect.
Ciliæ, hairs like those of the eye-lash.
Ciliated, *Ciliary*, surrounded by hairs like those of the eye-lash.
Ciliately-toothed, having teeth like the hairs of the eye-lash.
Ciliary-scabrous, having rough ciliated margins.
Ciliary-serrated, *Ciliately-serrated*, having serratures like ciliæ.
Ciliately-jagged, having unequal notches like ciliæ.
Ciliately-plumose, having long hairs on the edges like the feathers of a quill.
Cinereous, ash-coloured, or coloured like ashes, grey.
Cinereously-canescent, between white and ash-coloured.
Cinereously-glaucous, between sea-green and ash-coloured.
Cinereously-pubescent, covered with grey pubescence.
Cinereously-tomentose, covered with grey tomentum.
Cinereously-villous, covered with grey villi.
Cingalese, inhabitants of or belonging to Ceylon.
Circinate, *Circinnate*, curled round like a sharp crook, to make a circle.
Circinal, resembling a circle.
Circinately-revolute, curled round like a circle.
Circinately-trochleate, curled round like a pully.
Cirrhose, *Cirrhous*, tendrilled, having tendrils or claspers, as the pea.
Cirrhiferous, bearing tendrils or claspers.
Clammy, viscid, sticky.
Clathrate, latticed, divided like lattice-work.
Clavate, *Clavated*, club-shaped, shaped like a club, the thick end uppermost.
Clavellose, having club-shaped processes.
Clavus, a name for the ergot, a disease in corn.
Claws, the unguis of petals, the narrow end.
Clawed, having claws.

Cleft, divided, but not exactly to the base, split.
Clinandrium, that part of the column of orchideous plants in which the anther lies.
Closed, that which is closed up, leaving no aperture; the throat of a flower with hairs or other processes; pressed together, not spreading
Close-pressed, when any thing lies quite close upon a surface it is said to be close-pressed.
Clustered, disposed in clusters.
Clypeate, shaped like a Roman buckler.
Coadunate, united together, soldered together.
Coarctate, pressed together.
Cobwebbed, covered as if with a cobweb.
Cochleate, *Cochleated*, twisted so as to resemble the shell of a snail.
Cocculiferous, bearing coccula.
Cocculum, a kind of cell which opens with elasticity; a kind of membranous spring.
Cohering, connected.
Coleorhiza, a little sheath which tips the radicle in cruciferous plants.
Collapsion, the act of closing or falling together.
Columella, the axis of the fruit in mosses.
Columnar, formed like a column.
Compact, close, crowded.
Complanate, flattened.
Complicate, *Complicated*, folded together.
Compound, used in botany to express the union of several things in one; thus a compound umbel is formed by several simple umbels; if above one it is always called compound; a compound flower by several simple flowers; a compound leaf by several smaller leaflets.
Compressed, pressed together, and flattened.
Concave, hollow.
Concave-cucullate, hollowed out in the form of a hood.
Concentric, points or lines at equal distances from a common centre.
Concrete, formed into one mass, or joined together.
Conduplicate, twice doubled, or twice folded.
Cone. See *Strobile*.
Conferruminate, *Conferruminated*, united together, so as to be undistinguishable.
Confluent, running into one another at the base or apex.
Conglutinate, glued together into one mass.
Conico-cylindrical, form of a cylinder, but tapering to a point.
Conico-subulate, awl-shaped and conical, tapering to a point.
Conical, resembling a cone in shape.
Conically-subulate, between cone-shaped and awl-shaped, thickest at the base.
Conic-ovate, between egg-shaped and conical.
Conjugate, joined by pairs, chiefly applied to leaves.
Connate, joined together at the base. When two opposite leaves are joined together at the base, with the stem running through the centre of the joined part, it is called a connate leaf.
Connivent, *Conniving*, converging, lying close together.
Conoid, shaped like a cone.
Constricted, tightened or contracted in some particular place.
Continuous, uninterrupted connection.
Contiguous, so close as to touch one another.
Contortuplicate, twisted in plaits.
Contracted, narrowed in some particular place.
Convex, rising in a circular form.
Convolute, rolled together, or over each other.
Coralloid, like coral.
Cordate, formed like a heart in cards.
Cordate, when it is joined by a hyphen to another word, signifies a figure between the two, as *cordate-reniform*; *cordately-reniform*, a figure between heart-shaped and kidney-shaped; *cordate-triangular*, a form between heart-shaped and triangular; *cordate-roundish*, circular and cordate; *cordate-oblong*, oblong and cordate; *cordate-sagittate*, *cordately-sagittate*, between heart-shaped and arrow-shaped; *cordate-auriculate*, having auricles at the base, so as to give the leaf the figure of a heart; *cordate-orbicular*, a figure between a heart and a circle; *cordate-lanceolate*, *cordate-peltate*, a form between that of a buckler and a heart.
Coriaceous, the consistence of leather, thick and tough.
Corolla, the inner envelope of a flower; the coloured part of a flower, composed of a petal or petals. The term is only applied when the calyx is present; otherwise it is called a *perianth*, which see.
Corollaceous, like a corolla, a corolla.
Corollate, like a corolla.
Corneous, horny, of the consistence of horn.
Corniculate, *Corniculated*, having processes like small horns, or like horns.
Corona, literally a crown; applied in botany to the crown-like cup which is found at the orifice of the tube of the corolla in *Narcissus* or other flowers.
Corpuscle, a small body, a particle of any thing.
Corroborant, strengthening.
Corrosive, having the power to eat away.
Corrugate, *Corrugated*, wrinkled or shrivelled.
Cortical, of or belonging to bark.
Corticate, like bark.
Corymb, a raceme or panicle, in which the stalks of the lower flowers are longer than those of the upper, so that the flowers themselves are all on the same level.
Corymbiferous, bearing a corymb.
Corymbose, formed or arranged in the manner of a corymb.
Corymbosely-cymose, arranged in a manner between a corymb and a cyme.
Corymbosely-fastigiate, between fastigiate and corymbose.
Corymbosely-racemose, arranged between racemose and corymbose.
Corymbosely-umbellate, arranged in a manner between an umbel and a corymb.
Corymbulose, formed of many small corymbs.
Cosmetic, beautifying.
Costate, ribbed, any longitudinal elevations.
Cotyledons, seed-leaves, the first leaves from seed.
Creeping, spread upon the ground, and rooting at the joints.
Crenatures, the notchings.
Crenæ, round notches.
Crenate, or *Crenated*, having round notches.
Crenate-angular, crenate and angular.
Crenulate, full of small round notches.
Crenately-serrated, *Crenate-serrate* or *serrated*, with notched serratures; that is to say, something between crenated and serrated.
Crenately-lobed, so deeply crenated as to appear lobed.
Crenate-toothed, between crenate and toothed.
Crenately-denticulated, between crenate and toothletted.
Crenulate, *Crenulated*, having small round notches.
Crest, applied to some elevated appendage, terminating a particular organ; a stamen is crested when the filament projects beyond the anther, and becomes dilated; a petal is crested when it is terminated by a fringed appendage, or an appendage in any part.
Crested, having a crest.
Crestedly-toothed, toothed in a crested manner.
Cretaceously-pruinose, covered with white glittering spots or pustules.
Cribriform, riddled with holes like a sieve.
Cribrose, perforated like a sieve.
Crowned, terminated by any thing; in *Carophylleæ* the petals are said to be crowned when they are furnished with the appendages in the throat.
Cruciate, shaped like a Maltese cross. A flower is said to be cruciate, when four petals are placed opposite each other at right angles.
Cruciferous, the name of a particular family of plants, bearing cruciate flowers.
Cruciately-opposite, placed opposite, so as to form right angles.
Crustaceous, having a hard brittle crust.
Crystalline, consisting of or resembling crystals.
Cucullate, a leaf is said to be cucullate when its edge is curved inwards in such a manner as to represent the cowl or hood of a monk.
Cucullately-saccate, a form between cucullate and saccate.
Culm, the stem of grasses, scitamineous plants, and the like.
Culmiferous, producing culms.
Cultrate, *Cultriform*, shaped like a pruning knife.
Cuneate-obovate, *Cuneate-ovate*, a form between obovate and wedge-shaped, and between egg-shaped and wedge-shaped.
Cuneate, *Cuneated*, *Cuneiform*, wedge-shaped, the broadest end uppermost, tapering to the base.
Cuneiform-ovate, between wedge-shaped and egg-shaped.
Cuneately-lanceolate, between wedge-shaped and lanceolate.
Cup, the same as *Corona*, any thing in the shape of a cup.
Cupula, *Cup*, the cup of an acorn, and such like fruits.
Cupulate, *Cupuliform*, shaped like a cup or reversed bell.
Cuspidate, when a leaf suddenly tapers to a point it is so called.
Cuspidately-serrated, when serratures end abruptly in a point they are so called.
Cutaneous, relating to the skin.
Cuticle, the scarf, skin, or epidermis.
Cut-toothed, cut and toothed at the same time.
Cyathiform, cup-shaped, concave.
Cylindraceous, having the form of a cylinder.
Cylindrical, cylinder-shaped, round.
Cylindrically-campanulate, between bell-shaped and cylinder-shaped.
Cylindrically-conical, cylindrical and conical, tapering to the apex
Cylindrically-globose, a form between a cylinder and a sphere.
Cymbiform, having the shape of a boat.
Cyme, a mode of inflorescence resembling a flattened panicle, as that of the *Elder*.
Cymiferous, bearing cymes.
Cymose, flowering in cymes.

D

Decandrous, having 10 stamens.
Deciduous, falling off; leaves which are shed annually are said to be deciduous, as are also trees that annually lose their leaves.
Declinate, bending downwards.
Decompound, a leaf is said to be decompound when it is twice or thrice pinnate; a panicle, when its branches are also panicled, &c.
Decorticated, disbarked, the bark fallen off or taken off.
Decumbent, lying down on the ground.
Decurrent, running down; a leaf is said to be decurrent when it extends down the leaf-stalk or stem.
Decussate, *Decussated*, leaves and branches are said to be decussate, when two right lines cross each other at right angles, forming a kind of square, or four angles.
Decussately-opposite, applied to leaves when they are opposite and form right lines, cross each other at right angles and form a square.
Definite, that which may be counted, a regular number.
Deflexed, bent downwards.
Dehiscent, gaping, opening; an expression applied to the mode in which the anthers or the fruit burst open and discharge their contents.

Deliquescent, melting away on exposure to the air heat.
Deltoid, shaped like the Greek Δ.
Deltoid-ovate, having an outline between the shape of an egg and a Δ.
Demulcent, having the property of softening any thing.
Dentate, having the margin divided into incisions resembling teeth.
Dentately-ciliated, *Dentately-fringed*, having the margin toothed and tipped with hairs.
Dentately-lobed, toothed so deep as to appear lobed.
Dentately-pinnatifid, toothed so deep as to appear pinnatifid.
Dentately-runcinate, toothed so deep as to appear runcinate.
Dentately-serrated, having the margin divided into incisions, resembling the teeth of a saw.
Dentately-sinuated, having the margin scolloped and toothed.
Denticulate, *Denticulated*, having the margins finely and slightly toothed.
Denticulately-serrated, having the margins finely toothed, resembling a very fine saw.
Denticulately-ciliated, having the margin so finely toothed as to appear edged with hairs.
Denticulately-scabrous, having rough denticulations.
Denticulations, very small teeth.
Deobstruent, having the power of removing obstructions, a term in medicine.
Dependent, hanging down.
Depressed, pressed down, low, having the appearance of being pressed.
Depurated, purified, cleansed.
Despumate, to throw out a froth or scum.
Detergent, detersive, having the power of cleansing; a term in medicine.
Diadelphous, stamens are said to be so when they are connected into two bodies.
Diandrous, having two stamens.
Diaphanous, transparent.
Diaphoretic, promoting perspiration.
Dichotomous, ramifying in pairs.
Dichotomously-branched, branched in a dichotomous manner. See *Dichotomous*.
Dichotomously-panicled, having a panicle divided in a dichotomous manner.
Didymous, two, united, usually applied to the fruit when they appear twin.
Didynamous, having two long stamens and two short ones in the same flower, each pair being collateral.
Dietetic, relating to food or diet.
Difform, *Difformed*, two forms, used to express irregularity.
Diffuse, scattered, widely spread.
Diffusible, such as may be spread.
Digitate, *Digitated*, fingered; shaped like the hand spread open.
Digitately-lobed, lobed in a digitate manner. See *Digitate*.
Digitately-pinnate, pinnated in a digitate manner.
Digynous, having two styles or female organs.
Dilated, widened.
Diluent, something diluting.
Dimidiate, halved, divided into two parts.
Diœcious. When a plant bears female flowers on one individual and males on another, it is called diœcious.
Disciform, having the form of a disk. See *Disk*.
Discoid, when in compositæ the florets are all tubular, the head of flowers is said to be discoid. In other cases, when the florets of the centre of a head of flowers are more perfect than the rest, they are called discoid. Finally, when any thing is dilated into something which may be compared to a disk, the term discoid is also made use of.
Disk, the fleshy annular process that surrounds the ovary in many flowers; a receptacle which adheres to the calyx; also the surface of a leaf; also the centre of a head of flowers of compositæ.
Discutient, having the power to scatter the matter of tumours; a term in medicine.
Dissepiment, the partitions by which a seed-vessel is divided internally.
Distich, *Distichous*, producing leaves, flowers, or branches in two opposite rows.
Distinct, separate, not joined nor meeting together.
Di-trichotomous, divided in twos or threes; stems continually dividing into double or treble ramifications: the term is sometimes applied to a panicle of flowers.
Diuretic, having the power of promoting the flow of urine.
Divaricate, *Divaricated*, *Divaricating*, growing in a straggling manner.
Divergent, *Diverging*, going far from one point, or far asunder; applied to branches and leaves.
Dodecandrous, having 12 stamens.
Dolabriform, having the form of an axe or hatchet.
Dorsal, on the back, or growing on the back.
Dots, may be either pellucid, resinous, or hairy.
Doubly-serrated, twice serrated. See *Serrated*.
Down, soft short hairs like down.
Downy-villous, covered with long soft hairs like down.
Downy-pubescent, soft short down, closely pressed to the surface.
Drastic, applied to medicines which act violently.
Drupe, a kind of fruit consisting of a fleshy succulent rind, and containing a hard stone in the middle—olive, plum, cherry.
Drupaceous, form of a drupe, fleshy.
Dyspepsia, difficulty of digestion; a term in medicine.

E.

Eared, having ears or appendages.
Echinate, *Echinated*, covered with prickles, like a hedgehog.
Edible, eatable.
Effuse, applied to inflorescence, and means a kind of panicle, with a very loose 1-seeded arrangement.
Effusely-panicled, panicled in an effuse manner.
Electuaries, a medicine of conserves and powders, the consistence of honey.
Elephantiasis, a disease in which the limbs become prodigiously swollen and finally fall off.
Elevated, any thing that rises above the surface.
Ellipsoid, form of an ellipsis.
Elliptic, *Elliptical*, formed like an ellipsis, an oval figure.
Elliptic or *elliptical*, when joined by a hyphen to another word, signifies a form between the two words; thus, *elliptic-spatulate*, *elliptic-lanceolate*, *elliptically-spatulate*, *elliptical-ovate*, *elliptical-obovate*, &c.
Elongated, lengthened out.
Emarginate, having a small notch at the end or tip.
Emarginately-2-lobed, so deeply emarginate as to form two lobes.
Embossed, projecting in the centre like the boss, or umbo, of a round shield or target.
Embracing, a leaf is said to embrace a stem when it clasps it round with its base.
Embryo, the young plant in the seed.
Emetic, that which produces vomiting.
Emersed, applied to those leaves of water plants, which are above the water.
Emmenagogue, any medicine that promotes menstruation.
Emollient, softening.
Emulsions, medicines made of bruised oily seeds.
Endocarp, the inner membrane of fruit which forms the cells, usually under the sarcocarp. It is various in consistence.
Endopleura, the inner coat of seeds under the spermaderm.
Endosperm, the same as albumen.
Enlarged, grown large.
Ensate, *Ensiform*, shaped like a sword with a straight blade.
Entire, not notched.
Epicarp, the outside covering of a fruit.
Epidermis, the outer skin of the bark.
Epiphyllous, growing upon the leaves.
Epipetalous, growing upon the petals.
Epigynous, growing upon the style or ovary.
Epiphytes, plants which grow upon other plants without deriving any nutriment from them.
Equal, applied to petals and sepals when they are equal in size and shape with each other; to the calyx in *Cruciferæ*, when it is without pouches at the base.
Equidistant, a mode of vernation, or of arrangement of leaves with respect to each other, in which the sides or edges alternately overlap each other.
Erectly-spreading, between erect and spreading.
Erose, gnawed, bitten, a term used to denote a particular kind of irregular denticulation.
Erosely-toothed, when the teeth are gnawed or erose.
Erosely-serrated, when the serratures are gnawed.
Errhine, promoting a discharge of mucous from the nostrils.
Escharotic, having the power to burn the skin.
Esculent, good for food.
Even, applied to a surface when it is not wrinkled or curled, but smooth and even.
Evanescent, quickly vanishing.
Evolved, unfolded.
Exarillate, without aril. See *Aril*.
Exalbuminous, without albumen. See *Albumen*.
Excavated, hollowed out.
Excentral, out of the centre.
Excoriate, stripped of the bark or skin.
Excurrent, projecting or running beyond the edge or point of any thing.
Exotic, foreign.
Expectorant, any thing that promotes the discharge of mucous from the chest.
Exserted; projecting much beyond something else.
Exsiccated, dried up.
Extra-axillary, growing from above or below the axils of the leaves or branches.
Extra-foliaceous, away from the leaves, or inserted in a different place from them.
Exstipulate, without stipulas. See *Stipulas*.
Exuvia, whatever is cast off from plants.

F.

Fæcula, the nutritious powder of wheat or other things, the albumen of seeds.
Falcate, *Falciform*, bent like a sickle.
Falsely-2-valved, having two valves, which are not of the same nature as other valves.
Fan-nerved, the nerves disposed in the manner of a fan.
Farinaceous, full of flour.
Farina, meal.
Farinaceously-tomentose, *Farinosely-tomentose*, covered with a mealy kind of down.
Farinose, mealy.
Fasciated, faced, having white blotches or stripes.
Fascicled, in bundles or parcels.
Fascicles, parcels or bundles.
Fascicled-hairs, hairs in parcels.
Fasciculate, *Fascicular*, arranged in bundles or parcels.
Fascicled-whorles, arranged in parcels, but still forming a whorl or circle.
Fascicled-racemes, disposed in separate parcels, the whole forming a raceme.
Fasciculately-tuberous, *Fascicled-tuberous*, roots composed of a parcel or parcels of tubers.
Fastigiate, tapering to a narrow point like a pyramid.

Fastigiately-branched, branched in such a manner, the branches becoming gradually shorter from the base to the apex.
Fastigiately-corymbose, a corymb, whose branches gradually become shorter towards the top, like a pyramid.
Fauces, the jaws, the gaping part of monopetalous flowers.
Favose, pitted or excavated, like the cells of a honeycomb.
Favosely-scrobiculate, excavated in little pits or hollows.
Feathery, resembling a feather.
Feather-nerved, the nerves disposed like the feathers of a pen.
Febrifuge, *Febrifugal*, } efficacious in moderating fevers.
Feculent, muddy, thick with sediment.
Fecundation, the act of making fruitful.
Ferruginous, *Ferrugineous*, } iron-coloured, rusty.
Fibrillose, covered with little strings or fibres.
Fibrous, being composed of fibres.
Filamentose, thready.
Filiform, like a thread in form.
Fimbriate, fringed.
Finger-parted, divided into lobes, having a fanciful resemblance to the five fingers of a human hand
Firm, hardish, firm, not soft.
Fistular, *Fistulous*, *Fistulose*, } hollow, like a pipe.
Flaccid, feeble, weak.
Flagellæ, runners without leaves.
Flagellæform, form of runners, creeping along the ground.
Flat, plane.
Flexile, capable of being bent in different directions, pliable.
Flexuous, having a bent or undulating direction, zigzag.
Floccose, *Flocky*, } covered with little tufts like wool.
Floccosely-tomentose, down disposed in little tufts.
Floccullosely-scabrous, covered with rough hairs in tufts.
Floral, of or belonging to a flower, near the flower.
Floral-envelopes, the calyx, bracteas, and corolla, which envelope the inner parts of the flower are all so called.
Florets, little flowers, chiefly applied to compositæ and grasses.
Floriferous, that which bears flowers.
Flosculous, compound flowers, consisting of many tubular monopetalous florets.
Foliaceous, having the form of leaves.
Foliate, when a leaf is divided into leaflets it is called 1-2-3-10 or 12-foliate, according to the number of leaflets.
Follicle, a particular kind of two-valved seed-vessel, such as those of *Hakea* and *Pæonia*.
Follicular, resembling a follicle.
Footstalks, the stalks of leaves.
Fornicate, arched.
Foveate, *Foveolate*, } pitted, full of little pits.
Foveolæ, little pits or hollows.
Free, free from each other, not connected together, usually applied to stamens; the ovary or fruit is said to be free when it neither adheres to the corolla nor calyx.
Fringed, having a border like a fringe.
Fringe-toothed, having a border toothed so as to appear fringed.
Frond, the leaves of palms and ferns.
Front, in *Aconitum*, the front of the helmet or upper sepal.
Frosted, covered with glittering particles.
Fructiferous, that which bears fruit.
Fructification, all those parts composing the fruit of plants.
Frutescent, *Fruticose*, } shrubby.
Fruticulose, a little shrub.
Fugacious, that which lasts but for a short time.
Fulcra, scales and stipulas, &c.
Fulvous, tawny-yellow, or fox-coloured.
Fungous, having the consistence of fungi or mushrooms.
Funicle, a little stalk, by which the seed is attached to the placenta.
Furcate, forked.
Furcately-divided, divided in a furcate manner.
Furfuraceous, scaly, mealy, scurfy.
Furrowed, having longitudinal channels or furrows.
Fuscous, blackish-brown.
Fusiform, spindle-shaped, like the root of a carrot.

G.

Galeate, helmeted; the upper lip of a ringent corolla is the galea of that corolla.
Gamosepalous, when the sepals are joined together at the base, they are so called, improperly monosepalous.
Gelatine, jelly, a term in chemistry.
Gelatinous, consisting of jelly.
Geminate, twin.
Gemmæ, leaf buds, as distinguished from alabastra or flower-buds.
Gemmiferous, bearing buds.
Genitals, styles and stamina.
Germ or *Germen*, the old name of the ovary.
Germen-inferior, fruit below the flower.
Germen-superior, fruit above the flower.
Germination, the first act of vegetation in a seed.
Gibbo, in *Aconitum*, the swelling of the tube of the petals or nectaries.
Gibbous, protuberant, swelled.
Gibbosity, a protuberance or swelling.
Girded, surrounding any thing.
Glabrous, smooth, destitute of hairs.
Gladiate, shaped like a short straight sword.
Glandular, having glands.
Glandularly-crenated, *Glandularly-serrated*, } having crenatures or serratures tipped with glands.
Glandularly-muricated, covered with tubercles tipped with glands.
Glandularly-pilose, covered with glandular hairs.
Glandularly-toothed, margins toothed, with the teeth bearing glands.
Glanduliferous, bearing glands.
Glaucescent, having something of a bluish-green, hoary, or sea-green appearance.
Glaucous, having a decided hoary-grey surface.
Globose, *Globular*, } round or spherical.
Globosely-elliptical, between spherical and oval.
Globosely-ovate, between spherical and egg-shaped.
Globulose, a diminutive of globose.
Glochidate, having hairs, the ends of which are split and hooked back.
Glomerate, *Glomerated*, } gathered into round heaps or heads.
Glumaceous, plants are said to be glumaceous when their flowers are like those of grasses.
Glume, a part of the floral envelopes of a grass.
Gluten, glue.
Glutinous, *Glutinose*, } adhesive, gluey.
Gomopetalous, improperly monopetalous.
Graniform, formed like grains of corn.
Granular, *Granulated*, } covered as if with grains.
Granuliferous, bearing grains.
Greenish-glaucous, of a colour between grey and green.
Gregarious, herding together.
Grooved, furrowed, channelled, marked with grooves.
Grumose, clubbed, knotted, contracted at intervals into knots.
Gynandrous, having the stamens and style combined in one body.
Gynobase, a fleshy receptacle, bearing separate fruits.
Gynobasic, having a gynobase.
Gynophore, a lengthened receptacle, bearing the petals, stamens, and pistil, but not the calyx.
Gynous, flowers are said to be 3-4-5-6-7, &c. gynous, when they contain so many styles.
Gyrose, turned round like a crook.

H.

Habit, features or general appearance of a plant.
Habitat, habitation, native country.
Hæmorrhages, copious bleeding.
Hæmorrhoids, a kind of disease called the piles.
Hairy, covered with long hairs.
Hairy-canescent, covered with grey hairs.
Hairy-pubescent, covered with short soft hairs.
Hairy-tomentose, covered with dense, white, close, curled hairs.
Hastate, formed like the head of a halbert.
Hastately-cordate, between halbert-shaped and heart-shaped.
Hastately-kidney-shaped, a form between halbert-shaped and kidney-shaped.
Hastately-lanceolate, between halbert-shaped and lance-shaped.
Hastately-4-5-lobed, lobed in such a manner as still to appear somewhat halbert-shaped.
Hastately-2-eared, a leaf having two ears at the base, giving it the appearance of a halbert.
Haulm, dead stems of herbs.
Helmet, the same as *Galea*. See *Galeate*. The upper sepal in *Aconitum*.
Hemispherico-conical, a shape between a globe and a cone.
Herbaceous, a plant the stem of which perishes annually.
Hermaphrodite, a flower is so called when it consists both of male and female organs.
Hexagonal, six-sided.
Hexandrous, having six stamens.
Hibernaculum, any thing which serves as a protection to the young buds during winter.
Hilum, *Hylum*, { the scar or mark on the seed which indicates the place by which it adheres to the placenta.
Hirsutely-tomentose, covered with dense, close, white hairs.
Hispid, covered with stiff hairs.
Hispidly-ciliated, fringed with stiff hairs.
Hispidly-villous, covered with stiff villi.
Hoary, covered with grey or white down.
Hoary-pubescent, covered with white down, which is pressed to the surface.
Hoary-tomentose, covered with white tomentum; which see.
Hoary-velvety, covered with white velvety down.
Hoary-villous, covered with white villi.
Holosericeous, covered all over with silky down.
Hollow-leaf, form of a cowl, concave above.
Homogeneous, having a uniform nature, or principle, or composition.
Honey-combed, having pits like a honeycomb.
Honey-pore, the pore in flowers which secretes honey.
Honey-scales, the scales in flowers which secrete honey.
Hooded, being hollowed into the form of a hood.
Horn, any awl-shaped stiff process is called a horn.
Horny, hard, the consistence of a horn.
Hyaline, crystalline, transparent.
Hybrid, a mule, partaking of the nature of two species.
Hydragogue, that which removes dropsy.
Hygrometrical, indicating the approach of moisture.
Hypocrateriform, salver-shaped.
Hypogynous, situated below the ovarium.
Hypophyllous, situated under the leaf.

I.

Icosandrous, having 20 stamens or more.
Imbricate, *Imbricated*, laid over each other like tiles.
Immarginate, without a margin.
Immersed, buried in; applied to the leaves of water plants when they grow under water, also to the ovary when it is buried in the disk.
Impari-pinnate, leaves pinnate, with a terminal or odd leaflet.
Impressed, pressed into.
Inarticulated, without joints.
Inciso-repand, cut and repand.
Inclined, bending inwards, forming a curve.
Incomplete, not full.
Incumbent, lying upon any thing; in *Cruciferæ* when the radicle lies upon the back of the cotyledons.
Incurved, bending inwards.
Indefinite, that which cannot be counted, an irregular number.
Indehiscent, not dehiscent, not opening.
Induplicate, doubled inwards, folded inwards.
Indurated, hardened.
Indusium, the membrane that incloses the thecæ in ferns.
Inferior, any thing placed below the ovary is so called, the lowest of any thing; the ovary or fruit is said to be inferior when it is crowned by the calyx, petals, and stamens; a radicle is said to be inferior when it is situated at the lower end of the seed at the hylum.
Inflexed, bent inwards.
Inflorescence, disposition of the flowers.
Infra-axillary, below the axils of the leaves.
Infracted, bending inwards.
Inner-angle of the fruit or cells, the central placenta.
Inspissated, thickened, spoken of sap or other liquor.
Integument, the outer covering of seeds.
Intermediate, between two plants; the middle one of any thing. Intermediate is applied to the styles in *Oxalis* when they are longer than the outer stamens, and shorter than the inner ones.
Internodes, the space between the joints in stems.
Interpetiolar, between the petioles or leafstalks.
Interrupted, any thing which is not continuous, but is separated by gaps or vacancies.
Interruptedly-crested, crested at intervals.
Interruptedly-lyrate, lyrated with smaller lobes intervening between the larger ones.
Interruptedly-pinnate, pinnate with smaller leaflets intervening between the larger ones.
Interruptedly-pinnatifid, pinnatifid with smaller lobes intervening between the larger ones.
Interstices, spaces between one thing and another.
Intervalvular, in the middle of the valves.
Intra-axillary, within the axils of leaves.
Intricate, entangled.
Inverse, *Inverted*, upside down, opposed to direct.
Involucel, a small involucre.
Involucelled, having an involucel.
Involucre, *Involucrum*, the bracteas which surround the flowers or umbels, particularly in umbelliferous plants.
Involucrate, *Involucrated*, having an involucrum.
Involute, rolled inwards.

J.

Jagged, cut in a coarse manner.
Joints, the places at which the pieces of the stem are articulated with each other.

K.

Keel, when the mid-rib of a leaf or petal is sharp and elevated externally, it is called a keel; in papilionaceous flowers the lower petal is called the keel.
Keeled, having a keel.
Kneed, knee-jointed, bent like the knee joint.

L.

Labellum, the front segment of an orchideous or other flower, the lower petal, the lip.
Labiate, having a lip or lips.
Lacerate, *Lacerated*, torn, appearing torn.
Lacerately-toothed, toothed in a coarse irregular manner.
Laciniate, *Laciniated*, jagged, cut, or divided into unequal segments.
Lactescent, yielding milky juice.
Lacunæ, little pits or depressions, applied to vessels when they are full of air.
Lacunose, covered with little pits or depressions.
Lamellate, *Lamellated*, divided by little plates, or covered with little plates.
Lamellose, having little plates.
Lamina, generally applied to a leaf of a plant, considered without its petiole.
Lanceolate, lance or spear-shaped.
Lanceolate, when joined by a hyphen to another word, signifies a figure between the two words, as *lanceolate-linear*, *lanceolate-spatulate*, *lanceolate-oblong*, *lanceolate-obovate*, &c.
Lateral, on one side, or on the sides.
Lax, loose, not compact.
Leaflets, small parts of leaves of compound leaves.
Leafy, covered with leaves, or the consistence of a leaf.
Leathery, thick, the consistence of leather.
Legume, *Legumen*, a pod, the fruit of leguminous plants, a pea-pod, &c.
Leguminous, plants which bear legumes, such as the pea, the bean, &c.
Lenticular, shaped like a lens or pea.
Lentiform, shaped like a lens.
Lepidoted, covered with prominent dots.
Leprous, covered with spots or scales like leprosy.
Leprosy, covered with scales or dots resembling the leprosy.
Leprously-silvery, *Leprously-white*, covered with white or silvery dots, scales or scurf, resembling the leprosy.
Leprously-tomentose, covered with shaggy down, having the appearance of leprosy.
Liber, the inner bark.
Lid, the calyx which falls off from the flower in a single piece, or the lid of a fruit which separates in a single piece.
Ligula, *Ligulæ*, the membrane at the top of the petiole of grasses, and other plants, straps.
Ligulate, strap-like, having the form of a strap.
Ligulately-setaceous, between the form of a strap and a bristle.
Limbate, having a dilated surface.
Limb, the border of a flower, the spreading part.
Line, in length the eighth of an inch.
Linear, narrow, when the two sides are nearly parallel.
Linear, when joined by a hyphen to another word, signifies a form between the two words, as, *linear-filiform*, *linear-ensate*, *linear-subulate*, *linear-lanceolate*, *linear-spatulate*, *linear-setaceous*, *linear-triangular*, triangular and linear; *linear-elongated*, linear and elongated; *linear-sagittate*, sagittate and linear, &c.
Linearly-cuneated, between linear and wedge-shaped.
Lined, having lines or streaks.
Linguiform, *Lingulate*, tongue-shaped.
Lip, the lower petal of any irregular flower. In *Aconitum* the lower part of the tube of petals or nectaries.
Lipped, having lips.
Lithontriptic, having the power of breaking the stone.
Lobate, divided into lobes.
Lobately-crenated, having deep crenatures or indentations.
Lobately-winged, having lobed wings.
Lobe, a division.
Lobed, divided into lobes.
Lobulate, having small lobes.
Lobules, small lobes.
Located, placed.
Loculaments, partitions, or cells of a seed-vessel.
Locular, a fruit is called unilocular if it contains but one cell; bilocular if it contains two cells; and trilocular if it contains three cells; and so on.
Loculate, having cells.
Loment, a kind of pod, which falls in pieces when ripe at the joints.
Lomentaceous, bearing fruit called loments.
Long, applied to the styles in *Oxalis*, signifies that they are longer than all the stamens.
Long-acuminated, having a long taper-point.
Lorate, shaped like a thong or strap.
Lubricate, to make slippery.
Lucid, bright, shining.
Lunate, *Lunulate*, *Lunulately*, shaped like a half-moon.
Lurid, a colour between purple, yellow, and grey.
Lymphatic, of or belonging to the lymph or sap.
Lyrate, shaped like a lyre.
Lyrately-pinnate, pinnate in a lyrate manner.
Lyrately-pinnatifid, pinnatifid in a lyrate manner.

M.

Macerate, to decompose by steeping in water or other liquor.
Mammæform, formed like a nipple or nipples.
Marcescent, permanent, when withered not falling off.
Margin, edge or border.
Marginal, relating to the margin.
Marginated, *Margined*, having a margin.
Masticatory, grinding or chewing with the teeth.
Matrix, a place where any thing is generated or formed.
Medulla, the pith of a plant.
Medullary, relating to the pith of plants.
Melliferous, bearing honey.
Membranous, *Membraneous*, *Membranaceous*, having the texture of a membrane.
Menstruum, a liquor used as a dissolvent.
Meshes, the openings of any tissue.
Micacious, glittering or shining.
Micæ, glittering particles.
Mid-rib, the middle vein of a leaf which passes from the petiole to the apex.
Miliary, granulated, resembling many seeds.
Mitriform, formed like a mitre.
Monadelphous, having the filaments cohering into a tube.
Monandrous, having only one stamen.
Moniliform, formed like a necklace, that is to say, with alternate swellings and contractions, resembling a string of beads.
Monocotyledonous, having only one seed-leaf or cotyledon.
Monœcious, having the one sex in one flower, and the other in another on the same plant.
Monopetalous, having only one petal.
Monosepalous, having only one sepal.
Mordant, that which enables vegetable matter or tissue to receive dyes or colouring matter, and to retain them.
Mottled, marked with blotches of colour of unequal intensity, passing insensibly into each other.
Mucilage, a turbid slimy fluid.
Mucronate, *Mucronated*, sharp-pointed.
Mucronately-acuminated, with a taper-point ending in a mucrone.

Mucronately-crenate, *Mucronately-toothed*, } serrate or toothed, having the crenatures, serratures, or teeth ending in a sharp point.
Mucronately-pungent, having a sharp prickly point.
Mucrone, a small sharp point.
Mucronulate, *Mucronulated*, } having a little hard sharp point.
Mulch, a gardener's term for the placing manure about the roots of trees, on the surface of the ground.
Multifarious, very numerous, or arranged in many rows.
Multifid, cleft into many parts.
Multifidly-pinnatifid, a leaf is so called when it is pinnately-lobed, and these lobes are again divided into many parts.
Multipartite, divided into many parts.
Multiple, many times more; applied to numbers.
Multiplex, much multiplied.
Muricate, *Muricated*, } covered with short sharp points.
Muricately-hispid, covered with short, sharp, stiff bristles.

N.

Naked, without hairs, without leaves, or without branches, &c.
Nakedish, nearly destitute of hairs or leaves.
Napiform, formed like a turnip, tuberous.
Narcotic, producing sleep or torpor.
Narrowed, tapering.
Navicular, boat-shaped.
Neck, the upper tapering end in bulbs or other plants is called the neck.
Nectarial, of or belonging to the nectary.
Nectariferous, bearing honey or nectaries.
Nectariferous-tube, in *Pelargonium*, is the tube or swelled part at the top of the pedicel.
Nectarium, *Nectary*, } that part of a flower which produces honey.
Nervedly-furrowed, with furrows like nerves.
Nerveless, without nerves.
Nerves, the strong veins upon leaves or flowers.
Nervose, *Nervous*, } full of nerves.
Nervosely-furrowed or *streaked*, *Nervously-furrowed* or *streaked*, } having nerves like furrows or streaks.
Netted, having the veins reticulated.
Neuter, neither male nor female.
Nidulant, nestling, lying among any thing, as a bird in its nest.
Nidus, the nest of any thing.
Nodding, having a drooping position.
Nodi, the swelled articulations of stems; the place where one joint is articulated with another.
Nodose, having many nodi or knots.
Nodules, small hard nodi or knots.
Nucleus, the kernel of a nut.
Nucamentaceous, producing nuts.
Nuts, seeds covered with hard shells.

O.

Ob, is used in the composition of Latin technicals, to indicate the thing is inverted, such as *obovate* is inversely ovate, *obcordate* is inversely cordate, and *oblanceolate* inversely-lanceolate, &c.
Obconical, inversely conical.
Obcordate, inversely cordate.
Obcordately-two-lobed, inversely cordate, with the indentation very deep, so as to appear of two lobes.
Oblong, when joined by a hyphen to another word, signifies a form between the two words, as, *oblong-elliptical*, *oblong-linear*, *oblong-cuneate*, *oblong-lanceolate*, *oblong-spatulate*, *oblong-rhomboid*, *oblong-sagittate*, oblong and arrow-shaped.
Oblong-triquetrous, oblong and three-sided.
Obliquely-cordate, cordate in an oblique manner.
Obliquely-repand, a leaf having a margin undulated, and unequally and obliquely dilated, is said to be obliquely-repand.
Obliquely-truncate, cut off in an oblique manner.
Obovate, *Obovoid*, } inversely egg-shaped, with the broadest end uppermost.
Obovate, when joined by a hyphen to another word, signifies a shape between the two words, thus, *obovate-spatulate*, a shape between obovate and spatulate; *obovate-oblong*, *obovately-oblong*, between obovate and oblong; *obovate-lanceolate*, between obovate and lance-shaped; *obovate-cuneated*, a figure between obovate and wedge-shaped; *obovate-roundish*, a figure between circular and obovate; *obovate-rhomboid*, a figure between obovate and rhomb-shape, &c.
Obovate-cuneated, *Obovately-cuneated*, *Obovately-wedge-shaped*, } between obovate and wedge-shaped, with the broadest end uppermost.
Obsolete, hardly evident.
Obsoletely-toothed, scarcely toothed.
Obtuse-angled, having blunt angles.
Obvolute, having one part rolled upon another.
Occidental, coming from the west.
Ochraceous, having the colour of yellow ochre.
Octandrous, having eight stamens.
Octogynous, having eight styles.
Officinal, any thing that has been or is sold in shops.
Oleaginous, having the qualities of oil.
Oleraceous, esculent, eatable.
Opaque, want of transparency.
Operculate, *Operculated*, } covered with a lid.
Operculum, a lid.
Opiate, having the power of opium.
Orbiculate, *Orbicular*, } circular or spherical.
Orbiculately-depressed, spherical, but depressed on the top.
Orbiculately-elliptical, a form between circular and elliptical.
Orbiculately-obovate, a form between circular and obovate.
Orbicularly-rhomboid, a figure between circular and rhomb-shaped; *orbicularly-reniform*, a figure between circular and kidney-shaped.
Orchideous, of or belonging to the natural order of *Orchideæ*.
Orifice, an opening.
Oscillatory, moving like a vane or weather-cock.
Ossified, become like bone.
Ova, the eggs of any thing, the seeds before they are mature.
Oval, when joined to another word by a hyphen, signifies a figure between the two words, as, *oval-rhomboid*, between oval and rhomb-shaped; *oval-lanceolate*, between oval and lance-shaped; *oval-oblong*, a shape between oval and oblong, &c.
Oval, having the figure of ellipsis.
Ovate, the shape of an egg, with the broad end downwards.
Ovate-globose, *Ovate-spheroid*, } between egg-shaped and spherical.
Ovary or *Ovarium*, the germ, the part of the flower in which the young seeds are contained.
Ovate, when joined by a hyphen to another word, signifies a figure between the two words, thus, *ovate-cordate*, ovate and heart-shaped; *ovate-elliptical*, a figure between egg-shaped and elliptical; *ovate-oblong*, a figure between egg-shaped and oblong; *ovate-orbicular*, a figure between egg-shaped and circular; *ovate-lanceolate*, a figure between ovate and lance-shaped; *ovate-spatulate*, a figure between egg-shaped and spatulate.
Ovate-cylindrical, egg-shaped and cylindrical.
Ovately-trapeziform, a form between an egg and a trapezium.
Overlapping, when the margin of one thing lies upon that of another it is said to overlap.
Ovoid, egg-shaped.
Ovula, the seeds in the ovary before they are mature, the same as ova.
Ovulate, containing ova, 2-3-4-ovulate, containing 2-3 or 4 young seeds.
Ovules, the young seeds of plants contained in the ovary.

P.

Palate, the mouth of a ringent flower.
Paleaceous, abounding with chaffy scales.
Palmate, *Palmated*, } divided so as to resemble a hand spread open.
Palmate-lobed, *Palmately-lobed*, } lobed in a palmate manner.
Palmate-parted, *Palmately-parted*, } parted in a palmate manner.
Palmately-cleft, cleft in a palmate manner.
Palmately-multifid, palmate, having the leaflets finely-multifid.
Palmatifid, divided so as to resemble a hand.
Panicle, a loose disposition of inflorescence, as oats.
Panicled, *Paniculate*, } forming a panicle.
Paniculately-branched, branched in a loose manner.
Paniculately-corymbose, having a loose corymb.
Paniculately-dichotomous, having a panicle, dividing in a dichotomous manner.
Paniculately-racemose, having numerous racemes, forming a panicle.
Papilionaceous, butterfly-shaped flowers, as the common pea.
Papillæ, small soft excrescences.
Papillose, *Papillous*, } having small glandular excrescences like pimples.
Pappus, crown of the seeds of compositæ and similar plants.
Papulæ, round, soft, watery protuberances.
Papulose, covered with papulæ.
Papyraceous, the consistence of paper.
Parabolical, form of a parabola, longer than broad, tapering gradually to both ends.
Parenchyma, all the parts of plants which consist of cellular tissue.
Parietal, being attached to the sides or walls of the ovary.
Parietes, the sides of the ovary or capsule.
Parted, divided, but not to the base, 3-4 or 5-parted, divided into 3-4 or 5 parts.
Partition, a division.
Patent, spread out or expanded.
Patulous, slightly spreading.
Pectinate, *Pectinated*, } resembling the teeth of a comb.
Pectinately-ciliated, ciliated in such a manner as to resemble the teeth of a comb.
Pectinately-jagged, jagged in such a manner as to resemble the teeth of a comb.
Pectinately-pinnate-lobed, having leaflets or lobes finely pectinated.
Pectinately-pinnatifid, pinnatifid in a pectinate manner.
Pectoral, relating to the breast.
Pedate, leaves when they are cut in divisions; the outer divisions again lobed, are called pedate.
Pedately, divided in a pedate manner.
Pedately-many-parted, cut into many divisions in a pedate manner.
Pedately-multifid, divided into many parts in a pedate manner.
Pedatifid, cut into lobes, the lateral ones of which do not radiate from the petiole like the rest.
Pedicel, small footstalks of flowers; commonly applied to the partial footstalks of flowers.
Pedicellate, *Pedicelled*, } stalked, having pedicels.
Peduncle, flower-stalk, usually applied to the common footstalk of a number of flowers, sometimes only of one flower.
Peduncled, *Pedunculate*, *Pedunculated*, } having stalks or peduncles.
Pellicle, a thin skin, which envelopes certain seeds.
Pellucid, bright, transparent.
Peltate, a leaf is said to be peltate when the petiole

is fixed in the disk instead of the margin, like the handle of a shield.

Peltately-cordate, between heart-shaped and peltate.

Peltately-rayed, rayed in a peltate manner.

Peltate-nerved, the nerves of a leaf disposed in a peltate manner, radiating from the centre.

Pencilled, marked in lines as with a pencil, or having the appearance of hair pencil, as the stigmas of numerous species of *Oxalis*.

Pencil-formed, resembling a hair pencil.

Pendulous, drooping, hanging down.

Pentagonal, having five angles.

Pentagynous, having five styles.

Pentandrous, having five stamens.

Pentapetalous, having five petals.

Perennial, lasting many years without perishing.

Perfoliate, when the stem passes through the base of a leaf, the leaf is said to be perfoliate.

Perforated, bored, or apparently so, full of holes.

Perianth, *Perianthium*, the envelope which surrounds the flower. This term is applied when the calyx cannot be distinguished from the corolla, as in *Lilium*, *Allium*, &c.

Pericarp, the seed-vessel.

Perichætial, leaves which in mosses surround the base of the stalk of the theca.

Perigone, the calyx and corolla.

Perigynous, inserted in the calyx, or in the disk which adheres to the calyx.

Perisperm, the same as *albumen*, which see.

Peristome, the rim which surrounds the orifice of the theca of a moss.

Peripheric, circular, curved.

Perithecium, *Peridium*, different kinds of envelopes of the reproductive organs of *Fungi*.

Permanent, *Persistent*, } remaining, not falling off.

Pervious, having a passage through which any thing can be transmitted.

Petal-like-scales in Caryophylleæ, the scales which are fixed to the petals at the throat.

Petalled, having petals.

Petaloid, like petals.

Petals, divisions of a corolla.

Petiolate, *Petioled*, } having footstalks.

Petiolar, of or belonging to the petioles.

Petioles, footstalks of leaves.

Petiolulate, having little petioles.

Petiolules, little petioles.

Phænogamous, such plants as are visibly furnished with sexual organs.

Pharmaceutical, relating to the art of pharmacy.

Phthisis, relating to the lungs.

Phyllodium, a dilated petiole, with the consistence of a leaf.

Pili, long stiffish hairs.

Piliate, having a cap or lid like the cap of a mushroom.

Piliferous, bearing hairs.

Pilose, covered with long soft hairs.

Pilosely-hairy, covered with long hairs.

Pilosely-hispid, beset with stiff long hairs.

Pilosely-pubescent, covered with longish pubescence.

Pilosely-scabrous, covered with long stiff hairs.

Pilosely-strigose, beset with unequal stiff hairs.

Pilosely-tomentose, covered with longish tomentum.

Pimpled, covered with minute pustules, resembling pimples.

Pinnæ, *Pinnulæ*, the leaflets of a pinnate leaf.

Pinnate, a leaf is so called when it is divided into numerous smaller leaves or leaflets, as the leaves of the ash.

Pinnately-cut, cut in a pinnate manner.

Pinnately-decompound, compounded in a pinnate manner.

Pinnately-lobed, lobed in a pinnate manner.

Pinnate-parted, divided into lobes in a pinnate manner, but not exactly to the base.

Pinnately-multifid, pinnate, and having the leaflets finely-multifid.

Pinnately-quinate, having 5 leaflets disposed in a pinnate manner.

Pinnatifid, a leaf is so called when it is divided into lobes from the margin nearly to the mid-rib.

Pinnatifidly-sinuated, scolloped in a pinnatifid manner: *pinnatifidly-lyrate*, lyrate in a pinnatifid manner; *pinnatifidly-serrated*, serrated in a pinnatifid manner; *pinnatifidly-runcinate*, runcinate in a pinnatifid manner; *pinnatifidly-toothed*, toothed in a pinnatifid manner; *pinnatifidly-lobed*, lobed in a pinnatifid manner, &c.

Pisiform, formed like a pea or peas.

Pistil, *Pistillum*, { the columnar body in the centre of a flower, consisting commonly of three parts, viz. the ovary, styles, and stigmas.

Pitchers, hollow leaves, so called.

Pith, medulla, occupying the centre of a stem or shoot.

Placenta, that part of the capsule which the seeds are attached to.

Placentarious, having placentas, acting as a placenta, bearing the seeds.

Placentiferous, bearing placentas.

Plane, flat.

Plethoric, having a full habit.

Plicate, plaited, 4, 5, or 6-plicate, having 4, 5, or 6 plaits.

Plumose, feathery, resembling feathers.

Plumule, the centre bud between the cotyledons in the embryo of a plant.

Plurilocular, having many cells.

Pod, a kind of seed-vessel, such as that of the pea tribe.

Podosperm, the stalk on which some seeds are borne.

Pollen, powder contained in the anthers, composed of globules, containing the fecundating fluid; on leaves the bloom.

Polyandrous, having more stamens than 20 inserted in the receptacle.

Polygamous, a plant is said to be polygamous when some flowers are male, some female, and others hermaphrodite on the same plant.

Polygamo-Diœcious, having male and female flowers on the same plant.

Polymorphous, assuming various appearances.

Polypetalous, having many petals.

Polyphore, an elongated receptacle, which bears many ovaries, but not the petals nor stamens.

Polyspermous, containing many seeds.

Pome, an apple or pear, or such like fruits, crowned by the calyx.

Pores, apertures in the cuticle through which transpiration takes place, or apertures in the anthers through which the pollen is ejected.

Porrect, extended forward.

Pouch, a little sack or bag at the base of some petals and sepals.

Powdered, *Powdery*, } covered as if with powder.

Præmorse, appearing as if bitten off.

Precocity, ripe before the usual time.

Pressed, close, not spreading.

Primordial, usually applied to leaves, the first leaves.

Prismatic, formed as a prism.

Proboscis-like, having a beak, form of a trumpet, curved.

Process, *Processes*, } protrusions either natural or monstrous.

Proliferous, a plant is said to be proliferous when it produces young plants about its root in abundance.

Propendent, hanging forwards and downwards.

Pruinose, covered with glittering particles, as if fine dew had been congealed upon it.

Pruinosely-velvety or *pubescent*, covered with short glittering down.

Prurient, stinging.

Pseudospermous, a false seed, a small carpel, as those of Ranunculus and Clematis.

Puberulous, covered with spreading down.

Pubescence, down, short soft hairs.

Pubescent, covered with pubescence.

Pubescently-pilose, covered with soft pressed hairs.

Pubescently-tomentose, covered with dense short white down.

Pulverized, reduced to powder.

Pulvinate, become cushion-shaped.

Punctate, covered with dots.

Punctately-warted, covered with little warts like dots.

Punctiform, formed like little points or dots.

Pungent, stinging or pricking.

Pustular, *Pustulate*, } covered with glandular excrescences like pustules.

Pustules, pimples or little blisters.

Putamen, a nut of many cells.

Pyramidal, formed like a pyramid.

Pyramidately-subulate, thick at the base, and narrow at the apex.

Pyriform, shaped like a pear.

Pyxidiform, a capsule is called a pyxidium when it divides transversely into two cells.

Q.

Quadrangular, having four angles.

Quadrate, square.

Quadrately-divaricate, branching in such a manner as to form a square.

Quadrifarious, arranged in four rows or ranks.

Quadrifariously-imbricated, arranged in four rows and imbricated.

Quadrifid, divided four times, or divided into four parts.

Quadripinnate, four times pinnate.

Quadruple, four times.

Quaternary, arranged by fours, or succeeding by fours.

Quinary, arranged by fives or succeeding by fives.

Quinate, in fives.

Quinate-pinnate, having five leaflets disposed in a pinnate manner.

Quinquefid, *Quinquifid*, } divided into five.

Quintuple, five times.

R.

Raceme, a particular arrangement of flowers, when they are arranged around a simple filiform axis, each particular flower being stalked.

Racemiferous, bearing racemes.

Racemose, disposed in racemes.

Racemosely-corymbose, disposed in a manner between a corymb and a raceme, or numerous racemes forming a corymb.

Racemosely-panicled, disposed in a manner between a raceme and panicle, or numerous racemes forming a panicle.

Racemose-corymbs, between a raceme and a corymb.

Racemules, small racemes.

Rachis, that part of a culm which runs up through the ear of corn, and consequently the part that bears the flowers in other plants; also the common petiole of a pinnate leaf.

Rayed, *Radiant*, *Radiate*, *Radiating*, { a flower is said to be so when in a cluster or head of florets, those of the circumference or ray are long and spreading, and unlike those of the disk. A stigma is said to be rayed or radiant when it is divided like the rays of a star, 5-6-rayed, having 5-6-angles.

Radical, of or belonging to the root, or proceeding from the root.

Radicant, rooting, roots proceeding from the stem.

Radicle, the root of an embryo.

Radius, the ray of a compound flower.

Rameal, of or belonging to the branches.

Ramenta, little brown withered scales, with which the stems of some plants, especially ferns, are covered.

Ramentaceous, covered with ramenta or scales.

Ramifications, subdivisions of root, branches, leaves, or panicles.
Ramose, branched.
Ramuli, twigs or small branches.
Raphe, *Raphis*, in seeds this is the channel of vessels, which connects the chalaza with the hilum; in umbelliferous plants it is the line of junction, of the two halves of which their fruit is composed.
Receptacle, that part of the fructification which supports the other parts.
Recess, *Recesses*, the bays or sinuses of lobed leaves.
Rectilinear, straight lines.
Reclinate, *Reclinated*, leaning back.
Reclinately-erect, at first leaning back, then erect.
Recumbent, lying upon the ground.
Recurved, curved backwards.
Reflexed, bent backwards.
Refracted, bent back.
Refrigerant, producing coolness.
Reniform, kidney-shaped.
Reniform-cordate, between kidney-shaped and heart-shaped.
Repand, a leaf having its margin undulated and unequally dilated, is said to be repand.
Repandly-angular, repand and angular.
Repand-crenated, *Repand-serrated*, *Repand-toothed*, *Repandly-toothed*, *Repandously-toothed*, toothed, serrated, crenated, and undulated.
Repellant, that which drives away any thing.
Replicate, folded back.
Reptant, creeping and rooting.
Resolutive, *Resolvent*, having the power to dissolve.
Resupinate, inverted in position, so that that which was in front becomes the back.
Reticulated, resembling a net, usually applied to the veins and nerves.
Reticulately-areolate, having areolæ disposed like net-work.
Reticulately-nerved, having nerves disposed like net-work.
Reticulately-veined, the veins disposed in the manner of a net.
Retracted, drawn in or lying between things; bent back.
Retrofracted, bent backwards.
Retroflexed, bent backwards.
Retrograde, usually applied to hairs when they are bent back or down, instead of forward or up.
Retuse, appearing as if bit off at the end, abruptly obtuse.
Revolute, rolled back, usually applied to the edges of leaves.
Rhizoma, *Rhysoma*, applied to roots which spread under ground, as the roots of *Iris*.
Rhizomatose, *Rhysomatose*, having rhizoma.
Rhomb, *Rhomboid*, *Rhomboidal*, shape of rhombus.
Rhomb-orate, *Rhomboid-orate*, *Rhomboid-lanceolate*, *Rhomb-spatulate*, between rhomboid and egg-shaped, between rhomboid and lanceolate, and between rhomboid and spatulate.
Rib, the projecting vein of any thing.
Ribbed, having projecting veins.
Rigid, stiff.
Rimose, having a longitudinal fissure or fissures, chinky.
Ringent, gaping.
Ringing, making an incision resembling a ring round a branch.
Rosellate, *Rosulate*, applied to leaves when they are disposed in the manner of the petals of a rose.
Rotate, a monopetalous corolla, the limb of which is flat, and the tube very short, is called rotate, or wheel-shaped.
Roundish-deltoid, form between orbicular and deltoid.
Roundish-obovate, roundly obovate.
Roundish-cordate, roundly cordate.
Roundish-ovate, roundly egg-shaped.
Rubefacient, any thing which reddens the skin, and raises slight cutaneous inflammation.
Rudiment, when an organ is imperfectly developed, botanists call such a rudiment, but sometimes the permanent parts of the leaves are called rudiments of these leaves.
Rufescent, rather rusty.
Rufescently-tomentose, covered with rusty down.
Rufous, reddish orange-colour, or rusty.
Rugosities, protuberances.
Rugose, rough or coarsely wrinkled.
Rugoso-striated, having wrinkled stripes.
Rugulose, finely wrinkled.
Runcinate, applied to the lobes of leaves, a leaf irregularly lobed, the lobes gradually diminishing to the base, and hooked back.
Runcinately-pectinate, runcinate and pectinate.
Runcinately-pinnatifid, pinnatifid, with the lobes hooked back.
Runcinately-toothed, hooked back, and toothed.
Runcinately-lyrate, lyrate, with the lobes hooked back.
Runners, procumbent shoots, which root at their extremity.
Running into, a leaf is said to run down into the petiole, or down the stem, when it extends down the petiole or stem, also applied to the calyx when it runs gradually into the pedicel.
Ruptured, appearing as if burst.
Rusty-tomentose, covered with rusty tomentum.

S.

Saccate, bagged, having a bag or pouch, as in many petals and sepals.
Sack-formed, formed like a sack or pouch.
Sagittate, shaped like the head of an arrow.
Sagittate and *Sagittately*, when joined by a hyphen to another word, signifies a form between the two words, as *sagittate-cordate*, *sagittate-lanceolate*.
Salivation, a discharge of saliva from the glands of the mouth.
Samara, a kind of winged seed-vessel, the same as what the English call a key, such as those of ash and sycamore.
Samaroid, having a seed-vessel like a samara.
Sapid, agreeable to the palate.
Saponaceous, soapy.
Sarcocarp, the most fleshy part of fruit under the epicarp.
Sarmentose, producing sarmenta, or runners and twigs.
Sawed, cut in such a manner as to resemble the teeth of a saw.
Scabrous, rough from little asperities.
Scale-formed, formed like scales.
Scales, any small processes resembling minute leaves or scales; also the leaves of the involucrum in compositæ; also the appendages at the top of the claws of the petals in *Caryophylleæ*.
Scandent, climbing.
Scape, a stem rising from the root, and bearing nothing but the flowers, or sometimes a few bracteas.
Scarious, *Scariose*, membranous and dry.
Scattered, without regularity.
Schistous, formed of the rock called schist.
Scion, a shoot intended for a graft.
Scolloped, having deep and wide indentations.
Scoria, cinders, ashes.
Scrobiculate, excavated into little pits or hollows.
Scrotiform, formed like a double bag.
Scurfy, covered with scales resembling scurf.
Scutate, formed like an ancient round buckler.
Secund, arranged on one side only.
Segments, parts of any thing.
Semi, half.
Semi-cordate, half-cordate.
Semi-orbicular, half-circular.
Semi-sagittate, half arrow-shaped.
Seminal, of or belonging to the seed.
Seminiferous, bearing seed.
Sepals, the divisions of the calyx.
Sepalled, having sepals.
Separable, that which is divisible.
Septa, the partitions which divide the interior parts of the fruit, the dissepiments.
Septiferous, bearing septa or partitions.
Series, a row, a layer.
Sericeous, silky.
Sericeously-velvety, velvety and silky.
Serrate, *Serrated*, like the teeth of a saw.
Serratures, the teeth of a serrated leaf.
Serrate-toothed, having teeth like a saw.
Serrulated, having notches like those of a very fine saw.
Serrate-crenate, having notches between serratures and crenatures.
Serrulations, notchings like those of a very fine saw.
Sessile, without stalks.
Setaceous, *Setacious*, resembling a bristle in shape.
Setaceously-toothed, having teeth like bristles.
Setaceously-pilose, covered with stiff bristle-like hairs.
Setæ, bristles.
Setiform, formed like bristles.
Setigerous, bearing bristles.
Setose, covered with bristles.
Setosely-prickly, covered with stiff bristle-like prickles.
Sheath, the lower part of the leaf that surrounds the stem.
Sherds, fragments of pots, employed by gardeners to drain their flower-pots.
Shield, a broad table-like process in the flower of *Stapelia* and its allies.
Short-acuminated, having a short taper point.
Shortly-bifid, *Shortly-2-cleft*, slightly cleft in two parts at the apex.
Sialagogue, having the power of exciting saliva.
Siliceous, flinty.
Silicle, small short pod of *Cruciferæ*.
Siliculose, form of a silicle, a silicle.
Silique, the long terete pod of *Cruciferæ*.
Siliquose, form of a silique, a silique.
Silky-puberulous, *Silky-pubescent*, *Silky-tomentose*, covered with silky pubescence or tomentum.
Silky-villous, covered with silky hairs.
Simple, the reverse of compound, not divided.
Sinuate, *Sinuated*, cut in such a manner as to appear bending in and out.
Sinuate-angular, *Sinuately-angular*, angled in a sinuated manner.
Sinuately-lobed, lobed in a sinuated manner.
Sinuately-3-lobed, lobed with three sinuated lobes.
Sinuately-pinnatifid, sinuated and pinnatifid, between sinuate and pinnatifid.
Sinuately-curled, sinuate and curled.
Sinuately-repand, scolloped and undulated.
Sinuately-runcinate, between scolloped and runcinate.
Sinuate-toothed, *Sinuately-toothed*, toothed in a sinuated manner.
Sinus, the bays or recesses formed by the lobes of leaves and other bodies.
Smooth, without hairs and smooth.
Smoothed, without hairs and glossy.
Soboliferous, producing young plants from the root.
Soddened, soaked.
Somniferous, causing sleep.
Soporific, causing sleep.
Sorediferous, bearing soredia.
Sori, the patches of fructification on the back of the fronds of ferns.
Spacelate, withered or dead.
Spadix, a spike protracted from a spath.

Spath, *Spatha*, a broad, sheathing leaf, enclosing flowers arranged upon a spadix.
Spathulate, *Spatulate*, shaped like a spatula, a knife so called, whose broadest end is at the extremity.
Spathaceous, furnished with a spatha, or like a spath.
Spatula, a spatulate-shaped process.
Spatulate-linear, between linear and spatulate.
Spatulate, when joined by a hyphen to another word, signifies a form between the two words, as *spatulate-ovate*, *spatulate-roundish*, *spatulate-lanceolate*, *spatulate-obovate*, &c.
Spermaderm, the outer covering of a seed.
Spherical, round like a sphere.
Spheroidal, *Spheroid*, almost like a sphere.
Spherules, minute spheres or globules.
Spicate, having a spike.
Spicately-disposed, disposed in the manner of a spike.
Spike, flowers sessile upon a long rachis, as *Veronica spicata*.
Spiked, having a spike.
Spike-formed, formed like a spike.
Spikelets, in grasses, flowers arranged in two rows, as in *Bromus*, small spikes.
Spinulosely-toothed, having spiny teeth, or small teeth like spines.
Spines, indurated branches or processes not falling off from the part that bears them.
Spinescent, furnished with soft spine-like processes.
Spiniform, formed like a spine.
Spinulescent, having a tendency to produce small spine-like processes.
Spinose, *Spinous*, furnished with spines or form of spines.
Spinosely-toothed, *Spinously-toothed*, having sharp stiff teeth like spines.
Spinosely-serrated, having serratures like spines.
Spinosely-trifid, divided into three spines.
Spinulose, furnished with small spines.
Spiny, furnished with a spine or spines.
Spiny-ciliated, edged with stiff processes like spines.
Spiny-serrated, having the serratures or teeth terminated by spines.
Spiny-toothed, having teeth like spines.
Siliculæform, form of a silicle.
Spiral, circularly involved, twisted like a screw.
Spirally-convolute, rolled together in a spiral manner.
Spirally-twisted, twisted like a screw.
Sporules, that part of cryptogamous plants which answers to the seeds of other plants.
Sporuliferous, bearing sporules.
Spurious, counterfeit.
Spurs, *Spur*, long processes resembling horns, produced by various parts of a flower; in *Aconitum* the process which terminates the petal or nectary.
Squamiform, like scales, formed like scales.
Squarrose, spreading stiffly at right angles or in a greater degree.
Squarrosely-imbricated, laid over each other in a squarrose manner.
Squinancy, an inflammation in the throat.
Stalks, the footstalks of leaves or flowers.
Stalked, having stalks.
Stamen, the male organ of a flower.
Staminiferous, bearing stamina.
Staminiferous-tube, the tube which is formed from the cohesion of the filaments.
Standard, the upper petal in pea-flowers.
Starry, *stellate*, in the manner of a star, radiating.
Starry-pubescent. See *Stellately-pubescent*.
Stellate-hairs, tufts of hairs radiating like a star.
Stellately-pubescent, covered by starry tufts of down.
Stellulate, resembling little stars.
Stellately-spreading, *Stellately-disposed*, disposed or spreading in the manner of a star.
Stem-clasping, clasping the stem; a leaf is so called when it clasps the stem with its base.
Sterile, barren.
Sternutory, qualities which provoke sneezing.
Stigma, the female organ of a flower.
Stigmatose, when a stigma is long, lateral, or on one side of the style.
Stimulating, exciting.
Stipe, the stalk of a fruit within the corolla and calyx, or the claw of a petal.
Stipe-formed, having the form of a stipe.
Stiped, having a stipe.
Stipitate, furnished with a stipe.
Stipitately-unguiculate, having cylindrical unguis or claws.
Stipulas, *Stipules*, small scales or membranes at the base of the petioles, uncertain leaves, usually one on each side.
Stipulate, *Stipulaceous*, furnished with stipulas.
Stipulaceously-dilated, when a petiole is dilated at the base it is so called.
Stipular, in place of stipulas.
Stipulary, occupying the place of stipulas.
Stipuled, having stipulas.
Stolons, runners which root at the joints, as those of the strawberry.
Stoloniferous, bearing creeping runners which root at the joints.
Stomachic, agreeable to the stomach.
Strangury, a disease, also produced on plants by tight ligatures.
Strata, layers, beds.
Streaks, little channels, furrows, or lines.
Striæ, small streaks.
Striated, having streaks.
Strict, upright, straight, not crooked.
Strigæ, little, upright, unequal, stiff hairs, swelled at their roots.
Strigose, covered with strigæ.
Strigosely-pilose, covered with long, stiff, unequal hairs, swelled at their roots.
Strigosely-muricated, covered with stiff unequal points, swelled at their roots.
Strobile, a fir cone; the fruit of *Magnolia*, and such like, are so called.
Strophiola, a round protuberance at the base of some seeds.
Strophiolate, having a strophiola.
Struma, a wen, a protuberance.
Strumose, *Strumous*, covered with strumæ.
Stupa, filamentose matter.
Stupose, full of filamentose matter.
Style, the stalk which intervenes between the ovary and the stigma and bearing the latter. The styles are called short in *Oxalis* when they are shorter than the shortest stamens.
Styliferous, bearing a style or styles.
Styptic, having the power to staunch blood.
Sub, in composition, signifies somewhat, as *subrotund*, somewhat round, or roundish; *substipitate*, having a very short stipe; *subcaulescent*, having a kind of stem; *subumbellate*, somewhat umbellate; *subsagittate*, somewhat sagittate; *sublobate*, somewhat lobed; *subdentate*, somewhat toothed; *subradical*, almost radical, and so forth.
Subalate, with a narrow wing or margin.
Suberose, corky.
Subulate, form of an awl, tapering to a point.
Subulate-conical, between awl-shaped and conical.
Succulent, fleshy, and filled with juice.
Sudorific, having the power of producing perspiration.
Suffrutescent, *Suffruticose*, *Suffruticulose*, shrubby in a slight degree.
Sulcate, *Sulcated*, furrowed, having furrows.
Superior, when any thing is above the ovarium it is called superior; the uppermost of any thing; the ovary or fruit is so called when it is above the calyx, petals, and stamens; a radicle is said to be superior when in that end of the seed furthest from the hylum.
Supernatant, floating on the surface of any thing.
Supine, lying with the face upwards.
Suppurate, to generate matter.
Supra-axillary, above the axils, in opposition to *infra-axillary*.
Supra-decompound, above compound, doubly compounded.
Surculi, young shoots.
Suture, the line formed by the cohesion of two parts, usually applied to the fruit.
Syngenesious, belonging to the 19th class in the sexual system.
Synthetical, combining, opposed to analytical.
Syphilitic, of or belonging to syphilis.

T.

Tails, the long feathery or hairy terminations of certain fruits.
Tap-root, a root which penetrates deep and perpendicularly into the ground without dividing.
Tapering, becoming gradually narrower.
Taper-pointed, having a long taper point.
Tartareous, consisting of tartar.
Teated, resembling the figure of a teat in animals.
Tendrils, the curling, twining organs by which some plants lay hold of others, as the vine.
Tendrilled, having tendrils.
Terete, like a taper, round and long.
Terminal, ending, or at the top of any thing.
Tern, in threes, or three in a whorl.
Ternary, consisting of threes, or succeeding by threes.
Ternate, a leaf consisting of three leaflets, 2-3-ternate, twice or thrice ternate.
Ternately-decompound, compounded in a ternate manner.
Ternately-verticillate, having three leaves in a whorl.
Tessellated, variegated by squares, chequered.
Testa, the skin or integument of a seed.
Testaceous, consistence of a shell.
Tetanus, cramp of the stomach.
Tetrachotomous, a stem that ramifies in fours.
Tetragonal, having four angles.
Tetragynous, having four styles.
Tetrandrous, having four stamens.
Tetrapetalous, having four petals.
Tetraquetrous, having four angles or sides.
Tetrasepalous, having four sepals.
Thalamus, that part of a flower which rises below the ovarium, and sometimes supports the outer envelopes as well as the stamens in all the *Thalamifloræ*.
Thallus, that part which bears the fructification in lichens.
Thecæ, the cases that contain the sporules of cryptogamic plants.
Thecaphore, an elongated receptacle, which bears one ovary only but not the petals, nor stamens; example the caper.
Thready, having long hairs like threads.
Threads, long hairs like threads.
Throat, the orifice of a flower.
Thyrse, a kind of dense panicle, like that of the lilac.
Thyrsoid, resembling a thyrse.
Tissue, may be composed of membranes, bladders, cells or fibres.
Tomentose, covered with dense curled white down or hairs.
Tomentosely-cinereous, covered with grey tomentum.
Tomentosely-scabrous, covered with rough tomentum.
Tomentosely-hairy, covered with long tomentum.
Tomentosely-hispid, covered with stiff tomentum.
Tomentosely-hoary, covered with hoary tomentum.
Tomentosely-pilose, covered with long tomentum.
Tomentosely-villous, covered with villous tomentum.
Tomentosely-pubescent, covered with pubescent tomentum.
Tomentum, dense, close, white curled hairs or down.
Tonic, bracing, corroborative.

Toothed, divided so as to resemble teeth.
Toothletted, furnished with little teeth.
Topical, local, confined to some particular place.
Torose, uneven, alternately elevated and depressed.
Tortuous, twisted.
Torulose, slightly torose.
Torus, the same as *Thalamus*.
Transversely-flexuous, bent in a cross direction.
Transversely-plicate, plaited in a cross direction.
Trapesiform, *Trapeziform*, } in the shape of a trapezium.
Trapezoid, having the form of a trapezium.
Triandrous, having three stamens.
Tribracteate, having three bracteas.
Trichotomous, branches dividing in threes.
Trichotomously-panicled, having a panicle, whose branches divide in threes.
Tricoccous, a fruit of 3 1-seed cells is so called, as those of *Euphorbia*.
Tricuspidate, having three points.
Tridentate, having three teeth
Trifarious, arranged in triple rank or in three rows.
Trifoliate, having three leaflets.
Trifid, divided into three, or not to the base.
Trigonal, having three angles.
Trigynous, having three styles.
Trilocular, having three cells.
Tripetaloid, appearing as if furnished with three petals.
Tripetalous, having three petals.
Tripinnate, thrice-pinnate.
Tripinnatifid, thrice pinnatifid.
Triple-nerved, three-nerved, and throwing out three side nerves a little above the base.
Triquetrous, having three sides or angles.
Triquetrously-2-edged, having only two edges, the third being nearly obsolete.
Trisected, cut into three parts.
Triternate, thrice ternate.
Triturated, reduced to powder by pounding.
Trochleate, twisted like a pully.
Trochleately-arched, twisted and arched.
Tropical, belonging to the torrid zone.
Truncate, blunt, as if cut off.
Truncately-obtuse, blunt, and as if cut off.
Truncately-triangular, cut off at end so as to give the leaf a triangular figure.
Tube of stamens or *staminiferous tube*, the tube formed from the cohesion of the filaments in monadelphous flowers is so called.
Tube of calyx, the tube formed from the cohesion of the sepals.
Tubercled, *Tuberculate*, *Tuberculated*, *Tubercular*, } covered with knots or tubercles.
Tuberculately-hairy, covered with stiff short hairs resembling tubercles.
Tuberous, bearing fleshy, solid, roundish or longish roots, like the potatoe.
Tubers, roots so called, potatoes.
Tubular, forming a tube.
Tufted, forming a dense tuft.
Tumid, swelling.
Tunic, a coat, a seed cover.
Tunicated, having a coat or coats.
Turbinate, *Turbinated*, } having the figure of a top.
Turbinately-globose, between the form of a top and a globe.
Turgid, swollen, puffed up.

U.

Umbellulate, disposed in small umbels.
Umbellate, having the flowers in round flat heads, the peduncles originating from a common centre, as in the carrot.
Umbellately-branched, branched in an umbellate manner.
Umbelliferous, bearing umbels.
Umbellules, *Umbellets*, } small umbels, the divisions of an umbel.
Umbels, the flat tuft of flowers produced by a carrot, the peduncles and pedicels always rising from a common centre.
Umbilical, of or belonging to the umbilicus.
Umbilicate, *Umbilicated*, } hollowed like the navel.
Umbilicus, the cord which attaches the seed to the placenta.
Umbonate, having a top in the centre like that of the ancient shield.
Unarmed, destitute of prickles or spines, which are called the arms of plants.
Unappendiculate or *inappendiculate*, without appendages of any kind.
Uncinate, hooked.
Uncinately-inflexed, hooked inwards.
Unctuous, fat, oily.
Undulate, *Undulated*, } waved, rising and falling.
Undulately-crenated, crenated and waved.
Undulately-curled, curled and waved.
Undulately-rugose, *Undulately-wrinkled*, } rugged or wrinkled and waved.
Unequal, when applied to petals or sepals, indicates that they are of unequal size and shape.
Unequal-sided, having unequal sides.
Unguiculate, *Unguiculated*, } furnished with claws or an unguis.
Unguis, the taper-base of a petal or any thing else.
Unilabiate, having only one lip.
Unilateral, one-sided, or leaning to one side.
Unilocular, having one cell.
Unisexual, being of one sex.
Urceolar, of or belonging to an urceolus, having an urceolus, or expanded into an urceolus; usually applied to the disk.
Urceolate, pitcher-shaped.
Urceolus, the filaments may be joined into a pitcher-shaped body, this is called the urceolus of the stamens, or they may be surrounded by a pitcher-shaped membrane, this is also called an urceolus.
Ustulate, blackened.
Uterine, belonging to the womb.
Uterus, the womb.
Utricle, a little bottle or bladder.
Utricular, composed of little bladders.

V.

Valvate, opening like valves.
Valvately-connate, joined like valves.
Valvæform, form of a valve.
Valveless, without valves.
Valvular, consisting of valves.
Valvular-dissepiments, having dissepiments or partitions in the centre of the valves.
Valves, the divisions of a capsule.
Valved, having valves.
Varicose, swollen here and there.
Vascular, composed of tubes or vessels.
Vaulted, formed or placed like the roof of a vault.
Veinless, without veins.
Velvety, covered with down like velvet.
Velvety-puberulous, covered with velvety down.
Velvety-pubescent, covered with soft, pressed down, like velvet.
Velvety-tomentose, covered with soft tomentum like velvet.
Veneering, the art of covering one kind of wood with thin plates of another kind.
Ventricose, inflated.
Vermicular, having the appearance of a worm.
Vermifuge, that which expels worms.
Vernacular, native.
Vernal, belonging to the spring.
Versatile, swinging lightly on a stalk, so as to be continually changing direction.
Vertex, the uppermost point.
Vertical, perpendicular.
Vertically-compressed, that is depressed.
Verticillate, disposed in a whorl.
Vertilinear, the same as rectilinear.
Vesicatories, blistering plasters.
Vesicles, hollow excrescences, resembling bladders.
Vexillum, standard, the upper petal of a pea-flower.
Villi, long, close, rather soft hairs.
Villous, covered with soft, close, long, loose hairs.
Villously-ciliated, ciliated with soft hairs.
Villously-cinereous, covered with grey, soft, long loose hairs.
Villously-hairy, covered with soft hairs.
Villously-pubescent, covered with soft long pubescence.
Villously-tomentose, covered with soft long tomentum.
Violaceous, the colour of a violet.
Virescent, greenish.
Viscid, *Viscous*, } adhesive, clammy.
Viviparous, bearing young plants in the place of flowers and seed.
Vulnerary, useful in the cure of wounds.
Vulviform, like a cleft with projecting edges.

W.

Warted, covered with protuberances like warts.
Wattled, having processes like the wattles of a cock.
Wavy, undulated.
Waved, having wavy edges.
White-velvety, covered with white down like velvet.
Whorled, disposed in whorls or whirls.
Whorls, leaves inserted round a stem, as those of *Hippuris* or *Equisetum*.
Wing, in botany, signifies a membranous border, wherewith many seeds are supported in the air, when floating from place to place.
Wings, the side petals of a pea-flower.
Wing-formed, having the form of a wing.
Winged, having a wing or wings.
Wrinkled, having an uneven surface.

Z.

Zonate, having a dark belt in the shape of a horse-shoe, as in some species of *Pelargonium*.
Zones, stripes or belts.
Zigzag, a stem is called zigzag when it bends from side to side.

INDEX TO THE FIRST VOLUME,

COMPRISING THE

SYSTEMATIC AND ENGLISH GENERIC NAMES, AND THE ENGLISH AND SYSTEMATIC SYNONYMES.

*** In this Index the systematic names used, and the English names in common use, are in *Roman letters;* the synonymes in *Italics;* the names of Classes, Sub-classes, and Orders in *large capitals;* and the names of Sub-orders and Tribes in *small capitals.*

CORRECTIONS.

Page 15. *for* Pulsatllaf *read* Pulsatílla.
—— 47. *under* Isopyrum fumarioides *read* flowers yellow instead of white.
—— 57. *for* Monk's-wood *read* Monk's-hood.
—— 68 *for* Polydelphous *read* Polyadelphous.
—— 78. *for* shobile-like *read* strobile-like.
—— 86. *for* Calyciflora *read* Calycifloræ.
—— 118. first column, in the specific characters of Mahònia aquifòlium, no. 2. and Mahònia nervòsa, no. 4. *for* distant from the petiole *read* distant from the base of the petiole.
—— 122. 128, and 129 *for* Nymphiaceæ *read* Nymphæaceæ.
—— 122. and 124 *for* Nymphæea *read* Nymphæeæ.
—— 418, lines 3 and 6, *for* grandiflora *read* grandifolia.
——, col. 2, lines 9 and 12, *for* parviflora *read* parvifolia.
—— 429. col. 2, line 17 from bottom, *for* ☉ *read* ♃.
Page 526. *for* urceolas *read* urceolus.
—— 354. *under* Polygala arillata *read* flowers yellow instead of red, and shrub 10 feet high instead of 1 foot.

The following words to be altered wherever they are found.

For monodelphous *read* monadelphous.
—- unquiculate *read* unguiculate.
—- Andr. Juss. *read* Adr. Juss.
—- Ræm. et Schultz. *read* Rœm. et Schult.
—- brevisty'lus a, um *read* brevístylus a, um.
—- longisty'lus a, um *read* longístylus a, um.
—- rádicans *read* radìcans.

GRAND DIVISIONS.

GRAND DIVISION I. VASCULA'RES, (from *vas*, a vessel; plants furnished with spiral vessels) OR COTYLEDO'NEÆ, (κοτυληδων, *cotyledon*, a seed leaf; plants furnished with seed leaves.)—Plants with cellular tissue (f. 1. 1. *b.*), woody fibre and spiral vessels (*a a*), and furnished with true leaves (f. 1. 3. 8. 7.). The flowers usually distinct and symmetrical (f. 2.). Embryo furnished with cotyledons (f. 1. 4. 5. 10. *a.*), and inclosed within a seed-cover. This division contains all the classes of Linnæus, Cryptogamia excepted.

GRAND DIVISION II. CELLULA'RES, (*cellula*, a little cell; plants with cellular tissue only,) OR ACOTYLEDO'NEÆ, (*a.* privative, κοτυληδων, *cotyledon;* plants without cotyledons.)—Plants with cellular tissue only (f. 1. 11, 12.). Embryo destitute of cotyledons. Parts of fructification hidden (f. 1. 14. 13. *a.*). This grand division only contains the class Cryptogamia of Linnæus.

GRAND DIVISION I.

VASCULA'RES OR COTYLEDO'NEÆ.

CLASSES.

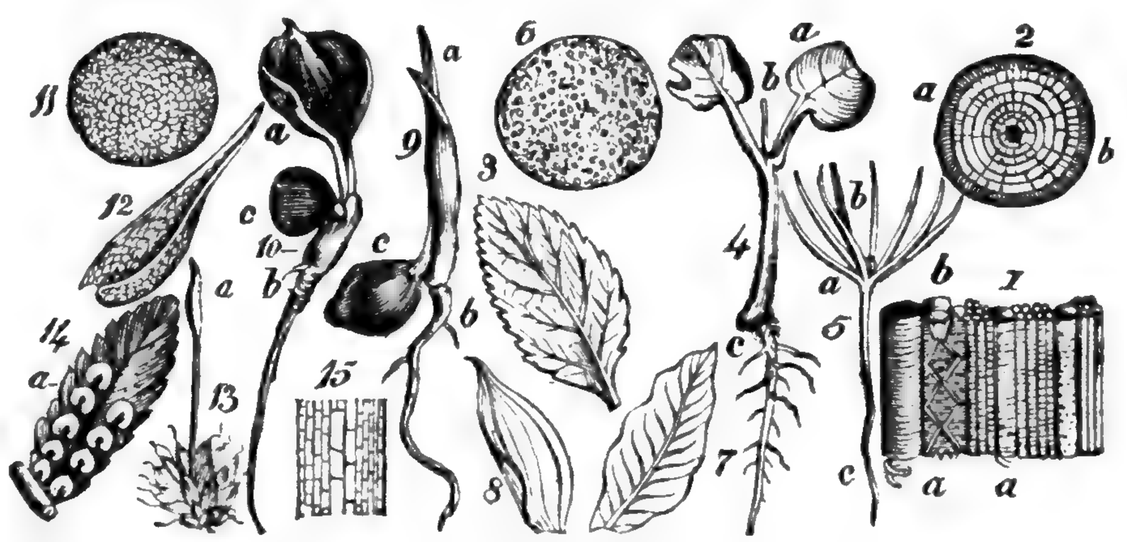
CLASS I. DICOTYLEDO'NEÆ, (δις, *dis*, two; κοτυληδων, *cotyledon;* plants furnished with two cotyledons) or EXOGE'NÆ (εξω, *exo*, without; γενναω, *gennao*, to bring forth; stem increasing by external layers). D. C. syst. 1. p. 123. prod. 1. p. 1.

Stem increasing by external layers; with an evident distinction between bark and wood (f. 1. 2. *a*, *b.*). Leaves traversed by branch veins (f. 1. 3.). Parts of flower generally disposed in a quinary number (f. 2. 2.). Embryo with 2 opposite cotyledons (f. 1. 4. *a.*), or when more they are disposed in a whorl (f. 1. 5. *a.*). Plumule in the centre of their point of junction (f. 1. 4. *b.* and 5. *b.*): the inferior end of the embryo itself elongated into a radicle, and not containing any secondary radicles in its substance (f. 1. 4. *c.* and 5. *c.*).

CLASS II. MONOCOTYLEDO'NEÆ, (μονος, *monos*, one; κοτυληδων, *cotyledon*, plants furnished with 1 cotyledon) or ENDOGE'NEÆ (ενδον, *endon*, within; γενναω, *gennao*, to bring forth; stem increasing by internal layers.)

Stem increasing by internal layers with no evident distinction between bark and wood, but are mixed together (f. 1. 6.). Leaves traversed by simple veins (f. 1. 7. 8.) usually with no articulation between the leaves and the stem, while in Dicotyledòneæ the leaves are always joined with the stem, from which they fall off, leaving a scar behind. Embryo furnished with 1 cotyledon (f. 1. 10. *a.*), or if 2, they are alternate (f. 1. 9. *a.*); the inferior end elongated into a radicle or radicles (f. 1. 10. *b.* & 9. *b.*). Plumule usually inclosed in the body of the embryo.

FIG. 1.



CLASS I.

DICOTYLEDO'NEÆ OR EXOGE'NÆ.

Synopsis of the Subclasses, deduced from the organs of fructification.

1. *Perigone double.* (f. 2. 3. and 4. *b.*)

Subclass I. THALAMIFLO'RÆ. (f. 2. 1.)

Petals many, distinct; and are, as well as the stamens, inserted in the receptacle (*a*).

Subclass II. Calyciflo'ræ (f. 2. 2.).

Petals many, distinct (*a*), or united together at the base, and are as well as the stamens, inserted in the calyx (*b*.).

Subclass III. Corolliflo'ræ. (f. 2. 3 and 4.).

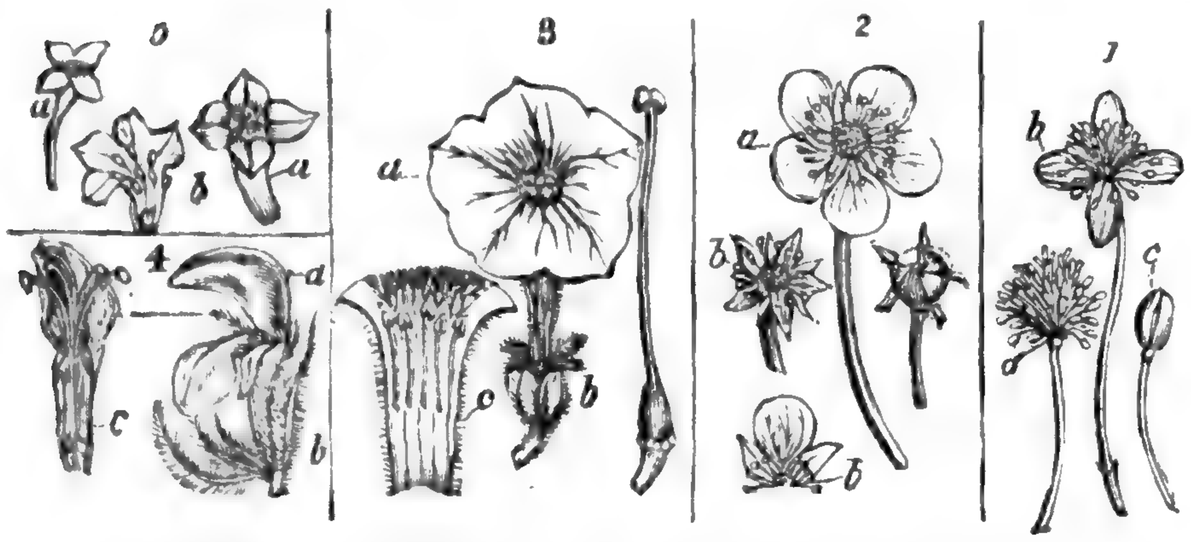
Petals united together in one (*a*.), inserted in the receptacle (*b*.), and bearing the stamens (*c*.).

2. *Perigone Simple* (f. 2. 5. *a*.).

Subclass IV. Monochlamy'deæ (f. 2. 5.).

Corolla wanting, or united with the calyx (*a*.) and bearing the stamens (*b*.).

FIG. 2.



Subclass I. THALAMIFLO'RÆ (from *thalamus*, a bride chamber, and *flos*, a flower, in allusion to the parts of the flower being inserted in the receptacle.) D. C. prod. 1. p. 1. Calyx of many sepals. Petals many, distinct, and are as well as the stamens inserted into the receptacle (f. 2. 1. *a*.). The insertion of the petals and stamens into the receptacle is the great character of this subclass, which therefore contains all the Polyandrous plants of Linnæus.

Sect. I. Ovaries numerous, aggregate (f. 3. *b*. f. 7. *b*. & f. 6. *c*.), each bearing a style rarely solitary from abortion or coalition (f. 13. *b*.). Stamens indefinite, or if definite then opposite the petals.

Order I. RANUNCULA'CEÆ. (plants agreeing with Ranunculus in many important characters.) Juss. 231. D. C. syst. 1. p. 127. prod. 1. p. 2.

Calyx of many definite sepals (f. 4. *a*. f. 6. *b*. f. 14. *a*.), or many parted with an equal number of petals (f. 14. *c*.), or twice or thrice that number, sometimes wanting (f. 7. *a*. f. 4. *a*. f. 3. *a*.). Stamens indefinite, free (f. 2. 1. *a*. f. 4. *b*.). Anthers adnate, usually turned outwards (f. 4. *b*.). Pistils inserted in the torus (f. 10. *d*.). Carpels many (f. 3. *b*. f. 6. *c*.), 1-celled (f. 6. *d*. f. 9. *g*.), pseudospermous (f. 6. *c*. f. 3. *b*.), baccate (f. 7. *b*. f. 13. *b*.), capsular (f. 11. *c*. f. 12. *c*.), or follicular (f. 14. *e*. *f*.), 1 (f. 6. *e*. f. 9. *g*.), or many-seeded (f. 13. *c*. f. 14. *f*.). Seeds attached by their inner side, solitary, erect (f. 9. *g*. *f*.) or pendulous (f. 6 *e*.), or if many, usually disposed in one row along the margin of the carpel (f. 14. *f*.). Embryo minute, placed in the base of a corneous albumen (f. 9. *f*.). Herbs, undershrubs, or sarmentose shrubs. Roots fascicled, grumose or fibrous. Leaves, simple or variously cut, with stalks more or less dilated at their base, alternate; but opposite in Clematideæ.

The greater part of the plants of this order are objects of interest with gardeners, containing as it does many of the most elegant and shewy of the tribes of plants. It is remarkable, however, that the acrid and venomous properties of these plants are nearly as powerful as their beauty is great. M. De Candolle remarks, that its nature is extremely singular; it is so volatile, that in most cases, simple drying in the air, or infusion in water, is sufficient to destroy it; it is neither acid nor alkaline; but its activity is increased by acids, honey, sugar, wine, or alcohol, and it is in reality destructible only in water. The recent herb applied externally to the skin causes blisters. The roots are usually drastic or emetic. The seeds are generally acrid and aromatic, and retain their power of vegetation a considerable time, therefore they are easily imported in a vegetative state from any part of the world.

Synopsis of the Genera.

True RANUNCULA'CEÆ. Anthers bursting outwards (*pl.* 1. f. 5.).

Tribe I.

Clematídeæ. *Calyx in the bud valvate* (f. 2. 1. *c*.), *or induplicate* (f. 4. *c*. *d*.). *Petals wanting* (f. 2. 1. *b*. f. 4. *a*.), *or flat. Carpels indehiscent* (f. 3. *b*.), *1-seeded* (f. 3. *d*.), *ending in a tail, which is generally feathery* (f. 3. *e*. *c*.). *Seed pendulous* (f. 3. *d*.). *Leaves opposite* (f. 3. 4 and 5.). *Climbing shrubs, rarely herbs.*

1 Cle'matis. Petals wanting (f. 3. and 4. *a*.). Carpels sessile (f. 3. *b*.).

2 Atrage'ne. Petals numerous, shorter than the calyx. Carpels sessile.

3 Narave'lia. Petals 6 to 12, longer than the calyx (f. 5. *a*.). Carpels seated on a thick hollow stipe (f. 5. *b*.).

Tribe II.

Anemòneæ. *Calyx and Corolla imbricate in the bud* (f. 14. *a*.). *Petals wanting* (f. 6. *b*. f. 7. *a*.), *or flat. Carpels 1-seeded* (f. 6. *d*.), *indehiscent* (f. 6. *c*.), *usually ending in a tail* (f. 6. *f*.) *or point* (f. 6. *c*.). *Seed pendulous* (f. 6. *e*.). *Leaves radical* (f. 6.), *or alternate* (f. 7.). *Herbs, rarely shrubs.*

4 Thalíctrum. Involucre wanting. Calyx of 4 or 5 petal-like sepals. Petals wanting. Carpels dry, never ending in a tail, stipitate, or sessile, sometimes furrowed longitudinally.

5 Tetra'ctis. Involucre wanting. Calyx of 4 petal-like sepals. Petals wanting. Stamens 4. Carpels 4, acute.

6 Anemòne. Involucre of 3 cut leaflets, distant from the flower (f. 6. *a*.). Calyx of 5 to 15 petal-like sepals (f. 6. *b*.). Petals wanting.

7 Hepa'tica. Involucre of 3 entire leaflets, just under the flower. Calyx of from 6 to 9 petal-like sepals. Petals wanting.

8 Hydra'stis. Involucre wanting. Calyx of 3 sepals (f. 7. *a*.). Petals wanting. Carpels baccate (f. 7. *b*).

9 Knowltònia Involucre none. Calyx of 5 sepals. Petals 5 to 15. Carpels baccate.

10 ADÒNIS. Involucre wanting. Calyx of 5 pressed sepals. Petals 5 to 15. Carpels dry, ovate, pointed with the style.

11 HAMADRY'AS. Involucre wanting. Calyx of 5 or 6 sepals (f. 8. *a.*). Petals 10 or 12 (f. 8. *b.*). Carpels ovate. Flowers dioecious.

TRIBE III.

RANU'NCULEÆ. *Calyx and Corolla imbricate in the bud* (f. 14. *a.*). *Petals bilabiate, or increased with a scale on the inside at the base* (f. 9. *c.*). *Carpels* 1*-seeded* (f. 9. *g.*), *dry, indehiscent* (f. 9. *e. d.*). *Seed erect* (f. 9. *f.*). *Leaves radical or alternate* (f. 9.). *Herbs.*

12 MYOSU'RUS. Sepals 5, unconnected at the base, and drawn out downwards beyond their insertion. Petals 5. Carpels disposed on a long slender receptacle.

13 CERATOCE'PHALUS. Sepals 5, connected at the base. Petals 5. Pericarps gibbous on both sides at the base, and drawn out at the apex in a horn, which is 6 times longer than the seed, disposed in a long spike.

14 RANU'NCULUS. Sepals 5, connected at the base (f. 9. *a.*). Petals usually 5 (f. 9. *b.*). Pericarps not gibbous at the base, pointed, disposed in globose or cylindrical heads (f. 9. *e. d.*).

15 CASA'LIA. Calyx of 3 petal-like sepals connected at the base. Petals 3. Pericarps not gibbous at the base, pointed, disposed in hemispherical or cylindrical heads.

16 APHANOSTE'MMA. Calyx of 5 petal-like sepals, connected at the base. Petals 5, small, gland-like. Pericarps not gibbous at the base, compressed, orbicular, pointed, somewhat marginate.

17 FICA'RIA. Sepals 3, connected at the base. Petals 9. Pericarps blunt.

TRIBE IV.

HELLE'BOREÆ. *Calyx and Corolla imbricate in the bud* (f. 14. *a.*). *Petals sometimes wanting* (f. 12. *a.*), *sometimes irregular, bilabiate, nectariferous* (f. 11. *e.* f. 12. *b.*). *Calyx petal-like* (f. 11. *b.* f. 12. *a.*). *Carpels capsular, dehiscent, many-seeded* (f. 11. *c.* f. 12. *c.*). *Leaves radical or alternate* (f. 10. 12.). *Herbs.*

18 CA'LTHA. Calyx deciduous, or permanent, of 5 regular petal-like sepals (f. 10. *a.*). Petals wanting. Capsules sessile.

19 TRÓLLIUS. Calyx deciduous, of from 5 to 20 regular petal-like sepals. Petals from 5 to 20, unilabiate. Capsules sessile.

20 ERA'NTHIS. Involucre many-parted, just under the flower (f. 11. *a. d.*). Calyx deciduous, of from 5 to 8 regular petal-like sepals (f. 11. *b.*). Petals 6 to 8. Capsules on pedicels (f. 11. *c.*).

21 HELLE'BORUS. Calyx permanent, rather coriaceous, of 5 sepals. Petals 8 to 10. Capsules coriaceous, sessile.

22 CÓPTIS. Calyx deciduous, of 5 or 6 regular petal-like sepals. Petals 5 or 6. Capsules membranaceous, on pedicels.

23 ISOPY'RUM. Calyx deciduous, of 5 regular petal-like sepals. (f. 12. *a.*). Petals 5 (f. 12. *b.*). Capsules sessile, membranaceous (f. 12. *c.*).

24 ENE'MION. Calyx of 5 deciduous petal-like sepals. Filaments clavated. Capsules ovate, compressed, 2-seeded, pointed with the style, sessile, membranaceous.

25 GARIDE'LLA. Calyx deciduous, of 5 regular petal-like sepals. Petals 5. Carpels 3, connected. Styles very short.

26 NIGE'LLA. Calyx of 5 deciduous petal-like sepals. Petals 5 to 10. Carpels 5, connected. Styles very long.

27 AQUILE'GIA. Calyx of 5 regular petal-like sepals. Petals 5, each drawn out downwards into a hollow spur.

28 DELPHI'NIUM. Calyx of 5 deciduous petal-like irregular sepals, with the upper one drawn out downwards into a hollow spur. Petals 4, the 2 upper ones drawn out downwards into the spur.

29 ACONÌTUM. Calyx deciduous, of 5 irregular petal-like sepals, with the upper sepal helmet-shaped. Petals 2-stalked, tubular, within the hollow of the upper sepal.

TRIBE V.

PÆONIA'CEÆ, *or spurious* RANUNCULA'CEÆ. *Anthers bursting inwards. Leaves radical or alternate. Herbs, rarely shrubs.*

30 CIMICI'FUGA. Calyx of 4 deciduous sepals. Petals 4. Styles 1 to 12. Carpels dry, dehiscent, many-seeded.

31 ACTÆ'A. Calyx of 4 deciduous sepals. Petals 4. Style 1. Carpel baccate, indehiscent (f. 13. *b.*), many-seeded (f. 13. *c.*).

32 ZANTHORHÌZA. Calyx of 5 deciduous sepals. Petals 5. Carpels 2 or 3-seeded, but from abortion usually 1-seeded.

33 PÆÒNIA. Calyx of 5 permanent sepals (f. 14. *b.*). Petals 5, flat (f. 14. *c.*). Carpels follicular, many-seeded (f. 14. *f. e.*).

Tribe I.

CLEMATI'DEÆ (plants resembling Clematis,) D. C. syst. 1. p. 131. prod. 1. p. 2. Calyx when in bud valvate (f. 2. 1. *c.*) or induplicate (f. 4. *d. c.*). Petals none (f. 3. and 4.). or flat (f. 5.). Anthers linear, turned outwards (f. 4. *b.*). Carpels aggregate (f. 3. *b.*), 1-seeded, indehiscent, terminated by a tail. (f. 3. *c.*). Seed pendulous (f. 3. *d.*). Leaves opposite (f. 3. and 4.). Roots fibrous.

I. CLE'MATIS (from κλημα, *clema*, a vine branch, because most of the species climb like the vine) Lin. gen. no. 695. Gært. fruct. 1. p. 353. t. 14. D. C. syst. 1. p. 131. prod. 1. p. 2.

LIN. SYST. *Polyándria, Polygy'nia.* Involucre none, or situated under the flower, in the form of a calyx. Calyx of from 4 to 8 coloured sepals. Petals none (f. 3. and 4.). Carpels numerous, aggregate (f. 3. *b.*), terminated by a long, mostly feathery, tail. (f. 3. *c.*). Climbing shrubs, with variously cut opposite leaves. (f. 3. and 4.) The recent herb of all the species is more or less acrid, and when applied to the skin occasions blisters.

The English name of this genus, *Virgin's-Bower*, is given to it on account of several of the species being used for covering bowers. It is also called *Traveller's-joy*, because several of the species grow in hedges by way-sides, as well as from the beauty and the scent of their flowers, or more probably from their affording a grateful shade.

SECT. I. FLA'MMULA (from *flammeo*, to inflame; blistering qualities of plants). D. C. syst. 1. p. 131. prod. 1. p. 2. Involucre wanting. Tail of carpel long, bearded, feathery (f. 3. *c.*). Cotyledons distant in the seed.

§ 1. *Flowers panicled. Leaves pinnate* (f. 4.), *or bipinnate. Those species that are said to have pinnate leaves have the leaflets of the lower leaves often ternate.*

1 C. ERE'CTA (All. pedem. No. 1078.) stem erect; leaves pinnate, with stalked ovate, acuminated quite, entire leaflets; corymbs dense; sepals oval. ♃. H. Native of the south of Europe, particularly in France, Spain, Austria, Tartary, &c. on hills and in woods. Schkur. handb. 2. t. 151. C. récta, Lin. spec. 767. Jacq. aust. t. 291. Woodv. med. bot. 1. p. 173. t. 62. C. flámmula. All. pedem. no. 1080, exclusive of the synonymes. Flowers white, sweet-scented. This plant was recommended by Baron Stœrk, in 1769, as an useful medicine in many obstinate complaints. He found it successful in inveterate syphilitic diseases. It was usual for him to employ the leaves and flowers, as well as an extract prepared from the former; yet the preparation which he chiefly recommends is an infusion of two or three drams of the leaves in a pint of boiling water, of which he gave four ounces three times a day, while the powdered leaves were applied as an escharotic to the ulcers.

Var. β, C. surrécta præcócior, &c. Tourn. inst. 394. stems reddish; leaflets cordate or ovate-lanceolate.

Var. γ, C. Hispánica surrécta, &c. Tourn. inst. 594. leaflets oblong-lanceolate; bracteas large, elongated, oblong. C. Hispánica Mill. dict. no. 3. C. corymbòsa, Poir. dict. 2. p. 297.

Var. δ, bracteòsa (Banks. herb.) bracteas oblong, large, elongated.

Erect Virgin's Bower. Fl. Ju. to Aug. Clt. 1597. Pl. 2 to 3 ft.

2 C. MARÍTIMA (Lin. spec. 767.) stem erect, herbaceous; leaves pinnate; leaflets lanceolate, tapering to both ends, entire, and 3-lobed; upper leaves linear; corymbs loose; sepals spatulate. ♃. H. Native of Europe. Leaflets 5, stalked, 3-nerved. Corymbs terminal and axillary. Flowers white, larger than those of *C. erécta*; sepals 3-5.

Sea-side Virgin's Bower. Fl. Jul. Aug. Clt.? Pl. 3 to 4 ft.

3 C. FLA'MMULA (Lin. spec. 766.) leaves pinnate, smooth with orbicular, oval, oblong or linear, entire or 3-lobed, acutish leaflets. ♄. ◡. H. Native of the South of Europe and North of Africa, common in hedges and bushy places. Flowers white, sweet-scented.

Var. α, rotundifòlia (D. C. syst. 1. p. 134.) leaflets almost orbicular. Native of Naples. C. frágrans, Tenore, fl. neap. vol. 1. t. 48. prod. 32.

Var. β, vulgàris (D. C. l. c.) leaflets oval or oblong-lanceolate. C. flámmula, Lin. spec. 766. C. marítima, All. pedem. no. 1081.

Var. γ, marítima (D. C. l. c.) leaflets linear. Native near Montpelier, by the sea-side.

Var. δ, rubélla (D. C. syst. 1. p. 135.) leaflets oval, usually emarginate; sepals 4, reddish on the outside.

Var. ε, cæspitósa (D. C. prod. 1. p. 3.) leaflets minute, entire, or cut. C. cæspitòsa, Scop. fl. carn. ed. 2. vol. i. p. 389. C. flámmula, B. Bertol. amœn. 236. These plants are less acrid than any others of the genus.

Flame, or sweet-scented Virgin's Bower. Fl. Jul. to Oct. Clt. 1596. Shrub cl.

4 C. MASSONIA'NA (D. C. syst. 1. p. 135.) leaves pinnate; leaflets smooth, rather glaucous, ovate, deeply-toothed, 3-lobed or ternate. ♄. ◡. G. Native of South Africa. Leaflets usually 7. Pericarps elliptical, pubescent.

Masson's Virgin's Bower. Fl.? Clt.? Shrub cl.

5 C. ORIENTA'LIS (Lin. spec. 763.) leaves pinnate; leaflets smooth, wedge-shaped, with 3 toothed pointed lobes. ♄. ◡. H. Native of the Levant and Caucasus, in bushy places. Pict. hort. par. p. 37. f. 3. C. flàva. Mœnch. meth. 296.—Dill. elth. 144, t. 119, f. 145, good. There is a variety with trifid peduncles. Flowers greenish-yellow, with a tinge of russet on the upper part and outside; sweet-scented.

Eastern Virgin's Bower. Fl. Aug. Sept. Clt. 1731. Sh. cl.

6 C. GLAU'CA (Willd. arb. 65. t. 4. f. 1.) leaves pinnate; leaflets smooth, glaucous, wedge-shaped, with entire bluntish lobes; peduncles trifid. ♄. ◡. H. Native of the southern parts of Siberia in arid places. Wats. dend. brit. t. 78. Leaflets usually 3-lobed. Panicle somewhat corymbose. Flowers yellowish, scentless.

Glaucous Virgin's Bower. Fl. Ap. to Jul. Clt. 1800? Sh. cl.

7 C. PANICULA'TA (Thunb. in Lin. trans. 2. p. 337.) leaves pinnate; leaflets ovate-cordate, acute, entire; peduncles panicled, many-flowered. ♄. ◡. H. Native of Japan, near Nagasaki. C. vitálba japónica, Houtt. pflanz. 7. p. 309. f. 2. C. críspa, Thunb. fl. jap. 239, but not of Lin. Leaves pinnately decompound. Panicles axillary. Flowers white, sweet-scented, resembling those of *C. flámmula*.

Panicled-flowered Virgin's Bower. Fl. Jul. Aug. Clt. 1796. Shrub cl.

8 C. LONGI'LOBA (D. C. syst. 1. p. 136.) leaves pinnate; leaflets oblong-lanceolate, quite entire, smooth. ♄. ◡. H. Native of China. An intermediate species between *C. paniculáta*, and *C. minor*. Leaflets 5 or 7, distant, on long stalks. Flowers probably white, and sweet-scented.

Long-lobed-leaved Virgin's Bower. Shrub cl.

9 C. MI'NOR (Lour. fl. cochin. 1. p. 422.) leaves pinnate; leaflets ovate-lanceolate, quite entire; peduncles many flowered, length of leaves; ovaries 4. ♄. ◡. H. Native of China, in the suburbs of Canton. A little like *C. flámmula*. Stem suffruticose. Leaflets 5, blunt, on long stalks. Flowers the smallest of all the genus, white and sweet-scented.

Smaller-flowered Virgin's Bower. Shrub cl.

10 C. CHINE'NSIS (Retz. obs. 2. p. 18. No. 53. t. 2.) leaves pinnate, leaflets ovate-lanceolate, quite entire; peduncles few-flowered, longer than the leaves; ovaries usually 4, with almost naked tails. ♄. ◡. H. Native of China, in the islands called Danes. C. Sinénsis, Lour. coch. 1. p. 422. Leaflets 5. Flowers small, dark-purple, and probably sweet-scented.

Chinese Virgin's Bower. Fl.? Clt. 1820. Shrub cl.

11 C. TERNIFLÒRA (D. C. syst. 1. p. 137.) leaves pinnate; leaflets ovate, blunt, quite entire; peduncles trifid, 3-flowered; ovaries usually 5, with bearded tails. ♄. ◡. F. Native of China, in the province of Chekiang. Leaflets 5 or 7. Flowers probably white and sweet-scented. Middle pedicle naked, lateral ones bearing awl-shaped bracteas beneath their middle.

Three-flowered Virgin's Bower. Shrub cl.

12 C. BREVICAUDA'TA (D. C. syst. 1. p. 138.) leaves pinnate; leaflets ovate-lanceolate, acuminated, grossly serrated; peduncles spreading, crowdedly panicled, shorter than the leaves. ♄. ◡. F. Native of China, between Pekin and Jehol. Flowers probably white.

Short-tailed-carpelled Virgin's Bower. Shrub cl.

13 C. HERACLEÆFÒLIA (D. C. syst. 1. p. 138.) leaves pinnate; leaflets ovate-lanceolate, broadly and deeply-toothed, terminal one 3-lobed; peduncles erect, and are, as well as the branches, velvety-cinereous. ♄. ◡. F. Native of China, between Pekin and Jehol. Leaflets coriaceous. Flowers white.

Heracleum-leaved Virgin's Bower. Shrub cl.

14 C. GOURIA'NA (Roxb. ined in herb. Lamb. D. C. syst. 1. p. 138.) leaves pinnate; leaflets ovate-lanceolate, usually 5-nerved, acuminated, entire or toothed, cordate at the base; peduncles pubescent, generally longer than the leaves. ♄. ◡. S. Native of the East Indies. Leaflets 3 or 5, on long stalks. Sepals velvety.

Gour's Virgin's Bower. Shrub cl.

15 C. VITA'LBA (Lin. spec. 766.) leaves pinnate; leaflets ovate-lanceolate, acuminated, cordate at the base, partly cut; peduncles forked, shorter than the leaves. ♄. ◡. H. Native of the middle and south of Europe, in the islands of the Archipe-

lago, and north of Africa; very common in hedges and bushy places, in the plains, and on the lower mountains; in Britain especially on a calcareous soil. Eng. bot. t. 612. Curt. lond. fasc. 4. t. 37. Jacq. aust. t. 308. Schkur. handb. 2. p. 1472. t. 151. Schrank hort. monac. 2. t. 108. C. sèpium, Lam. fl. fr. 3. p. 306. Leaflets 5. Flowers white, with a sweet almond scent.

Var. β, integràta (D. C. syst. 1. p. 139.) leaflets with very few teeth or quite entire. Vítis nìgra. Fusch. hist. 97, with a wood-cut.

White-vine, or Traveller's Joy. Fl. July to Sept. Brit. Sh. cl.

16 C. GREWIÆFLÒRA (D. C. syst. 1. p. 140.) leaves pinnate, clothed with yellow down; leaflets cordate, acute, sharply serrated; peduncles 3 or 5-flowered, shorter than the leaves. ♄. ◡. H. Native of Nipaul, about Narain-Hetty. Leaflets 3 or 5. Flowers white, downy, purplish at the base on the outside.

Grewia-flowered Virgin's Bower. Fl. Nov. Shrub cl.

17 C. BUCHANIA'NA (D. C. syst. 1. p. 140.) leaves pinnate, white-velvety underneath, and smooth above; leaflets cordate, acute, toothed; peduncles many-flowered, shorter than the leaves. ♄. ◡. H. Native of Nipaul at Narain-Hetty. C. Buchanàni, D. Don, prod. fl. nep. p. 191. C. Bucamàra, Ham. MSS. Leaflets 3 or 5. Flowers white, downy.

Buchanan's Virgin's Bower. Fl. Oct. Shrub cl.

18 C. LOASÆFÒLIA (D. C. syst. 1. p. 140.) leaves ternate or quinate, sometimes simple, very villous; leaflets cordate, acuminate, lobed, grossly-serrated; peduncles trifid, few-flowered, much shorter than the leaves. ♄. ◡. H. Native of Nipaul. C. Bucamàra var. Ham. MSS. Flowers woolly, campanulate, with a revolute border.

Loasa-leaved Virgin's Bower. Fl. Oct. Shrub cl.

19 C. CONNA'TA (D. C. prod. 1. p. 4.) leaves smooth, pinnate; leaflets ovate-lanceolate, acuminate, grossly serrated; petioles dilated at the base, connate. ♄. ◡. F. Native of Nipaul. Flowers probably white.

Connate-petioled Virgin's Bower. Shrub cl.

20 C. PERUVIA'NA (D. C. syst. 1. p. 141.) leaves bipinnate, villous; leaflets ovate, trifid, cut at the apex; flowers somewhat panicled, polygamous; peduncles longer than the leaves, furnished with bracteas. ♄. ◡. S. Native of Peru. Stems purplish, and are as well as petioles pubescent. Flowers small, greenish-yellow?

Peruvian Virgin's Bower. Shrub cl.

21 C. MONTEVIDE'NSIS (Spreng. syst. 2. p. 667.) leaves ternate-pinnate, smooth; leaflets divaricating, ovate-lanceolate, acuminated, trifid; peduncles few-flowered, spreading, equal in length with the leaves; sepals spreading, lanceolate, villous. ♄. ◡. S. Native of Monte-Video. Flowers white.

Monte-Videan Virgin's Bower. Shrub cl.

22 C. CORDA'TA (Pursh, fl. am. sept. 2. p. 384.) leaves pinnate, leaflets cordate, acuminated, lobed, or deeply-toothed; peduncles elongated, many-flowered; flowers dioecious in racemose panicles. ♄. ◡. H. Native of Virginia, on high mountains. Leaflets 3 or 5. Flowers small, white. In general appearance it approaches near to *C. vitálba*.

Cordate-leafletted Virgin's Bower. Fl. July. Shrub cl.

23 C. CARIPE'NSIS (H. B. and Kunth nov. gen. et spe. amer. 5. p. 36.) leaves pinnate; leaflets ovate, acuminated, 5-nerved, quite entire, smooth; pedicels and bracteas pubescent; flowers panicled, dioecious. ♄. ◡. S. Native of Cumana, in shady places, near Caripa. C. Caracasàna, D. C. syst. 1. p. 141. Leaflets 5. Flowers white, sweet-scented. Differing from all the other dioecious species in the leaves being pinnate, not ternate. In general appearance it is like *C. vitálba*.

Caripa Virgin's Bower. Fl. Aug. Sept. Clt. 1820. Shrub cl.

24 C. AFFI'NIS (St. Hil. fl. bras. 1. p. 3.) leaves pinnate; leaflets oblong, acuminate, acute, quite entire, pubescent beneath; pericarps hairy. ♄. ◡. S. Native of Brasil, in the province of Minas Geraes, near Onca. Flowers white? Pericarps with feathery tails. Leaflets 5 or 7, stalked.

Allied Virgin's Bower. Shrub cl.

§ 2. *Flowers panicled Leaves ternate* (f. 3.) *or biternate.*

25 C. VIRGINIA'NA (Lin. amœn. 4. p. 275.) flowers panicled, dioecious; leaves ternate; leaflets cordate, acute, grossly-toothed or lobed. ♄. ◡. H. Native of North America, from Canada to Florida, in hedges, and among small shrubberies on the sides of woods, and grassy banks of rivers. Wats. dend. brit. t. 74. C. Canadénsis, Mill. dict. no. 5. C. cordifòlia, Mœnch suppl. 104. Alb. acad. ann. 1. p. 79. t. 7. Flowers small, white and fragrant. In general appearance like *C. vitálba*.

Var. β, bracteàta (D. C. prod. 1. p. 4.) leaflets ovate-lanceolate, entire. C. bracteàta, Mœnch suppl. 103.

Virginian Virgin's Bower. Fl. June to Aug. Clt. 1767. Sh. cl.

26 C. CATESBYA'NA (Pursh. fl. amer. sept. 2. p. 736.) flowers panicled, usually dioecious; leaves biternate; leaflets somewhat cordate, 3-lobed. ♄. ◡. H. Native of South Carolina. Flowers small, white. Resembles *C. Virginiàna*. The filaments of the female flowers are membranous and linear, without anthers.

Catesby's Virgin's Bower. Shrub cl.

27 C. BRASILIA'NA (D. C. syst. 1. p. 143.) flowers panicled, dioecious; leaves 3-lobed, ternate or pinnate; leaflets stalked, ovate-lanceolate, entire or hardly toothed. ♄. ◡. S. Native of Brasil. Deless. icon. sel. 1. t. 1. Leaves pubescent. Flowers small, white, fragrant. Resembles *C. vitálba*.

Var. β, láxa (St. Hil. fl. bras. 1. p. 2.) stems slenderer; panicles elegantly loose; sepals narrower.

Var. γ, mìnor (St. Hil. l. c.) leaves, panicles, and bracteas smaller; bracteoles all linear, and are as well as the pedicels and ovaries villous; pericarps very villous.

Var. δ, glàbra (St. Hil. l. c.) leaves almost smooth.

Brasilian Virgin's Bower. Fl. July to Oct. Clt. 1823. Sh. cl.

28 C. DIOI'CA (Lin. amœn. 5. p. 398, spec. 765.) flowers panicled, dioecious; leaves ternate, smoothish; leaflets ovate, cordate, acuminated, 3-nerved, entire; pericarps oval; pedicels pubescent. ♄. ◡. S. Native of Jamaica.—Sloan. jam. 84. hist. 1. p. 199. t. 128. f. 1. Flowers white, fragrant. Resembles *C. vitálba*.

Dioecious Virgin's Bower. Fl. May to July. Clt. 1733. Sh. cl.

29 C. MOCINIA'NA; flowers panicled, dioecious; leaves pubescent; leaflets stalked, cordate-ovate, bluntish, 3-nerved, quite entire; sepals oblong or lanceolate, obtuse, about the length of the stamens, pubescent; pedicels pubescent. ♄. ◡. G. Native of Mexico. C. dioìca Lamb herb. The whole plant pubescent. Flowers small, white, resembling those of *C. vitálba*.

Mocino's Virgin's Bower. Shrub cl.

30 C. GLA'BRA (D. C. syst. 1. p. 143.) flowers panicled, dioecious; leaves ternate, very smooth; leaflets acuminated, 3-nerved, quite entire; pericarps oval-oblong; pedicels smooth. ♄. ◡. S. Native of St. Domingo. Very like *C. dioìca*.

Smooth Virgin's Bower. Shrub cl.

31 C. AMERICA'NA (Mill. dict. no. 14.) flowers panicled, dioecious; leaves ternate or pinnate; leaflets smooth, ovate, cordate, 5-nerved, quite entire, acuminated; pericarps lanceolate. ♄. ◡. S. Native of South America, Campechy, Guadaloupe, Martinico, and Jamaica. C. Guadalùpæ, Pers. ench. 2. p. 99. Panicle large. Flowers white.

American Virgin's Bower. Fl.? Clt.? Shrub cl.

32 C. LOUREIRIA'NA (D. C. syst. 1. p. 144.) flowers panicled, dioecious; leaves ternate; leaflets ovate, acute, very entire, usually 5-nerved; pericarps 80, bluntly trigonal. ♄. ◡. G. Native of Cochinchina. Flowers white.

Loureiro's Virgin's Bower. Shrub cl.

33 C. seri'cea (H. B. and Kunth nov. gen. et spec. amer. 5. p. 37.) flowers panicled, dioecious; leaves ternate or pinnate; leaflets ovate, 5-nerved, grossly 3 or 5-toothed, underneath silky, villous; peduncles shorter than the leaves, with many bracteas. ♄. ◡. S. Native of South America, about Santa Fe de Bogota, and probably along the banks of the Rio-Grande. Flowers white?

Var. a, striàtula (D. C. syst. 1. p. 144.) stems with 10 or 12 stripes. Native of Santa Fe de Bogota. Leaves ternate.

Var. β, tereticaúlis (D. C. l. c.) stem terete, not striped; pericarps 20—30, pubescent; leaves ternate and entire.

Var. γ. costàta (D. C. l. c.) stem with hardly prominent ribs. Native on the banks of the river called Rio-Grande. Leaves pinnate.

Silky-leaved Virgin's Bower. Shrub cl.

34 C. holoseri'cea (Pursh. fl. amer. sept. 2. p. 384.) flowers paniculately corymbose, dioecious; leaves ternate, pubescent on both surfaces; leaflets oblong-lanceolate, entire. ♄. ◡. H. Native of Carolina. The whole plant is clothed with silky pubescence. Sepals linear, longer than the stamens. Flowers small, white.

Whole-silky Virgin's Bower. Shrub cl.

35 C. Bonarie'nsis (Juss. herb. and D. C. syst. 1. p. 145.) flowers panicled, polygamous; leaves ternate, smoothish; leaflets ovate-lanceolate, quite entire; peduncles shorter than the leaves, and are as well as the branches pubescent. ♄. ◡. F. Native of Buenos Ayres. Flowers white. Ovaries covered with long silky hairs.

Buenos-Ayrean Virgin's Bower. Shrub cl.

36 C. glycinoi'des (D. C. syst. 1. p. 145.) flowers panicled, dioecious; leaves ternate, smooth; leaflets ovate-lanceolate, acuminated, quite entire, 3-nerved at the base; peduncles one, half shorter than the leaves; branches smooth. ♄. ◡. G. Native of New Holland, about Port Jackson. Flowers small, and probably white. Resembles *Glycine trifoliàta*.

Glycine-like Virgin's Bower. Fl.? Clt. 1826. Shrub cl.

37 C. hexase'pala (D. C. syst. 1. p. 146.) flowers panicled, dioecious, of 6-sepals; leaves ternate; leaflets ovate, cordate, broadly crenated, netted with veins, smooth, coriaceous. ♄. ◡. F. Native of New Zealand. C. Forstèri, Gmel. syst. 873. Forst. icon. ined. in Banks, lib. t. 170. C. hexapétala, Lin. fil. suppl. 271. Bracteas oblong-linear. Flowers spreading, of a yellowish white colour.

Six-sepalled Virgin's Bower. Shrub cl.

38 C. coria'cea (D. C. syst. 1. p. 146.) flowers panicled, dioecious; leaves ternate; leaflets cordate, grossly and crenately cut, smooth, coriaceous; anthers ovate-oblong. ♄. ◡. G. Native of New Holland, about Port Jackson. Very like *C. hexasépala*, but differing in the flowers being of 4 sepals, not 6. Flowers spreading, pale purple?

Var. α, obtùsa (D. C. l. c.) leaflets cordate, obtuse. Plant male.

Var. β, acùta (D. C. l. c.) leaflets ovate, acuminate. Plant female.

Coriaceous-leaved Virgin's Bower. Fl.? Clt. 1821. Sh. cl.

39 C. stenose'pala (D. C. syst. 1. p. 147.) flowers panicled, dioecious; leaves ternate; leaflets cordate, acuminate, 3-nerved, entire or somewhat toothed; anthers ovate-oblong. ♄. ◡. G. Native of New Holland, about Port Jackson. *C.* stenopétala, R. Br. ined. Bracteas oblong, quite entire, acute at both ends. Sepals 4, oblong-linear. Flowers white, a little larger than those of *C. vitálba*.

The *narrow-sepalled* Virgin's Bower. Shrub cl.

40 C. microphy'lla (D. C. syst. 1. p. 147.) flowers panicled, dioecious; leaves ternate; leaflets oblong, usually 1-nerved, quite entire, smooth, coriaceous. ♄. ◡. G. Native of New Holland, in the Barren islands. Like *C. stenosépala*, but with the pericarps smooth, not pubescent. Flowers white.

Small-leaved Virgin's Bower. Shrub cl.

41 C. arista'ta (R. Br. prod. nov. holl. vol. 2. ined. D. C. syst. 1. p. 147.) flowers panicled, dioecious; leaves ternate; leaflets ovate, somewhat cordate, acute, grossly-toothed, 3-nerved; anthers awned at the apex. ♄. ◡. G. Native of New Holland. Ker. bot. reg. t. 238. Resembles *C. stenosépala*. Flowers of 4 sepals, of a greenish-yellow colour.

Awned anthered Virgin's Bower. Fl. May to Aug. Clt. 1812. Sh. cl.

42 C. indivìsa (Willd. spec. 2 p. 1291.) flowers panicled; leaves ternate; leaflets ovate, quite entire, mucronate, coriaceous, smooth. ♄. ◡. F. Native of New Zealand. C. integrifòlia, Forst. prod. 42. No. 231, but not of Lin. C. paniculàta, Gmel. syst. 873. Panicles axillary. Flowers probably white.

Undivided-leafletted Virgin's Bower. Shrub. cl.

43 C. hedysarifòlia (D. C. syst. 1. p. 148.) flowers panicled: leaves ternate; leaflets ovate-lanceolate acuminated, nearly entire, smooth, 5-nerved at the base. ♄. ◡. S. Native of the East Indies, on rocks about Daogown. Ker. bot. reg. t. 599. Flowers white. Ovaries very villous, ending in a short bearded tail.

Hedysarum-leaved Virgin's Bower. Fl. Oct. Clt. 1819. Sh. cl.

44 C. acumina'ta (D. C. syst. 1. p. 148.) flowers somewhat panicled; leaves ternate; leaflets ovate-lanceolate, much acuminated, rather serrated at the middle, smooth, 3 or 5-nerved. ♄. ◡. F. Native of Nipaul at Narain-Hetty. Peduncles trichotomous, 3-flowered, hardly longer than the leaves. Flowers campanulate, hairy. Ovaries numerous, ending in a feathery tail.

Acuminated-leaved Virgin's Bower. Fl. Dec. Shrub cl.

45 C. apiifòlia (D. C. syst. 1. p. 149.) flowers panicled, with six styles; leaves ternate; leaflets ovate, obtuse, repand-toothed. ♄. ◡. H. Native of Japan. Flowers unknown. Pericarps 5 or 7, stellately spreading.

Parsley-leaved Virgin's Bower. Shrub cl.

46 C. trifolia'ta (Thunb. in Lin. soc. trans. 2. p. 337.) flowers panicled; leaves ternately decompound, smooth; leaflets ovate, obtuse, repand-toothed. ♄. ◡. H. Native of Japan. Stems purple.

Trifoliate Virgin's Bower. Shrub cl.

47 C. biterna'ta (D. C. syst. 1. p. 149.) flowers panicled, hermaphrodite, with six styles; leaves biternate; leaflets somewhat cordate, acute. ♄. ◡. F. Native of Timor, Japan, and Cochinchina C. Virgínica, Thunb. fl. jap. 240, but not of Lin. Flowers white.

Biternate-leaved Virgin's Bower. Shrub cl.

48 C. triterna'ta (D. C. syst. 1. p. 150.) flowers? leaves bi or triternate, smoothish; leaflets oval-cuneated, 3-nerved, acutely-trifid. ♄. ◡. H. Native of? Atragène triternàta, Desf. hort. par. Stem round; branches striped with 6 furrows, and velvety when young.

Triternate-leaved Virgin's Bower. Fl.? Clt.? Shrub cl.

§ 3. *Peduncles trifid, 3-flowered* (f. 4.), *or in threes, 1-flowered. Leaves ternate* (f. 4.), *very rarely pinnate.*

49 C. Domínica (Lam. dict. 2. p. 45.) peduncles trifid, 3-flowered, longer than the leaves; leaves ternate; leaflets ovate, somewhat cordate, acute, pubescent underneath, a little toothed. ♄. ◡. S. Native of St. Domingo, Martinico, Dominica, and Cuba. Atragène polygama. Jacq. amer. ed. pict. 2. t. 261. f. 244. Flowers small, white, scentless, dioecious. Sepals spreading, clothed with rusty down on the outside.

Dominica Virgin's Bower. Shrub cl.

50 C. brachia'ta (Ker. in bot. reg. t. 97.) peduncles in threes, 1-flowered, trifid or panicled, longer than the leaves; leaves ternate or pinnate; leaflets ovate, grossly-toothed; flower-

bud globose. ♄. ◡. G. Native of the Cape of Good Hope. Flowers of a yellowish-green colour; filaments of stamens hispid, especially at their base.

Armed Virgin's Bower. Fl. Oct. Dec. Cult. 1804. Shrub cl.

51 C. GRANDIFLÒRA (D. C. syst. 1. p. 151.) peduncles 1-3-flowered, shorter than the leaves; leaves pinnate, smooth; leaflets ovate-cordate, acuminated, netted with nerves on the under surface, coarsely serrated. ♄. ◡. S. Native of Sierra Leone on the mountains. C. chlorántha Lindl. bot. reg. 1234. Flowers campanulate, the largest of all the genus, of a greenish-yellow colour. Leaflets 5.

Great-flowered Virgin's Bower. Fl. Feb. May. Clt. 1823. Sh. cl.

52 C. LECHENAULTIA'NA (D. C. syst. 1. p. 151.) peduncles trifid, 3-flowered, shorter than the leaves; leaves ternate, silky; leaflets ovate-lanceolate, 5-nerved, serrated. ♄. ◡. S. Native of Java. Sepals oblong, acute, velvety.

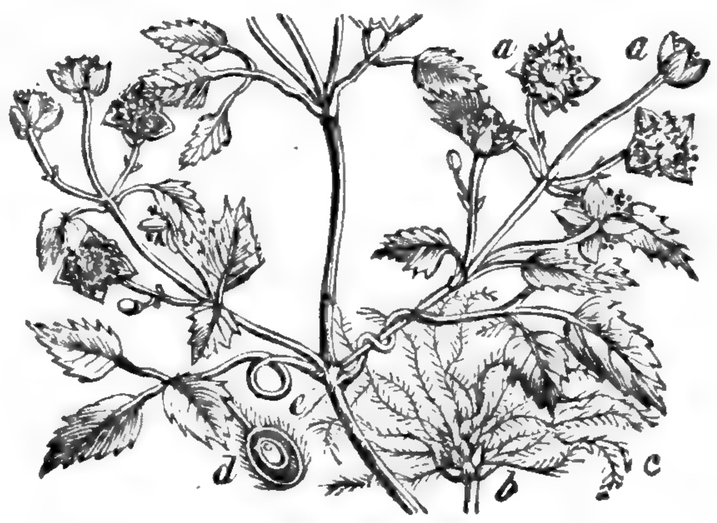
Lechenault's Virgin's Bower. Shrub cl.

53 NORONHIA'NA (D. C. syst. 1. p. 151.) peduncles 1-3-flowered, shorter than the leaves; leaves ternate, hairy; leaflets ovate-lanceolate, 3-nerved, serrated. ♄. ◡. S. Native of Java. Trígula trifoliàta, Noronha icon. ined. in Juss. lib. Flowers yellowish, with villous anthers and white styles.

Noronha's Virgin's Bower. Shrub cl.

54 C. MAURITIA'NA (Lam. dict. 2. p. 42.) peduncles trifid; leaves ternate, smooth; leaflets ovate, acuminated, coarsely-serrated. ♄. ◡. S. Native of the Mauritius and Madagascar. Deless. icon. sel. 1. t. 2. C. triflòra, Vahl. symb. 3. p. 74. C. Sonnerátii, Pers. ench. 2. p. 99. Flowers hermaphrodite. The recent herb is very acrid, and is used in Madagascar in place of Cantharides, hence Commerson has named it in his herbarium *C. furiàlis* and *C. urentissima*. (f. 3.)

FIG. 3.



Mauritian Virgin's Bower. Shrub cl.

55 C. SUBTRÍLOBA (N.E. herb. Lamb.) stems furrowed, young ones villous as well as the petioles and peduncles; peduncles trifid, 3-flowered; leaves ternate; leaflets 5-nerved, broad ovate, 3-lobed acute, lateral lobes small; carpels with long bearded tails. ♄. ◡. G. Native of Mexico. Flowers white.

The *subtrilobed*-leaved Virgin's Bower. Shrub cl.

56 C. HAVANE'NSIS (H. B. and Kunth nov. gen. et spec. amer. 5. p. 38.) peduncles 1-3-flowered; leaves ternate, silky-pubescent underneath; leaflets ovate-lanceolate, grossly-serrated. ♄. ◡. S. Native of Cuba, about Havanna. Pericarps pubescent.

Havanna Virgin's Bower. Shrub cl.

57 C. TRÍLOBA (St. Hil. fl. bras. 1. p. 3.) leaves trifoliate, smooth; leaflets stalked, 3-lobed, pointed; peduncles trifid, each furnished with two bracteas. ♄. ◡. S. Native of Brazil, in the province of Cis Platine. Flowers greenish-white.

Var. β, Guaranitica (St. Hil. l. c.) leaflets narrower, usually 2-lobed, much shorter than the peduncles; pedicels pubescent; flowers sometimes panicled.

Three-lobed leaved Virgin's Bower. Fl. Nov. Dec. Shrub cl.

58 C. JAVA'NA (D. C. syst. 1. p. 152.) pedicels 1-3-flowered; leaves ternate or biternate, pubescent; leaflets ovate-lanceolate, acuminated, entire or trifid, a little toothed. ♄. ◡. S. Native of Java. Flowers small, probably white. Sepals oblong, spreading, with velvety margins, a little longer than the stamens.

Java Virgin's Bower. Shrub cl.

59 C. DAHU'RICA (Pers. ench. 2. p. 99.) peduncles in threes, one-flowered; leaves ternate, smooth; leaflets ovate, quite entire, mucronate, oblique at the base; flowers hermaphrodite, nodding. ♄. ◡. H. Native of Dahuria. Flowers of an obscure purple colour, like those of *C. viticélla*. Ovaries villous.

Dahurian Virgin's Bower. Fl. Sept. Cult. 1820. Shrub cl.

60 C. PLUKENE'TII (D.C. syst. 1. p. 153.) peduncles 1-flowered; leaves ternate, smooth; leaflets elliptical or obovate, obtuse, quite entire, mucronate; flowers dioecious, erect. ♄. ◡. H. Native of America?—Pluk. alm. 109. Flowers purplish, fragrant.

Plukenet's Virgin's Bower. Shrub cl.

§ 4. *Peduncles solitary, 1-flowered* (f. 4.). *Leaves pinnate* (f. 4.), *rarely ternate.*

61 C. ANGUSTIFÒLIA (Jacq. enum. 310. coll. 1. p. 137. icon. rar. 1. t. 104.) peduncles 1-flowered; sepals 6 or 8, very blunt; leaves pinnate; leaflets lanceolate-linear, acuminated, entire, or 3-lobed; stems erect. ♃. H. Native of Siberia, Dahuria, and on the northern shore of the Adriatic Sea. Wats. dend. brit. t. 112. C. lasiántha, Fish. hort. gorenk. ex. litt. C. hexapétala, Pall. itin. 3 app. No. 96. t. 9. f. 2. ed. Gall. 8. p. 329. t. 74. f. 2. but not of Lin. Terminal leaflet always 3-lobed. Flowers white.

Narrow-leaved Virg.'s Bower. Fl. My. to Sep. Clt. 1787. P. 4 ft.

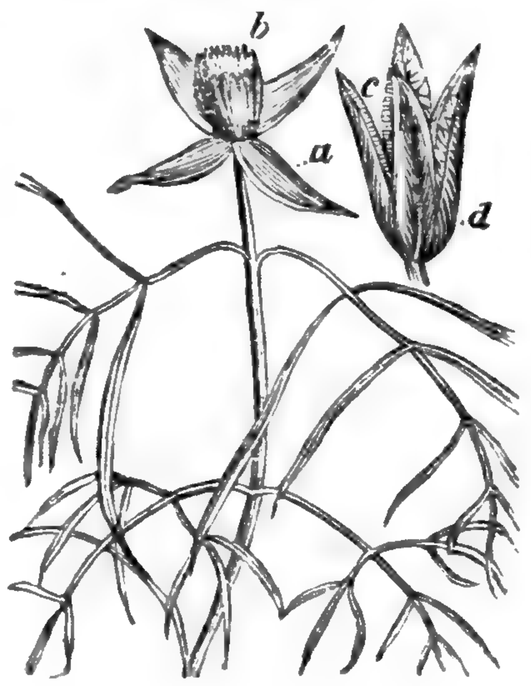
62 C. SCABIOSÆFÒLIA (D. C. syst. 1. p. 154.) peduncles 1-flowered; sepals 4, oval-oblong; leaves pinnate; leaflets 3-parted, cut, pubescent, with wedge-shaped lobes; stem erect, velvety. ♃. S. Native of India? The whole plant is clothed with velvety pubescence. Leaflets 7. Flowers white? filaments hispid at the base.

Scabious-leaved Virgin's Bower. Pl. 3 feet.

63. C. VILLÒSA (D. C. syst. 1. p. 154.) peduncles 1-flowered; sepals 4, oval-oblong; leaves villous, pinnate; leaflets sessile, oval, grossly-toothed at the apex, terminal one trifid; stem erect, villous. ♃. S. Native of India? Leaflets 7. Resembling *C. scabiosæfòlia.*

Villous Virgin's Bower. Pl. 3 feet?

FIG. 4.



64 C. LINEARÍLOBA (D. C. syst. 1. p. 155.) peduncles 1-flowered; sepals very acute; leaves smooth, pinnate; leaflets entire or 3-parted, with linear lobes. ♃. H. Native of Lower Carolina. Deless. icon. sel. 1. t. 3. Stem striped, purplish. Leaflets 7 or 9. Flowers pale purple; sepals downy on the margins, almost twice as long as the stamens (f. 4.)

Linear-lobed leaved Virgin's Bower. Fl. May, July. Cult. 1823. Pl. 3 feet.

65 C. WALTE'RI (Pursh. fl. amer. sept. 2. p. 384.) peduncles 1-flowered; sepals elliptical; leaves pinnate; leaflets divaricating linear-lanceolate acute, quite entire, glaucous underneath. ♃. H. Native of Carolina. Leaflets 7. Flowers white.

Walter's Virgin's Bower. Pl. 2 feet.

66 C. DIVERSIFÒLIA (D. C. syst. 1. p. 155.) peduncles 1-flowered; sepals very acute, spreading; leaves smooth, sometimes entire, sometimes 3-lobed or ternate; leaflets lanceolate, acute, lateral one sessile, terminal one stalked. ♄. ◡. H. Native of? Deless. icon. sel. 1. t. 4. Flower large, erect, purple. Anthers and filaments villous.

Various-leaved Virgin's Bower. Fl. Sept. Oct. Clt.? Sh. cl.

67 C. campe'stris (St. Hil. fl. bras. 1. p. 4.) stem 4-sided; peduncles axillary, solitary, terminal ones in threes; leaves ternate or pinnate, pubescent; leaflets ovate-lanceolate, acute; sepals spreading, villous. ♄. ◡. S. Native of Brasil, in the province of St. Paul, at the mouth of the river Yapa. Flowers greenish-yellow. Leaflets 3 to 7.

Field Virgin's Bower. Fl. July. Shrub cl.

68 C. Viórna (Lin. spec. 765.) peduncles 1-flowered; sepals connivent, thick, acuminated, reflexed at the apex; leaves smooth, pinnate; leaflets entire, 3-lobed, or ternate, ovate, acute, floral ones entire. ♄. ◡. H. Native of North America, in hedges and copses, from Virginia to Carolina. Jacq. fil. ecl. 1. p. 50. t. 32—Dill. elth. 144. t. 118. f. 144. Leaflets 5 or 7. Flowers purple, large, drooping, yellow inside. Herb very acrid.

American Traveller's Joy. Fl. June, Aug. Clt. 1730. Sh. cl.

69 C. Dougla'sii (Hook fl. bor. amer. 1. t. 1.) stem erect simple 1-flowered; flower drooping; leaves pilose, pinnate; leaflets twice pinnatified; lobes linear, bluntish. ♃. H. Native of North America on the Rocky Mountains near the sources of the Columbia river. Flowers purple about the size of those *C. viórna*. Leaves almost as fine as those of *Pæònia tenuifòlia*.

Douglas's Virgin's Bower. Fl. June, July. Clt.? Pl. 1½ ft.

70 C. cyli'ndrica (Sims. in bot. mag. t. 1160.) peduncles 1-flowered; sepals thin, acuminated, reflexed at the apex, with wavy margins; leaves slender, pinnate; leaflets stalked, ovate, or oblong; middle one sometimes trifid; floral ones entire. ♃. H. Native of Virginia and Carolina. C. críspa, Lam. dict. 2. p. 44. C. Viórna, Andr. bot. rep. t. 71. not of Lin. C. divaricàta Jacq. fil. ecl. t. 33. Leaflets 5—7 entire. Flowers large, of a pale purplish blue, drooping.

Cylindrical-flowered Virgin's Bower. Fl. Ju. Aug. Clt. 1802. Pl. 1 to 3 feet.

71 C. Si'msii (Sweet, hort. brit. p. 1.) peduncles 1-flowered; leaves pinnate; leaflets cordate, acuminated, entire, ciliated, reticulated; sepals 4, coriaceous, connivent, lanceolate, reflexed at the apex, curled. ♄. ◡. H. Native of South Carolina and Georgia. C. cordata Sims, bot. mag. 1816. but not of others. Flowers lilac. An intermediate species between *C. crispa* and *C. viórna*.

Sims's Virgin's Bower. Fl. Ju. Aug. Clt. 1812. Sh. cl.

72 C. reticula'ta (Walt. fl. carol. 156.) peduncles 1-flowered; sepals connivent; leaves coriaceous, netted with nerves, smooth, pinnate; leaflets stalked, 3-lobed or entire, ovate. ♄. ◡. H. Native of Georgia and Carolina. Wats. dend. brit. t. 72. C. ròsea, Abbot insect. amer. icon. t. 101. Stem purplish. Flowers resembling *C. viórna*, of a pale purplish red.

Netted-leaved Virgin's Bower. Fl. Jun. July. Clt. 1812. Sh. cl.

73 C. Japónica (Thunb. fl. jap. 240.) peduncles 1-flowered; sepals connivent; leaves villous, ternate; leaflets elliptical, acuminated, serrated at the apex. ♄. ◡. H. Native of Japan. Stem purplish. Leaves ternately decompound. Peduncles length of leaves. Flowers purple.

Japan Virgin's Bower. Shrub cl.

74 C. comòsa (D. C. syst. 1. p. 157.) peduncles 1-flowered; leaves ternate, velvety; leaflets oval-oblong, acuminated, 3-nerved, entire. ♄. ◡. S. Native of the East Indies. Flowers unknown. Pericarps ovate, somewhat compressed.

Tufted Virgin's Bower. Shrub cl.

75 C. tri'loba (Roth. nov. pl. spec. 251.) peduncles 1-flowered, somewhat corymbose; stem and petioles downy; leaves pubescent, lower ones ovate, acuminated, middle ones 3-lobed, upper ones ternate; sepals oblong-lanceolate, mucronate, silky on the outside. ♄. ◡. S. Native of the East Indies.

Three-lobed leaved Virgin's Bower. Shrub. cl.

76 C. clitorioi'des (D. C. syst. 1. p. 158.) peduncles 1-flowered, axillary twisted; leaves smooth, pinnate; leaflets oblong, acute, quite entire. ♄. ◡. G. Native of New Holland about Port Jackson. Resembling a species of *Clitòria* or *Kennèdia*. Leaflets 3 or 5. Flowers whitish.

Clitoria-like Virgin's Bower. Fl. July. Clt. 1824. Sh. cl.

§ 5. *Peduncles usually solitary, 1-flowered. Leaves undivided. Stems herbaceous, erect.*

77 C. integrifòlia (Lin. spec. 767.) peduncles 1-flowered; flower nodding; leaves entire, ovate-lanceolate, smooth. ♃. H. Native of Hungary, Carniola, Tartary, Siberia, Austria, and the Pyrenees. Jacq. fl. aust. t. 363. Tratt. tab. 4. t. 179. Curt. bot. mag. t. 65.—Clus. hist. 1. p. 123. f. 2. C. nùtans, Crantz. C. inclinàta, Scop. Peduncles terminal, very rarely rising from the fork of the stem. Sepals blue, coriaceous; younger ones with villous edges, adult ones with wavy edges. The two upper leaves are concave and connivent before flowering; hence they inclose the flower as if it were in a bladder.

Var. β, angustifòlia (Fisch. in litt. D. C. prod. 1. p. 8.) leaves very narrow, acuminated, 3 or 5-nerved; sepals rather unequal, somewhat longer than the stamens.

Var. γ, elongàta (D. C. prod. 1. p. 8.) flowers almost erect; leaves acuminated, rather hairy. C. elongàta, Tratt. tab. 4. t. 178. Native of Siberia.

Entire-leaved Virgin's Bower. Fl. Jun. Aug. Clt. 1596. Pl. 2 ft.

78 C. ochroleu'ca (Ait. hort. kew. ed. 1. vol. ii. p. 260.) peduncles 1-flowered; flower erectish; leaves entire, ovate: younger ones silky. ♃. H. Native of North America, on the banks of rivers, in Carolina, Pennsylvania, and Virginia. Sims, bot. mag. t. 1175. Lodd. bot. cab. t. 661. Tratt. arch. 2. t. 64. C. sericea, Mich. fl. bor. amer. 1. p. 319. Resembles *C. integrifòlia* but differs in the leaves being oval or ovate, blunt, and in the flower being a little smaller, erect, or a little inclined but not nodding, cream-coloured, and yellow on the inside.

Cream-coloured-flowered Virgin's Bower. Fl. July, Aug. Clt. 1767. Pl. 1 to 2 feet.

79 C. ova'ta (Pursh fl. amer. Sept. 2. p. 736.) peduncles 1-flowered; flower erect; leaves ovate, acute, smooth, netted with veins, lower ones rather cordate. ♃. H. Native of South Carolina.—Pluk. mant. t. 379. f. 4? Resembles *C. integrifòlia*. Pericarps with long feathery tails. Flowers blue.

Ovate-leaved Virgin's Bower. Pl. 1 to 2 feet.

80 C. gentianoi'des (D. C. syst. 1. p. 159.) peduncles 1-flowered; flower erect, dioecious; leaves ovate, entire or toothed, smooth, 3-nerved. ♃. G. Native of New Holland, in Mary Island, and Van Dieman's Land. Deless. icon. sel. 1. t. 5. Sepals 4, oblong, thin, terminating in a small callosity.

Gentian-like Virgin's Bower. Pl. 1 feet.

81 C. smilaci'na (Blum. ex Spreng. syst. app. p. 221.) peduncles 1-flowered; leaves ovate, coriaceous, smooth, quite entire, 5-nerved. ♃. S. Native of Java. Flowers?

Smilax-like Virgin's Bower. Pl. 2 feet?

§ 6. *Peduncles 3 or many-flowered, panicled, axillary. Leaves undivided. Climbing shrubs.*

82 C. glandulòsa (Blum. ex Spreng. syst. app. p. 221.) leaves ovate, with glandular teeth, smooth, 5-nerved; peduncles panicled, trifid; flowers monoecious. ♄. ◡. S. Native of Java. Flowers purplish?

Glandular-toothed Virgin's Bower. Shrub. cl.

83 C. subpelta'ta (Wall. pl. asiat. rar. No. I. p. 19. t. 20.) leaves ovate-cordate, smooth, acute, entire, or slightly crenulated, and slightly peltate at the base; petioles twisted; panicles axillary loose, equal in length to the leaves; sepals 4 ovate obtuse, clothed with dense rusty tomentum on the outside. ♄. ◡. S.

Native of Ava, on Mount Taong Dong. Sepals smooth, and purple inside.

Subpeltate-leaved Virgin's Bower. Fl. Nov. Shrub cl.

84 C. smilacifòlia (Wall. Asiat. Res. 13. p. 402.) leaves ovate-cordate 5-nerved, smooth, entire, panicles axillary, few-flowered, rather shorter than the leaves; sepals 4 linear-oblong, clothed with dense rusty tomentum on the outside, spreading. ♄. ◡. S. Native of Nipaul. Flowers clothed with rusty tomentum on the outside, but smooth and purple on the inside. This plant comes very near to *C. subpeltàta*, but differs from it in the leaves being cordate at the base, never slightly peltate.

Smilax-leaved Virgin's Bower. Fl.? Clt. 1823. Shrub cl.

Sect. II.—Vitice'lla, (from *viticella*, a small vine; plants climbing like the vine.) D. C. syst. 1. p. 160. prod. 1. p. 8. Involucre wanting. Tail of pericarp short, beardless. Leaves ternate or decompound. Stems climbing.

85 C. flórida (Thunb. fl. jap. 240.) peduncles 1-flowered, longer than the leaves; leaves ternately decompound; leaflets ovate, acute, quite entire; sepals oval-lanceolate, much pointed. ♄. ◡. H. Native of Japan. Sims, bot. mag. t. 834. Andr. bot. rep. t. 402. Jacq. hort. schœn. 3. p. 57. t. 357. Atragène índica, Desf. tab. par. ed. 1. p. 123. Leaves ternate or triternate. Flowers large, spreading, pale-white. Sepals 6 or 8, oval, marked towards the margins with feathery veins. Stamens purplish.

Var. β, flòre-plèno; flowers double. This is much more common in our gardens than the single-flowered.

Florid Virgin's Bower. Fl. April, Sept. Clt. 1776. Sh. cl.

86 C. vitice'lla (Lin. spec. 762.) peduncles 1-flowered, longer than the leaves; leaves entire or ternately decompound; lobes or leaflets entire; sepals obovate, spreading. ♄. ◡. H. Native of the South of Europe, in hedges and among bushes, particularly in Spain, Portugal, Carniola, and Bithynia, &c. Fl. græc. t. 516. Curt. bot. mag. t. 565. Viticélla deltoìdea, Mœnch. meth. 297. Flowers large, blue, purple, or rose-coloured, drooping.

Var. β, múltiplex; flowers double, purple, or flesh-coloured. C. pulchélla, Pers. ench. 2. p. 99.—Chabr. sciagr. p. 117, with a figure.—Weinm. phyt. t. 398. f. d.

Var. γ, tenuifòlia (D. C. syst. 1. p. 161.) leaflets oblong-lanceolate. C. tenuifòlia Lusitánica, &c. Tourn. inst. 299.

Var. δ, baccàta (D. C. syst. l. c.) fruit somewhat baccate. C. baccàta, Pers. ench. 2. p. 99.

Vine-bower. Fl. June, Sept. Clt. 1569. Shrub cl.

87 C. campaniflòra (Brot. fl. lus. 3. p. 359.) peduncles 1-flowered, somewhat longer than the leaves; leaves biternately decompound; leaflets entire or 3-lobed; sepals half spreading, dilated at the apex, wavy. ♄. ◡. H. Native of Portugal, in hedges, especially on the road from Coimbra to Oporto. Lodd. bot. cab. t. 987. Leaflets about 24. Flowers large, half open, of a purplish-white colour. An intermediate species between *C. Viticélla* and *C. crispa*.

Bell-flowered Virgin's Bower. Fl. Ju. Jul. Clt. 1810. Sh. cl.

88 C. cri'spa (Lin. spec. 765.) peduncles 1-flowered, shorter than the leaves; leaves entire, 3-lobed or ternate, very acute; sepals connivent at the base, but reflexed and spreading at the apex. ♄. ◡. H. Native of Virginia and Carolina, in hedges and among bushes on the banks of rivers. Sims. bot. mag. t. 1892. Leaflets entire or 3-lobed. Flower erect, large, purple. Pericarp ending in a short awl-shaped tail. C. flore críspo, Dill. elth. 1. t. 73. f. 84.

Curled-flowered Virgin's Bower. Fl. Jul. Sept. Clt. 1726. Sh. cl.

89 C. parviflòra (D. C. mem. soc. hort. gen. 1. p. 433.) peduncles 1-flowered; sepals elliptical, somewhat dilated at the apex; leaves pinnate, with tendril-like petioles; leaflets stalked, 3-parted or entire; lobes oblong, mucronate, entire. ♄. ◡. H. Native of? Carpels smooth, tailless. Flowers small, white.

Small-flowered Virgin's Bower. Fl. July. Shrub cl.

Sect. III.—Cheirópsis, (from χειρ, *cheir*, the hand; and οψις, *opsis*, resemblance, in allusion to the form of the bracteas.) D. C. syst. 1. p. 162. prod. 1. p. 9. Involucre in the form of a calyx from two joined bracteas situated at the top of the peduncle just under the flower. Tails of pericarps bearded. Climbing or rambling shrubs, with simple or ternate leaves.

90 C. cirrhòsa (Lin. spec. 766.) peduncles 1-flowered, with an involucre; leaves ovate, somewhat cordate, toothed, in fascicles. ♄. ◡. H. Native of the South of Europe and North of Africa, in hedges and among bushes, particularly in Spain, Majorca, Sicily, Calabria, Algiers, and the Islands of the Archipelago. Smith fl. græc. t. 517. C. cæspitòsa, Scop. carn. ed. 2. No. 671? Atragène cirrhòsa, Pers. euch. 2. p. 98. An elegant evergreen shrub. Flowers pale and downy on the outside, but smooth and purple on the inside, and marked with darker spots.

Tendrilled Virgin's Bower. Fl. Mar. Apr. Clt. 1596. Sh. cl.

91 C. pedicella'ta (Sweet, hort. brit. p. 1.) peduncles 1-flowered, stalked within the involucre; leaves ovate, somewhat cordate, toothed, in fascicles. ♄. ◡. H. Native of Majorca. C. cirrhòsa, Sims. bot. mag. t. 1070. C. Baleárica, Pers. ench. 2, p. 99, but not of Rich. C. cirrhòsa var. β, pedicellàta, D. C. syst. 1. p. 163. An elegant evergreen shrub. Resembles *C. cirrhòsa*. but differing in the flower being smaller and seated on a pedicel within the involucre, not sessile. Flowers white, hardly spotted on the inside.

Pedicelled-flowered Virgin's Bower. Fl. Oct. Feb. Clt. 1596. Shrub cl.

92 C. polymórpha (Viv. app. fl. cors. in Schlecht. Linnæa. 1829. p. 502.) peduncles axillary, naked, 1-flowered; flowers pendulous; involucrum urceolate-campanulate, almost entire; sepals ovate-oblong, clothed with silky wool on the outside. ♄. ◡. H. Native of Corsica. Resembles *C. cirrhòsa*.

Var. a, vèra; leaves somewhat cordate, entire, 3-lobed or 3-parted; lobes and segments deeply serrate-crenated. Native of Corsica.

Var. β, semitríloba (Lag. cat. hort. madr. p. 17.) leaves 3-parted and ternate; middle leaflet stalked, lateral ones sessile oblique, all unequally serrate-crenate. Native of the south of Spain and of Corsica. Branches angular, dark-purple.

Var. γ, lanceolàta; leaves all ternate; leaflets lanceolate, middle one stalked, lateral ones sessile. Native of Corsica.

Polymorphous Virgin's Bower. Fl. April? Shrub cl.

93 C. Balea'rica (Rich. in journ. phys. Feb. 1779, 127, with a figure, but not of Pers.) peduncles 1-flowered, with an involucre under the flower; leaves ternate; leaflets stalked, 3-lobed, deeply toothed. ♄. ◡. H. Native of Minorca. C. calycìna, Ait. hort. kew. ed. 1. vol. 2. p. 259. Sims. bot. mag. t. 959. Atragène Baleárica, Pers. ench. 2. p. 98. A very elegant evergreen shrub. Involucre two-lobed, blunt, bell-shaped, closely girding the flower. Flowers pale, pubescent on the outside, and marked on the inside with oblong red spots.

Minorca Virgin's Bower. Fl. Feb. Mar. Clt. 1783. Sh. cl.

94 C. monta'na (D. Don, prod. fl. nep. p. 192.) peduncles many, 1-flowered, with an involucre under each flower; leaves ternate or trifid, smooth; leaflets oblong, acuminated, rather toothed at the base, lateral ones almost sessile, 1-nerved, terminal one 3-nerved. ♄. ◡. H. Native of Nipaul. C. montàna var. Hamilt. MSS. C. Nepaulénsis, D. C. syst. 1. p. 164. Flower a little distant from the involucre, clothed with cinereous down. Pericarps many, compressed, ovate-acuminated.

Mountain Virgin's Bower. Fl. April. Shrub cl.

95 C. anemoniflòra (D. Don, prod. fl. nep. p. 192.) peduncles many, 1-flowered, longer than the leaves, without an involucre; leaves ternate; leaflets cuneated, elliptical, mucronate,

deeply-toothed, villous; flowers spreading, with oval membranaceous sepals. ♄. ◡. H. Native of Nipaul, in the vicinity of Chitlong. C. montàna Hamilt. MSS. D. C. syst. 1. p. 164. Flowers white, almost like those of *Anemòne sylvéstris*. This species is perhaps sufficiently distinct to constitute a separate section, from the want of the involucrum.

Anemone-flowered Virgin's Bower. Fl. April. Shrub cl.

†*Species not sufficiently known.*

96 C. Tournefórtii (D. C. syst. 1. p. 166.) C. orientàlis latifolia semine brevissimis pappis donato. Tourn. Cor. 20. ♄. ◡. H. Native of the Levant.

Tournefort's Virgin's Bower. Shrub cl.

97 C? polype'tala (Poir. suppl. 2. p. 296.) ♃. H. Native of Japan. Atragène polypétala, Thunb. fl. jap. 239. Stem erect, two feet high. Leaves triternate; leaflets ovate, acute, deeply toothed, villous. Pedicels filiform, 1-flowered, elongated. Petals beyond 20, bluntish, purple on the outside, clothed with white down within. This plant would appear to be an *Anemòne*, from the description of the flower.

Many-petalled Virgin's Bower. Pl. 2 feet.

98 C. canalicula'ta (Lag. cat. hort. madr. 17). ♄. ◡. H. Native of Spain, in the provinces of Murcia and Granada, in rocky and stony places. A climbing subshrub, with linear decompound leaves and axillary three-flowered peduncles. (Lag.)

Channelled-leaved Virgin's Bower. Shrub cl.

99 C. Zanzibare'nsis (Loud. hort. brit. p. 228); leaves pinnate, with twisted petioles; leaflets ovate, acuminated, membranaceous, entire or 3-lobed. ♄. ◡. S. Native of Zanquebar. Leaflets 5, with their margins and nerves, as well as petioles, rather hairy.

Zanquebar Virgin's Bower. Fl.? Clt. 1820. Shrub cl.

Cult. The species of this genus are mostly climbing shrubs of rapid growth, free flowerers, very ornamental, and some are highly odoriferous. The hardy kinds are well adapted for bowers or trellis-work, or for training up against a wall; and they will thrive well in any common garden soil. They are readily increased by laying down the young shoots in July or October, or by seeds, which in many species ripen in abundance. The greenhouse species are very desirable for a conservatory where many climbing plants are wanted. Any light soil, or a mixture of loam and peat, will suit them well, and young cuttings will strike root freely under hand glasses. The stove kinds require the same treatment as the greenhouse species. The herbaceous perennial species are increased by dividing the plants at the root early in spring.

II. ATRAGE'NE (from αθραγενη, a name originally given to Clématis Vitálba by Theophrastus.) Lin. gen. No. 615. Gært. fruct. 1. p. 356. t. 74. f. 8. Schkuhr. handb. t. 150. Clématis, Sect. IV. Atragène, D. C. syst. 1. p. 165. prod. 1. p. 9.

Lin. Syst. *Polyándria Polygýnia.* Involucre none. Sepals 4, somewhat induplicate in the bud. Petals numerous, shorter than the sepals. Cariopsides terminated by a bearded tail. Cotyledons approximate in the seed. Climbing shrubs with variously cut opposite leaves, possessing the same qualities as *Clématis.*

1 A. alpi'na (Lin. spec. 764.) peduncles 1-flowered, longer than the leaves; leaves biternate; leaflets ovate-lanceolate, acuminated, serrate; petals somewhat spatulate, blunt. ♄. ◡. H. Native of the mountains in many parts of Europe from the height of 2400 to 6000 feet, especially on a calcareous soil, in Austria, Carniola, Piedmont, South of Switzerland, Geneva, Dauphiny, and the Eastern Pyrenees. Jacq. aust. t. 241. Schkuhr. handb. t. 150; Sims. bot. mag. t. 530. A. Austrìaca, Scop. carn. ed. 2. No. 666. Andr. bot. rep. t. 180. Sims. bot. mag. t. 807. A. Clematìdes, Crantz. austr. 111. t. 5. Clématis alpìna, Mill. dict. No. 9. D. C. syst. 1. p. 165. Flowers blue, varying to white. Sepals oblong, acuminated. Petals 10 to 12, linear at the base, but dilated at the apex.

Alpine Atragene. Fl. May, July. Clt. 1792. Shrub cl.

2 A. Sibi'rica (Lin. spec. ed. 1. p. 343.) peduncles 1-flowered, almost equal in length with the leaves; leaves biternate; leaflets oblong-lanceolate, acuminated, serrated; petals emarginate at the apex. ♄. ◡. H. Native of Siberia, in woods, at the river Oby, and in the Ural mountains, and along that chain of Alps even to the Eastern Ocean. Sims. bot. mag. t. 887. A. alpìna, Gmel. sib. 4. p. 194. No. 33. Pall. fl. ross. 2. p. 69. t. 76. Resembles *A. alpìna*, but differs in the leaves being sometimes ternate, with narrower leaflets, and in the flowers being a little smaller, from white to yellowish, never blue, as well as in the petals being emarginate at the apex not obtuse.

Siberian Atragene. Fl. June, July. Clt. 1753. Shrub cl.

3 A. Ochote'nsis (Pall. ross. 2. p. 69.) peduncles 1-flowered; leaves biternate; leaflets oblong-lanceolate, acuminated, serrate; petals few; linear. ♄. ◡. H. Native of Siberia towards the Ochotskoi Sea, and of Kamtschatka between Ochotsk and Kamtsch. A. violàcea, Pall. in herb. Lamb. C. Ochoténsis, Poir. suppl. 2. p. 298. Resembles *A. Sibírica*. Flowers with 4 ovate-mucronate sepals, which are downy on their margins. Petals none, or sometimes with the outer stamens abortive, a little elongated and linear. Filaments velvety, a little shorter than the sepals.

Ochotskoi Atragene. Fl. May, July. Clt. 1818. Shrub cl. acuminated.

4 A. America'na (Sims. bot. mag. t. 887.) peduncles 1-flowered; leaves whorled, in fours, ternate; leaflets stalked, cordate, lanceolate, acuminated, entire, or somewhat lobed, or serrated; petals acute. ♄. ◡. H. Native of North America, in shady places, on the sides of rivulets, climbing and creeping among loose rocks, New York and Pennsylvania, near the foot of the Blue Mountains, and on the eastern declivity of the Rocky Mountains and at Cape Mendocina, on the North-west coast. Clématis verticillàris, D. C. syst. 1. p. 166. Resembles *A. alpìna*. Flowers large, purplish-blue.

Var. β, oblìqua (Dougl. mss.) leaflets bluntly serrated. ♄. ◡. H. Native on the eastern declivities of Rocky Mountains, in vallies, and at Cape Mendocina, on the western coast.

American Atragene. Fl. May, July. Clt. 1797. Shrub cl.

5 A. occident'alis (Horn. hort. hafn. 2. p. 520.) leaves opposite, ternate; leaflets nearly entire, shining; sepals ovate-lanceolate; flowers, somewhat bell-shaped. ♄. ◡. Native of? Clématis occidentàlis, D. C. prod. 1. p. 10.

Western Atragene. Fl.? Clt. 1818. Shrub cl.

Cult. The species are very shewy, and require the same treatment as that recommended for the hardy kinds of *Clématis.*

III. NARAVE'LIA (from *Naravæl*, its name in Ceylon. Herm. Zeyl. 26.) D. C. syst. 1. p. 167. prod. 1. p. 10.

Lin. syst. *Polyándria, Polygy'nia.* Petals from 6 to 12, longer than the calyx (f. 5. *a.*) Carpels seated on a thick hollow stipe, (f. 5. *b.*) terminated by a long feathery tail (f. 5. *c.*) A climbing shrub, with the habit of *Clématis*, but the leaves are only furnished with two opposite many-nerved leaflets.

1 N. Zeyla'nica (D. C. syst. 1. p. 167.) leaves opposite, stalked; leaflets two, ovate-acuminated, on very short stalks, 5-7 nerved, quite entire, or notched with one or two teeth on each side, velvety underneath, smooth above,

FIG. 5.

drawn out at the apex into a trifid twisted tendril; (f. 5. *d.*) panicle terminal, with trichotomous pedicels. ♄. ◡. S. Native of the East Indies. Sepals 4, caducous. Flowers yellow.

Var. a Hermánni (D. C. syst. 1. p. 167.) leaves velvety-tomentose on the under surface. Native of Ceylon, in groves. Atragène Zeylánica, Lin. Amœn. 1. p. 405. Clématis Zeylánica, Poir. suppl. 2. p. 296.

Var. β Roxbúrghii (D. C. syst. 1. p. 168.) leaves velvety-pubescent on the under surface. Atragène Zeylánica, Roxb. corom. 2. p. 47. t. 188. Native of Coromandel, near a place called Samulcoath, in hedges and groves, in humid places. (f. 5.)

Ceylon Narawæl. Fl. summer. Clt. 1796. Shrub cl.

Cult. This plant will thrive best in a mixture of loam and peat. Young cuttings planted thinly in a pot of sand will strike root, under a hand-glass in heat. (Sweet.)

Tribe II.

ANEMO'NEÆ (plants resembling Anemone). D. C. syst. 1. p. 167. prod. 1. p. 10. Calyx and corolla imbricate in the bud (f. 4. *a.*) Petals none, (f. 6. *b.* f. 7. *d.*) or flat. Carpels 1-seeded, (f. 6. *d.*) indehiscent, (f. 6. *c.*) generally terminated by a tail (f. 6. *f.*) or point (f. 6. *c.*) Seed pendulous (f. 6. *e.*) Stems herbaceous, never climbing. Leaves radical (f. 6.) or alternate (f. 7.)

IV. THAL'ICTRUM (said from *θαλλω, thallo,* to grow green; from the bright colour of the young sprouts). Lin. gen. No. 697. Gært. fruct. 1. p. 355. t. 74. Lam. ill. t. 497. D. C. syst. 1. p. 168. prod. 1. p. 11.

Lin. syst. *Polyándria Polygy'nia.* Involucre none. Calyx of 4 or 5 deciduous petal-like sepals. Petals none. Carpels 4 to 15, pointed not terminated by a tail, stalked or sessile, sometimes furrowed longitudinally. Roots perennial, with annual stems. Flowers corymbose, panicled, and somewhat racemose, green, white, and yellow. Herbs usually fetid, with yellowish bitter roots, tonic, resembling *rhubarb* (especially *T. flavum*) in its cathartic qualities. The English name of this genus, *Meadow-Rue*, is given to it on account of the species usually growing in meadows, and their leaves resembling those of *Rue*. It is also called *Feather-Columbine*, from the feathery appearance of the panicles of flowers, and the leaves resembling those of the *Columbine*.

Sect. I. Tripte'rium, (*τρεις, treis,* three, *πτερον, pteron,* a wing, in allusion to the three winged fruit). D. C. syst. 1. p. 169. prod. 1. p. 11. Fruit triquetrous, with winged angles, somewhat stipitate.

1 Th. aquilegifòlium (Lin. spec. 770.) stipulas ovate, twin, at the base of the ramifications of the petiole; panicle corymbose. ♄. H. Native of Europe, on wooded mountains, in Germany, France, Italy, Hungary, Siberia, &c. Sims. bot. mag. t. 1818. Jacq. aust. t. 318. Stem fistulous, purple, meally. Leaves tripinnate, with suborbicular, smooth, deeply toothed leaflets. Sepals white, fugacious. Stamens white, but usually purple. Pericarps smooth, pendulous, narrowed at the base, on long pedicels.

Var. β, atropurpùreum (Murr. syst. 513. Jacq. hort. vind. 3. t. 81.) stems and stamens dark purple. Native of Austria.

Var. γ, formòsum (D. C. prod. 1. p. 11.) stamens dark purple, dilated at the apex. Sims. bot. mag. t. 2025.

Var. δ, álbum; stems green, stamens white.

Columbine-leaved Meadow-Rue. Fl. May, July. Clt. 1731. Pl. 1 to 3 feet.

2 Th. chelidònn (D. C. prod. 1. p. 11.) stipulas wanting; axils of leaves gemmiferous; flowers loosely panicled; fruit stipitate, pendulous from the inflexed pedicel. ♄. H. Native of Nipaul. Flowers large, purplish. Pistils 8. Stamens 8 to 12.

Swallow-wort Meadow-Rue. Fl. May, Jul. Clt. 1823. Pl. 2 ft.

3 Th. contórtum (Lin. spec. 770.) stipulas wanting; flowers in loose corymbose racemes; fruit pendulous. ♄. H. Native of Siberia. Resembles *Th. aquilegifòlium*, but dwarfer. Flowers white. Leaves glaucous, with small simple or trifid obtuse leaflets. Stem 2-edged. Fruit twisted.

Twisted Meadow-Rue. Fl. Ju. Jul. Clt. 1796. Pl. 1 ft.

Sect. II. Physoca'rpum, (*φυσα, physa,* a bladder, *καρπος, karpos* a fruit). D. C. syst. 1. p. 171. prod. 1. p. 11. Fruit inflated, bladdery, stipitate. Flowers dioecious or polygamous. Leaves bi or triternate.

4 Th. clava'tum (D. C. syst. 1. p. 171.) flowers monoecious, or hermaphrodite; filaments club-shaped; anthers elliptical awnless; pericarps inflated, with a very short beak; leaves smooth, without stipulas. ♄. H. Native of North America, on Portage de La Loche, a height of land, composed of sand-hills, in lat. 57°, and separating the waters flowing to Hudson's Bay, from those falling into the Arctic Sea. Deless. icon. sel. 1. t. 6. Leaves biternate; leaflets roundish, membranous, glaucous underneath, crenate-lobed. Flowers white, erect. Pericarps 5-6, stellately spreading.

Clavate-filamented Meadow-Rue. Fl. June, July. Clt. 1820. Pl. 1 to 2 feet.

5 Th. podoca'rpum (H. B. et Kunth nov. gen. spec. amer. 5. p. 38.) flowers polygamous; filaments filiform; anthers long, with an awn at the apex; pericarps oval-oblong, smooth, with a long awn; leaves smooth without stipulas. ♃. G. Native of New Granada. Stem fistulous. Leaves 4-times pinnate, or 4-times ternate; leaflets stalked, ovate-orbicular, cordate at the base, smooth, glaucous underneath; somewhat lobed at the apex, with 3 or 4 teeth. Flowers loosely panicled.

Foot-fruited Meadow-Rue. Fl. July. Pl. 2 to 3 feet.

6 Th. longist'ylum (D. C. syst. 1. p. 171). Flowers polygamous; filaments filiform; anthers with a long awn; pericarps oval-oblong; style with a long awn; branches of petiole stipulled; segments of leaves hairy at the nerves. ♃. F. Native of South America. Deless. icon. sel. 1. t. 7. Leaves 3 or 4-times ternate; leaflets ovate-orbicular, cordate at the base, grossly 3-5-toothed at the apex, or lobed, scarcely glaucescent underneath. Flowers loosely panicled.

Long-styled Meadow-Rue. Pl. 4 or 5 feet.

7 Th. pelta'tum (D. C. prod. 1. p. 11.) flowers polygamous; pericarps sessile, with a long awn; leaflets of lower leaves peltate. ♃. F. Native of Mexico.

Peltate-leaved Meadow-Rue. Fl. June, July. Pl. 2 feet.

8 Th. Mexica'num (D. C. syst. 1. p. 187). ♃. F. Native of Mexico. Coztipatli II. Hern. Mexic. 236 icon. Roots thick, fascicled, fibrous, of an amethyst colour, with yellow fibres. Leaves biternate; leaflets stalked, ovate, toothletted. (Hern.)

Mexican Meadow-Rue. Pl. 2 feet.

9 Th. rutidoca'rpum (D. C. syst. 1. p. 172.) flowers polygamous; filaments filiform; pericarps ovate, somewhat compressed, marked with elevated branched rugosities; leaves without stipulas; leaflets hairy at the nerves. ♃. F. Native of South America.

Rugged-fruited Meadow-Rue. Pl. 2 feet.

Sect. III. Euthali'ctrum, (from *ευ, eu,* well or good, and *thalictrum;* genuine species). D. C. syst. 1. p. 172. prod. 1. p. 12. Fruit, ovate-oblong, striped, sessile. Leaves various, almost always free of stipulas.

§ 1. Heterog'ama. *Flowers dioecious or polygamous.*

10 Th. Cornu'ti (Lin. spec. 768.) flower dioecious or polygamous; filaments somewhat club-shaped; anthers elliptical, or nearly linear; leaflets roundish-abovate and oblong, 3-lobed,

glaucous beneath, with the nerves hardly prominent, rather revolute at the edges; carpels ovate oblong; stigma filiform with membranous margins. ♃. H. Native of North America, on banks of rivers, in woody districts, the whole breadth of the continent. Hook fl. bor. amer. 3. t. 2. Leaves bi or tripinnate. Flowers white, or in many pale-purple, panicled. Th. revolutum D. C. syst. 1. p. 173. Th. Canadensis, Cornuti Canad. 186. t. 187.

Var. α. revolùtum; anthers linear-oblong. Th. revolutum. D. C. syst. 1. p. 173. Var. β. subglàbrum.

Var. β, pubéscens (Ph. fl. amer. sept. 2. p. 388.) anthers elliptical; leaves velvety, pubescent beneath. Th. corynéllum. D. C. syst. 1. p. 172.

Cornuti's Meadow-Rue. Fl. Jul. Aug. Clt. 1806. Pl. 3 to 4 ft.

11 Th. dioi'cum (Lin. spec. 768.) flowers dioecious; filaments filiform; leaflets roundish, cordate, smooth, bluntly crenate-lobed, glaucous beneath; peduncles axillary, shorter than the leaves. ♃. H. Native of North America, in shady grassy places, on the banks of rivers from Canada to Virginia and elsewhere. Deless. icon. sel. 1. 6. 8. Th. lævigàtum, Mich. fl. bor. amer. 1. p. 322. Plant very smooth. Leaves 3-times trifid. Leaflets stalked, glaucous underneath. Panicle branched, somewhat corymbose at apex. Flowers white. Pericarps ovate, awnless.

Dioecious Meadow-Rue. Fl. May, Jul. Clt. 1759. Pl. 1 to 2 ft.

12 Th. Carolinia'num (Bosc. ined. but not of Walt. D. C. syst. 1. p. 174.) flowers dioecious; filaments filiform; leaflets oval, 3—5-toothed, smooth, glaucous underneath; peduncles axillary, longer than the leaves. ♃. H. Native of North America, from Pennsylvania to Carolina, on the banks of rivers and in swamps. Th. rugòsum, Pursh fl. amer. sept. 2. p. 388, but not of Ait. hort. kew. Flowers white, in divaricating panicles.

Var. β, subpubéscens (D. C. syst. 1. p. 174.) leaflets, a little hairy at the nerves on the under surface. Native of New Jersey.

Carolinian Meadow-Rue. Fl. June, Aug. Clt. 1818. Pl. 1 to 2 feet.

13 Th. purpura'scens (Lin. spec. 769.) flowers dioecious or monoecious; filaments filiform, colored; leaflets somewhat orbicular, grossly toothed, glaucous underneath; panicle contracted, almost leafless. ♃. H. Native of Pennsylvania and Virginia, on dry sunny hills.—Moris. oxon. 3. p. 324. Stems purple. Leaves triternate. Panicle of female flowers erect. Ovaries 7, 8. Styles long, acute. Stamens purple.

Var. β, monoícum (D. C. syst. 1. p. 174.) panicle few-flowered, female flowers at bottom, and male at top of panicle. Native of New England. Filaments red. Anthers long, yellow, acute.

Purplish Meadow-Rue. Fl. May, Ju. Clt. 1699. Pl. 1 to 2 ft.

14 Th. Java'nicum (Blum. bijdr. Spreng. syst. append. p. 221.) Stem 4-sided, striated; leaflets orbicular, smooth, trifid, glaucous beneath; panicle forked, corymbose, erect; flowers dioecious. ♃. S. Native of Java. Flowers yellow.

Java Meadow-Rue. Fl. June, July. Pl. 3 feet.

§. 2. Genuìna, (*genuinus, natural; species all hermaphrodite.) Flowers hermaphrodite. Leaves decompound. Roots fibrous.*

15 Th. foliolòsum (D. C. syst. 1. p. 175.) stem round, smooth, branched; flowers in corymbose panicles, drooping; leaves quadripinnate; leaflets somewhat ternate, roundish or cordate, 3-lobed, membranous, smooth; petioles 3-parted. ♃. H. Native of Upper Nipaul, at Suembu. Th. Dalínga, Hamilt. MSS. Flowers small, yellow.

Leafy Meadow-Rue. Fl. May, July. Pl. 1 ½ to 2 feet.

16 Th. saniculæfórme (D. C. prod. 1. p. 12.) stem roundish, branched; flowers few, panicled; peduncles rigid, divaricating; sepals reflexed; pericarps striated, pointed with the long inflexed style. ♃. H. Native of Nipaul.

Sanicula-formed Meadow-Rue. Pl. 1½ feet.

17 Th. petaloìdeum (Lin. spec. 770.) stem round, almost naked; flowers corymbose; filaments dilated at the apex; leaflets smooth, ovate, obtuse, entire or 3-lobed. ♃. H. Native of the mountains of Dauria, and on Mount Odon-Tchelen on the confines of China. Deless. icon. sel. 1. t. 9. Lodd. bot. cab. 891. Leaves ternately decompound. Sepals roundish, white. Filaments flesh-colored. Anthers yellow. Pericarps 6. 8, sessile, oblong, striated.

Var. β, stamíneum (Lin. fil. suppl. 271).

Petal-like-sepalled Meadow-Rue. Fl. June, July. Clt. 1799. Pl. 1½ feet.

18 Th. alpìnum (Lin. spec. 767.) stem quite simple, almost naked, dwarf; raceme simple, terminal; flowers nodding; leaves smooth, shining. ♃. H. Native of Kamtschatka, Newfoundland, Lapland, Greenland, Iceland, Pyrenees, &c. On most of the highest mountains in Wales and Scotland. Smith. eng. bot. t. 262. Lightf. scot. t. 13. f. 1.; Fl. dan. t. 11. A small very smooth plant. Leaves chiefly radical, twice ternate and somewhat pinnate; leaflets wedge-shaped, dark green and shining above, glaucous beneath. Sepals whitish, acute. Anthers tawny.

Alpine Meadow-Rue. Fl. May, Jul. Britain. Pl. ¼ to ½ ft.

19 Th. fœ'tidum (Lin. spec. 768?) stem simple, naked at the base, leafy in the middle, panicled at top; leaves with clammy pubescence; leaflets obtuse, toothed. ♃. H. Native of France, Switzerland, Hungary, Siberia, Russia, &c. In valleys, on hills, or in the fissures of calcareous rocks. Lam. ill. t. 497. f. 2. Waldst. and Kit. pl. hung. 2. p. 190. t. 174. Th. styloìdeum, Lin. fil. suppl. 271. Th. saxátile, Vill. dauph. 4. p. 714. Stem clammy-pubescent, covered with scales at the base instead of leaves. Petioles 3-parted. Segments of leaves twice or thrice pinnate. Leaflets orbicular, cordate, irregularly 3 to 5-lobed at the apex. Panicle erect, spreading, few-flowered. Flowers nodding. Anthers yellow. Sepals reddish on the outside.

Fetid Meadow-Rue. Fl. May, Jul. Clt. 1640. Pl. 1 ft.

20 Th. pube'scens (Schl. pl. helv. D. C. syst. 1. p. 176.) stem simple, with a few leaves, panicled at top; leaves clammy-pubescent. ♃. H. Native of Caucasus; about Montpelier, and in Lower Vallais, on chalky rocks. Th. Cornùti, Poir. dict. 5. p. 319, exclusive of the synonymes and countries. Resembles *Th. fœtidum*, but with the leaves scattered equally over the stem, and with the leaflets more acute.

Pubescent Meadow-Rue. Fl. May, July. Clt. 1819. Pl. 2 ft.

21 Th. acuti'lobum (D. C. syst. 1. p. 177.) stem simple, naked at the base, leafy in the middle, and panicled at top; leaves pubescent, viscid; lobes of leaflets acute. ♃. H. Native of Siberia. Very like *Th. fœtidum*. Deless. icon. sel. 1. t. 10.

Acute-lobed Meadow-Rue. Fl. Ju. Jul. Clt. 1820. Pl. 1½ ft.

22 Th. dive'rgens (Link enum 584.) leaflets ovate-oblong, pubescent beneath, bluntly 3-lobed; branches and petioles divaricating; panicle diverging. ♃. H. Native of Siberia. *Th. divaricàtum*, Spreng. new entd. 1. p. 37. No. 68. Flowers yellow.

Diverging-panicled Meadow-Rue. Fl. Ju. Jul. Clt. 1819. Pl. 2 feet.

23 Th. Schweigge'ri (Spreng. syst. 1. p. 271.) stem erect, furrowed; leaflets ovate, cuneated, multifid and acutely toothed; petioles with stipulas at their base; filaments capillary, elongated; anthers awned. ♃. H. Native of? Flowers yellow.

Schweigger's Meadow-Rue. Fl. June, July. Pl. 3 feet.

24 Th. squarròsum (Steph. in Willd. spe. 2. p. 1299.) stem round; flowers panicled, drooping; petioles stem-clasping, winged. ♃. H. Native of Siberia. Leaves supra-decompound;

lateral leaflets for the most part ovate-acute, and very entire, terminal ones, as well as the superior lateral ones, trifid or bifid. Petiole with an orbicular membranous toothed wing at the base on each side. Flowers yellow.

Squarrose Meadow-Rue. Fl. June, Jul. Clt. 1806. Pl. 1 ft.

25 Th. SIBÍRICUM (Gært. fr. 1. p. 355. t. 74.) stem roundish; flowers panicled, drooping; leaflets smooth, ovate-cuneated, trifid with acute, entire, or acutely cut lobes. ♃. H. Native of Armenia and Siberia. Flowers light yellow. Plant glaucous.

Siberian Meadow-Rue. Fl. Ju. Jul. Clt. 1775. Pl. 1 to 3 ft.

26 Th. MÌNUS (Lin. spec. 769.) stem round, mealy; flowers loosely panicled, drooping; leaflets smooth, roundish, toothed at apex, glaucous; pericarps acute, furrowed. ♃. H. Native almost throughout Europe, as well as Siberia, in mountainous pastures. In Britain, in chalky pastures, especially such as are rather mountainous, or in shell sand on the sea coast. Smith, eng. bot. t. 11. Fl. dan. t. 732. Jacq. aust. t. 419. Stem zigzag. Leaves doubly pinnate, then ternate; leaflets broadly cordate or wedge-shaped. Stipulas rounded. Sepals pale-purple with white edges. Anthers yellow.

Lesser Meadow-Rue. Fl. June, Jul. Britain. Pl. $\frac{1}{2}$ to 1 ft.

27 Th. COLLÌNUM (Wallr. sched. crit. 259.) stem leafy at the base, intercepted with approximate internodes; leaves green on both surfaces, smooth, radical ones sessile, crowded; leaflets ovate or cordate, roundish, bluntly trifid; flowers panicled, drooping; pericarps ovate, equally ribbed, crowned by the straight style. ♃. H. Native of Saxony in fields about Halle. Th. mìnus, Spreng. fl. hal. 156, exclusive of the synonymes. Sepals purplish. Anthers yellow.

Hill Meadow-Rue. Fl. June, Jul. Clt. 1800. Pl. 1 to 1 $\frac{1}{2}$ ft.

28 Th. SAXA'TILE (Schl. pl. helv. D. C. syst. 1. p. 178.) stem round; flowers panicled, erect; leaflets smooth, roundish, toothed at apex, glaucous underneath; pericarps acute at both ends. ♃. H. Native of middle Europe in woody hills and mountain valleys, especially in Alsace, Switzerland, and the Pyrenees. Th. mìnus, Poll. pal. No. 522. Very like *Th. mìnus* but distinguished from it by the stem being green but purple at the base, and destitute of mealiness, as well as in the flowers being erect. Anthers yellow.

Rock Meadow-Rue. Fl. Ju. Jul. Clt. 1819. Pl. 1 to 2 ft.

29 Th. CALA'BRICUM (Spreng. pug. 1. p. 37. No. 67.) stem roundish, destitute of mealiness; panicle of flowers somewhat racemose, contracted, leafless; leaflets roundish, bluntly 3-lobed, rather glaucous underneath; pericarps deeply furrowed, tapering to the base. ♃. H. Native of Calabria on Mount Leone and of Sicily.—Moris. Hist. 1. sect. 9. to 20. f. 16.? Flowers yellow.

Calabrian Meadow-Rue. Fl. Ju. Jul. Clt. 1800. Pl. 2 to 3 ft.

30 Th. ELA'TUM (Murr. syst. ed. 14. p. 513.) stem roundish, destitute of mealiness; flowers panicled, erect; leaflets smooth, ovate, somewhat cordate, and somewhat trifid; pericarps obtuse at the base. ♃. H. Native of Hungary. Jacq. hort. vind. 3. t. 95. Intermediate between *Th. saxátile* and *május*, differing from the first in the pericarps being obtuse at the base not acute, and from the second in the flowers being erect not drooping. Flowers with white sepals and yellow anthers.

Var. β, ambíguum (Schl. pl. helv.) ♃. H. Native of Switzerland on the edges of fields in the valley called Binn.

Tall Meadow-Rue. Fl. August, Sept. Clt. 1794. Pl. 5 ft.

31 Th. MA'JUS (Murr. syst. 513.) stem round, destitute of mealiness; flowers loosely panicled, drooping; leaflets smooth, trifid, glaucous underneath, with ovate mucronate lobes; pericarps obliquely rounded at the base. ♃. H. Native of Switzerland, Dauphiny, and Cevennes, on dry bushy hills. In England at Baydales, near Darlington; also on the margin of Ulswater. Jacq. aust. t. 420. Smith, eng. bot. t. 611. Stem purplish, angular on the upper part. Sepals purplish-green. Anthers yellow. Leaves triply pinnate then ternate. Stipulas crescent-shaped, notched.

Greater Meadow-Rue. Fl. June, Jul. England. Pl. 3 ft.

32 Th. NU'TANS (Desf. tabl. mus. ed. 1. p. 123.) stem round, destitute of mealiness, flowers loosely panicled, drooping; leaflets 3 to 5-toothed at apex, acutely cut, glaucous beneath; pericarps oblique and obtuse at the base. ♃. H. Native of the Alps of Savoy. Th. acuminàtum, Spreng. pug. 2. Very like *Th. màjus*. Flowers yellow.

Nodding Meadow-Rue. Fl. Ju. Jul. Clt. 1819. Pl. 2 to 3 ft.

33 Th. ME'DIUM (Murr. syst. 513.) stem round, destitute of mealiness; flowers loosely panicled, erectish; leaflets smooth, oblong, wedge-shaped, acutely trifid, upper ones undivided, lanceolate. ♃. H. Native of Hungary and Tauria, on hills. Jacq. hort. vind. 3. t. 96. Th. diffùsum, Schrad. Flowers yellowish.

Middle Meadow-Rue. Fl. June, Jul. Clt. 1789. Pl. 2 ft.

34 Th. TRÍGYNUM (Fisch. in litt. D. C. prod. 1. p. 14.) stem furrowed, erect; flowers very loosely panicled, erect, with 3 styles; leaflets smooth, oval, wedge-shaped, acutely trifid, glaucous beneath. ♃. H. Native of Dahuria. Pericarps 1 to 3 oblong, striated. Flowers yellow.

Three-styled Meadow-Rue. Fl. Ju. Jul. Clt. 1818. Pl. 2 ft.

35 Th. CONCÍNNUM (Willd. enum. 584.) stem round, straight; flowers drooping, disposed in a very ample spreading panicle; leaflets smooth, wedge-shaped, trifid, acute, with the middle lobe usually 3-toothed. ♃. H. Native of? Stem erect, purplish. Radical leaves quadriternate, cauline ones 3-parted, with the partitions bipinnate. Flowers white with yellow anthers.

Neat Meadow-Rue. Fl. June, July. Clt? Pl. 3 feet.

36 Th. GLAUCE'SCENS (D. C. syst. 1. p. 180.) stem round, straight; flowers drooping, loosely panicled; stipulas small, at the base of the ramifications of the petioles; leaflets smooth, 3-lobed at the apex. ♃. H. Native of Russia? Resembles *Th. aquilegifòlium*. Herb glaucous. Stem fistulous. Sepals oval, purplish. Anthers yellow.

Glaucescent Meadow-Rue. Fl. Ju. Jul. Clt. 1818. Pl. 2 to 3 ft.

37 Th. GALIOÌDES (Nestl. in Pers. ench. 2. p. 101.) stem round, a little furrowed, upright; root creeping; panicle strict; flowers nodding; leaflets linear, narrow, very entire, shining, with revolute margins, ultimate one almost sessile. ♃. H. Native of Alsace in sandy meadows. Deless. icon. sel. 1. t. 11. Th. angustifòlium. *Var. β, galioìdes*, D. C. fl. fr. no. 4601. Panicle of flowers resembling that of *Gàlium vérum*. Flowers yellow.

Lady's Bedstraw-like Meadow-Rue. Fl. Ju. Jul. Clt. 1816. Pl. 1 to 3 feet.

38 Th. ANGUSTIFÒLIUM (Jacq. hort. vind. 3. t. 43.) stem upright, round, a little furrowed; root fibrous; panicle multiple, erect; flowers erectish; leaflets linear-lanceolate, quite entire, shining, ultimate one rather cut, remote. ♃. H. Native of Germany and France in meadows and woods. Th. angustíssimum, Crantz. austr. 2. p. 79. Stem fistulous. Flowers yellow.

Narrow-leaved Meadow-Rue. Fl. June, July. Clt. 1793. Pl. 3 or 4 feet.

39 Th. LU'CIDUM (Lin. spec. 770.) stem branched, round, somewhat furrowed; panicle multiple, erect; flowers erectish; leaflets linear-lanceolate, entire, shining, ultimate one lobed. ♃. H. Native of France, about Paris, and Spain, in meadows. Th. mèdium, Poir. dict. 5. p. 316. Th. speciòsum, Mill. dict. no. 2. Th. longifòlium, Krok. fl. siles. 2. 1. p. 242—Pluk. alm. 363. t. 65. f. 5. An intermediate plant between *Th. angustifòlium* and *mèdium*. Flowers yellow.

Shining-leaved Meadow-Rue. Fl. June, Jul. Clt. 1739. Pl. 2 to 3 feet.

40 Th. NÌGRICANS (Jacq. fl. aust. 5. t. 421.) stem upright,

branched, furrowed; root fibrous; panicle multiple, erect, somewhat corymbose; leaflets of radical leaves wedge-shaped, trifid, those of the stem leaves oblong-linear. ♃. H. Native of Austria, north of Italy, and south of France, on the margins of fields and on the banks of rivers in moist sandy places.—Moris. hist. 1. sect. 9. t. 20. f. 3. Th. rugòsum, Poir. dict. 5. p. 317. exclusive of the synonymes and countries. Like *Th. flàvum*. Flowers yellow.

Blackish-leaved Meadow-Rue. Fl. Ju. Jul. Clt. 1798. Pl. 2 to 3 feet.

41 TH. FLA'VUM (Lin. spec. 770. var. *a*.) stem erect, branched, furrowed; root fibrous; panicle multiple, erect, somewhat corymbose; leaflets wedge-shaped, trifid, acute. ♃. H. Native throughout all Europe, also Siberia and about Constantinople. In Britain in wet meadows and about the banks of rivers and ditches. Smith, eng. bot. t. 367. Fl. dan. t. 939. Th. praténse, Lin. fl. lapp. 224. Stem hollow. Leaves doubly pinnate, ultimately ternate. Sepals cream-coloured. Anthers yellow. Root yellow. The root dyes wool yellow, and has been formerly used to cure the jaundice, probably from its colour. An acrid herb, raising blisters on the skin; but cattle frequently feed upon it mixed with grass.

Var. β paupérculum (D. C. fl. fr. No. 4603.) panicle few-flowered.

Var. γ vaginàtum (D. C. prod. 1. p. 14.) sheaths of petioles expanded into auricles. Th. vaginàtum. Desf. cat. hort. par. ed. 2. suppl. 274.

Yellow-rooted Meadow-Rue. Fl. Ju. Jul. Britain. Pl. 3 to 4 ft.

42 TH. DIVARICA'TUM (Horn. hort. hafn. add. 967.) stem branched, upright, leafy, furrowed; leaflets ternate, linear, very narrow, trifid, divaricating; panicle diffuse (strict?); flowers erect. ♃. H. Native of? Flowers yellowish.

Divaricating-leaved Meadow-Rue. Fl. Ju. Jul. Clt. 1819. Pl. 2 feet.

43 TH. ROSMARINIFÒLIUM (Nocett. in Spreng. syst. 2. p. 672.) leaves supradecompound; leaflets lanceolate, acute, very entire, opaque above, glaucous beneath; panicle diffuse; flowers erect. ♃. H. Native of Italy. Flowers yellow.

Rosemary-leaved Meadow-Rue. Fl. Ju. Jul. Clt. 1816. Pl. 2 to 3 feet.

44 TH. LASERPITIIFÒLIUM (Horn. hort. hafn. suppl. p. 62.) lower leaflets cuneated, trifid, those of the cauline leaves linear, ultimate ones 3-parted; flowers erect. ♃. H. Native of? Flowers yellow.

Laserwort-leaved Meadow-Rue. Fl. Ju. Jul. Clt. 1810. Pl. 3 ft.

45 TH. THUNBE'RGII (D. C. syst. 1. p. 183.) stem erect, branched, round; panicle compound, erect; leaflets wedge-shaped, acutely trifid at the apex, glaucescent. ♃. H. Native of Japan. Resembles *Th. flàvum*, but differing in the stem being round and smooth, not furrowed; flowers smaller; ovaries 3 to 5, not 10 to 15; stamens 10 to 12 not 24. Flowers yellow.

Thunberg's Meadow-Rue. Fl. June, July. Pl. 3 feet.

46 TH. SÍMPLEX (Lin. mant. 78.) stem erect, simple, angular; root creeping; panicle erect, racemose, few-flowered; leaflets linear, or lower ones oblong, acute, trifid. ♃. H. Native of France, Sweden, Norway, Denmark, Switzerland, in waste meadows and on the banks of rivers. Fl. dan. t. 244. Th. angustifòlium, Vill. dauph. 3. p. 722, exclusive of the synonymes. Th. tenuifòlium, Swz. Flowers with green sepals and yellow stamens. Herb glaucous.

Simple-stemmed Meadow-Rue. Fl. May, July. Clt. 1778. Pl. 1 to 2 feet.

47 TH. DENSIFLÒRUM (H. B. and Kunth. nov. gen. et spec. amer. 5. p. 38.) stem erect, striated; panicle compound, erect; flowers crowded, somewhat capitate; leaflets oval, acutely trifid or 3-toothed, glaucous and reticulately veined beneath. ♃. G. Native of South America. Stem hollow. Petioles trifid; lateral segments bearing 3 leaves, middle one pinnate. Flowers yellow. Ovaries few and sometimes perhaps wanting, as is the case in most of the American species.

Dense-flowered Meadow-Rue. Fl. June, July. Pl. 2 to 3 ft.

48 TH. CINE'REUM (Desf. cat. hort. par. ed. 2. p. 146.) stem erect, round, striated; panicle much branched, loose, rigid; flowers erect; leaflets oval, cuneated at the base, 3 to 5-toothed at the apex. ♃. H. Native of? Stem hollow, leaves tripinnate. Flowers yellow. Ovaries 7 to 8, acute.

Cinereous Meadow-Rue. Fl. Ju. Jul. Clt. 1810. Pl. 3 or 4 ft.

49 TH. GLAU'CUM (Desf. cat. hort. par. ed. 2. p. 146.) stem erect, round, striated, mealy; panicle compound, erect, crowded; leaflets ovate, rather cordate, bluntly trifid, glaucous beneath. ♃. H. Native of Spain, Portugal, Pyrenees, and Switzerland. Schrad. hort. gött. 1. p. 14. t. 8.—Moris. hist. 1. sect. 9. t. 20. f. 1. Th. speciòsum, Poir. dict. 5. p. 315. Stem simple, hollow. Petioles 3-parted, with pinnate and bipinnate branches. Leaflets ovate, orbicular, 3-lobed; lobes grossly toothed. Flowers of 4 to 5 sepals, yellow. Ovaries 4 to 6 ovate.

Glaucous Meadow-Rue. Fl. Ju. Jul. Clt. 1798. Pl. 2 to 5 ft.

50 TH. RUGÒSUM (Ait. hort. kew. ed. 1. vol. 2. p. 262.) stem round, striated, green; panicle compound, erect; flowers crowded; leaflets ovate, rather cordate, coarsely 3 to 5 crenate-toothed, glaucous beneath, shining above. ♃. H. Native of North America, in wet meadows, and on the banks of rivers, from Pennsylvania to Carolina. Th. crenàtum, Desf. cat. hort. par. ed. 2. p. 126. Resembles *Th. glaùcum*, but differing in the stem being green not glaucous. Flowers with white sepals and yellow anthers.

Var. β, díscolor; stem purplish; leaflets purplish beneath; sepals purplish; anther yellow. Th. díscolor, Willd. enum. app. 46.

Var. γ, umbellíferum (D. C. prod. 1. p. 134.) stem thicker and taller, ending at the apex in long-stalked umbels. Flowers yellow. Perhaps a distinct species.

Wrinkled-leaved Meadow-Rue. Fl. Jul. Clt. 1774. Pl. 4 to 6 ft.

†*Species belonging to last division but not sufficiently known.*

51 TH. CYNAPIIFÒLIUM (Fisch. in litt.) ♃. H. Native of Siberia.

Cynàpium-leaved Meadow-Rue. Fl. Ju. Jul. Clt. 1818. Pl. 2 ft.

52 TH. OLIGOSPE'RMUM (Fisch. in litt.) ♃. H. Native of Siberia.

Few-seeded Meadow-Rue. Fl. Ju. Jul. Clt. 1820. Pl. 2 ft.

§ 3. INDIVÌSA, (*from indivisus, undivided; because the leaves are simple*). *D. C. syst.* 1. *p.* 185. *prod.* 1. *p.* 15. *Flowers hermaphrodite. Leaves undivided.*

53 TH. ROTUNDIFÒLIUM (D. C. syst. 1. p. 185.) leaves radical, stalked, kidney-shaped, somewhat orbicular, broadly crenated, many-nerved. ♃. H. Native of Nipaul. Th. Bátula, Hamilt. MSS. Th. alchemillæfòlium. Wall. in litt. Root fascicled, with long black fibres. Scapes radical, bracteate, with a few one-flowered branches at the top. Sepals 5 rarely 4. Ovaries sessile, oblong, terminated by the acute stigma, collected into a globose head. Pericarps striated.

Round-leaved Meadow-Rue. Pl. ½ to 1 foot.

54 TH. RANUNCULÌNUM (Muhl. in Willd. enum. 585.) leaves simple, 5-lobed, serrated. ♃. H. Native of Carolina. Flowers corymbose, pale yellow.

Crowfoot-like Meadow-Rue. Fl. Ju. Jul. Clt. 1806. Pl. 1 ft.

§ 4. GRUMÒSA, (*from grumòsus, full of clods; tuberous roots*). *D. C. syst.* 1. *p.* 186; *prod.* 1. *p.* 15. *Roots grumose. Flowers hermaphrodite. Sepals petal-like, longer than the stamens.*

55 TH. TUBERÒSUM (Lin. spec. 768.) root grumose; flowers

loosely corymbose; involucre none; bracteas sessile. ♃. H. Native of Spain and the Pyrenees, in sterile stony pastures or hills.—Moris. hist. 2. p. 438, sect. 4. t. 28. f. 13.—Mill. fig. 177 to 265. f. 2. Roots like those of *Œnánthe*. Leaves crowded, stalked, bi-tripinnate; leaflets orbicular, 3-lobed, smooth. Flowers white, with 5 oval blunt sepals. Ovaries 7 to 8, elongated, rather incurved.

Var. β, uniflòra. Stem 1-flowered. ♃. H. Native of Occitania. *Tuberous*-rooted Meadow-Rue. Fl. June. Clt. 1713. Pl. 1 ft.

56 TH. ANEMONOÌDES (Mich. fl. bor. amer. 1. p. 322.) root grumose; flowers umbellate; leaves biternate; leaflets cordate-roundish, 3-lobed; floral leaves opposite or tern, stalked, biternate, constituting an involucre. ♃. H. Native of North America in woods, frequent from Canada to Carolina. Anemòne thalictroìdes, Lin. spec. 763. Juss. an. du mus. 3. p. 249. t. 21. f. 2. Sims. bot. mag. t. 866. Willd. hort. berl. t. 44. Roots black. Radical leaves biternate; leaflets somewhat cordate, 3-toothed. Floral leaves 2-3, with stalked wedge-shaped leaflets. Flowers white, of 5 sepals. Pericarps striated. This plant has the habit of *Isopỳrum*, flowers of *Anemòne*, and the fruit of *Thalictrum*.

Var. β uniflòra (Pursh. fl. amer. sept. 2. p. 387.) stem one-flowered.

Var. γ múltiplex. Flowers double. A beautiful plant, commonly cultivated in gardens.

Anemòne-like Meadow-Rue. Fl. March, May. Clt. 1768. Pl. ½ foot.

†*A doubtful species.*

57 TH.? SINE'NSE? (Lour. fl. cochin. 1. p. 423.) ♄. ♃. G. Native of China. Root a white solid round tuber. Stem round, erect, suffruticose, simple, one-flowered. Flower white, terminal; petals 5, round, spreading. Stamens short, polyandrous. Seeds many, minute. Leaves linear-lanceolate. Perhaps this plant is a species of *Ranúnculus*.

Chinese Meadow-Rue. Pl. 1 foot.

Cult. Mostly hardy perennial herbaceous free growing plants, well adapted for borders, easily increased by dividing at the root. The *Th. anemonoìdes* thrives best in peat soil. Those natives of warm climates require protection during winter. The species belonging to the two last divisions of the last section are the most ornamental.

V. TETRA'CTIS (from τετρας, *tetras*, by fours; in allusion to the parts of flower.) Spreng. new entd. 3. p. 53; D.C. prod. 1. p. 16.

LIN. SYST. *Tetràndria, Tetragỳnia*. Involucre none. Calyx of 4 blunt sepals. Petals none. Anthers oblong, seated at the base. Carpels 4, acute. A small shrub with alternate oblong entire leaves.

1 TET. CAPE'NSES (Spreng., l. c.) ♄. G. Native of the Cape of Good Hope. Peduncles capillary, crowded towards the top of the branches. Flowers red.

Cape Tetráctis. Shrub 1 foot.

Cult. This plant will grow well in a mixture of sand, loam, and peat, and young cuttings planted in a pot of sand, and placed under a bell glass, will strike root.

VI. ANEMO'NE (from *ανεμος, anemos*, wind; because the greater part of the species grow in elevated places, much exposed to the wind.) C. Bauh. pin. 173 and 177. Tourn. inst. 275 and 284. t. 147 and 148. Lin. gen. 694. Lam. ill. t. 496. Gært. fruct. 1. p. 357. t. 74. D. C. syst. 1. p. 188. prod. 1 p. 16.

LIN. SYST. *Polyandria, Polygynia*. Involucre of 3-cut leaves distant from the flower, (f. 6. *a*.) Calyx of 5 to 15 petal-like coloured sepals, (f. 6. *b*.) Petals wanting. Perennial herbs with more or less divided leaves, (f. 6.) The recent herb is acrid, applied externally it occasions blisters, taken internally it is poisonous; but nevertheless some of the species are proposed for chronic, ophthalmic and venereal diseases.

SECT. I. PULSATLLAÍ, (from *pulso* to beat; in allusion to the species growing in elevated situations much exposed to the wind.) Bauh. prin. 177. D. C. syst. 1. p. 188. prod. 1. p. 16. Cariopsides ending in a long bearded tail (f. 6. *f*.). Leaves of involucre sessile, palmately-parted into linear lobes. Flowers generally purple.

1 AN. VERNA'LIS (Lin. sp. 759.) leaves pinnate; segments cuneate-lanceolate, trifid, smoothish; flower erect; involucre very villous; sepals 6, straight, elliptical-oblong. ♃. H. Native of Europe, on rocks and in meadows, on the highest mountains in the Alps, near the limits of perpetual snow, Pyrenees, Avergne, Germany, Sweden, Norway, &c. Fl. dan. t. 29. Sweet. fl. gard. 205.—Hall. helv. no. 1147. t. 21. Pulsatílla vernàlis, Mill. dict. no. 3. An. sulphùrea, All. ped. no. 1921. but not of Lin. Radical leaves somewhat villous or smooth. Involucre very pilose. Leaves clothed with white, sometimes yellowish hairs, especially when dry. Flower subsessile or on pedicels; sepals oblong or oboval, acute or obtuse, purple or white.

Var. β, lùteus; flowers yellow. Pulsatílla alpìna, II, Dalech. lug. 851. f. 1. Pulsatílla lutea apii hortensis folio. C. Bauh. pin. 177.

Var. δ, autumnàlis; flowering in autumn, leaves like parsley Pulsatílla apii folia autumnàlis. C. Bauh. prod. 94.

Spring Pasque-flower. Fl. Ap. or δ. Aug. Clt. 1752. Pl. ½ ft.

2 AN. HALLE'RI (All. ped. no. 1922. t. 80. f. 2.) leaves pinnate, very villous; segments 3-parted; lobes lobate; lobules lanceolate-linear, acuminated; flower erect; sepals 6, oval-lanceolate. ♃. H. Native of Switzerland, Alps of Valais, Piedmont, Savoy, Dauphiny, and in the Eastern Pyrenees, near the limits of perpetual snow. Lodd. bot. cab. 940. The whole plant is covered with long silky hairs. Flowers large, erect, purplish inside.

Haller's Pasque-flower. Fl. Ap. May. Clt. 1816. Pl. ½ ft.

3 AN. CE'RNUA (Thunb. fl. jap. p. 238.) leaves pinnate, villous underneath; segments pinnatifid; lobes cut, oblong; flower somewhat drooping; sepals 6, spreading, elliptical-oblong. ♃. H. Native of Japan near Jedo and Nagasaki. Scapes, petioles and peduncles clothed with downy hairs. Radical leaves from 2 to 3, one half shorter than the scape. An intermediate plant between *An. pulsatilla* and *vernàlis*. Flowers smaller than in *An. pulsatílla*, of a dark purple color. Sepals villous outside, smooth inside. Stamens 3 times shorter than the sepals. Ovaries and styles villous. Stigmas smooth, purple.

Drooping-flowered Pasque-flower. Fl. May, Ju. Clt. 1806. Pl. ½ foot.

4 AN. PA'TENS (Lin. spe. 759.) leaves pinnate, rising after the flower; segments 3-parted; lobes toothed at the top; flowers erect, spreading; sepals 5-6. ♃. H. Native of Siberia, in uncultivated fields of Tobolsk, and in pine-groves about Barnaoul, Lower Lusace, and Poland, also in Silesia, and Switzerland. Ker. bot. reg. t. 61.—Breyn. icon. t. 61. cent. 132. t. 134.—Helw. puls. 52. t. 2, 3. Pulsatilla patens, Mill. dict. No. 4. This is a very distinct species with the flowers rising before the leaves; but nevertheless it is found about Barnaoul flowering in the month of May, with the almost dried leaves of the preceding year. Flower in the involucre almost sessile. Fruit in the involucre on a very long peduncle. There are evidently several varieties of this plant, or perhaps distinct species, one with the flower composed of 6 or 8 sepals. The Siberian plant has yellow flowers; the Swiss and German have purplish flowers; the Polish one has them white.

Var. β, orchroleùca (D. C. prod. 1. p. 17.) leaves yellowish;

flower cream-coloured. Sims. bot. mag. 1994. Native of the Eastern parts of Russia. (Fisch.)

Spreading Pasque-flower. Fl. Ju. Jul. Clt. 1752. Pl. 1 ft.

5 AN. PULSATÍLLA (Lin. spe. 759.) leaves pinnate; segments many-parted; lobes linear; flowers rather nodding; sepals 6, spreading. ♃. H. Native of uncultivated fields and dry hills, in exposed situations throughout Europe and Siberia, in England in dry open chalky pastures. Smith, eng. bot. 51. Fl. dan. 153.—Clus. hist. 1. p. 246. f. 1. Pusatílla vulgàris, Mill. dict. no. 1. An. praténsis, With. brit. 498. An. collìna, Sal. prod. 371.

Var. β, rùbra (Lam. dict. 1. p. 163.) plant dwarf; flower erect; sepals blunter. ♃. H. Pulsatílla rùbra, Dalech. lug. 850, f. 1.—Lob. icon. 282, f. 1.

Var. γ, lilacìna (D. C. syst. 1. p. 192.) flowers lilac. ♃. H. Native of Switzerland. An. intermèdia, Schult. obs. 101. An. longipétala, Schleich. pl. ex. helv.

Var. δ, Dahùrica (D. C. syst. 1. p. 192. prod. 1. p. 17.) plant dwarf, very villous; flower erect; sepals oblong. ♃. H. Native of Dahuria.

Variations. Flower purple, blue, red, lilac, greenish and white, single or double from the stamens being sometimes changed into petals, and sometimes the ovaries are converted into green leaflets. Stature, from a hand to a foot high. Sepals acute, but in var. β, obtuse. Var. β, is distinguished by its dwarfer stature, erect very spreading red flowers, and blunter sepals. Var. γ, by the peduncle and involucre being villous, flowers pale lilac with the outside very pilose. Var. δ is dwarf and very villous, with the lobes of leaves short and very acute, flower erect, sepals oblong. Perhaps the two following species belong to one or other of the preceding varieties. *A. Pisciénsis* and *punícea* of Sism. agr. tosc. 223.

The plant is acrid, and will easily raise blisters; the distilled water will vomit, it cannot therefore be given with safety in disorders of the lungs. The juice of the petals stain paper green. Goats and sheep will eat it, but horses, cows, and swine will refuse it.

Pulsatilla or common Pasque-flower. Fl. Ap. May. Britain. Pl. ½ to 1 foot.

6 AN. PRATE'NSIS (Lin. spe. 760.) leaves pinnate; many-parted; lobes linear; flower pendulous; sepals 6, erect, reflexed at top. ♃. H. Native of Denmark, Scania, Russia at the river Courba, France, Germany; in dry exposed fields and meadows. Fl. dan. t. 611. Schk. hand. t. 150. Pulsatílla nìgricans, Störck. lib. puls. with a figure. An. Pulsatílla β, Lam. fl. fran. 3. p. 320. An. sylvéstris, Vill. daup. 4. p. 726. exclusive of the synonymes of Gerard and Lin. An. Pusatílla, Sturm. deutsch. fl. icone? Differing from *An. Pulsatílla* in the flower being smaller, pendulous not suberect, and of a deeper colour; sepals narrower, and more acute, connivent at base, reflexed at apex. M. Storck recommends an extract or infusion of this plant in chronic affections of the eyes, and also in long standing siphilitic sores. In its recent state the plant has scarcely any smell, but its taste is extremely acrid, and when chewed corrodes the tongue and fauces. The liquor obtained by distilling the plant with water is strongly impregnated with its virtues, and the remaining extract is considerably active. It also appears from some experiments to contain a camphoraceous matter, which was obtained in the form of crystals, of an acrid taste, and very inflammable.

Var. β, obsolèta; flower larger, pale; lobes of pinnula broader, awned. Sims, bot. mag. t. 186. Helw. puls. p. 65. t. 11. D. C. prod. 1. p. 17.

Meadow Pasque-flower. Fl. May. Clt. 1731. Pl. ½ to 1 ft.

7 AN. ALBA'NA (Stev. mem. soc. nat. mosc. 3. p. 264.) leaves pinnate; segments many-parted; lobes oblong-linear; flower nodding; pedicels scarcely longer than the involucre; sepals 6, erect, somewhat reflexed at apex. ♃. H. Native on the highest mountains in Eastern Caucasus. Very like *An. praténsis*, but differing from it in the flower being white or cream-coloured, not purple.

White Pasque-flower. Fl. May. Clt. 1821. Pl. ½ foot.

8 AN. DAHU'RICA (Fisch. in lit. D. C. prod. 1. p. 17.) leaves ternate with the two lateral segments sessile, unequal, 3-lobed, terminal one-stalked, 3-parted; lobes 2—3-cleft, all linear and acute; sepals 6, erect, connivent. ♃. H. Native of Dahuria, at the river Ingoda. Flower flesh-coloured, size of those of *A. praténsis*, but pale, and with the fruit of *A. Pulsatílla*.

Dahurian Pasque-flower. Fl.? Clt. 1823. Pl. ½ foot.

9 AN. NUTTALIA'NA (D. C. syst. 1. p. 193.) leaves 3-parted or ternate, segments cuneate, trifid, cut; lobes linear-lanceolate, elongated; leaves of the involucre parted into linear lobes; flower erect; sepals 5-6, erect, connivent. ♃. H. Native of North America, in Louisiana, banks of the Mackenzie river, and valleys of the Rocky Mountains. Clématis hirsutíssima. Ph. fl. amer. sept. 2. p. 385. An. Ludoviciàna. Nutt. gen. am. 2. p. 20. in Journ. acad. sc. phil. vol. 5. p. 158. t. 8. A. pàtens Hook fl. bor. amer. p. 4. A very distinct species, with the habit almost of *An. Pulsatílla*. Radical leaves ternate, not pinnate. Flower purple, sometimes cream-coloured, erect, villous outside as well as the base of scapes and the leaves of the involucre. Fruit like those of *An. Pulsatílla*. The young flower-buds are eaten by the marmots. Hooker considers this identical with *An. pàtens*, but they are evidently very distinct plants.

Nuttall's Pasque-flower. Fl. Ju. Jul. Clt. 1826. Pl. 1 ft.

10 A. FLAVE'SCENS (Zucc. in fl. d. Gaz. bot. ratisb. 1826. p. 369.) leaves rising after the flower, ternate, segments many-parted, lobes cut, linear; flower erectly-spreading. ♃. H. Native of Siberia, frequent about Omsk. Flowers yellowish.

Yellowish-flowered Pasque-flower. Pl. ½ foot.

SECT. II. PREONA'NTHUS, (from *πρηον, preon*, the top of a mountain; *ανθος, anthos*, a flower; habitat.) D. C. syst. 1. p. 193. prod. 1. p. 17. Cariopsides ending in long bearded tails (f. 6. *f.*). Leaves of involucre ternate, stalked. Flowers yellow or white.

11 AN. ALPÌNA (Lin. spe. 760.) leaves biternate; segments pinnate and deeply serrated; involucre of the same form; flower erect; sepals 6, spreading. ♃. H. Native of sloping pastures and stony places of mountains in Middle Europe, Pyrenees, Cevennes, Auvergne, and Switzerland; North America, on the eastern declivities of the Rocky Mountains, &c. Crantz. aust. 2. p. 105. t. 3. f. 2. A very variable species, as will be seen by the following varieties. The transition between the extreme varieties are scarcely discernible, not less so in the gardens than in the mountains where they are gathered. Flowers sometimes the size of *A. coronària*, but seldom so small as *A. nemeròsa*. Colour sometimes white, sometimes white with the back purple, sometimes cream, yellowish or yellow with their backs paler. Sepals elliptical, rarely ovate. Leaves sometimes smooth, sometimes sparingly pilose, sometimes clothed with long crowded silky hairs; rising before or with the flowers, rarely afterwards. Stature variable, 1 to 2 feet, but when growing on the tops of the Alps, scarcely a hand high.

Var. α, màjor (Lam. dict. 1. p. 165.) flowers large, white, rather purplish on the outside; sepals elliptical; leaves smoothish or a little villous, expanding before the flower. Sims. bot. mag. t. 2007. An. alpìna, Vill. daup. 4. p. 726. An. apiifòlia, Hop. herb. val. D. C. fl. pan. ed. 3. vol. 4. p. 881. Flore plèno, double-flowered variety. An. alpina. *var. γ*, Lap. abr. pyr. 308.

Var. β, millefoliàta (D. C. prod. 1. p. 17. Bert. amœn. 374.) flowers large, white, purplish outside; sepals elliptical; leaves rising before the flowers; segments lanceolate acute.

Var. γ, *micrántha* (D. C. prod. 1. p. 17.) flowers small, white, outside purplish; sepals elliptical; leaves smoothish, expanding before the flower. An. alpìna, Jacq. fl. aust. t. 85. An. Baldénsis, Lam. dict. 1. p. 614, but not of Lin. An. alpìna, α Willd. sp. 2. p. 1275. β fl. fr. ed. 3. vol. 4. p. 881.

Var. δ, *flavéscens* (D. C. prod. 1. p. 17.) flowers large, yellow, outside paler; sepals elliptical; leaves sparingly villous, expanding before the flower. An. apiifòlia, Scop. carn. No. 663. Jacq. misc. 2. p. 47. t. 4. An. myrrhidifòlia β, Vill. dauph. 4. p. 727.

Var. ε, *nivàlis* (D. C. prod. 1. p. 18.) flowers middle sized, outside purplish; sepals elliptical; leaves very villous, expanding with the flower and after it; scape dwarf.

Var. ζ, *intermèdia* (D. C. prod. 1. p. 18.) flowers large, yellow, outside paler; sepals elliptical; leaves very villous, springing up with the flower or before it.

Var. η, *sulphùrea*, (D. C. prod. 1. p. 18.) flowers middle sized, outside rather paler; sepals ovate; leaves very villous, rising with or before the flower. Native also of North America, on the eastern declivities of the Rocky Mountains. (Hook.) An. sulphùrea, Lin. mant. 78. An. apiifòlia, Willd. spec. 2. p. 126. Flowers white, with a purplish tinge at the base.

Alpine Wind-flower. Fl. July. Clt. 1658. Pl. $\frac{1}{2}$ foot.

12 AN. INTEGRIFÒLIA; plant densely clothed with villi; root woody, fusiform; leaves all radical, ovate, entire; petiole rather broad very villous at the base; scape much shorter than the leaves; involucrum wanting; sepals numerous about 15, linear, villous on the back thrice as long as the stamens. ♃. F. Native of Peru on the Andes. Flower solitary, large, purple. This very remarkable plant will perhaps form a distinct genus with the *Hepática integrifòlia* of D. C. from the want of the involucrum.

Entire-leaved Wind-flower. Pl. $\frac{1}{8}$ foot.

SECT. III. PULSATILLOÌDES (from *Pulsatilla* and εἶδος, *eidos*, resemblance; plants resembling Pulsatillas, *which see.*) D. C. syst. 1. p. 195. prod. 1. p. 18. Cariopsides very hairy. Calyx of 15—20-sepals. Leaves of involucre 2 or 3, sessile, cut at the top.

13 AN. CAPE'NSIS (Lin. sp. 764.) leaves biternate, stiff, smooth, segments wedge-shaped, toothed at top. ♃. G. Native of the Cape of Good Hope, in stony places on the declivities of mountains. Atragène Capénsis, Lin. spe. 764. Andr. bot. rep. t. 9. Sims, bot. mag. t. 716. Clématis Capénsis, Poir. suppl. 2. p. 296. Pulsatílla Africàna, Herm. Root black. Leaves coriaceous, smooth, young ones somewhat villous. Sepals 13—18, oblong, bluntish, silky-villous on the outside and at the margins, smooth, purplish inside. Stamens 20—25, outer ones shortest. Ovaries 10—15, oblong. Styles short, smooth. Fruit unknown.

Cape Wind-flower. Fl. Mar. April. Clt. 1795. Pl. $\frac{1}{2}$ foot.

14 AN. TENUIFÒLIA (D. C. syst. 1. p. 196.) leaves triternate, stiff, smooth; segments pinnate-parted; lobes linear-filiform. acute, entire. ♃. G. Native of the Cape of Good Hope. Atragène tenuifòlia, Lin. fil. suppl. 270. Willd. spe. 2. p. 1286. Atragène ténuis, Thunb. fl. jap. 239. Clématis tenuifòlia, Poir. suppl. 2. p. 298. Leaves of *Knowltònia daucifòlia*. Flowers of *Anemòne Capénsis*. Lower leaves almost radical, stalked. Stem erect, somewhat flexuous, terete, villous. Leaflets of involucre oblong, erect, acute, villous. Flowers one-half smaller than those of *An. Capénsis*. Sepals 7—9, oblong, obtuse, silky outside. Styles smooth, short.

Thin-leaved Wind-flower. Pl. 1 foot.

SECT. IV. ANEMONA'NTHEA, (from ανεμος *anemos*, ανθος *anthos*, a flower; that is to say, the true wind-flower. *See Anemone.*) D. C. syst. 1. p. 196. prod. 1. p. 18. Cariopsides tailless, (f. 6. *c.*) egg-shaped. Pedicels solitary, or in pairs, all leafless and 1-flowered. Leaflets of involucre sessile (f. 6. *a.*) or stalked.

§ 1. *Leaves of involucre sessile (f. 6. a.) Trunk of root egg-shaped tuberous. (f. 6.)*

15 AN. CORONA'RIA (Lin. spe. 760.) leaves ternate; segments multifid; lobules linear, mucronated; leaves of the involucrum sessile, multifid; sepals 6, oval, approximate. ♃. H. Native of sub-humid pastures in the south of France, Montpelier, Provence, Nice; Italy, about Rome, &c.; Greece, Archipelago, Aleppo; Troas, at the tomb of Ajax (E. D. Clarke). Lam. illus. about t. 496. f. 1. Sims, bot. mag. 841. Fl. græc. 514. An. horténsis ect. Weinm. Phyt. 1. p. 50 and 51, t. 119 to 128. An. œnánthe Ucria in Rœm. arch. 1. A. p. 69.

The varieties of this species are very common and graceful ornaments in gardens. Leaves finely or broadly dissected. Flowers purple, blue, violet, lilac, yellowish, white, or variegated, single or double; sepals oval or orbicular. *See* Weinm. figures cited above.

Anemòne coronària is a well known florist flower, valued for its hardy nature, and also because it will flower at almost any season, according to the time the roots are kept out of the ground, and the season when they are replanted. Many new varieties have been raised from seed, but they are not named by florists, as in the case of Tulips and Pinks. The prevailing colours are red, white, and blue; and semi-double flowers are in nearly as much repute as double ones. A root which has remained in the ground two or three years will attain a great breadth. They are increased by dividing the roots. The soil preferred by the Anemòne is a fresh loam rather heavy than light. The usual time of planting is in October, covering the roots three inches; but to have earlier bloom, they may be planted in the beginning of September, and to have bloom every month in the year, plant every month. The finer sorts require protection from violent storms and excessive light and heat; but many varieties do exceedingly well in borders. A very severe winter will destroy the roots if the surface is not mulched, but the Anemòne is considerably hardier than the garden Ranúnculus.

In order to obtain new varieties, seeds should be saved from fine single or semi-double kinds; and sown in shallow pots, or boxes filled with light rich earth, in August, covering them a quarter of an inch thick with the same kind of earth, and when the plants rise, care should be taken to protect them from the frost. In the following season, when their leaves begin to decay, they should be taken up and dried, and afterwards planted out in borders in the same manner as the old roots; and in the following summer they will produce flowers.

Garland or Garden Wind-flower. Fl. Ap. My. Clt. 1596. Pl. $\frac{3}{4}$ ft.

16 AN. PUSÍLLA (D. C. syst. 1. p. 197.) leaves ternate; segments multifid; lobules linear, mucronated; leaves of involucrum sessile, cut at top: sepals 6, oblong, distant. ♃. H. Native of the island of Cyprus. Deless. icon. sel. 1. t. 12. Root tuberous, the size of a nut. Flower erect, pale purple. Sepals 6, rarely 4-5. Carpels woolly, disposed into an oval-oblong head. Very near *An. Coronària*, and perhaps only a variety of it.

Small Wind-flower. Fl. ? Pl. $\frac{1}{2}$ foot.

17 AN. PAVONÌNA (D. C. syst. 1. p. 197.) leaves 3-parted; lobes cuneated, deeply toothed; leaves of the involucrum sessile, oblong, entire, or somewhat toothed; sepals 10-12, lanceolate, very acute. ♃. H. Native of Gascony, in vineyards near the river Adour; in Provence; about Olbia, and Nice. Flowering in the summer.—Clus. hist. 1. p. 261, 262. f. 1. and 2. Mor. oxon. sect. 4. t. 35. f. 1. Very rarely seen with single flowers, but the double variety is to be found common enough in gardens under the names of *An. Œil de Paon*, *An. Candiote*, *An. de Crete*, &c. Easily distinguished from *An. Coronària* by its very acute sepals. Flowers variable in colour.

Var. β, *fúlgens* (D. C. prod. 1. p. 18.) leaves tri-parted; lobes

cuneated, deeply toothed; leaves of the involucrum sessile, oblong, entire, or a little toothed; sepals oblanceolate, broadest at apex, tapering to the base. An. fúlgens, Gay. ined, An. hortênsis, Thor. chl. land, 238; An. pavonìna, Lois. not. 87. Flowers larger than in var. *a*.

Peacock Wind-flower. Fl. April. May. Clt.? Pl. 1 foot.

18 An. stella'ta (Lam. dict. 1. p. 166.) leaves 3-parted; lobes cuneated, deeply toothed; leaves of the involucrum sessile, oblong, entire, or a little toothed; sepals 10, 12, oblong bluntish. ♃. H. Native of Germany, France, Switzerland, Italy, Rome, and the Levant, in hedges and bushy places. Flowering in winter and summer. An. hortênsis, Lin. spe. 761. Curt. bot. mag. 123. Fl. græc. 515. An. versícolor, Sal. prod. 371. Sepals narrow, oblong, or broad oval, but always blunt. Flowers purple, or rose, or whitish, never truly yellow.

Starry Wind-flower. Fl. April, May. Clt. 1597. Pl. ¾ ft.

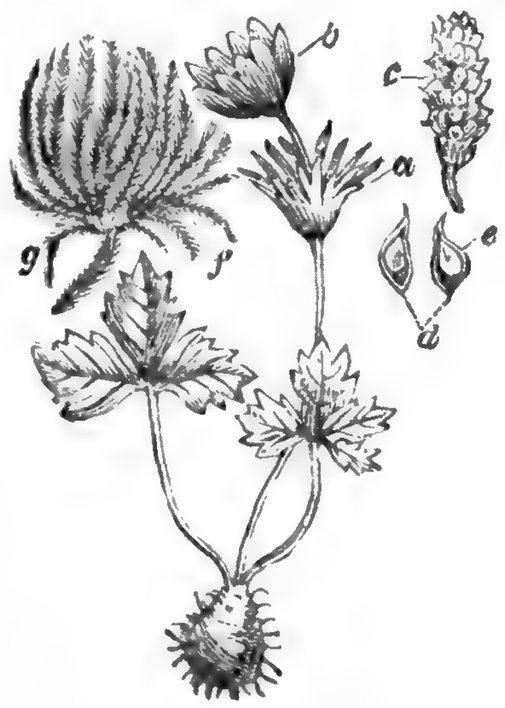
19 An. palma'ta (Lin. spe. 758.) leaves cordate, suborbicular, bluntly 3-5-lobed, toothed; leaves of the involucrum sessile, trifid; sepals 10-12, oblong, obtuse. ♃. H. Native of humid and uncultivated places about Algiers; Portugal, at the Tagus, &c.; Spain, near Madrid and Valencia; Provence, near Olbia. Andr. bot. rep. 172. Ker. bot. reg. 200. Involucrum 1 very rarely 2-flowered. Differing from *An. stellàta* at first sight by its yellow flowers.

Var. β, flore plèno (Clus. hist. 1. p. 249. f. 1.) flowers double.

Pulmated-leaved Wind-flower. Fl. My. Ju. Clt. 1597. Pl. ½ to 1 ft.

20 An. decape'tala (Lin. mant. 79.) leaves 3-parted: lobes grossly toothed, or somewhat cut; leaves of involucrum sessile, twice trifid, with linear lobes (f. 6. *a*.); sepals 10-12, oblong obtuse. (f. 6. *b*.) ♃. G. Native of Brasil about Monte Video, and in the province of Rio Grande do Sul, near the town of St. Francisco de Paulo; Peru and Chili in woods. An. trilobàta Juss. ann. mus. 3. p. 247. t. 21. f. 3., An. macrorrhìza, Domb. herb. Scapes naked. Flower solitary, white, blueish on the outside.

FIG. 6.



Ten-petalled Wind-flower. Fl. May. Pl. ½ foot.

21 An. Carolinia'na (Walt. fl. car. 157.) leaves ternate, with 3-parted or cut, acutely-toothed lobes; leaves of the involucrum trifid, with cut lobes; sepals 10-12, linear. ♃. H. Native of Carolina, and on the banks of the river Missouri. A. tenélla, Pursh. fl. amer. sept. 2. p. 386. Scape 1-flowered. Involucrum 3-leaved. Flower on a long pedicel; sepals small, purplish, pubescent on the outside. Fruit woolly, mucronate. A very slender and delicate plant.

Carolinian Wind-flower. Fl. May, Jun. Clt. 1824. Pl. ¾ ft.

22 An. triterna'ta (Vahl. symb. 3. p. 74. t. 65.) leaves triternate: segments 3-toothed; leaves of the involucrum sessile, cleft into many setaceous lobes; sepals 10-12, oblong, obtuse. ♃. G. Native of Brasil about Monte Video, and at the mouth of the river Plate, as well as on the mountains called Cerro-Aspro, and of Peru. Anemòne, Lam. illust. t. 496. f. 3.; An. fumariæfòlia, Juss. ann. mus. 3. p. 247. t. 20. f. 2. Root and habit that of *An. decapétala*. Flowers white. Fruit woolly, disposed into an oblong head. St. Hil. fl. bras. p. 5.

Triternate-leaved Wind-flower. Fl. Oct. Nov. Pl. ¾ foot.

23 An. biflòra (D. C. syst. 1. p. 201.) leaves ternate; segments divided into linear blunt cut lobes; leaves of the involucrum 2, sessile, many-parted; pedicels in pairs, one of them bearing a two-leaved involucel. ♃. H. Native of the Levant. Scape round length of petioles. Flower somewhat drooping, yellow, of 5 oval, oblong, obtuse sepals, which are pubescent outside, and a little longer than those of *An. ranunculoìdes*. Stamens few in the flower with two involucrums, but numerous in the flower with one involucrum. Ovaries many in the first.

Two-flowered Wind-flower. Pl. ½ foot.

24 An. formòsa (Clark. ex Spreng. neu. entd. 3. p. 201.) radical leaves thick, 3-parted, roundish fan-shaped, somewhat 3-lobed, acutely toothed; leaves of involucrum 3, 3-parted: segments lanceolate; sepals broadly ovate. ♃. H. Native of Asia Minor. A. biflòra var. β, trifòliata, D. C. prod. 1. p. 19. Petioles and Scapes much shorter than in *An. biflòra*. Flowers on long pedicels, white or purplish. Carpels woolly, few.

Shewy Wind-flower. Pl. ½ foot.

§ 2. *Leaflets of involucrum stalked. Trunk of roots egg-shaped tuberous.*

25 An. Apenni'na (Lin. spe. 762.) leaves triternate; segments lanceolate, deeply-toothed, acute; leaves of the involucrum stalked, trifid, deeply cut; sepals 12-14, oblong, obtuse. ♃. H. Native of England in Wimbledon park; also near Harrow; near Lutonhoe, Bedfordshire; Berkhampstead, Herts; near Brussels; in Provence; Apennines, Italy; and on the mountains of Caucasus. Hook. fl. lond. 6. t. 35. Smith, fl. græc. 581. eng. bot. 1062. Flower erect, blue. Roots black.

Var. β, ranúnculus nemoròsus, &c. fl. álbo. Tourn. cor. 20. Flowers white.

Var. γ, párvula (D. C. prod. 1. p. 19.) leaves almost sessile; flowers blue. Native of Caucasus.

Apennine Wind-flower. Fl. Mar. Apr. England. Pl. ½ ft.

§ 3. *Leaflets of involucrum stalked. Trunk of roots cylindrical, slender and elongated, but can scarcely be called tuberous.*

26 An. cæru'lea (D. C. syst. 1. p. 163.) leaves of the involucrum, 3-5-cleft on short stalks, with deeply-toothed segments; sepals 4-5, oval. ♃. H. Native of Siberia about Zmeof. Deless. icon. sel. 1. t. 14. Flowers blue or white. Stems 1 or 2-flowered.

Blue Wind-flower. Fl. May, June. Clt. 1826. Pl. ½ foot.

27 An. Urale'nsis (D. C. prod. 1. p. 19.) leaves of involucrum on short stalks, ternate; segments linear, deeply-toothed; sepals 5-6, oval-oblong. ♃. H. Native of the Ural mountains. Plant small, almost the habit and size of *An. cærùlea*. Flowers tinged with blue.

Ural Wind-flower. Fl. May. Clt. 1824. Pl. ¼ foot.

28 An. Balde'nsis (Lin. mant. 78.) leaves biternate; segments many-parted; lobes linear; leaves of the involucrum on short stalks, multifid; sepals 8-10, oblong-oval. ♃. H. Native on Mount Baldo, Alps of Austria, Tyrol, Carniola, Switzerland, Piedmont, Dauphiny, Provence, and, according to Hooker, in North America in arid places on the eastern summits of the Rocky Mountains. All. ped. No. 1928. t. 44. f. 3. and t. 67. f. 2.; Vill. dauph. 3. p. 723 t. 49; An. alpìna, Scop. carn. ed. 2. No. 662. t. 26, not of Lin. An. fragífera, Murr. syst. 510; Jacq. icon. rar. 1. t. 103. Scape woolly, ascending or erect, 1-flowered. Flowers white, clothed with pressed hairs on the outside, and reddish, tinged with blue. Root fusiform. (Hook.) Hooker considers this and the two preceding to be identical.

Mount-Baldo Wind-flower. Fl. May. Clt. 1798. Pl. ½ ft.

29 An. parviflòra (Mich. fl. bor. amer. 1. p. 319.) leaves 3-parted; lobes cuneated, trifid, and crenate at the apex; leaves of the involucrum sessile, 3-parted, with the lobes toothed at the apex; sepals 6, oval-oblong. ♃. H. Native of North America at the mouths of the rivers and rivulets falling into Hudson's Bay; from the Rocky Mountains to the Arctic sea in limestone tracts and barren grounds; Labrador, and Newfoundland. An.

cuneifòlia, Juss. ann. mus. 3. p. 248, t. 21. f. 1. An. tenélla, Banks, herb. A. boreàlis, Richards. in Frankl. 1st. journ. ed. 2. p. 22. Flowers small, white; sepals clothed with pressed hairs on the outside. Fruit woolly, acuminated, collected into a globose head. Like *An. decapétala* and *palmàta*.

Small-flowered Wind-flower. Fl. Apr. Ju. Clt. 1824. Pl. 1 ft.

30 AN. NEMORÒSA (Lin. spe. 762.) leaves ternate; segments trifid, deeply-toothed, lanceolate acute; leaves of involucrum stalked; sepals 6, elliptical. ♃. H. Native throughout Europe in groves, hedges, hills, bushy and shady places. North America, from Canada to Carolina. Fl. dan. t. 549; Smith eng. bot. 353; Schkuhr. handb. t. 150. Colour of flower commonly white, sometimes red, lilac, purple or blue, never yellow. Flowers single or double. Leaves of involucrum in threes or fives, with parted segments. In fine clear weather the blossoms are expanded and face the sun; but in the evening and wet weather they are closed and hang down. This plant is acrid and in some degree poisonous. Goats and sheep eat it; but horses, cows, and swine refuse it. It is now disused in medicine; but Chomel says, that the leaves bruised with the flowers, and applied twice a day to the head, have, in a little while, healed the *Tinea;* and it is also said that a blister prepared of these, when recent, serves to remove intermittent fevers; but it should be cautiously used.

Var. β, quinquefòlia (Lin. spe. 769.) leaves somewhat 5-parted. Native in North America, from Canada to the south of Lake Winepeg and elsewhere, and Siberia. Hardly differing from the European plant, unless that the lateral lobes of the leaves of this plant are often profoundly 2-parted; but this is also sometimes observed in European plants.

Var. γ, flòre cærùleo is evidently different from *An. Apennìna* by its root being elongated not tuberous; sepals 6, elliptical not 12-15, linear, oblong.

Grove or Wood Wind-flower. Fl. Mar. May. Brit. Pl. ½ ft.

31 A. DELTOÌDEA (Dougl. mss. in Hook. fl. bor. amer. 6. t. 3. A.) radical leaves? those of the involucrum 3, sessile ovate-acuminated, deeply-serrated, never cut: stem pilose; sepals 5-6, obovate. ♃. H. Native of North America, in thick shady woods on the Columbia river, near its confluence with the sea. Flowers large, solitary, white. Allied to *An. nemoròsa*, but the leaves of the involucre are never divided.

Deltoid-leaved Wind-flower. Pl. ¾ foot.

32 AN. ISOPYROÌDES (Jus. ann. mus. 3. p. 249. t. 20. f. 3.) leaves biternate; segments deeply 3-toothed, somewhat cuneated; leaves of the involucrum stalked, ternate, with the lateral segments bifid; middle one trifid; sepals 5, oblong. ♃. H. Native of Siberia. Flowers 1 or 2. Sepals narrow, elongated, oblong. Very like *An. nemoròsa*.

Isopyrum-like Wind-flower. Pl. ½ foot.

33 AN. FISCHERIA'NA (D. C. prod. 1. p. 20.) leaves biternate, those of the involucrum on very short stalks; lobes elongated, acuminated; pedicels 2, pubescent: sepals 5, elliptical. ♃. H. Native of Siberia, near Salair. Flowers white, nearly the same as those of *An. isopyroìdes*. Carpels villous, pubescent.

Fischer's Wind-flower. Pl. ½ foot.

34 AN. LANCIFÒLIA (Ph. fl. amer. sept. 2. p. 386.) leaves all stalked, ternate; segments lanceolate, crenate-toothed; sepals 5, ovate-acute. ♃. H. Native of Pennsylvania and Virginia, on high mountains in a boggy soil. Like *An. trifòlia;* but differing from it in the leaflets being lanceolate, not ovate-lanceolate, and crenate-toothed, not truly toothed, with the flowers a little larger. Sepals always 5, more acute. Fruit ovate. Style short, hooked.

Lance-leaved Wind-flower. Fl. May, Jul. Clt. 1823. Pl. ¼ ft.

35 AN. TRIFÒLIA (Lin. spe. 762.) leaves all stalked, ternate; segments ovate-lanceolate, acute, toothed; sepals 5, elliptical, obtuse. ♃. H. Native of sub-mountainous groves in France, Piedmont, Carniola, Carinthia, Siberia. Sturn. deutsch. fl. icon. —Mor. oxon. 2. sect. 4. t. 25. f. 1. Roots horizontal, white. Scapes 1-flowered. Flower white, erect, of 5-6-sepals. Ovaries 20—25, pubescent. Stamens often beyond 100 in number. Like *An. nemoròsa*.

Three-leaved Wind-flower. Fl. Apr. May. Clt. 1597. Pl. ½ ft.

36 AN. MÍNIMA (D. C. syst. 1. p. 206.) leaves of the involucrum stalked, 3-parted; lobes ovate, acuminated, and serrated at the top; sepals 5, oval-oblong, obtuse. ♃. H. Native of the Alleghany mountains, Virginia. Scape 1-flowered. Flowers small, white; sepals smooth. Ovaries few, pubescent. Like *A. trifòlia*, but three times smaller.

Least Wind-flower. Fl. April, May. Pl. ¼ foot.

37 AN. COMMERSONIA'NA (Richard ex. Spreng. syst. 2. p. 662.) leaves of involucrum 2, stalked opposite, and are, as well as the rest, 3-parted, with multifid segments, all villous as well as the stem; sepals 8. ♃. F. Native of the Straits of Magellan. A. multifida var. γ, uniflora. D. C. prod. 1. p. 21. Deless. icon. sel. 1. t. 17. Flowers yellowish.

Commerson's Wind-flower. Pl. ¼ foot.

38 AN. RANUNCULOÌDES (Lin. spe. 762.) radical leaves 3-5 parted; segments subtrifid, deeply toothed; those of the involucrum on short stalks, 3-parted, deeply toothed; sepals 5-6 elliptical. ♃. H. Native of Middle and Northern Europe, in meadows and mountains, in hedges and groves; England, near King's Langley, Herts; and Wrotham, Kent; near Abbot's Langley. Fl. dan. t. 140. Smith, eng. bot. 1484. Lodd. bot. cab. 556. An. lùtea, Lam. fl. fr. 3. p. 318. Flowers generally solitary, seldom in pairs, single or double, usually yellow, but in the Pyrenean variety purple. Lobes of involucrum usually deeply-toothed, rarely entire.

Crowfoot-like Wind-flower. Fl. Mar. Apr. England. Pl. ¼ ft.

39 AN. REFLE'XA (Steph. in Willd. spec. pl. p. 1282.) leaves ternate; segments subtrifid, toothed at apex; those of the involucrum stalked; pedicles solitary; sepals 6, linear obtuse, reflexed. ♃. H. Native of Siberia. Deless. icon. sel. 1. t. 15. Flower 3-times smaller than in *An. ranunculoìdes*, yellow.

Reflexed-sepalled Wind-flower. Fl. Mar. Apr. Clt. 1818. Pl. ¼ ft.

40 AN. RICHARDSÒNII (Hook in Frank. 1st. journ. ed. 2. app. p. 21. fl. bor. amer. p. 6. t. 4. A.) plant somewhat pilose; leaves kidney-shaped, 3-5-parted; lobes somewhat trifid and acutely toothed; leaves of the involucrum roundish-cuneate, sessile, trifid and toothed; sepals 6, spreading; carpels compressed, smooth, terminated by a long deflexed, hooked beak. ♃. H. Native of North America, in Hudson's Bay, and the Rocky Mountains, in barren and wet mossy ground, and of Unalaschka. An. ranunculoìdes var. Richards. in Frankl. 1st. journ. ed. 1. app. 740. An. Arctica Fisch. MSS. Flowers yellow.

Richardson's Wind-flower. Pl. ½ foot.

§ 4. *Leaflets of involucrum stalked. Roots fascicled, fibrous.*

41 AN. SYLVE'STRIS (Lin. spe. 761.) leaves ternate or quinate, hairy beneath; segments deeply-toothed at top; those of the involucrum stalked; pedicel solitary; sepals 6, elliptical; fruit very hairy. ♃. H. Native of groves and hedges in France, north of Italy, Germany, Caucasus, Siberia, on the banks of the Oby about Barnaoul. Bull. herb. t. 59. Curt. bot. mag. 54. Schkuhr. hand. t. 150. Flower large or small, of 5 or 6 sepals, white, greenish or purplish, single or double. Receptacle of fruit, globose.

Var. β, álba mìnor (Bauh. pin. 176.) Native of Siberia.

Wild Wind-flower. Fl. April, May. Clt. 1596. Pl. ½ ft.

42 AN. A'LBA (Juss. ann. mus. 3. p. 248. t. 20. f. 1.) leaves ternate or quinate; segments deeply-toothed at top; those of the involucrum stalked; pedicel solitary; sepals 5, obovate; fruit very hairy. ♃. H. Native of Dauria about Tschita and Barnaoul, and in fields at the river Oby, as well as in the Crimea. Sims, bot. mag. 2167. An. Ochoténsis, Fisch. hort. gorenck. 47.

Differing from *An. sylvéstris* by its smaller stature, as well as in having 5 not 6 sepals shorter, rounder, and very blunt. The specimen collected in the Crimea by Dr. Clarke has its stem and petioles very villous.

White-flowered Wind-flower. Fl. June. Clt. 1820. Pl. ½ ft.

SECT. V. ANEMONOSPE'RMOS, (from *ανεμος, anemos*, the *wind*, and *σπερμα, sperma*, a *seed*; application the same as Pulsatilla, *which see.*) D. C. syst. 1. p. 208. prod. 1. p. 21. Cariopsides somewhat compressed, tailless; pedicels numerous, rising from the involucrum, 1-flowered, one of which is leafless, the rest furnished with 2-leaved involucels.

43 AN. VIRGINIA'NA (Lin. spe. 761.) leaves ternate; segments trifid, acuminated, deeply-toothed; those of the involucrum and involucels stalked; sepals 5, elliptical. 4. H. Native of North America, in woods and on rich banks of rivers, from Canada to Carolina. Hook. fl. bor. amer. 8. t. 4. B. Gært. fruct. 1. p. 357. t. 74.—Herm. par. p. 18. with a figure. An. hirsùta, Mœnch. meth. 105. Herb erect, tall, pubescent. Peduncles 3-4, much elongated, middle one naked, sometimes a foot high, lateral ones bearing 2-leaved involucels; pedicels often rising in pairs from the involucel. Flowers small, pale, yellowish green, or pale purplish; sepals silky-pubescent on the outside. Carpels compressed, woolly, collected into an oblong head.

Virginian Wind-flower. Fl. May, June. Clt. 1722. Pl. 2 ft.

44 AN. MULTÍFIDA (Poir, suppl. 1. p. 364. D. C. syst. 1. p. 209.) radical leaves ternate; segments cuneated, 3-parted multifid, with linear lobes; those of the involucrum and involucel multifid on short petioles; sepals 5-10, elliptical, obtuse. 4. H. Native of the Straits of Magellan, and the Andes of Peru. Deless. icon. sel. 1. t. 16. Root hard, woody. Herb a hand high, erect, hairy. Peduncles 3, 1-flowered, one of which is naked and earlier, the other two longer, and bearing 2-leaved multifid involucels on their middle. Flowers small, from whitish-yellow to a citron-colour; sepals oval-oblong, villous on the outside. Style short, hooked.

Multifid-leaved Wind-flower. Fl. Jun. Jul. Clt. 1824. Pl. ½ ft.

45 AN. HUDSONIA'NA (Richards. in Frankl. 1st. journ. ed. 2. app. p. 22.) villous; radical leaves ternate, with many-parted segments and linear lobes; those of the involucrum are ternately decompound on short stalks; peduncles 2, bearing involucels; sepals 5-8, ovate, acutish. 4. H. Native of North America, from Hudson's Bay to the western declivities of the Rocky Mountains, and several other parts of North America. An. multifida *var. β*, Hudsoniàna D. C. syst. 1. p. 209. prod. 1. p. 21. Deless. icon. sel. 1. t. 17. A. multifida. Hook. fl. bor. amer. p. 6. Leaves ternately divided; segments cuneate, 3-parted, jagged; lobes linear acute. (Hook.) Flowers, small, white, purple, yellow, or deep red. (Hook.)

Var. β, uniflòra, stem 1-flowered. A. multifida *var. γ*, uniflora, D. C. syst. 1. p. 209. Hook, fl. bor. amer, p. 6.

Var. γ, sanguìnea (Richards. in Frank. 1st. journ. ed. 2. app. p. 22.) flowers deep red. Native of the Gulf of St. Lawrence, from the shores of Hudson's Bay to the western declivities of the Rocky Mountains, and from the United States to near the shores of the Arctic Sea. All the varieties may be found in the last-mentioned habitats. A. multífida, *var. γ*, sanguìnea. Hook, fl. bor. amer. p. 6.

Hudson's-Bay Wind-flower. Fl. Ju. Jul. Clt. 1826. Pl. ½ ft.

46 AN. PENNSYLVA'NICA (Lin. mant. 247.) plant rather pilose, leaves 3-parted; segments bipartite or trifid; lobes lanceolate, deeply serrated; those of the involucrum and involucels sessile; sepals 5, elliptical, blunt; carpels villous, compressed, marginate, ending in a long style, which is sometimes hooked at the apex. 4. H. Native in North America in meadows and on the borders of rivers, from the United States to near the mouth of the Mackenzie river, and from Hudson's Bay to the Pacific, as well as on the borders of fountains in Siberia. Hook. fl. bor. amer. 8. t. 3. B. An. irregulàris, Lam. dict. 1. p. 167; An. aconitifòlia, Mich. fl. bor. amer. 1. p. 320.; An. boreàlis Richards. Flowers large, white, anthers yellow. Root creeping.

Var. β, Laxmánni (D. C. syst. 1. p. 210.) involucrum 2-leaved; lateral pedicles involucelled at base. Perhaps a distinct species. The flower at first sight has the appearance of *An. narcissiflòra*, but upon a more attentive examination it is seen to belong to *An. Pennsylvánica.*

Pennsylvanian Wind-flower. Fl. My. Ju. Clt. 1766. Pl. 1½ ft.

47 AN. DICHO'TOMA (Lin. amœn. 1. p. 155.) leaves 3-parted; lobes oblong, deeply toothed at top; those of the involucrum sessile, all 2-leaved; sepals 5, elliptical; carpels smooth. 4. H. Native of Siberia in moist woods and pastures; Dauria, near Tschita; North America, from Canada to New York. Lin. fil. decad. 29. t. 15. Root creeping. Fruit at last smooth. Flowers white with a tinge of red on the under side, smaller than those of the foregoing. Lobes of leaves oblong. Pedicels many, usually bifid. Like *An. Pennsylvánica*, but differing in its stature, being more slender, with a smooth surface. Perhaps the American plant is exactly the same as the Siberian one. Dr. Hooker considers this and the preceding identical, but at present we consider it most proper to keep them separate.

Dichotomous Wind-flower. Fl. My. Ju. Clt. 1768. Pl. 1½ ft.

48 AN. MEXICA'NA (H. B. et Kth. nov. gen. et spe. am. 5. p. 41.) leaves ternate; segments oval, somewhat cuneated, deeply toothed at the apex; leaves of the involucrum two, sessile, deeply toothed; sepals 5; ovaries pubescent. 4. H. Native of Mexico near Santa-Rosa. Herb somewhat villous. Lateral segments of leaves usually bifid. Involucels of lateral flowers small. Flowers white, very like those of *An. Pennsylvánica.*

Mexican Wind-flower. Fl. May, June. Pl. 1 foot.

49 AN. HELLEBORIFÒLIA (D. C. syst. 1. p. 211.) leaves pedate: segments smooth, somewhat coriaceous, stalked, cuneated, trifid; lobes serrated, acute; involucrum and involucels 3-leaved and almost sessile; ovaries smooth. 4. G. Native of Peru about Huassa-Huassi. Lobes of leaflets sometimes somewhat trifid, as well as those of the involucrum. Stem round, fistular. Flowers white; sepals 5-oval. Carpels 15-20, oval, smooth. Style hooked. A very shewy and distinct plant.

Hellebore-leaved Wind-flower. Pl. 1½ foot.

50 AN. VITIFÒLIA (Buch. in herb Lamb. D. C. syst. 1. p. 210.) leaves large, cordate, 5-lobed, beneath as well as the stems clothed with white wool; lobes broadly ovate, acute, cut and crenate; those of the involucrum stalked, white-woolly underneath, smooth above, bluntly cordate, 5-lobed, and are as well as involucels 3-leaved; ovaries smooth. 4. F. Native of Upper Nipaul at Suembu. Sepals 8, oval, oblong, villous on the outside, and purplish inside; anthers copper-coloured. Carpels small, villous, collected into a round head.

Vine-leaved Wind-flower. Fl. July. Pl. 2 foot.

51 AN. RIVULA'RIS (Buch. in herb. Lamb. D. C. syst. 1. p. 211.) leaves villous, as well as petioles, 3-parted; lobes cuneated, trifid; lobules cut, acutely toothed; those of the involucrum 2-sessile, 3-parted; lobes lanceolate, acute, serrated, somewhat pinnatifid at apex. 4. F. Native of Nipaul about Chitlong, along the banks of rivulets. Pedicels 3, one of which is naked. Sepals 5, oval, naked, white, smooth. Carpels smooth, with a revolute beak.

Rivulet Wind-flower. Fl. April. Pl. 1 to 2 feet.

52 A. OBTUSÍLOBA (D. Don. fl. nep. p. 194.) leaves 3-lobed, cordate, and are, as well as petioles, very villous; segments broadly cuneated, and deeply crenate; involucrum 3-leaved, trifid; lobes linear, oblong, rounded at the apex, toothed; sepals 5, obovate; carpels beaked, pilose. 4. F. Native of Nipaul

at Gosaingsthan. Stem erect, villous. Leaves with very broad cuneated, 3-lobed, deeply crenate, very blunt segments. Peduncles 2-3, one-flowered, villous, naked, or the lateral ones are furnished with 2 membranous bracteas. Flowers cream-coloured, about the size of those of *A. dichótoma*.

Blunt-lobed Wind-flower. Pl. 1 foot.

53 A. elonga'ta (D. Don. prod. fl. nep. p. 194.) leaves 3-parted, and are, as well as petioles, nakedish; segments wedge-shaped, deeply lobed or toothed, connate at the base; peduncles three, simple or trifid, pilose; sepals 5, oval; carpels beaked, smooth. ♃. F. Native of Nipaul at Gosaingsthan. Flowers cream-coloured.

Elongated Wind-flower. Pl. 1 foot.

Sect. VI. Omaloca'rpus, (ομαλος, *omalos*, smooth; καρπος, *carpos*, a fruit; because the carpels are smooth) D. C. syst. 1. p. 212. prod. 1. p. 21. Cariopsides compressed, flat, oval, orbicular, smooth, tailless. Pedicels numerous, leafless, 1-flowered, umbelled in the involucrum.

54 An. narcissiflòra (Lin. spe. 763.) radical leaves somewhat villous, palmately 3-5-parted; lobes deeply toothed; lobules, linear, acute; those of the involucrum 3-5-cleft; flowers umbellate. ♃. H. Native throughout the whole of the northern hemisphere in calcareous mountain pastures, particularly in the Pyrenees, Switzerland, Caucasus, Cappadocia, and in the mountains of Siberia, island of Unalaschka, on the western coast of North America and in Canada. Jacq. aust. t. 159. Sims, bot. mag. t. 1170. An. umbellàta, Lam. fl. fr. ed. 11. 3. p. 322, but not of Willd. A very variable species. Stems from a hand to a cubit in height, hairy or smooth. Flowers usually cream-coloured, sometimes purplish on the outside. Umbels generally many-flowered, but sometimes few-flowered, very rarely 1-flowered. Pedicels twice or three times longer than the involucrum, sometimes equal in length, sometimes very short. Sepals 5 or 6, ovate or oval, blunt or acute. Lobes of leaves acute or blunt, more or less profound.

Var. β, *fasciculàta* (D. C. syst. 1. p. 213.) flowers umbellate, almost sessile, fascicled. Native of Cappadocia. Toun. cor. p. 20. voy. 2. p. 245. An. fasciculàta, Lin. spe. 763, not of Vahl.

Var. γ, *monántha* (D. C. syst. 1. p. 213.) flowers solitary or in pairs. An. dùbia, Bell. app. fl. ped. 232. t. 7.

Var. δ? *pedicellàris* (D. C. syst. 1. p. 213.) pedicels many, elongated; radical leaves ternate. Native of Dauria and Siberia.

Var. ε? *frígida* (D. C. syst. 1. p. 213.) pedicels few, elongated; radical leaves smooth, parted into very narrow linear lobes. Native of Siberia.

Var. ζ, *villosíssima* (D. C. prod. 1. p. 22.) flowers few, subsessile; stem very villous. Native of Unalaschka.

Narcissus-flowered Wind-flower. Fl. My. Clt. 1773. Pl. 1 ft.

55 An. umbella'ta (Willd. spec. pl. 2. p. 1284, not of Lam.) radical leaves 3-5-parted; segments trifid, very entire, densely villous at their margins; those of the involucrum undivided; flowers umbellate. ♃. H. Native of Cappadocia on mountains. Deless. icon. sel. 1. t. 18; An. fasciculàta, Vahl. symb. 3. p. 74. not of Lin. Scapes clothed with very long white hairs. Leaves of involucrum 3-parted; lobes entire. Pedicels 2-3, 1-flowered, longer than the involucrum. Sepals white, 5, oval obtuse, villous on the outside.

Umbellated-flowered Wind-flower. Fl.? Pl. ½ foot.

56 A. polya'nthes (D. Don. prod. fl. nep. p. 194.) leaves on long stalks, cordate, 3-parted, very villous: segments broadly cuneated, 3-lobed, and deeply-toothed; involucre 3-leaved, 3-parted; segments trifid or pinnatifid; peduncles simple umbellate; sepals 5, obovate, and are, as well as the carpels, smooth. ♃. H. Native of Nipaul at Gosaingsthan. Roots grumose. Peduncles 5-6, umbellate. Flowers whitish? Like *A. Narcissiflòra*.

Many-flowered Wind-flower. Pl. 1 foot.

57 An. Sibírica (Lin. spe. 763.) leaves ternate; segments deeply-toothed, ciliated; those of the involucrum on short stalks, ternate; sepals 6, orbicular. ♃. H. Native of Siberia beyond the Baikal. Lobes of leaves linear, crowded, obtuse, entire, hairy. Scapes 1-flowered; involucrum 3-parted, lobed, with lanceolate segments. Segments, when dry, fulvous. Ovaries smooth. Perhaps related to *An. alba*.

Siberian Wind-flower. Fl. June. Clt. 1804. Pl. ½ foot.

Anemones not sufficiently known

58 An Walte'ri (Ph. fl. amer. sept. 2. p. 387.) ♃. H. Native of Carolina. Thalíctrum Caroliniànum, Walt. car. 157. Root tuberous. Stem 1-flowered, naked Leaves palmate on long stalks. Sepals 5. Very like *An. parviflora*.

Walter's Wind-flower. Pl. 1 foot.

59 An. peda'ta (Raf. Schmaltz. in Desv. jour. bot. 1808. v. 1. p. 230.) ♃. H. Native of New Jersey. Stem short, one-flowered. Leaves pedate, 5-parted; lobes jagged; sepals 6.

Pedate-leaved Wind-flower. Pl.?

Doubtful Species.

60 An. Flemme'msis (Scop. ann. hist. nat. tyr. ann. 2 ex fl. aust. 2. p. 41.) ♃. Native of the Alps of Tyrol. Perhaps a variety of *An. alpìna*.

Flemm Wind-flower. Pl.?

61 An. dodecaphy'lla (Krock. fl. sil. 2. p. 235. t. 20.) ♃. H. Native of Silesia. An. decapétala var. β. Gmel. syst. 871.

Twelve-leaved Wind-flower. Pl. 1 foot.

Cult. All the species are shewy flowering plants well worth the cultivator's care; they thrive best in a light loamy soil. Those species belonging to sections *Pulsatílla*, *Preonánthus*, *Anemonospérmos*, and *Omalocárpus*, are either increased by dividing the plants at the root or by seeds: and those belonging to section *Anemonánthea* are either increased by offsets from the roots or by seeds; those of section *Pulsatilloìdes* are greenhouse evergreen herbaceous plants, and grow best in an equal mixture of sand, loam, and peat, but care must be taken not to let them have too much water when in a dormant state. They often produce perfect seeds, by which young plants are readily raised: they will also strike root from cuttings, in the same kind of soil, under a hand-glass.

† *Species belonging to section Pulsatilla, which appear to be only varieties of An. pàtens* and *An. praténsis*.

62 A. interme'dia (Brand. in Schlecht. Linnæa, 3. p. 163, under Pulsatílla,) leaves ternate or pinnate; segments rather coriaceous, terminal ones on long stalks, profoundly 2-3-cleft; lobes cut-serrated; sepals elliptical or lanceolate, clothed with yellowish villi on the outside. ♃. H. Native of Saxony on hills near Dresden. Plant villous. Flowers lilac or violet, rarely blue. Like *An. pàtens*, and perhaps only a variety of it.

Intermediate Pasque-flower. Fl. June, July. Pl. 1 foot.

63 A. propínqua (Brand. l. c. p. 165.) leaves pinnate, with 2 or 3 pair of multifid leaflets and an odd one; lobes narrow, lanceolate. ♃. H. Native of Saxony on hills near Dresden. Sepals 6, elliptical, spreading, pale violet or red, yellowish on the outside. Plant rather villous. Perhaps only a variety of *An. praténsis*.

Related Pasque-flower. Fl. April, May. Pl. 1 foot.

64 An. affìnis (Brand, l. c. p. 166.) leaves pinnate, with 3-4 pair of multifid leaflets and an odd one; lobes linear cut; peduncles drooping; sepals spreading, somewhat reflexed at the apex, elliptical, obtuse. ♃. H. Native of Saxony in woods

near Dresden. Flowers blueish or dark violet. Perhaps a variety of *An. praténsis*.

Allied Pasque-flower. Fl. April, May. Pl. $\frac{3}{4}$ foot.

VII. HEPA'TICA (from ἡπατικος, *hepaticos*, of or relating to the liver. The three lobes of the leaves have been compared to the three lobes of the liver.) Dill. giess. p. 108. t. 5. Lin. hort. cliff. 223. D. C. syst. 1. p. 215. prod. 1. p. 22.

LIN. SYST. *Polyándria, Polygýnia*. Involucrum of 3 entire leaves, in the form of a calyx, close to the flower. Calyx of 6 to 9 petal-like coloured sepals, disposed into two or three series. Stamens and ovaries numerous. Carpels tailless. Small perennial early-flowering evergreen herbs, with 3-7-lobed leaves. Scapes 1-flowered, numerous, rising from the same root.

1 H. TRÍLOBA (Chaix in Vill. dauph. 1. p. 336.) leaves cordate, 3-lobed; lobes quite entire, ovate, acutish; petioles and scapes rather hairy. ♃. H. Native of many parts of Europe in hedges and shady places. Anemòne Hepática, Lin. spe. 758. Oed. fl. dan. 612. Smith, eng. bot. t. 51. fl. græc. 513. Schk. hand. 2. t. 150. Anemòne præ'cox, Sal. prod. 371. Colour of flowers usually blue; found in gardens, but seldom if ever in the fields, with white, brown, flesh-coloured, red, purple, violet, or variegated flowers, but never yellow; single or double. Leaves green, purplish or variegated underneath. All these varieties are designated under names in old books, but here we have thought proper to omit them.

Three-lobed-leaved or common Hepatica. Fl. Feb. April. England. Pl. $\frac{1}{4}$ foot.

2 H. AMERICA'NA (Ker. bot. reg. t. 387.) leaves cordate, 3-lobed; lobes quite entire, roundish, obtuse; petioles and scapes very pilose. ♃. H. Native of North America on the sides of fertile and rocky hills from Canada to Carolina. H. tríloba β. D. C. syst. 1. p. 216; H. tríloba, Ph. fl. amer. sept. 2. p. 391. Var. γ, Hook. Flowers red.

American Hepatica. Fl. Feb. April. Clt. 1800. Pl. $\frac{1}{4}$ ft.

3 H. ANGULÒSA (D. C. syst. 1. p. 217.) leaves palmately 5-lobed; lobes serrated. ♃. H. Native of? formerly cultivated in the Physic garden, Paris. An. angulòsa, Lam. dict. 1. p. 169. Flowers purple or blue. Sepals 8-9, elliptical, spreading.

Angular-leaved Hepática. Fl. Feb. April. Clt? Pl. $\frac{1}{4}$ ft.

4 H. ACUTÍLOBA (D. C. prod. 1. p. 22.) leaves cordate, 3-lobed; lobes quite entire, acute; petioles pilose. ♃. H. Native of North America on the Rocky Mountains and in Canada. Anemòne Hepática. var. acutíloba, Bigl. Hook. Flowers blue. Perhaps a good species. Dr. Boott has gathered a variety of this or *H. Americàna* with 5-cleft leaves near Boston.

Acute-lobed Hepatica. Fl. Feb. April. Clt. 1818. Pl. $\frac{1}{4}$ ft.

5 H. INTEGRIFÒLIA (D. C. syst. 1. p. 217.) leaves ovate, quite entire: scapes and petioles very villous. ♃. F. Native of South America on the mountain Gualgayoc, at the height of 1850 fathoms. Anemòne integrifòlia, H. B. et Kth. nov. gen. et spe. amer. 5. p. 40. Perhaps the involucrum is 1-leaved, and the leaflets divided to the base into 3 parts. Flower sessile, white. Sepals 8-10, linear, shorter than the involucrum. Ovaries villous.

Entire-leaved Hepatica. Pl. $\frac{1}{4}$ foot.

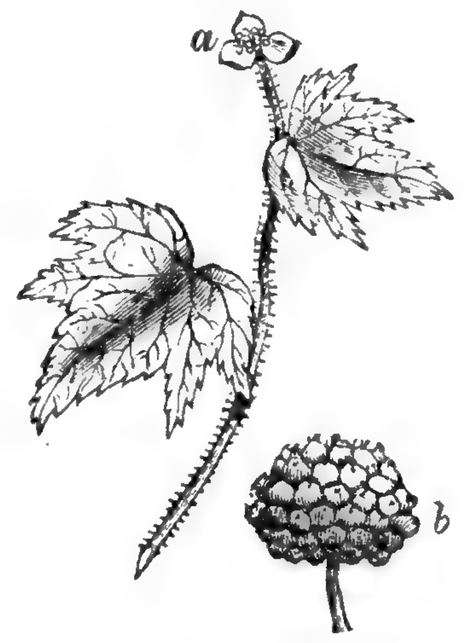
Cult. Hepáticas are great favourites for the flower-border, both as being evergreen in their foliage, and for their abundant early blossoms and great variety of colours and shades. A light loam or peat soil suits them best; and they are easily increased by dividing the plants at the root, in spring.

VIII. HYDRA'STIS (from ὑδωρ, *hydor*, water; in reference to the humid places wherein it grows.) Lin. gen. no. 704. Juss. gen. 232. D. C. syst. 1. p. 217. prod. 1. p. 23. Warneria Mill. fig. 2. t. 285.

LIN. SYST. *Polyándria Polygýnia*. Calyx of 3 ovate sepals. (f. 7. *a*.) Petals wanting. Stamens and ovaries numerous. Fruit baccate, numerous, collected into a head (f. 7. *b*.) each terminated by the style, 1-celled, 1-2-seeded. Seeds somewhat egg-shaped, smooth. A small perennial herb with tuberous roots and 3-5-parted leaves. Root bitter, rather pungent and tonic, yielding a beautiful yellow dye, whence its name *yellow-root*.

HY. CANADE'NSIS (Lin. spe. 784.) ♃. H. Native of North America in watery places, in tracts along the Alleghany mountains, from Canada to Carolina; along the river Ohio, and on the western parts of Virginia and Pennsylvania, in shady woods in fertile soil and among rocks. Pict. hort. par. 37. t. 17. Root with fleshy tubercles, yellow on the inside. Stem herbaceous, simple, 1-flowered. Lower leaves 1 or 2, stalked, upper ones almost sessile, all of which are 3-5-parted, with their lobes grossly toothed. Flowers white or purplish, terminal, stalked. Fruit fleshy, red, similar to those of *Rùbus*. Carpels ovate, acute. (fig. 7.)

FIG. 7.



Canadian Yellow-Root. Fl. May, June. Clt. 1759. Pl. 1 foot.

Cult. This plant being rather difficult to increase, is rare in our gardens. It requires to be planted in a moist shady situation, because if planted in a situation exposed to the sun it rarely lives through the summer. It is increased by dividing the plants at the root in spring, or by seeds.

IX. KNOWLTO'NIA (named after Thomas Knowlton, once the Curator of the Botanic Garden at Eltham). Sal. prod. 372. D. C. syst. 1. p. 218. prod. 1. p. 23.

LIN. SYST. *Polyándria Polygýnia*. Calyx of 5 sepals. Petals 5-15, with a naked claw. Stamens numerous. Ovaries numerous, seated on a globose receptacle. Cariopsides numerous, 1-seeded, baccate. Styles deciduous, awnless. Evergreen perennial herbs, emulating the habit of some umbelliferous plants, with biternate or triternate leaves, and umbels of greenish-yellow flowers.

1 KN. RÍGIDA (Sal. prod. 372.) leaves biternate; leaflets somewhat cordate, coriaceous, smoothish, lateral ones obliquely truncate at the base, umbel supradecompound, spreading. ♃. G. Native of the Cape of Good Hope. Lodd. bot. cab. 850.—Com. hort. 1. p. 1. t. 1. Adònis Capénsis, Lin. spec. 772: Adònis coriàcea, Poir. suppl. p. 146. Anamènia coriàcea, Vent. malm. 1. p. 22. t. 22.

Rigid Knowltonia. Fl. Mar. April. Clt. 1780. Pl. 1 foot.

2 KN. VESICATO'RIA (Sims, bot. mag. t. 775.) leaves biternate; Leaflets somewhat cordate, rigid, smoothish, lateral ones at base obliquely truncate; umbel rather simple, few-flowered. ♃. G. Native of the Cape of Good Hope.—Pluk. alm. 198. t. 95. f. 2. Adònis vesicatòria. Lin. fil. suppl. 272. Adònis Capénsis, Lam. dict. 1. p. 46, exclusive of the synonym of Barr. Anamènia laserpitiifòlia, Vent. malm. 1. p. 22. Anamènia vesicatòria, Dum. cours. bot. cult. 4. p. 438. Adònis laserpitiifòlia, Poir. suppl. 1. p. 147.

Blistering Knowltonia. Fl. Feb. Apr. Clt. 1691. Pl. 1 ft.

3 KN. GRA'CILIS (D. C. syst. 1. p. 219.) leaves biternate; leaflets ovate, profoundly serrated, rigid, pilose; scapes branched at the top; branches erect, few-flowered. ♃. G. Native of the Cape of Good Hope. Deless. icon. sel. 1. t. 19. Adònis Æthiopica. Thun. prod. cap.? Anamènia grácilis, Vent. malm. 1. p. 22. in obs.; Adònis grácilis, Poir. suppl. 1. p. 147. Adònis Capensis Thunb.

Slender Knowltonia. Fl. Mar. April. Clt. 1820. Pl. 1 foot.

4 KN. HIRSU'TA (D. C. syst. 1. p. 200.) leaves biternate; leaflets lanceolate, profoundly serrated, hairy; scapes branched at the base; branches decumbent, few-flowered. ♃. G. Native of the Cape of Good Hope.—Burm. afr. 145. t. 51. Anamènia hirsùta, Vent. malm. 22. in obs. Adònis hirsùta, Poir. suppl. 1. p. 147.

Hairy Knowltonia. Fl. April, May. Clt. 1823. Pl. 1 foot.

5 KN. DAUCIFÒLIA (D. C. syst. 1. p. 200.) leaves ternate; leaflets pinnatifid; lobes linear, acute; umbel compound. ♃. G. Native of the Cape of Good Hope. Adònis fília, Lin. fil. suppl. 271. Adònis daucifòlia, Lam. dict. 1. p. 46. Anamènia daucifòlia, Vent. malm. 22. in obs. Root horizontal. Herb villous at the neck, base of stem and petioles, the rest smooth. Scapes naked, nearly two feet high. Peduncles pubescent.

Carrot-leaved Knowltonia. Fl.? Clt. 1822. Pl. 2 feet.

Cult. These plants will grow freely in a mixture of loam and peat, and may either be increased by dividing the plants at the root, or by seeds, which often ripen in abundance.

X. ADO'NIS (The plant which sprang from the blood of *Adonis* when wounded by a boar; in allusion to the blood-red color of the flowers of most of the annual species.) Dill. giess. nov. gen. 109. t. 4. Lam. illust. t. 498. Gært. fruct. 1. p. 355. t. 74. Lin. gen. 698.

LIN. SYST. *Polyándria Polygýnia.* Calyx of 5 pressed sepals, but they are sometimes loosened at the base. Petals from 5 to 15, with a naked claw. Stamens numerous, inserted in the base of the gonophor. Cariopsides numerous, 1-seeded, spiked, ovate, pointed with the style. Embryo ovate. Cotyledons distant. Annual or perennial herbs, with their cauline leaves pinnate-parted into multifid lobes with innumerable linear lobules. Flowers solitary, on the top of the stem or branches.

SECT. I. ADÒNIA, (applied to this section on account of its containing the original or true species of *Adonis.*) D. C. syst. 1. p. 221; prod. 1. p. 23. Cariopsides acuminated with the straight style. Petals 5-10. Stamens 18-20. Roots annual. The species of this section are probably varieties of one species.

1 AD. AUTUMNA'LIS (Lin. spe. 771.) calyx smooth; petals 6-8, concave, conniving, scarcely larger than the calyx; carpels somewhat reticulated, crowned by very short styles, collected into an ovate head; stems branched. ⊙. H. Native throughout Europe in corn-fields, and very frequently cultivated in gardens: also in Labrador. Smith. eng. bot. t. 308. Curt. fl. lond. 2. t. 37. Schkuhr. hand. 2. No. 1489. t. 152. Flower of an intense blood-red, rarely pale, globose from the concave conniving petals, and from its form and colour is called in France *Goutte de sang.*

Autumnal Pheasant's-eye. Fl. May, Sept. Britain. Pl. 1 foot.

2 AD. FLA'VA (Vill. cat. strasb. 247.) calyx smooth, loosened at the base; petals flat, oblong, double the length of the calyx; carpels smoothish, collected into an oblong head; stem almost simple. ⊙. H. Native of France in corn-fields and vineyards, and probably throughout Germany.—Weinm. phyt. t. 28. f. a. and b. exclusive of the synonyms.—Tab. icon. 790. f. 1. Stem scarcely branched. Flowers yellow, rarely flame-coloured. Petals nearly linear.

Yellow Pheasant's-eye. Fl. June, July. Clt.? Pl. 1 foot.

3 AD. PARVIFLO'RA (Fisch. in litt. D. C. prod. 1. p. 24.) calyx loosened at the base, smooth; petals flat, oblong, length of calyx; carpels few, collected into an ovate head, crowned by straight conical styles; stem simple. ⊙. H. Native of Russia on the banks of the Rhymnus, near the salt lake Indirio. Petals pale scarlet, when dried whitish.

Small-flowered Pheasant's-eye. Fl. Ju. Jul. Clt.? Pl. 1 foot.

4 AD. MICRA'NTHA (D. C. syst. 1. p. 222.) calyx smooth, not loosened at the base; petals flat, oblong, a little longer than the calyx; carpels somewhat reticulated, collected into a somewhat ovate head; stem a little branched. ⊙. H. Native of the south of France about Toulouse, Avignon, &c. in corn-fields. Flowers small, yellow or flame. Ovaries few 7-10. Stem simple at the base, at the top usually a little branched. A doubtful species.

Small-flowered yellow Pheasant's-eye. Fl. Ju. Jul. Pl. 1 foot.

5 AD. MICROCA'RPA (D. C. syst. 1. p. 223.) calyx smooth; petals flat, oblong, twice as long as calyx; carpels reticulated, disposed in an oblong head; stem almost simple. ⊙. H. Native of Spain about Tudela in corn-fields, and of the island of Teneriffe. Calyx scarcely loosened at the base. Fruit about one half smaller and more numerous than in any other species. Flowers yellow-citron, or somewhat flame-coloured. Perhaps distinct enough from *Ad. flàva*, by its stem being one half or more shorter, and more crowded with leaves.

Small-fruited Pheasant's-eye. Fl. Ju. Jul. Clt. 1824. Pl. ½ ft.

6 AD. ANO'MALA (Wallr. sched. 273.) calyx pilose on the outside, acutish; petals 3, oblong, flat, bluntish, spreading, with the claw of the same colour; carpels ovate, disposed in 6 rows, crowned with the withered styles, afterwards becoming loosely and irregularly disposed into an oblong spikes; stem branched. ⊙. H. Native about Halle in fields.

Anomalous Pheasant's-eye. Fl. June, July. Pl. 1 foot.

7 AD. CÍTRINA (Hoffm. fl. germ. 1. p. 251.) calyx hispid at the base; petals flat, oblong, longer than the calyx; carpels disposed into an ovate-oblong head; stem almost simple; flowers small, almost sessile among the leaves. ⊙. H. Native of France, Germany, and Teneriffe, in corn-fields. Plant small. Stem erect, simple, very rarely branched. Flowers solitary, small, yellow.

Citron-coloured-flowered Pheasant's-eye. Fl. June, July. Clt. 1819. Pl. 1 foot.

8 AD. FLA'MMEA (Murr. syst. 514.) calyx hispid at the base; petals flat, oblong, acute, longer than the calyx; carpels disposed into a cylindrical head; stem branched; flowers large, stalked. ⊙. H. Native of Austria in corn-fields. Jacq. fl. aust. 4. t. 355.—Besl. hort. eyst. œ'st. ord. 5. t. 11. f. 3. Stem smooth or pilose. Petioles pilose. Flowers flame-coloured; sepals oblong, acute.

Flame-coloured-flowered Pheasant's-eye. Fl. July, August. Clt. 1800. Pl. 1 foot.

9 AD. ÆSTIVA'LIS (Lin. spec. 772.) calyx hispid at the base: petals, flat, oblong, obtuse, one half longer than the calyx: carpels reticulated, disposed into a loose oblong spike, beaked with the straight style; stem almost simple. ⊙. H. Native of England in corn-fields; south of France, Italy, &c. Ad. miniàta, Jacq. fl. aust. t. 354; Ad. maculàta, Wallr. sched. 270. Stem elongated. Flowers peduncled, small, of a deep crimson colour.

Summer Pheasant's-eye. Fl. June, July. England. Pl. 1 foot.

10 AD. DENTA'TA (Del. fl. ægyp. ill. 17, descr. eg. t. 53. f. 1.) calyx hispid at the base; petals flat, oval-oblong, a little longer than the calyx; carpels toothed at the base, with tubercles, netted, disposed into an elongated spike. ⊙. H. Native of Egypt in corn-fields and arid places. Stem striato-angular, hard, branching. Flowers on short peduncles.

Var α, *orientàlis*, (D. C. syst. l. c.) petals yellow. Native of Egypt and the island of Cyprus. Ad. dentàta, Del. fl. ægyp. ill. p. 17, descr. ægyp. t. 53. f. 1. Petals oval, yellow, with a black claw. Fruit echinately toothed at the base, with the back a little crested, disposed in slender spikes.

Var. β, *provinciàlis* (D. C. syst. l. c. prod. l. c.) petals flame-coloured. Native of Provence between Digne and Colmars. Petals oblong. Fruit a little tuberculately-toothed at the base, disposed in a long spike.

Toothed-fruited Pheasant's-eye. Fl. Ju. Jul. Clt.? Pl. 1 foot.

Sect. II. Consolìgo, (perhaps derived from *Consolido* to unite, on account of the plants being perennial) D. C. syst. 1. p. 224. prod. 1. p. 24. Cariopsides hooked with the recurved styles, collected into an ovate head. Petals 8-15. Stamens 25-30. Roots perennial, black, acrid, and purgative. Flowers yellow.

11 Ad. verna'lis (Lin. spe. 771.) radical or lower leaves abortive, or reduced to somewhat sheathing scales, the middle and upper ones sessile and multifid, with very entire lobes, carpels velvety; petals 10-12, oblong, rather denticulated. ♃. H. Native of France, Siberia, Tauria, Switzerland, and Italy, on hills and in valleys, in sunny places of mountains, flowering in the spring after the melting of the snow. Gært. fruct. 1. p. 355. t. 74. Curt. bot. mag. 134. Schkuh. hand. No. 1490. t. 152. Ad. helléborus, Crant. aust. 2. p. 82. Ad. Apennìna, Jacq. aust. t. 44. Ad vernàlis a. Lam. dict. 1. p. 45. ill. t. 498. f. 3.

Var. β, Mentzèlii (D. C. syst. 1. p. 225. prod. 1. p. 25.) Ad. Apennìna, Lin. spe. 772. Ad vernàlis β. Lam. dict. 1. p. 45.—Mentz pug. t. 3. f. 1.

Var. γ, Sibírica (Patrin. D. C. syst. et prod. l. c.) Native of Siberia on the banks of the river Oby about Barnaoul.—Gmel. sib. p. 200. No. 43. Not differing from the European plant, unless that the flowers are a little larger.

Spring Adonis. Fl. Mar. April. Clt. 1629. Pl. 1 foot.

12 Ad. Volge'nsis (Stev. ined. D. C. syst. i. p. 545.) radical or lower leaves abortive, or reduced to somewhat sheathing scales, middle and upper ones sessile, multifid, with the lobules toothed at their margins; carpels somewhat velvety; calyx pubescent on the outside; petals 10-12, oblong. ♃. H. Native of the Russian empire at the rivers Volga and Rhymnus. Deless. icon. sel. 1. t. 20. Ad. Apennìna? Pall. nov. act. petrop. vol. 10. Ad. chærophýlla. Fisch. ined. An intermediate plant between *Ad. vernàlis* and *Pyrenàica*, differing from the first in the stems being branched, leaves more distant, carpels much less velvety; from the last by the lower leaves being abortive, squamiform, and with the carpels when young somewhat velvety; differing from the whole in the sepals of calyx being pubescent on the outside, not smooth.

Volga Adonis. Fl. April, May. Clt. 1818. Pl. 1 foot.

13 Ad. Ircutia'na (D. C. prod. i. p. 25.) radical leaves? middle and upper ones sessile, pinnately, many-parted with toothed lobules; calyx very smooth; petals obovate. ♃. H. Native of Siberia about Irkoutsk. A species not sufficiently known.

Irkoutsk Adonis. Pl. 1 foot.

14 Ad. Sibírica (Patrin. ex Spreng. syst. append. p. 218) plant quite smooth; segments of leaves short, cut; petals numerous obovate, crenulate at the apex, much longer than the calyx. ♃. H. Native of Siberia.

Siberian Adonis. Fl. April, July. Pl. 1 foot.

15 Ad. Davu'rica (Rchb. icon. t. 321. Spreng. syst. app. p. 218) segments of leaves trifid, linear; petals 12, spatulate, crenulated at the apex, much longer than the smooth calyx. ♃. H. Native of Dahuria.

Dahurian Adonis. Pl. 1 foot.

16 Ad. villo'sa (Ledeb. in litt. ex Spreng. l. c.) petals 12, linear-oblong, crenulate at the apex, twice the length of pubescent calyx; stem branched, and is, as well as the leaves, hoary villous; segments of leaves trifid, linear, pointed. ♃. H. Native of Russia on Mount Imaus. This plant differs from *A. Sibírica* of Rchb, in being villous, as well as in the stem being branched, and the segments of the leaves narrower.

Villous Adonis. Pl. 1 foot.

17 Ad. Pyrena'ica (D. C. fl. fr. 5. p. 635) radical leaves on long stalks, with trifid petioles and many-parted segments, upper ones sessile multifid, with linear very entire lobules; carpels smooth; petals 8-10, oblong-cuneated, entire. ♃. H. Native of the Eastern Pyrenees in the valley called Eynes; and near Ædinburgh, in Hungary. Deless. icon. sel. 1. t. 21. Stem beyond a foot high and usually much branched. Radical leaves with trifid stalks not squamiform. Flowers almost sessile. Pedicel of fruit much elongated. Petals smaller and more obtuse than in *Ad. vernàlis*. Fruit also smooth. Like *Ad. vernàlis* but truly distinct.

Var. β, mìnor (D. C. prod. 1. p. 25). Native of the south of the Apennines in Mount Velino. Ad. Apennìna, Schousb. in litt. not Lin.

Pyrenean Adonis. Fl. July. Clt. 1817. Pl. 1½ foot.

Cult. A genus of beautiful plants. Those species belonging to section *Adònia* being annual, only require to be sown in open borders; those belonging to section *Consoligo* are very handsome perennial herbaceous flowering plants, very proper for the front of flower-borders; they may be either increased by dividing the plants at the roots or by seeds.

XI. HAMADRY AS (from ἁμα, *hama*, together, δρυον, *dryon*, a forest; habitat.) Commers. in Juss. gen. p. 232.

Lin. syst. *Polyándria Polygýnia.* Flowers dioecious from abortion. Calyx of 5 or 6 sepals. (f. 8. *a.*) Petals 10-12, linear, long. (f. 8. *b.*) Male flowers with numerous short stamens, female ones with numerous ovaries and sessile stigmas. Carpels ovate, 1-seeded. Small downy herbs with the appearance of *Ranúnculus*. Leaves radical, palmate, stalked. Scapes 2 or 3-flowered, hardly longer than the leaves. Flowers yellow, alternate, sessile, collected at the top of the scape into a sort of spike.

FIG. 8.

1 Ham. Magella'nica (Lam. dict. 3. p. 67) calyx smooth, upper leaves smooth above, 3-parted; lobes deeply parted. ♃. H. Native of the Straits of Magellan in mountainous groves. Deless. icon. sel. 1. t. 22. Herb erect. Radical leaves 3 or 4, with the base of the petioles dilated, and smooth, the rest villous. Scapes hairy, a little longer than the leaves.

Magellan Hamadryas. Pl. ¼ ft. (f. 8.)

2 Ham. tomentòsa (D. C. syst. 1. p. 227) calyx tomentose; upper leaves cobwebbed, villous, 5 or 7-cleft into oblong or subtrifid lobes. ♃. H. Native of South America, in Statenland, on the declivities of mountains. Herb erect, tomentose. Radical leaves 2 or 3, somewhat orbicular, upper ones somewhat cordate at the base. Scapes simple, a little longer than the pètioles. Flowers 2 or 3, sessile, crowded at the top of the scape. Ovaries disposed into a round head.

Tomentose Hamadryas. Fl. Feb. March. Pl. ½ foot.

Cult. These plants will require to be kept in pots, in a mixture of sand and loam. They should be protected during winter by a frame, and may be either increased by dividing the plants at the roots or by seeds.

Tribe III.

RANU'NCULEÆ, (plants agreeing with *Ranúnculus* in habit and character,) D. C. syst. 1. p. 228; prod. 1. p. 25. Calyx and corolla imbricate in the bud. (f. 14. *a.*) Petals furnished with a scale on the inside at the base (f. 9. *c.*) or bilabiate. Carpels 1-seeded (f. 9. *g.*) dry, unopening. (f. 9. *e.*) Seed erect. (f. 9. *f.*) Leaves radical or alternate. (f. 9.) Flowers of various colors but never blue. Herbs.

XII. MYOSU'RUS (*μυς, mys*, a mouse, and *ουρα, oura*, a tail. The seeds are seated upon a long receptacle, which looks exactly like the tail of a mouse). Dill. geiss. p. 106. t. 4. Lin. gen. No. 394. D. C. syst. 1. p. 229. prod. 1. p. 25. Gært. fr. 1. p. 354. t. 4. Juss. gen. 233. Lam. ill. t. 221.

LIN. SYST. *Pentándria Polygýnia.* Calyx of 5-sepals; sepals loosened at the base or drawn out downward beyond their insertion. Petals 5, with a filiform tubular claw. Stamens 5-20. Cariopsides numerous, triquetrous, very much crowded on a long receptacle, each pointed with the straight style. Small annual plants with linear entire leaves, and small yellow flowers. Scapes 1-flowered.

1 MY. MÍNIMUS (Lin. spec. 407.) scape nearly equal in length with the leaves, or longer; appendages of calyx somewhat leafy, ☉. H. Native throughout Europe in exposed muddy situations. and in fields where it has been inundated in the winter. Fl. dan. t. 406. Curt. fl. lond. t. 151. Smith, eng. bot. Schkuhr. handb. t. 88. Scapes shorter or longer than the leaves, 3-8, rising from the same root. Sepals and petals equal in number.

Least Mouse-tail. Fl. April, June. Britain. Pl. 1-2 inches.

2 MY. SHO'RTII (Raf. in Sill. amer. jour. sc. 1819. vol. 1. No. 4. p. 379.) scapes shorter than the leaves; appendages of calyx membranous. ☉. H. Native of North America about Hopkin's Town, West Kentucky. Perhaps a variety of the first.

Short's Mouse-tail. Fl. April, June. Pl. 1 inch.

Cult. The species of Myosurus only require to be sown in the open ground in a moist situation, where they should afterwards be allowed to sow themselves.

XIII. CERATOCE'PHALUS (from *κερας, keras*, a horn, and *κεφαλη, kephale*, a head, on account of the horn ends of the seeds in the heads of the capsules) Mœnch. meth. p. 218. D. C. syst. 1. p. 230. prod. 1. p. 26, but not of Vaill.

LIN. SYST. *Pentándria Polygy'nia.* Calyx of 5 permanent sepals. Petals unguiculate. Stamens 5-15. Carpels numerous, attached to a long receptacle, with a gibbosity on both sides at the base, and drawn out at top into a long flat horn, which is 6-times longer than the seed. Seeds 4-sided, with an erect embryo. Small annual herbs, with 1-flowered scapes, yellow flowers, and leaves many-parted into linear lobes.

1 CER. FALCA'TUS (Pers. ench. 1. p. 341.) horns of carpels falcate, somewhat ascending. ☉. H. Native of Spain, south of France, Italy, Hungary, Austria, Argolis, Arcadia, and about Damascus, &c. in corn-fields. Ranúnculus falcàtus, Lin. spe. 781. Jacq. fl. aust. t. 48; Ranúnculus testiculàtus. Crantz. aust. 2. p. 97. Ceratocéphala spicàta, Mœnch. meth. 218. Herb nearly smooth, but downy in hot exposed situations.

Falcate-horned Ceratocephalus. Fl. May. Clt. 1739. Pl. 1 to 2 inches.

2 CER. ORTHÓCERAS (D. C. syst. 1. p. 231.) horns of pericarps straight. ☉. H. Native of Tauria and the south of Siberia in uncultivated fields. Deless. icon. sel. 1. t. 23. Ranunculus falcàtus, Bieb. fl. cauc. 2. p. 29, exclusive of the synonyme. Differing from *C. falcàtus*, in being a little smaller, and in the pericarps being constantly clothed with white wool, as well as in the horns of pericarps being straight, not falcate.

Straight-horned Ceratocephalus. Fl. May. Clt. 1823. Pl. 1 inch.

Cult. They only require to be sown in the open ground. Not worth cultivating unless in the gardens of the curious.

XIV. RANU'NCULUS (from *rana*, a frog, because most of the species inhabit humid places frequented by that reptile; *Renoncule* and *Grenouillette*, Fr.; *Ranunkel*, Germ.; *Ranuncole*, Ital.; *βατραχιον*, Gre.; *Crowfoot* in English, in allusion to the form of the leaves of many of the species,) C. Bauh. pin. 180; Pers. ench. 2. p. 102; Gært. fruct. 1. p. 353. t. 74. Ranunculi spe. Lin. gen. No. 699.

LIN. SYST. *Polyándria, Polygýnia.* Calyx of 5 deciduous sepals (f. 9. *a.*) which are not loosened at the base. Petals 5, rarely 8 (f. 9. *b.*) 10, furnished with a nectariferous scale on the inside at the base (f. 9. *c.*). Stamens numerous. Cariopsides numerous, ovate, somewhat compressed ending in a point or horn, which is scarcely ever longer than the seed, (f. 9. *d.*) smooth striated or tubercled (f. 9. *e.*), disposed into globose or cylindrical heads (f. 9. *e. d.*). Annual or perennial herbs, with entire, toothed, or multifid leaves (f. 9.), and white, yellow, or purple, scentless flowers. The recent herb is acrid, applied to the skin occasions blisters, but taken inwardly poisonous.

SECT. I.—BATRA'CHIUM (*βατραχιον, batrachion*, a frog; because the plants grow in water frequented by that reptile for the purpose of depositing their spawn;) D. C. syst. 1. p. 232. prod. 1. p. 26. Pericarps transversely rugoso-striated. Petals white, marked with a yellow hollow nectariferous claw. Water plants.

1 R. HEDERA'CEUS (Lin. spe. 781.) stem creeping; leaves reniform, usually 3 or 5-lobed; lobes broad, entire, very blunt; petals oblong, scarcely longer than the calyx; stamens 5-12; carpels smooth. ♃. H. W. Native throughout Western Europe, in springs, fountains, running waters, and inundated places; especially in Iceland, Britain, north and west of France, Spain, Portugal, Algiers, and in North America from the United States to the Arctic sea. Smith, eng. bot. 2003. Curt. fl. lond. Haynes, pl. euro. 106. R. hederàceus, var. *α.* Thor. chl. land. 242. Schlecht. anim. ran. 1. p. 7. R. hederæfòlius, Sal. prod. 372.

Ivy-leaved Crowfoot. Fl. May, Aug. Britain. Pl. aq.

2 R. SANICULÆFÒLIUS (Viv. ex. Spreng. syst. 2. p. 645.) stem floating, and rooting; leaves kidney-shaped, bluntly 5-lobed, crenated; petioles naked at the base; peduncles equal in length to the leaves; petals 3-times longer than the calyx. ♃. H. W. Native of the north of Africa.

Sanicula-leaved Crowfoot. Fl. May, Aug. Pl. flt.

3 R. TRIPARTÌTUS (D. C. icon. gal. rar. 1. p. 15. t. 49.) stem floating, submersed leaves capillaceously-multifid, emersed ones 3-parted; lobes cuneated, toothed at top; carpels smooth. ♃. H. W. Native of the west of France, Britain, in springs and inundated places. An intermediate species between *R. hederàceus* and *R. aquátilis.*

Var. α, micránthus (D. C. l. c.), petals oblong acutish, length of calyx; R. tripartítus, D. C. icon. gal. rar. 1. p. 15. t. 49. R. hederàceus, var. *β*, Thor. chl. land. 242.

Var. β, obtusiflòrus (D. C. l. c.) petals, obovate obtuse, longer than the calyx. Water Crowfoot, Pet. engl. herb. t. 39. f. 1.

Three-parted-leaved Crowfoot. Fl. May, Aug. Britain. Pl. flt.

4 R. AQUA'TILIS (Lin. spe. 781.) stems floating; submersed leaves capillaceously-multifid, emersed ones 3-parted; lobes wedge-shaped, toothed at top; petals obovate, larger than calyx; carpels hispid, with stiff bristles. ♃. H. W. Native throughout Europe, Western Asia, North Africa, and also in North America, in pools and stagnant waters, in plains and low mountains. Smith. eng. bot. 101; Bir. ran. 32. t. 1. f. 18 and 27.

This plant sometimes produces very large flowers, and makes a handsome show in ponds and ditches; the curious variety in the floating and immersed leaves adds to the beauty of this common aquatic plant. Dr. Pulteney (Linn. soc. trans. 5. p. 19.) contradicts the assertions of its deleterious qualities, and proves that it is not merely innoxious, but nutritive to cattle, and capable of being converted to useful purposes in agricultural economy. In the neighbourhood of Kingswood, on the borders of the Avon, some of the cottagers support their cows, and even horses, almost wholly by this plant. A man collects a quantity every morning,

and brings it in a boat to the edge of the water, from which the cows eat it with great avidity, insomuch that they stint them, and allow only about twenty-five or thirty pounds to each cow daily. One man kept five cows and one horse so much on this plant, with the little which the heath afforded, that they had not consumed more than one half a ton of hay throughout the whole year, none being used except when the river is frozen over. Hogs are also fed with this plant, and improve so well on it, that it is not necessary to give them any other sustenance till they are put up to fatten. This property of Water-crowfoot is the more remarkable, as all the species have been deemed acrimonious, and some of them are without doubt highly so. It is probable this and the other water species are rendered inert as a poison by growing in water; although it must be confessed, that in other instances moisture heightens the deleterious property of vegetables, especially in the umbelliferous tribe.

Var. α, heterophýllus (D. C. l. c.) emersed leaves 3-parted. R. heterophýllus, Hoffm. fl. germ. 197; R. fluviátilis, Tabern. 54. f. 2; R. diversifòlius, Schrank. fl. bav. 103. Emersed leaves peltate or often not peltate. Carpels hispid with rigid setæ, or rarely smooth.

Var. β, capillàceus (D. C. l. c.) leaves stalked, immersed, dissected into slender filiform segments.—Barrel. icon. 57. t. 566. R. trichophy'llus, Chaix. in Vill. dauph. 1. p. 337. R. pántothrix, var. α. D. C. syst. 1. p. 135. R. fluviátilis, Wahl. veg. helv. no. 597. Flowers large or small. Carpels hispid, or rarely smooth.

Var. γ, cæspitòsus (D. C. l. c.) leaves stalked, all emersed ones with a suborbicular black mark, dissected into diverging stiff segments; petioles with a broad sheathing auricled base. R. aquátilis, var. β, Schk. hand. 2. no. 1527. t. 152. R. rígidus, Pers. in Hoffm. fl. germ. 4. p. 257. R. pántothrix β, D. C. syst. 1. p. 236. R. púmilus Poir. dict. 6. p. 133. R. circinnàtus, Sibth. in Smith. fl. brit. 2. p. 596. Fine Water-crowfoot, Pet. herb. t. 39. f. 3.

Var. δ, stagnàlis (D. C. l. c.) leaves sessile, all immersed, capillaceously-multifid, circinnate: segments short; sheaths obsoletely auricled, and are, as well as carpels, acutish and smoothish. R. stagnátilis, Wallr. sched. 285.

Var. ε, peucedanifólius (D. C. l. c.) leaves stalked, all immersed, dissected into long parallel segments. R. fluitans, Oed. fl. dan. t. 376. R. peucedanifòlius, All. ped. no. 1469. R. pántothrix γ, D. C. syst. 1. p. 236. R. peucedanoìdes, Desf. atl. 1. p. 444. R. fluviátilis, Willd. spec. 2. p. 1333.

Water-Crowfoot. Fl. April. Aug. Britain. Pl. flt.

SECT. II. RANUNCULA'STRUM, (from *Ranunculus* and *astrum*, an affixed signification; like) D. C. prod. 1. p. 27. Carpels smooth, compressed, disposed in spikes. Roots grumose. Flowers yellow, but variable in *R. Asiáticus*. Leaves toothed, or dissected.

5 R. BULLA'TUS (Lin. spe. 774.) eaves all radical, stalked, ovate, toothed; scape naked, 1-flowered. ♃. H. Native of the region of the Mediterranean, especially in Portugal, Andalusia, Mogadore, Algiers, Corsica, Sicily, Malta, Crete; in uncultivated fields, olive plantations, and cretaceous hills. Flowers yellow, sweet scented, 9-12-petalled, single or double, sometimes small, as in *R. flámmula*; sometimes large, as in *R. bulbòsus*.

Var α, parviflòrus (D. C. syst. 1. p. 254. prod. 1. p. 27.) flower small; scape pilose; leaves a little blistered.—Clus. hist. 1. p. 238. f. 2.—Tabern. icon. 50. f. 1 and 2.—Ger. hist. 954. f. 10.—Mor. hist. 2. p. 447. sect. 4. t. 31. f. 51.

Var. β, grandiflòrus (D. C. l. c.) flower large; scape clothed with pressed hairs; leaves much blistered.—Clus. hist. 1. p. 238. f. 1.—Ger. herb. 855. f. 11.—Mor. hist. 2. p. 447. sect. 4. t. 31. f. 49, 50.

Blistered-leaved Crowfoot. Fl. Aug. Sept. Clt. 1640. Pl. 1 ft.

6 R. CHÆ'ROPHY'LLOS (Lin. spe. 780.) radical leaves stalked, and somewhat villous, trisected; segments once or twice 3-parted, acute; the first or primordial leaves ovate, toothed or 3-lobed; stem erect, 1 or 2-flowered; calyx spreading, somewhat reflexed. ♃. H. Native throughout the south of Europe, North Africa, and Archipelago, in hills and fields. The first leaves are oval, the successive ones more and more dissected. Carpels acuminated, with the styles, densely crowded into ovate, oblong heads.

Var. α, vulgàris (D. C. l. c.) leaves nearly all trisected, multifid.—Col. ecphr. 1. p. 212. t. 311.—Mor. hist. 2. p. 446. sect. 4. t. 30. f. 44.—Barrel. icon. 581. R. chœrophýllos, Lin. spe. 780. R. Illýricus, Poir. dict. 6. p. 121. exclusive of the synonyms.

Var. β, gregàrius (D. C. syst. 1. p. 255. prod. l. c.) some of the leaves trifid, cut, others trisected, multifid. R. gregàrius, Brot. fl. lus. 2. p. 369. R. Thomàsii, Ten. prod. fl. neap. suppl. 2. p. 68.

Var. γ, flabellàtus (D. C. l. c.) some of the leaves oval, toothed, others trisected, multifid. R. flabellàtus, Desf. atl. 1. p. 438. t. 114. Smith, fl. græc. t. 520.

Chervil-leaved Crowfoot. Fl. Jul. Aug. Clt. 1820. Pl. 1 foot.

7 R. AGE'RII (Bertol. opus. sc. 3. 1819. p. 182. t. 6.) leaves smooth, first ones reniform, 3-lobed, crenated, succulent, 3-parted, ultimate ones ternate; lobes multifid, linear; stem 2-leaved, hairy, usually 1-flowered; calyx reflexed; carpels ending in subulate points. ♃. H. Native of Buenos Ayres.

Ager's Crowfoot. Pl. 1 foot.

8 R. PALUDÒSUS (Poir. voy. 2. p. 184. dict. 6. p. 108.) leaves pubescent, radical ones ternate; lobes multifid; upper leaves linear entire; stem erect, dichotomous; calyx adpressed. ♃. H. Native of Barbary about Lacalle and elsewhere, in marshes. R. chæ'rophýllos var. d, Bir. ren. 42. Corolla of *R. àcris*. Carpels almost pointless, collected into elliptical heads. Calyx villous.

Marsh Crowfoot. Fl. May, June. Clt. 1816. Pl. 1 foot.

9 R. ADSCE'NDENS (Brot. fl. lus. 2. p. 63. t. 37.) leaves woolly, radical ones 3-parted: segments cuneated, trifid, deeply toothed; stems ascending, dichotomous; peduncles furrowed, angular; calyx reflexed. ♃. H. Native of Portugal about Coimbra and elsewhere in Beira and Estramadura, at the bottom of hills in bushy and shady places. Stature great. Leaves large, usually spotted at the recesses.

Ascending-stemmed Crowfoot. Fl. May, June. Pl. 4 feet.

10 R. MILLEFOLIA'TUS (Vahl. symb. 2. p. 63. t. 37.) leaves decompound, multifid; lobes linear, smooth; stem almost leafless, erect, villous, 1-flowered; calyx pressed. ♃. H. Native of the kingdom of Tunis about Cape Carthage in cultivated places, and on the mountains of the Morea, and Naples. Desf. atl. 1. p. 441. t. 116. Smith fl. græc. 521. Very like *R. chæ'rophýllos*, but differing in the tubercles of the roots being shorter and thicker; leaves always decompound; flower larger, calyx pressed, not reflexed.

Thousand-leaved Crowfoot. Fl. May, July. Plant 1 foot.

11 R. SCA'BER (Presl. ex Spreng. syst. app. p. 218.) leaves decompound, multifid, scabrous; segments linear-oblong, obtuse; calyx pubescent, reflexed; stem erect, leafy, many-flowered, clothed with close-pressed pubescence; roots grumose. ♃. H. Native of Sicily.

Scabrous Crowfoot. Pl. 1 foot.

12 R. GRA'CILIS (D. C. syst. 1. p. 256.) leaves very smooth, some orbicular 3-lobed, toothed at top, others ternate, with oblong deeply lobate lobes; stem nearly leafless, erect, clothed with pressed hairs, 1-flowered; calyx reflexed, a little pilose. ♃. H. Native of the Archipelago in the island of Cos. R. nov. spe.

Clarke's Travels, 2. p. 723. Sepals oval, reflexed, somewhat pilose on the outside. Petals obovate, orbicular, size of those of *R. àcris*. Flower terminal, erect, yellow.

Slender Crowfoot. Fl. May, June. Clt. 1818. Pl. ½ ft.

13 R. FUMARIÆFÒLIUS (Desf. in icon. pict. hort. paris, 37. t. 74.) leaves quite smooth, pinnate, many-parted; lobes oblong; scapes numerous, 1-flowered, clothed with pressed villi; calyx spreading, smooth. Native? Formerly cultivated in gardens. R. rutæfòlius, Mill. dict. no. 6. but not of Lin. Scapes sometimes leafless, sometimes furnished with one multifid leaf about the middle. Sepals ovate, oblong. Flowers always double, yellow, about the size of the double-flowered var. of *R. acris*. A species allied on one side to *R. grácilis* and *R. millefoliàtus*, on the other to *R. Asiáticus*.

Fumitory-leaved Crowfoot. Fl. May, Jul. Clt? Pl. 1 foot.

14 R. MYRIOPHY'LLUS (Russel. gew. alep. in Schrad. journ. 1799. p. 424.) leaves decompound, multifid, hoary-villous; segments linear; stem branched, beset with close pressed hairs, calyx spreading, villous. ♃. H. Native between Aleppo and Mossul. The whole herb canescent, with white villi. Petals yellow, obovate, a little longer than the calyx. Ovaries collected into an oval-oblong head.

Myriad-leaved Crowfoot. Fl. May, June. Pl. 1 foot.

15 R. ORIENTA'LIS (Lin. spe. 781.) leaves decompound, multifid, pubescent; stem branched, clothed with close, pressed villi; calyx reflexed; carpels with long horns. ♃. H. Native of the Levant, island of Lesbos. Deless. icon. sel. 1. t. 32. stem from a finger to a hand high. Peduncles short, 1-flowered; petals oblong.

Var. β, R. O. pulsatillæ folio parvo flore. Tourn. cor. p. 20. Native of Smyrna. Scarcely differs from the first unless that the petals are a little narrower.

Eastern Crowfoot. Pl. ½ foot.

16 R. LEPTA'LEUS (D. C. syst. 1. p. 258.) leaves decompound, multifid, smooth; stem pilose; calyx spreading; carpels with long horns. ♃. H. Native of the island of Cyprus. Deless. icon. sel. 1. t. 33. Carpels as in the preceding species hooked at the apex.

Slender Crowfoot. Fl. May, June. Pl. 2 foot.

17 R. CICUTA'RIUS (Schlecht. anim. ran. 25. t. 4. f. 2.) leaves pinnate and pinnate-parted; segments cuneated, cut, or toothed, smooth; stem somewhat branched, covered with close-pressed villi; calyx spreading, pubescent. ♃. H. Native of eastern Siberia.

Cicuta-like Crowfoot. Fl. May, July. Clt. 1818. Pl. 1 ft.

18 R. OXYSPE'RMUS (Willd. spec. 2. p. 1328.) leaves villous, radical ones stalked, ovate, 3-parted, toothed, floral ones 3-parted; lobes elongated, toothed at the top; stem erect, villous, dichotomous; calyx reflexed; carpels muricated, awned. ♃. H. Native of Tauria, Caucasus, Iberia, and Syria near Aleppo, in fields. Petals oblong or obovate. Carpels disposed into an ovate-oblong head, muricated, with the back smooth, ending in straight, stiff, awl-shaped points. Perhaps a distinct section.

Sharp-seeded Crowfoot. Fl. May, Ju. Clt. 1822. Pl. 1 ft.

19 R. PEDA'TUS (Waldst. and Kit. hung. 2. p. 112. t. 108.) leaves smooth, radical ones stalked, 3-parted or pedate; lobes linear, entire or bifid; stem leaves sessile, parted, uppermost ones linear; stem erect, few-flowered, calyx adpressed. ♃. H. Native of Hungary near Buda, Tartary, and in Siberia near the river Volga. Lodd. bot. cab. 4. p. 351. Sims, bot. mag. t. 2229. Stem pubescent or smooth, or with the base smooth and the top pubescent, 1-5-flowered. Carpels disposed into an ovate head.

Pedate-leaved Crowfoot. Fl. May, Ju. Clt. 1306. Pl. 1 ft.

20 R. PETROSELÌNUS (Biria, ren. 43. t. 2.) leaves smooth, but villous at the base of the petioles, ternate; segments 3-parted; lobes somewhat 3-lobed, deeply toothed; stem erect, many-flowered. ♃. H. Native of the island of Bourbon. Stem 2 feet high. Sepals oblong, acute. Carpels ovate, pointed with the very short styles, collected into ovate-oblong heads.

Parsley-like Crowfoot. Pl. 2 feet.

21 R. ILLY'RICUS (Lin. spe. 776.) leaves clothed with silky wool, first ones entire linear, the rest 3-parted, with entire or 3-parted linear lobes; stem erect, many-flowered; calyx somewhat reflexed. ♃. H. Native of Dalmatia in pastures, Austria on Mount Hamburgh; in shady places in Mount Hæmus; not rare in Tauria and about Odessa. Jacq. aust. t. 222.—Lob. icon. 672. Tab. icon. t. 48. f. 1. R. tomentòsus, Mœnch. meth. 212. R. gramíneus, Habl. taur. 149 from Bieb. R. seríceus, Willd. enum. 589, not Poir. Like *R. Monspelìacus*, but differs in having the first leaves entire, not trifid. Carpels acuminated, collected into ovate-oblong heads.

Illyrian Crowfoot. Fl. May, June. Clt. 1596. Pl. 1½ ft.

22 R. MONSPELIA'CUS (Lin. spe. 778.) leaves woolly, radical ones 3-lobed; lobes cuneated, trifidly-toothed; upper leaves 3-parted, with entire linear lobes; stem erect, few-flowered; calyx reflexed; spikes of carpels ovate. ♃. H. Native in the region of the Mediterranean, in sunny pastures or among rocks, especially in Arragon, Occitania, Provence, Italy, Algiers, and Tunis. Similar but differing from *R. Illýricus* by the radical leaves being 3-parted, toothed; the rest very variable, as may be seen from the number of varieties.

Var. α, angustifòlius (D. C. l. c.), inhabits exposed situations; lobes of leaves narrow, elongated. R. Illyricus, Besl. eyst. vern. ord. 1. t. 13. f. 1. Gouan. fl. monsp. p. 269. Willd. enum. 589.

Var. β, cuneàtus (D. C. l. c.) inhabits grassy places; lobes of leaves wedge-shaped, trifidly toothed at the top.—Mor. hist. 2. p. 445. sect. 4. t. 30. f. 43. R. Monspelìacus, D. C. icon. gall. rar. t. 50. R. apiifòlius. Desf. in pict. hort. par. 37. t. 73. not Pers.

Var. γ, rotundifòlius (D. C. l. c.) inhabits rocks; leaves roundish, trifid; lobes toothed, obtuse.—Mor. hist. 2. p. 446. sect. 4. t. 30. f. 47. (bad). R. Monspelìacus. Gouan. fl. monsp. 279. Poir. dict. 6. p. 111. R. saxátilis, Balb. misc. p. 27.

Montpelier Crowfoot. Fl. April, May. Pl. 1½ foot.

23 R. SPICA'TUS (Desf. fl. atl. 1. p. 438. t. 115.) leaves somewhat hairy, radical ones stalked, orbicular, 3-lobed, upper ones 3-parted; lobes entire linear; stem erect, few-flowered; calyx reflexed. ♃. H. Like the preceding, but with the leaves less hairy, and less profoundly cut, rounder and larger. Carpels very much compressed, hooked at the top, collected into a cylindrical spike. Leaves 3-lobed and toothed in the same specimen.

Var. α, vèra; leaves 3-lobed, toothed, stem 1 to 2-flowered. Native about Algiers in marshy places. R. spicàtus. Desf. l. c. Bir. ren. 42.

Var. β, Olyssiponénsis (Pers. syn. 2. p. 106.) leaves crenated; stem 1 to 2-flowered. Native about Lisbon. R. Lusitánica grumosa radice, foliis hederæ terrestris, Tour. inst. 286.

Var. γ, Carthusianòrum; leaves 3-lobed, crenated; stem 2 to 5-flowered. Native about Carthage. R. asphodeli radice, &c. Tour. herb.

Spiked Crowfoot. Pl. 1½ foot.

24 R. ASIA'TICUS (Lin. spe. 777.) leaves ternate or biternate; segments toothed or deeply trifid; stem erect, simple, or branched at the base; calyx spreading, afterwards reflexed; spikes of carpels cylindrical. ♃. H. Native of the Levant. Smith fl. græc. t. 518. In all the varieties the petals are obovate and longer than the calyx, very blunt, and larger than in the rest of *Ranunculi;* carpels smooth, much compressed, hooked with the remaining style. The three varieties enumerated are perhaps so many distinct species.

Var. a, vulgàris (D. C. l. c.) stem branched at the bottom; leaves ternate; segments trifid, cut, acute. Native of the Levant.—Clus. hist. 1. p. 241. f. 2. R. Asiáticus, Mill. icon. t. 216; dict. No. 11. A very variable variety and a great ornament to gardens, where its variations are innumerable. Flowers double or single, white, yellow, red, purple, and variegated, in fact of all colours, blue excepted. This variety is called the *Persian Ranuncu'us.*

Var. β, sanguíneus, (D. C. prod. l. c. syst. 1. p. 262.) stem simple; leaves ternate; segments toothed, obtuse. Native of the Archipelago, Caria, Cilicia, and Syria.—Clus. hist. 1. p. 242. icon. R. sanguíneus, Mill. dict. No. 10. Flowers always double, purple, yellow, orange, and variegated with the same colours, excluding all colours verging upon white or blue. This variety is called the *Turkey Ranunculus.*

Var. γ, tenuílobus (D. C. l. c.) stem somewhat branched; leaves multifid, with linear-acute lobes. Native of the island of Cyprus. R. Creticus albo flore. J. Bauh. hist. 3. p. 862. f. 2. (ex herb. Vaill). Flowers white, yellow, rarely purple.

According to Maddock a fine *Ranunculus* should have a strong straight stem from 8 to 12 inches high. The flower should be of an hemispherical form, at least two inches in diameter, consisting of numerous petals gradually diminishing in size to the centre, lying over each other, so as neither to be too close, nor too much separated, but having more of a perpendicular than a horizontal direction, in order to display the colours with better effect. The petals, with entire well-rounded edges, their colours dark, clear, rich, or brilliant, either of one colour or variously diversified on an ash, white, sulphur, or fire-coloured ground, or else regularly striped, spotted, or mottled in an elegant manner. The varieties raised from seed are endless. Maddock, in the end of the last century, had nearly eight hundred, all with proper names, and ranged as purple, grey, crimson, red, rosy, orange, yellow, white, olive, coffee, striped, spotted, &c. No plant is more prolific in new varieties from seed; no two plants, as Maddock observes, producing flowers alike, or the same as the original. Established sorts are propagated by offsets which usually flower the first year; rare sorts may be multiplied by dividing the crown of the tuber with a sharp penknife into as many parts as there are buds: these will not flower till the second year, but will diminish the risk of losing a very rare variety.

The Ranunculus prefers a fresh loamy soil, rather than otherwise inclined to clay: it should be well manured, and it is customary in forming the beds to place a stratum of well-rotted cowdung, six or nine inches below the surface, which both retains moisture and supplies nourishment. The roots may either be planted in November or earlier, in which case, to prevent their being destroyed by the frost, they should be mulched, or they need not be planted till March. The former mode gives much the strongest bloom, as the roots when kept in air all the winter are apt to be over dried, and kept in sand they sometimes get mouldy, and in this and similar cases the progress of vegetation from the planting to the flowering period is more rapid than is natural to the plant. Ranunculus roots will retain their vegetative properties two and sometimes three years, a thing not uncommon among bulbs and tubers. In order to obtain good new varieties of this plant, seeds should be saved from the best plants of the semi-double kinds, and be sown in flat pans or boxes filled with light rich earth in August, covering them a quarter of an inch thick with the same sort of earth, placing them in a frame when frost is apprehended. In the following season, when their leaves begin to decay, the roots may be taken up and dried in the same manner as the old roots, and planted with them in October, and in the following summer they will produce flowers, when such as are good should be marked. The plants intended to flower should not be suffered to run to seed, as roots which have produced seeds seldom furnish fine flowers afterwards.

Asiatic Crowfoot, or common garden Ranunculus. Fl. May, June. Clt. 1596. Pl. $\frac{3}{4}$ foot.

25 R. JAPO'NICUS (Thunb. in Lin. soc. trans. 2. p. 337.) leaves hairy, radical ones roundish, 3-cleft, with toothed, cut lobes, upper ones cleft; stem erect, hairy, branched at the top. ♃. H. Native of Japan near Nagasaki, Jedo, and elsewhere, common in ditches. R. Asiáticus, Thumb. jap. 241. R. Langsdòrfii. Spreng. syst. 2. p. 652. All parts of the plant except the corolla are hairy. Stem flexuous, scarcely leafy, branching into peduncles at the top.

Japan Crowfoot. Pl. 1 foot.

26 R. KRA'PFIA (D. C. in Deless. icon. sel. 1. t. 35.) leaves villous, radical ones on long stalks, ovate, somewhat trifid, toothed, stem ones small, tapering to the base, trifid at the top; stem 1-flowered. ♃. H. Native of Chile about Huassa-Huassi. Krápfa ranunculìna. D. C. syst. 1. p. 228. Petals 5, from the dried specimen apparently purple, obovate, retuse nearly as in *Tróllius Europæ'us*, and about the same size, equalling the calyx in length.

Krápf's Crowfoot. Pl. 1 foot.

27 R. GUZM'ANNI (Humb. tabl. reg. equ. 69. nov. gen. 5. p. 43.) upper surface of leaves and petioles villous, radical leaves rather orbicular, trifid; lobes grossly toothed at the top; upper leaves trifid with oblong entire lobes; stem erect, pilose, few-flowered; calyx pressed, very villous. ♃. H. Native of the rocky tops of the Andes near to the Equator. Deless. icon. sel. 1. t. 34. Petals obovate, rather orbicular, scarcely longer than the calyx.

Guzmann's Crowfoot. Pl. $\frac{1}{4}$ foot.

28 R. MACROPE'TALUS (D. C. prod. 1. p. 29.) petioles furnished with a broad membrane; radical leaves orbicular, crenated, smooth, or pilose, cauline ones ovate-lanceolate, sessile; stem smooth, few-flowered; calyx pressed, much smaller than the petals. ♃. H. Native of Peru on mountains. R. cochlearifòlius, R. et P. in herb. Lamb. not Horn. Leaves large. Flowers resembling a *Tróllius* but rather larger.

Long-petalled Crowfoot. Pl. $1\frac{1}{2}$ foot.

29 R. CRE'TICUS (Lin. spe. 775.) leaves and stems hairy, radical ones stalked, cordate-orbicular, somewhat cut, toothed, stem ones sessile, 3-parted; lobes oblong obtuse, somewhat toothed at the top; stem branched, many-flowered; calyx pressed. ♃. H. Native of the islands in the Archipelago, especially in Crete, Scio, &c. Aubr. in pict. hort. par. 37. t. 97.—Clus. hist. 1. 236. f. 1. Flowers large golden. Carpels smooth, much compressed, acuminated with the permanent styles, crowded into elliptical-cylindrical heads.

Var. β, macrophýllus (Desf. atl. 1. p. 437.) leaves less villous, larger, profoundly lobed, with the teeth a little rounder. Native of Barbary, near Sbiba, on the borders of rivulets.

Cretan Crowfoot. Fl. April, May. Clt. 1658. Pl. 1 foot.

30 R. CORTUSÆFÒLIUS (Willd. enum. 588.) leaves and stem somewhat pilose; radical leaves somewhat cordate-reniform, a little lobed, broadly crenated, stem ones almost sessile, 3-5-parted, floral ones lanceolate; stem branched, corymbose; calyx spreading much. ♃. H. Native of the Canary Islands on rocks, as well as of Sicily. Deless. icon. sel. 1. t. 36.—Pict. hort. par. 37. t. 96, exclusive of the synonyms. R. heucheræfòlius, Presl. Flowers yellow, smaller than in *R. Créticus*, but larger than in *R. lanuginòsus.* Fruit as in *R. Créticus.*

Var. a, radical leaves orbicular and cordate at the base, exactly like those of *Cortùsa Mathìola*, stem ones with toothed lobes.

Var. β, Teneriffæ (Pers. ench. 2. p. 103.) radical leaves reniform, somewhat truncate at the base, scarcely cordate, cauline

ones cleft into entire lobes. Native of Teneriffe. R. Créticus, Var. b, Bir. ren. 45.

Cortusa-leaved Crowfoot. Fl. May, Ju. Clt. 1826. Pl. 1 ft.

31 R. BREVICAU'LIS (Hook fl. bor. amer. 13. t. 7. A.) pubescent; radical leaves all cordate-ovate, entire, cauline ones crenate, palmately-multifid; stem erect, many-flowered, much shorter than the leaves; fruit globose; petals 6. ♃. H. Native of North America on the shores of Lake Huron. Root grumose. Mode of growth and general aspect like *R. parnassifòlius*. Flowers yellow.

Short-stemmed Crowfoot. Pl. $\frac{1}{4}$ foot.

SECT. III. THÒRA (φθορα, *phthora*, venom or corruption; because the Swiss hunters of wild-boars use the roots of *R. Thora* to envenom their darts) D. C. prod. 1. p. 30. Carpels smooth, almost globose. Roots grumose. Flowers yellow.

32 R. THÒRA (Lin. spe. 775.) leaves quite smooth, radical ones stalked, stem ones sessile, kidney-shaped, crenated, floral ones cut; stem 2-3-flowered, smooth. ♃. H. Native of the Alps of Switzerland, Austria, Greece, Apennines, Carpathian mountains, on rocks and in pastures near to the limits of perpetual snow. Jacq. fl. aust. 5. t. 442; obs. 1. p. 25. t. 13.

The root of this plant is reported to be extremely acrid and poisonous; its juice having been used formerly by the Swiss hunters of wild beasts, to envenom their darts, whose wound, by that means, becomes speedily fatal and incurable. Hence the name from φθορα, *phthora*, corruption or venom.

Venom Crowfoot. Fl. May, June. Clt. 1710. Pl. $\frac{1}{2}$ to 1 ft.

33 R. SCUTA'TUS (Walds. and Kit. pl. hung. 2. p. 205. t. 187.) leaves very smooth, without radical ones, stem ones sessile, kidney-shaped, crenate, floral ones cut; stem 3-4-flowered, rather pilose at the base. ♃. H. Native of Hungary in mountain woods. R. Thora. Towns itin. hung. p. 354 and 490. R. Thòra, var. scutàtus, Wahl. carp. no. 551. Very like *R. Thòra*, but differing in being without radical leaves, but with the lower ones clasping the stem. Sepals very blunt. Flowers and ovaries more numerous as well as larger than those of *R. Thòra*.

Shield-leaved Crowfoot. Fl. May, June. Clt. 1817. Pl. $\frac{3}{4}$ ft.

34 R. BREVIFÒLIUS (Ten. fl. neap. prod. suppl. 2. p. 68.) leaves very smooth, radical ones coriaceous, stalked, and 3-lobed, with the intermediate lobe 3-parted, stem-leaves sessile, wedge-shaped, 3-parted; stem 1-flowered, incurved. ♃. H. Native of the kingdom of Naples, on the rocks of Mugella. Like *R. Thòra*. Petioles flexuous, with a single small leaf on each stem.

Short-leaved Crowfoot. Fl. May, Ju. Clt. 1824. Pl. 1 foot.

35 R. HY'BRIDUS (Bir. ren. 30.) leaves very smooth, radical ones on long footstalks, kidney-shaped, crenately-lobed, stem ones two, on short stalks, lobed at the apex; stem 1-3-flowered. ♃. H. Native of the Alps of Austria. R. Thòra Sturn. deutsch. fl. with a figure. Jacq. obs. 1. t. 13. Like *R. Thòra* in habit, but with roots like *R. aurícomus*.

Hybrid Crowfoot. Fl. June, July. Clt. 1820. Pl. 1 foot.

SECT. IV. HECATÒNIA, (from ἑκατον, *hekaton*, a hundred; a name used by Loureiro to denote a number of germs) D. C. prod. 1. p. 30. Carpels smooth, roundish-ovate, disposed in a roundish head. Roots fibrous.

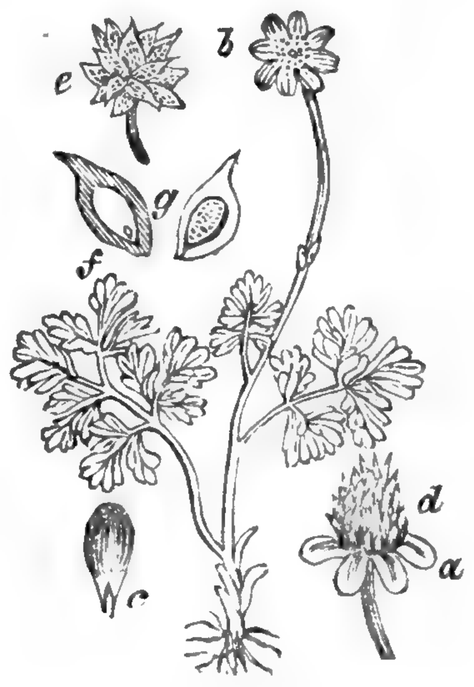
§ 1. *Flowers white. Leaves dissected.*

36 R. BITERNA'TUS (Smith, in Rees's cyclop. no. 48.) stem creeping; leaves 3-parted, with the partitions 3-lobed; lobes oblong, acute, entire or somewhat toothed; petals oblong, equal in length with the calyx. ♃. H. Native of the Straits of Magellan in water. A very small, slender, many-stemmed plant. Leaves on long stalks. Flowers smaller than those of *R. aquátilis*. Petals blunt, with a yellow claw.

Biternate-leaved Crowfoot. Fl. July. Pl. $\frac{1}{4}$ foot.

37 R. RUTÆFÒLIUS (Lin. spec. 777.) leaves pinnate, with 3-lobed multifid lobes; stem generally 1-flowered; calyx glabrous; petals 8-10 with a two-coloured claw. ♃. H. Native of the higher Alps of Europe among rocks near the limits of perpetual snow. Wulf. in Jacq. coll. 1. p. 186. t. 6, 7. All. pedem. no. 1451. t. 67. f. 1. Stem very rarely bearing 2 or 3 flowers. Petals oblong with an orange claw. (f. 9.)

FIG. 9.



Rue-leaved Crowfoot. Fl. May, Jul. Clt. 1759. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

38 R. ISOPYROÌDES (D. C. syst. 1. p. 238.) radical leaf pinnate with stalked twice trifid segments, cauline ones ternate; calyx smooth; petals 5, oval. ♃. H. Native of Siberia near the Lake Baikal. R. fumariæfòlius Fisch. in litt. Very like *R. rutæfòlius*. Petals sometimes beyond 5, twice as long as calyx. Peduncles 2 or 3, rising from the axillæ of the upper leaves or terminal. Ovaries 8-10, smooth.

Isopyrum-like Crowfoot. Fl. May, Ju. Clt. 1818. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

39 R. GLACIA'LIS (Lin. spec. 777.) radical leaves stalked, palmately 3-parted or ternate, with trifid lobes and bluntish lobules; stem generally 1-flowered; calyx very hairy; carpels compressed, marginate. ♃. H. Native of the higher Alps of Europe from Austria to Provence, Pyrenees, Hungary, Lapland, Iceland, &c. among rocks near the limits of perpetual snow. Wulf. in Jacq. coll. 1. p. 189. t. 8, 9. f. 1, 2. Scape 1-3-flowered. Leaves usually smooth, but the upper ones are sometimes villous. Petals somewhat orbicular, bluntly emarginate, length of calyx white or reddish, suffused with purple. Flowers seldom double.

Var. β? aconitoìdes (D. C. prod. 1. p. 30.) segments of leaves cuneated, acutely cut at the apex. A. hybrid, between *R. glaciàlis* and *R. aconitifòlius*.

Icy Crowfoot. Fl. Ju. Aug. Clt. 1775. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

40 R. CHAMISSÒNIS (Schlecht. anim. ran. 1. p. 12. t. 1.) radical leaves stalked, 3-parted; partitions cuneated, 3-lobed; lobes entire, bluntish; calyx very hairy; carpels oval, bladdery, acuminated, curved at the base. ♃. H. Native at the bottom of Icy Mountains in the Bay of St. Laurence. Stem 1-flowered.

Chamisso's Crowfoot. Pl. $\frac{1}{2}$ foot.

41 SEGUIE'RI (Vill. dauph. 4. p. 735. t. 49.) leaves 3-parted, with acute or bluntish entire trifid partitions; stem generally 1-flowered; calyx smooth; petals 5, entire. ♃. H. Native of the Alps of Provence, Dauphiny, Piedmont, Carniolia, in the fissures of rocks near the limits of perpetual snow. R. Colúmnæ, All. pedem. 1453. t. 67. f. 3, 4. Like *R. glaciàlis* and *alpéstris*. Floral leaves small, sessile, entire, or trifid. Stem from 1-3-flowered, villous under the flower. Calyx sometimes hairy. Petals orbicular, entire, longer than the calyx.

Seguier's Crowfoot. Fl. June, Jul. Clt. 1819. Pl. $\frac{1}{2}$ foot.

42 R. ALPE'STRIS (Lin. spec. 778.) leaves orbicular, cordate, 3-lobed, with the lobes deeply crenate at the apex, blunt; stem usually 1-flowered; calyx smooth; petals 5, obcordate or 3-lobed. ♃. H. Native of the Carpathian mountains, Pyrenees, and Alps of Jura, &c. on rocks and in the higher pastures. In Scotland in moist places, about two or three rocks on the Clova mountains in Angushire. The leaves are sometimes hardly trifid, sometimes trifid, sometimes 3-parted. Flowers varying in size, either single or double. Petals obcordate or 3-lobed. Smith, eng. bot. 2390. Jacq. aust. t. 110.

Haller says this is one of the most acrid of its tribe, blistering

the skin; and yet Alpine hunters chew it by way of refreshment, as removing fatigue and preventing giddiness.

Var. β, Magellénsis (Ten. cat. hort. app. 1. p. 53.) differs from var. α, in the lobes of the leaves being crenate, not 3-parted.

Var. γ, Traunfelnèri (Hopp. Jahrg. 1819. 731. ex icon. Schlecht. anim. ran. 2. p. 6.)

Alp Crowfoot. Fl. Ju. Aug. Scotland. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

43 R. CRENA'TUS (Waldst. & Kit. pl. hung. p. 119. t. 10.) leaves cordate, roundish, crenate at apex; stem 1-flowered; calyx smooth; petals 5, obcordate, crenate at apex. 4. H. Native in moist places on the mountains of Hungary, near the limits of perpetual snow. Like *R. alpéstris*, but with the scape always 1-flowered, and the petals are furnished with a melliferous pore at their base, not with a scale.

Crenate-petalled Crowfoot. Fl. Ju. Aug. Clt. 1818. Pl. $\frac{1}{2}$ ft.

44 R. ACONITIFÒLIUS (Lin. mant. 79.) leaves palmate, 3-5-parted, with the partitions deeply toothed; upper leaves sessile, cleft into linear-lanceolate lobes; stem branched, many-flowered; bracteas lanceolate serrated; calyx pressed, smooth. 4. H. Native of middle Europe, in moist pastures on the higher mountains, particularly in Holland, Germany, Hungary, and north of Italy, &c. This plant varies much in size, according to the places of its natural growth; on the tops of the highest mountains it does not attain the height of three inches, but in the lower valleys it attains the height of two feet. In shady places it becomes smooth, but in dry situations it is downy. Flowers sometimes few sometimes numerous, with oblong cuneated or orbicular petals, with a linear scale at the base of each.

Var. α, hùmilis (D. C. syst. 1. p. 240.) radical leaves 3-5-parted; stem slender, glabrous. 4. H. R. aconitifolius, Lin. mant. 79.—Mor. hist. 3. p. 462. sect. 12. t. 2. f. 3. 5.

Var. β, crassicaúlis (D. C. l. c.) radical leaves 3-parted; stem thickish, clothed with pressed hairs at the top. 4. H. Native of the Pyrenees in moist places by the sides of rivulets. R. heterophýllus, Lapeyr. abr. 316. but not of Smith. This variety may prove a distinct species.

Aconite-leaved Crowfoot. Fl. May, Ju. Clt. 1596. Pl. $\frac{1}{2}$ to 2 ft.

45 R. PLATANIFÒLIUS (Lin. mant. 79. Fl. dan. t. 111.) plant tall; radical leaves with 5-7 acuminated toothed lobes; upper leaves sessile, cleft into linear-lanceolate lobes; stem branched, many-flowered; calyx pressed, smooth; bracteas linear entire. 4. H. Native of many parts of Europe on low mountains in bushy places. R. aconitifòlius var. δ, platanifòlius, D. C. syst. 1. p. 241.

There is a variety of this with double flowers, which is very common in our gardens under the name of *Double white Batchelors' Buttons* and *Fair Maids of France*. R. aconitifòlius, β, flòre plèno. Curt. bot. mag. t. 204.

Var. β, dealbàtus, radical leaves with 7 toothed lobes, whitish on the under surface; cauline leaves 3-lobed. 4. H. Native of the Pyrenees in the crevices of calcareous rocks. R. dealbàtus Lapeyr. abr. p. 315. R. platanifòlius, var. ε, D. C. syst. 1. p. 241.

Var. γ, intermèdius, plant tall; radical leaves 3-parted. 4. H. Native of the woods of Cevennes. A. platanifòlius, var. γ, intermèdius, D. C. syst. 1. p. 240.

Platanus-leaved Crowfoot. Fl. May, Ju. Clt. 1596. Pl. 1 to 2 ft.

46 R. TERNA'TUS (Thunb. fl. jap. 241.) leaves all ternate with ovate, trifid, toothed, segments; stem rather hairy, many-flowered; calyx reflexed. 4. H. Native of Japan in the island of Nipon. Deless. icon. sel. 1. t. 25. Very like *R. aconitifòlius, var. β.* leaves all stalked of a deep green, with the upper surface pubescent as well as the nerves on the under surface. Flowers small, on short pedicels.

Ternate-leaved Crowfoot. Fl. May, June. Pl. 1 foot.

47 R. LA'CERUS (Bell. in act. turin. 5. p. 233. t. 8.) leaves wedge-shaped, irregularly and acutely cut; stem smooth, branched, many-flowered; calyx pressed. 4. H. Native of the Alps of Valais, Dauphiny, Piedmont in fertile pastures but very rare. R. Pyrenæ'us. var. Vill. dauph. 4. p. 733. R. Vallesiàcus Sut. fl. helv. 1. p. 325. R. laciniàtus. Guid. herb. valais. p. 177. This plant is considered a hybrid, between *R. aconitifòlius* and *R. Pyrenæ'us*, because the carpels in cultivated plants have always been observed to be empty.

Var. β, pállidus (D. C. prod. 1. p. 31.) flowers pale yellow, not white. R. frigidus, Schrank. hort. monac. t. 57. but not of Willd. This is a Hybrid between *R. graminifòlius* and *R. aconitifòlius* according to Stoffels.

Torn-leaved Crowfoot. Fl. Ju. Jul. Clt. 1821. Pl. $\frac{1}{2}$ to 1 ft.

§ 2. *Flowers white. Leaves undivided.*

48 R. PYRENÆ'US (Lin. Mant. 248.) leaves linear or lanceolate, quite entire; scapes and peduncles downy at the top. 4. H. Native of the highest Alps of Europe, particularly in the Pyrenees near the limits of perpetual snow, common. Deless. icon. sel. 1. t. 27.—Mor. hist. 2. p. 445. sect. 4. t. 30. f. 4.? R. amplexicaúlis, var. γ, Gouan ill. 34.

Var. β, bupleurifòlius (D. C. syst. 1. p. 243.) stem 1-flowered; leaves lanceolate. 4. H. Native of the Pyrenees in moist places in the valleys of the lower hills. R. Pyrenæ'us, Jacq. misc. 1. p, 154. t. 18. f. 1. R. bupleurifòlius, Lapeyr. abr. 314. R. lanceolàtus. Guid. herb. valais. p. 177.

Var. γ, plantagíneus (All. pedem. no. 1445. t. 76. f. 1. but not of Pers.) stem many-flowered; leaves lanceolate. 4. H. Native of Piedmont.

Pyrenean Crowfoot. Fl. May, July. Clt. 1807. Pl. $\frac{1}{2}$ to 1 ft.

49 R. ANGUSTIFO'LIUS (D. C. rapp. voy. 1. p. 74. syst. 1. p. 243.) leaves linear, or rather lanceolate, glaucous, not stem-clasping; scapes and peduncles smooth. 4. H. Native of the Eastern Pyrenees about Mount Louis. Deless. icon. sel. 1. t. 27. R. amplexicaúlis, β. D. C. fl. fr. ed. 3. vol. 4. p. 889. R. Pyrenæ'us, α, Lapeyr. abr. pyr. 313. exclusive of the synonyms. An intermediate plant between *R. amplexicaúlis* and *R. Pyrenæ'us*, differing from the first in the peduncles being smooth, not downy, with smaller flowers; from the last in the leaves not clasping the stem, narrower. Scape 1-2 or 3-flowered.

Narrow-leaved Crowfoot. Fl. April, May. Clt. 1822. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

50 R. AMPLEXICAU'LIS (Lin. spec. 774.) leaves oval-lanceolate, acuminated, clasping the stem; scapes and peduncles smooth. 4. H. Native of the Alps of Europe, Provence, Apennines, Pyrenees, Iceland, and on the mountains of Leon in Spain, in high moist rocky situations. Curt. bot. mag. t. 226. Deless. icon. sel. 1. t. 27. f. c. R. plantaginifòlius, Sal. prod. 372. Leaves smooth, or with a few deciduous hairs on the edges, glaucous. Stem 3-6-flowered. Flowers snowy white, but when growing near the limits of perpetual snow they are said to be purplish, seldom double.

Stem-clasping-leaved Crowfoot. Fl. April, May. Clt. 1633. Pl. $\frac{1}{4}$ to $\frac{3}{4}$ foot.

51 R. PARNASSIFO'LIUS (Lin. spec. 774.) radical leaves stalked, rather heart-shaped, ovate-roundish, cauline ones sessile, ovate-lanceolate; peduncles hairy. 4. H. Native of the Alps and the Pyrenees, in the fissures of rocks contiguous to perpetual snow. Wulf. in Jacq. coll. 1. p. 191. t. 9. f. 3. Rœm. fl. europ. fasc. 5. icon. Hoh and Rein. itin. p. 190. Curt. bot. mag. 386. R. cordàtus, Guid. herb. valais. 177. Leaves somewhat coriaceous, with the foot-stalks much dilated at their base. Stem 1-6-flowered. Flowers snowy-white, sometimes purplish about the size of those of *R. amplexicaúlis*.

Var. β, parviflòrus (D. C. syst. 1. p. 244.) leaves acutish; flowers smaller. 4. H. Native of the Alps of Valais. *Schleicher.* Flowers always white.

Parnassia-leaved Crowfoot. Fl. Ju. Jul. Clt. 1769. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

§ 3. *Flowers yellow. Leaves undivided.*

52 R. GRAMÍNEUS (Lin. spec. ed. 1. p. 549. ed. 2. p. 773.) leaves lanceolate, linear, quite entire; stem erect, quite smooth, with fibres at the neck; scales of petals tubular; root fascicled. 4. H. Native of France, Valais, Spain, and Portugal, in argillaceous fields and meadows; in Britain, in dry alpine pastures of Wales. Curt. bot. mag. t. 164. Boiss. fl. eur. t. 380. Smith, engl. bot. t. 2306.—Bull. herb. t. 123. Plant somewhat glaucous, and smooth. Scape 1-3-flowered. R. amplexicaúlis, Gouan. hort. monsp. 265, exclusive of the synonyms of Linnæus. R. graminifòlius, Sal. prod. 372.

Var. α, lineàris (D. C. syst. 1. p. 245.) leaves linear.—Tab. icon. 51. f. 1.—Mor. hist. 2. p. 244. sect. 4. t. 30. f. 38.

Var. β, phœnicifòlius (D. C. l. c.) leaves lanceolate.—Moris. hist. 2. p. 445. sect. 4. t. 30. f. 39.

Var. γ, horténsis (D. C. l. c.) leaves linear-lanceolate; flowers double. Mor. hist. 2. p. 445. Perhaps this is nothing more than the double flowering variety of *R. língua*.

Grassy-leaved Crowfoot. Fl. Ap. June. Wales. Pl. $\frac{1}{2}$ to 1 foot.

53 R. LONGICAU'LIS (Ledeb. in litt. ex. Spreng.) leaves all nervous, obtuse, quite entire, and smooth, radical ones oblong-lanceolate on long stalks, stem ones linear, half-stem-clasping; stem tall, simple, rather pilose towards the top, few-flowered; sepals adpressed, rather hairy, about equal in length to the corolla. 4. H. Native of Russia on mount Imaus. This species differs from *R. gramíneus*, in the stem being almost simple, as well as in the radical leaves being broader and stalked, and in the petals being equal in length to the corolla, not longer.

Long-stemmed Crowfoot. Pl. 1 foot.

54 R. BUPLEUROÌDES (Brot. fl. lus. 2. p. 365.) radical leaves ovate-lanceolate, stalked, 3-5-nerved, quite entire; stem erect, woolly at the bottom; scales of petals tubular; root fascicled. 4. H. Native of Portugal on hills in Beira. R. plantagíneus, Pers. ench. 1. p. 102. but not of All. R. gramíneus, var. β, Bir. ren. 36. Like *R. gramíneus*, but differing in the stems being woolly at the base, and in the leaves being ovate-lanceolate, not linear-lanceolate.

Bupleurum-like. Fl. May. June. Pl. $\frac{1}{2}$ to 1 foot.

55 R. LI'NGUA (Lin. spec. 772.) leaves lanceolate, serrated, sessile, half-stem-clasping; stem erect, smooth; root creeping. 4. H. Native throughout the whole of Europe, Siberia, and North America, from Pennsylvania to Virginia, in marshes, fountains, and bogs. Smith, engl. bot. t. 100. R. palústris.—Weinm. phyt. t. 846. f. c. R. longifòlius, Lam. fl. fr. 3. p. 189. Great Spear-wort. Pet. engl. herb. t. 39. f. 5. Like *R. flámmula*, but larger in all its parts, and more rigid. Leaves entire, or toothed. Flowers sometimes double.

Var. β, grácilis (Schlecht. anim. ran. p. 17.) stem slender; leaves linear-lanceolate; flowers small.

Var. γ, laciniàtus (Schlecht. anim. ran. p. 17.) leaves jagged.

Tongue-leaved Crowfoot, or Great Spear-wort. Fl. May, Aug. Britain. Pl. 1 to 2 feet.

56 R. FLA'MMULA (Lin. spec. 772.) leaves smooth, linear-lanceolate, or somewhat ovate, almost entire, lower ones stalked; stem declinate, solid, throwing out roots at the joints; peduncles opposite the leaves; carpels smooth. 4. H. Native throughout the whole of Europe, North Asia, North Africa, and North America, in wet and boggy places. Smith, eng. bot. 117. Curt. fl. lond. t. 37. fl. dan. t. 572. Bull, herb. t. 12. Small Spear-wort. Pet. eng. herb. t. 39. f. 6. Differing from *R. lingua* in the stems being declinate, not erect, and rooting at the joints; solid, not fistular, from *R. reptans* in throwing out roots only at the lower joints of the stem. Flowers sometimes semi-double. Dr. Withering recommends the distilled water as an instantaneous emetic in cases of poison. He does not mention the dose. Lightfoot says the bruised leaves of this plant are used in many parts of the Highlands of Scotland, particularly in the isle of Skye and other places upon the coast, for the purpose of raising blisters. It is applied in one or more limpet shells to the part where the blisters are to be raised.

Var. β, serràtus (D. C. syst. 1. p. 247.) leaves all serrated. 4. H. Not so common as the first.—Mor. hist. 2. p. 442. sect. 4. t. 29. f. 35.

Var. γ, ovàtus (D. C. l. c.) leaves all ovate and stalked. 4. H. Very rare. R. ovàtus, Pers. ench. 2. p. 102.

Var. δ, arenàrius (D. C. l. c.) radical leaves ovate-lanceolate, stiff, cauline ones linear. 4. H. Native in sandy wet places about Bayonne. R. flammuloìdes of Rafin, is hardly distinct from this variety. R. lanceolàtus, Pall. herb.

Var. ε, intermèdius (Hook. fl. bor. amer. p. 11.) stem creeping, slender; leaves narrow-lanceolate, upper ones linear, quite entire. 4. H. Native of the gravelly banks of rivers from Canada to Lat. 69. and Newfoundland.

Flame Crowfoot or Lesser Spear-wort. Fl. June, Sep. Britain. Pl. $\frac{1}{2}$ to 1 foot.

57 R. RE'PTANS (Lin. spec. 773.) leaves linear, entire, smooth; stem creeping, and rooting at every joint; carpels smooth. 4. H. Native of Switzerland, Germany, Denmark, Sweden, Norway, Russia near Petersburgh on the banks of the river Neva, Siberia, and China near Pekin; in sandy wet places on the borders of lakes and rivers; in Britain, on the margins of alpine lakes. Lin. fl. lapp. 236. t. 3. f. 5. Fl. dan. t. 108. Light. fl. scot. f. in title. R. flámmula, var. δ, Smith, engl. fl. 3. p. 45. This plant is supposed to be a variety of *R. flámmula*, merely arising from the nature of the places where it grows wild, nevertheless it differs in the stems being filiform and rooting at every joint, as well as in the linear leaves, and much smaller flowers.

Var. β, filifórmis (Mx. fl. bor. amer. 1. p. 320.) leaves linear awl-shaped, obtuse; stems rooting at every joint. 4. H. Native of North America, in inundated places along the gravelly banks of the rivers, from Canada to Lat. 69, Hudson's Bay and Labrador. Pursh. fl. bor. amer. 2. p. 392. ? R. flámmula, γ, filifórmis, Hook. fl. bor. amer. p. 11.

Creeping Crowfoot or Spear-wort. Fl. Ju. Sep. Brit. Pl. $\frac{1}{8}$ ft.

58 R. NA'TANS (N. E. herb. Lamb.) plant floating; leaves on long stalks, which sheath the stem at their base, lanceolate, entire, or a little toothed, sometimes bifid; petals blunt, longer than the stamens and sepals. 4. W. H. Native of Mexico. Flowers axillary and terminal, small, yellow. Allied to *R. flámmula*.

Floating Crowfoot. Pl. flt.

59 R. PUSÍLLUS (Poir. dict. 6. p. 99.) leaves all on long stalks, with the lower ones ovate, a little toothed, and with the upper ones linear-lanceolate; stems many, erect; pedicels opposite the leaves; petals length of calyx. 4. H. Native of Carolina on the margins of fountains, and in low watery places on heaths. R. flámmula, Walt. fl. carol. 158. R. hùmilis, Pers. ench. 2. p. 102. Like *R. flámmula*, but differing in the roots being fibrous, and in the foot-stalk being 6-times longer than the leaf, as well as in the flowers being 3-times smaller; carpels ovate, compressed, granular.

Small Crowfoot. Fl. June, Aug. Pl. $\frac{1}{2}$ foot.

60 R. POLYPHY'LLUS (Willd. spec. 2. p. 1331.) leaves very numerous on the stem, collected in whorles, emersed ones stalked, ovate, rather 3-lobed, immersed ones rather filiform. ⊙. H. W. Native of Hungary in bogs and in water. Hayne, term. bot. t. 28. f. 3. Waldst. and Kit. hung. 1. p. 44. t. 45. Stem branched at the top, many-flowered. Flowers having either 5-petals or 3-petals. Perhaps a species of *Casàlia*.

Many-leaved Crowfoot. Fl. May, June. Pl. flt.

61 R. PULCHE'LLUS (Ledeb. in litt. ex. Spreng.) radical leaves ovate, acute, a little 3-toothed at the apex, on long petioles, cauline ones linear, stem-clasping, cut, upper ones 3-parted; stem simple, few-flowered; sepals much smaller than the corolla, and are villous as well as the peduncles. ♃. H. Native of Dahuria on Mount Imaus.

Neat Crowfoot. Pl. 1 foot.

62 R. SALSUGINÒSUS (Pall. itin. ed. 3rd. vol. 3. p. 173.) radical leaves stalked, oval, or somewhat cordate, 3-5-toothed at the apex; scapes naked, 1-flowered, erect; petals oblong, cuneated, longer than the calyx. ♃. H. Native of the Russian empire, especially in Siberia and Dahuria not far from Mount Odon-Tchelon, in salt marshes. Root fascicled, fibrous, emitting from the neck numerous filiform creeping flagellæ. Flowers about the size of those of *R. lanuginòsus*. Carpels ovate, oblong, longitudinally striped, awned, with the short straight styles.

Salt-marsh Crowfoot. Fl. April, July. Clt. 1822. Pl. ½ foot.

63 R. HYDROPHÌLUS (Gaudich. ex. Spreng. syst. app. p. 219.) stem creeping, floating; radical leaves orbicular-ovate, on very long petioles; peduncles 1-flowered. ♃. H. W. Native of the Falkland islands.

Water-loving Crowfoot. Pl. ½ foot.

64 R. CYMBALA'RIÆ (D. C. syst. 1. p. 252.) radical leaves stalked, smooth, ovate-orbicular, rather fleshy, deeply crenated; scapes 1-3-flowered, ascending, emitting flagellæ from the neck; petals linear, length of calyx. ♃. H. Native of Siberia about the Baikal abundant, and at the rivers Jenisee and Oby, as well as about Barnaoul, in salt-marshes. R. nànus, Fisch. in litt.—Amman, Ruth. 81. no. 107. t. 13. f. 2. Like *R. salsugìnosus*, but differs in its much smaller size, and in the leaves being more orbicular, and crenated all round the margin, as well as in the petals being linear, not oblong-cuneated.

Var. β, Americànus (D. C. syst. 1. p. 252.) R. cymbalariæ, Pursh. fl. bor. am. 2. p. 392. Smith, in Rees, cyclop. ♃. H. Native in Salem, Massachusetts; marshes near the salt works of Onondago, New York, and from Canada to near the Arctic sea, and from Hudson's Bay to the summits of the Rocky Mountains in marshy and shady places. The flowers of this plant are said to be sometimes white, and heads of carpels oblong, otherwise it is hardly distinguishable from the Siberian plant.

Var. γ, alpìnus (Hook. fl. bor. amer. p. 11.) plant smaller; leaves 3-toothed at the apex; scape 1-flowered. Native of the Rocky Mountains, North America.

Boat-shaped-leaved Crowfoot. Fl. Ju. Jul. Clt. 1824. Pl. ¼ ft.

65 R. HALOPHILUS (Schlecht. anim. ran. p. 23. t. 4. f. 1.) radical leaves stalked, smooth, rather fleshy, cuneated, 3-toothed at the apex; runners rising from the neck of the stem; scapes 1-flowered, almost twice as long as the petioles; petals obovate, cuneated, longer than the calyx. ♃. H. Native of Siberia. A very small smooth plant. Calyx 5-sepalled; corolla 5-petalled. Carpels terminated by a hooked beak, disposed in an ovate head.

Salt-loving Crowfoot. Pl. 2 inches.

66 R. JAVA'NICUS (Blum. bijd. ex. Spreng. syst. app. p. 218.) leaves all stalked, cordate-ovate, crenate, upper ones lanceolate or trifid; peduncles opposite the leaves, 1-flowered; petals twice as long as the calyx. ♃. S. Native of Java.

Java Crowfoot. Pl. ¼ foot.

67 R. FONTA'NUS (Presl. ex. Spreng. syst. app. p. 218.) stem ascending, fistular; leaves toothed, lower ones stalked, cordate-ovate, blunt; upper ones linear-oblong, tapering into the petiole; peduncles opposite the leaves; petals longer than the calyx. ♃. H. W. Native of Sicily.

Fountain Crowfoot. Pl. ¼ foot.

68 R. TRIDENTA'TUS (H. B. et Kth. nov. gen. et spec. amer. 5. p. 42.) radical leaves stalked, smooth, somewhat fleshy, ovate, 3-toothed at the apex; scapes 1-2-flowered, smooth, length of petioles; petals linear, longer than the calyx. ♃. S.

Var. α, màjor (H. B. l. c.) ♃. S. Native of Mexico, near Carpio. R. stoloníferus, Lamb. herb.

Var. β, mìnor (H. B. l. c.) ♃. S. Native of Latacunga. Furnished with creeping flagillæ, but sometimes without.

Three-toothed-leaved Crowfoot. Fl. June, July. Pl. ⅛ foot.

69 R. NUBI'GENUS (H. B. and Kth. nov. gen. and spec. amer. 5. p. 42.) radical leaves stalked, almost orbicular, 7-toothed, smooth, rather fleshy; scape almost naked, generally 2-flowered, pubescent at the top; bracteas linear, somewhat 3-toothed. ♃. F. Native of Peru, on Mount Antisana. A very small and very smooth herb, with very small flowers, and a pressed calyx.

Cloud Crowfoot. Pl. 1 inch.

70 R. BREVISCA'PUS (D. C. syst. 1. p. 253.) radical leaves stalked, orbicular, cordate, 3-5-cleft; scapes 1-flowered, shorter than the foot-stalks, emitting flagellæ from the neck. ♃. F. Native of Peru. Flowers small, with pressed calyxes and obtuse petals. This plant is poisonous to animals, and is therefore called *Centélla*, according to Dombey.

Short-scaped Crowfoot. Pl. ¼ foot.

71 R. PALLA'SII (Schlecht. anim. ran. 1. t. 2.) stem creeping, fistulous; leaves all stalked, oval or obovate, cuneated, 3-parted; calyx 3-sepalled; flowers 8-petalled; carpels thick, ovate smooth, beaked, disposed into a round head. ♃. H. Native of North America, on the western coast, in marshy places; beyond Behring's Straits, in the bays of Eschscholtz and Good Hope, and in the little island St. George, to the north of the Aleutian Islands. Habit of *R. flámmula*, quite smooth.

Pallas's Crowfoot. Pl. ½ foot.

§ 4. *Flowers yellow. Leaves dissected.*

72 R. AURÍCOMUS (Lin. spec. 775.) leaves smooth, radical ones stalked, cordate, generally 3-parted, or 3-lobed, stem ones divided to the base, into linear, entire, or toothed lobes, calyx pubescent, shorter than the petals. ♃. H. Native of most parts of Europe, also of Siberia, Caucasus, Japan, and Pennsylvania, in dry woods, bushy, and shady places. Plentiful in Britain. Smith, engl. bot. t. 624. Curt. fl. lond. fasc. 2. t. 41. Fl. dan. t. 665. Stem branched, many-flowered. Calyx coloured, assuming the aspect of petals; hence its specific name *auricomus*, with a pore at the base of each. This species having no acrimony has been termed *dulcis*, or *sweet-wood Crowfoot*. The great and constant diversity in the leaves, especially the narrow linear shape of the upper ones distinguish it readily.

Var. β, procèrior (D. C. syst. 1. p. 267.) ♃. H. Native of Hungary. R. Cassùbicus, Geners. elench. scepus. ex. Wahlenb.

Var. γ, apétala (D. C. prod. 1. p. 34.) petals wanting; calyx coloured, assuming the aspect of petals. ♃. H. Native of Thuringia.

Golden-haired Crowfoot, or Goldilocks. Fl. April, May. Britain. Pl. 1 foot.

73 R. CASSU'BICUS (Lin. spec. 775.) leaves smooth, radical ones stalked, kidney-shaped, crenated, stem ones divided into linear serrated lobes; calyx pubescent, shorter than the petals. ♃. H. Native of Prussia, Russia, and Siberia in moist meadows. Sims, bot. mag. 2267. R. renifórmis, Gilib. in ust. del. 2. p. 240. R. auricomus, var. β, Bir. ren. p. 39. Very like *R. aurícomus*, but differing in the radical leaves being crenated, not lobed, and in the lobes of the upper leaves being always serrated.

Cassubian Crowfoot. Fl. June, Jul. Clt. 1794. Pl. ½ foot.

74 R. ABORTÌVUS (Lin. spec. 776.) leaves smooth, radical ones stalked, cordate, orbicular, crenated, some 3-parted, stem ones divided into 3-5 oblong linear lobes; calyx smooth, rather longer

than the petals. 4. H. Native of North America in wet places on the sides of ponds and ditches, from New York to Carolina; on the declivities of the Rocky Mountains; Newfoundland. R. aurícomus. Var. c. Bir. ren. p. 39. Flowers small.

Var. β, *nítidus* (Walt. fl. car. p. 159.) 4. H. Native in most meadows about New York, and in muddy places on the side of rivulets about Wilmington. Plant larger. Peduncles more elongated. Calyx pilose, more spreading.

Abortive Crowfoot. Fl. May, Aug. Clt. 1713. Pl. 1 ft.

75 R. RHOMBOÌDES (Goldie in edinb. phil. journ. 6. p. 329. t. 11. f. 1.) plant hairy-pubescent; radical leaves rhomboid, serrated, or entire, cauline ones palmate, floral ones profoundly jagged; calyx spreading, pilose. 4. H. Native of North America, common in the western parts of Canada, at Lake Simcoe, Upper Canada. R. ovalifòlius. herb. Lamb.

Rhomb-leaved Crowfoot. Pl. ½ foot.

76 R. GLABE'RRIMUS (Hook, fl. bor. amer. p. 12. t. 5. A.) leaves all stalked, radical ones roundish, quite entire, or coarsely 3-toothed, cauline ones somewhat cuneated, trifid; calyx spreading, one half shorter than the petals; heads of carpels globose. 4. H. Native of North America, common on the mountains round the Kettle Falls and on the Rocky Mountains near the limits of perpetual snow. Plant quite smooth. Petals 5, oval, yellow.

Very smooth Crowfoot. Pl. ½ foot.

77 R. CARDIOPHY'LLUS (Hook, fl. bor. amer. 14. t. 5. B.) plant pubescent, hairy; radical leaves roundish-cordate, crenate, and multifid, cauline ones palmately multifid; lobes linear deeply crenate; calyx spreading one half shorter than the corolla; heads of carpels oblong. 4. H. Native of North America in alpine prairies of the Rocky Mountains. Flowers large, golden. Carpels roundish, small, compressed, terminated by longish, hooked beaks.

Heart-leaved Crowfoot. Pl. 1 foot.

78 R. ANGULA'TUS (Presl. ex Spreng. syst. app. p. 219.) stem branched, clothed with close-pressed hairs; radical leaves on long stalks, cordate-roundish, angular-lobed, toothed, stem ones 3-parted, deeply toothed; carpels beaked, quite smooth. 4. H. Native of Sicily.

Angular-leaved Crowfoot. Pl. 1 foot.

79 R. SCELERA'TUS (Lin. spec, 776.) leaves smooth, radical ones stalked, 3-parted, with 3-lobed lobes, and bluntly toothed; upper leaves 3-parted, with oblong linear entire lobes; floral leaves oblong: calyx smooth; carpels small collected into an oblong spike. ⊙. H. M. Native throughout Europe, also in Siberia, Cochin China, Nipaul, North of Africa, and North America, in watery places. Smith eng. bot. t. 681. Curt. fl. lond. 2. t. 42. Fl. dan. t. 571. R. digitàtus Gilib. exerc. phyt. t. 373. Hecatònia palústris. Lour. fl. cochin. 371. Stem branched, hollow. Flowers smlal. The bruised herb is said to raise a blister, which is not easily healed, and by which strolling beggars sometimes excite compassion. When chewed it inflames the tongue, and when taken into the stomach, it produces violent effects. It is suspected to have proved poisonous to sheep. It is one of the most virulent of our native plants. The distilled water of this species is intensely acrimonious, and when cold deposits crystals, which are scarcely soluble in any menstruum, and are of an inflammable nature. The acrimony of the herb being wholly expelled in decoction, accordingly the shepherds in Wallachia boil and eat it.

Var. β, *umbellàtus* (Roxb. in Willd. enum. 588.) spikes of carpels more oblong. ⊙. H. M. Gathered by Dr. Roxburgh in the Botanic Garden of Calcutta.

Var. γ, *mínimus* (D. C. syst. 1. p. 268.) stem dwarf; radical leaves trifid. ⊙. H. W. Native of Tauria.

Hurtful or Water Crowfoot. Fl. Ju. Aug. Brit. Pl. ½ to 2 ft.

80 R. OVA'LIS (Rafin. in journ. bot. 1814. vol. 2. p. 268.)

Hook fl. bor. amer. 13. t. 6. B.) pubescent; radical leaves stalked, cordate, ovate, crenated, rarely cleft, pilose, stem ones sessile, digitate, with linear, pilose segments; stem erect, spreading, branched, pilose; carpels turgid, obovate, smooth, scarcely beaked, collected into a round head. 4. H. Native of North America in alpine prairies on the Rocky Mountains, and about Carlton House. Peduncles lengthening, when in fruit, to 3 inches, striated, swelling upwards. Calyx reflexed, pubescent; equal in length to the corolla.

Oval-leaved Crowfoot. Fl. May, Ju. Clt. 1826. Pl. ½ ft.

81 R. INUNDA'TUS (R. Br. prod. nov. holl. 2. ined.) leaves smooth, radical ones stalked, 5-parted, with trifid lobes and linear lobules which are 3-toothed at the top; stem erect, 2-4-flowered, almost naked; peduncles opposite the leaves; calyx smooth, rounded. ⊙. H. Native of New South Wales at Williams' river. Herb smooth, erect, slender. Flowers small. Sepals with membranous margins.

Inundated Crowfoot. Fl. June, Aug. Pl.?

82 R. PU'RSHII (Hook fl. bor. amer. p. 15. t. 7. B.) submersed leaves, capillary-multifid; emersed ones kidney-shaped, 3-5-parted with variously cut lobes; stem elongated, floating; sepals reflexed, twice shorter than the corolla; carpels terminated by the ensiform straight styles; heads rather globose. 4. H. W. Native of North America throughout the eastern and prairie districts to near the Arctic sea, upper Louisiana, &c. Never observed floating in deep water, but sometimes spreading over the surface of sphagnous bogs, more generally creeping on mud in very sheltered pools of water, in shady places. Flowers yellow. This aquatic plant has a very similar habit with *R. aquátilis*, and, like it, varies exceedingly in the length of the stems and the shape of the leaves, according to its situation in deep or shallow water, in more or less flowing streams, and on the almost dry mud.

Var. α, *multífidus* (Ph. fl. amer. sept. 2. p. 736.) leaves all capillary-multifid; flowers larger; stem fistulous. A. fluviátilis. Bigel. fl. bost. ed. 2. p. 228.

Var. β, *Hookèri*; submersed leaves capillary-multifid, floating ones kidney-shaped, palmately-multifid. 4. H. W. Native of lakes and marshes about Slave Lake, Cumberland House. Hook fl. bor. amer. p. 15. t. 7. B. f. 1.

Var. γ, *rèpens* (Hook fl. bor. amer. p. 15. t. 7. B. f. 2) lower leaves linear-many-parted, upper ones kidney-shaped, palmately-multifid. Found along with the preceding variety. A. Pùrshii Richards in Frankl. journ. ed. 2. app. p. 23.

Var. δ, *Gmelìni* (D. C. prod. 1. p. 35.) plant creeping, leaves all kidney-shaped, roundish, palmate, 3-5-lobed. Native about Bear Lake, and in the Bay of Eschscholtz on the western shore of extreme Arctic America and of Siberia. Hook fl. bor. amer. p. 15. t. 7. B. f. 3. R. Gmelìni, D. C. prod. i. p. 34, exclusive of the synonym of Schlecht. R. Langsdórfii. D. C. prod. 1. p. 34.—Gmel. sib. 4. t. 83. B. R. Sibíricus, Spreng. syst. 2. p. 652.

Pursh's Crowfoot. Fl. June, Aug. Pl. flt. and creeping.

83 R. RIVULA'RIS (Banks and Soland. MSS. D. C. syst. 1. p. 270.) leaves smooth on long stalks, 3-parted with wedge-shaped cut partitions; stems floating, reptant; peduncles opposite the leaves 1-flowered, petals lanceolate, remote. ⊙. G. Native of New Zealand in rivulets. A smooth, slender, creeping or floating herb. Carpels awned.

Rivulet Crowfoot. Pl. flt.

84 R. ACAU'LIS (Banks and Sol. MSS. D. C. syst. 1. p. 270.) leaves smooth, radical ones on long stalks, 3-parted, with oval very entire lobes; scape 1-flowered, naked, shorter than the leaf-stalks; calyx spreading; petals lanceolate, remote, erect. ⊙. 4. G.? Native of New Zealand in watery places near Opuragi. Plant resembling *Trifòlium uniflòrum*. Petals with long claws. Perhaps only a variety of *R. rivulàris*.

Stemless Crowfoot. Pl. 2 inches.

85 R. COLLÌNUS (R. Br. prod. fl. nov. holl. ined. D. C. syst. 1. p. 271.) leaves all radical, pubescent, stalked, ternate, with oval somewhat toothed segments; scape naked, 1-flowered, longer than the leaves; calyx spreading; petals stipitate, oval-oblong. ⊙.? H. Native of Van Dieman's Land, on hills. Scapes 1 or 2 rising from the root, erect, slender, twice as long as leaves. Flowers small. Calyx soon falling off. Ovaries few, smooth.

Hill Crowfoot. Fl. July. Pl. $\frac{1}{4}$ foot.

86 R. PUMÌLIO (R. Br. prod. fl. nov. holl. ined. D. C. syst. 1. p. 271.) leaves rather villous, 3-parted, with oblong trifid or entire lobes; stems erectish; pedicels opposite the leaves; carpels villous. ⊙. H. Native of Van Dieman's Land. A small many-stemmed herb with very small flowers. Carpels 7-8, pointed. This species has a little of the habit of *R. collìnus*, but perhaps it is more closely allied to *R. parviflòrus* and its congeners.

Dwarf Crowfoot. Fl. June, July. Pl. $\frac{1}{4}$ foot.

87 R. LAPPÓNICUS (Lin. spec. 778.) leaves smooth, radical, on long stalks, 3-parted, with dilated, blunt, toothed lobes; scape naked, 1-flowered, longer than the leaves; calyx of three reflexed sepals. ♃. H. Native of Lapland, Sweden, and Iceland, in moist, shady places; in North America in mossy woods in the eastern and central districts, from latitude 50° to the Arctic sea, eastern declivity of the Rocky Mountains in swamps, Whale Island in the Arctic sea, &c. Smith in fl. lapp. ed. 2. p. 194. t. 3. f. 4. Wahl. fl. lapp. 284. t. 8. f. 2. Lin. fl. lapp. no. 231. t. 3. f. 4. Habit almost of *Adóxa*. Petals 5-6, hardly longer than the calyx. Carpels 6-10, terminated by the hooked styles, collected into a round head. The scape is sometimes furnished with one leaf.

Lapland Crowfoot. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

88 R. HYPERBÒREUS (Rottb. act. hafn. 10. p. 458. t. 4. f. 16.) leaves smooth, stalked, trifid; lobes oblong, divaricating, with the lateral ones trifid or bifid and middle one entire; sheath of leaf 2-eared at the base; carpels margined on the back, tipped with a small inconspicuous point; stem filiform, creeping. ♃. H. Native of Iceland, Greenland, Norway, Siberia, Lapland, North America in marshes on the Rocky Mountains, Arctic Islands, &c. Fl. dan. t. 331. R. Ammáni Gun. fl. norv. no. 826. exclusive of synonyms. R. montànus, var. α, Bir. ren. 39. R. Gmelíni Schlecht. anim. ran. sect. 2. p. 35.—Gmel. sib. 4. t. 33. f. b. Like *R. Cymbalàriæ*, but from it easily distinguished by its trifid leaves.

Northern Crowfoot. Fl. Ap. May. Clt. 1820. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

89 R. PYGMÆ'US (Wahl. fl. lapp. no. 286. t. 8. f. 1.) leaves smooth, 3-5-cleft, radical ones stalked, cauline one sessile; stem 1-flowered; calyx smooth somewhat reflexed, longer than the petals; carpels roundish, pointed with the short hooked styles. ♃. H. Native of the Alps of Norway, Lapland, in irrigated places near rivulets under the rocks; North America in moist grassy places on the high parts of the Rocky Mountains, about Arctic sea coast, between long. 107° and 140°, about Behring's Straits; on Chamisso's Island, and on that of St. Lawrence; Spitzbergen and Labrador. Wahl. fl. lapp. no. 286. t. 8. f. 1. Mart. spitzb. cap. 3. t. 9. f. e. Lin. fl. lapp. no. 232. var. γ, t. 3. f. 3. Rchb. icon. bot. t. 2. f. 3, 4, 5. A very small plant with the appearance of *Saxífraga rivulàris*.

Pygmy Crowfoot. Fl. April, May. Clt. 1810. Pl. $\frac{1}{4}$ ft.

90 R. NIVA'LIS (Gun. norv. 627.) leaves smooth, radical ones kidney-shaped, stalked, 5-cleft, with entire ovate lobes, cauline leaves almost sessile, palmate; stem 1-flowered; calyx hairy, one half shorter than the obovate blunt petals. ♃. H. Native of Lapland, Norway, Iceland; North America on lofty parts of the Rocky Mountains, Copper Mountains and Arctic sea coast in muddy pools which become dry during summer, Behring's Straits, Kotzebue's Sound, Spitzbergen, &c.—Mart. spitzb. cap. 3. t. 1. f. d. Lin. fl. lapp, ed. 1. no. 232. t. 3. f. 2. Radical leaves rising after the flower. Stem villous under the flower, and furnished with two or three oval-oblong sessile cut or toothed leaves. Calyx spreading. Carpels beaked. Flowers pale yellow.

Var. β, *sulphùreus* (D. C. syst. 1. p. 273.) radical leaves cuneated at the base, hardly lobed to the middle, middle lobe half ovate, broadest at the base. Phips. voy. 202. R. nivàlis β, Wahl. fl. lapp. 157. R. prìmus. Mart. spitz. t. 6. f. c.

Snow Crowfoot. Fl. June, Aug. Clt. 1775. Pl. $\frac{1}{2}$ ft.

91 R. SABÌNII (R. Br. in app. to Capt. Parry's 1st voy. p. 265.) leaves 3-parted, radical ones on long petioles; segments elliptical, lateral ones semibifid; stem leaves sessile, linear, 3-parted; calyx hairy, about equal in length to the retuse petals. ♃. H. Native of Melville Island, shores of the Arctic Sea between the Mackenzie and Coppermine rivers.

Sabine's Crowfoot. Pl. $\frac{1}{4}$ foot.

92 R. A'RCTICUS (Richards in Frankl. 1st journ. ed. 1. app. p. 741.) leaves quite smooth, radical ones on long stalks, hastate, 3-parted; segments 3-4-cleft, obtuse; stem leaves linear-parted; stem simple, 1-flowered; calyx villous, reflexed, shorter than the petals which are very blunt. ♃. H. Native of North America in the Arctic regions. Hooker considers this identical with *R. affìnis*.

Arctic Crowfoot. Pl. $\frac{1}{4}$ foot.

93 R. FRÍGIDUS (Willd. spec. 2. p. 1312.) leaves smooth, radical ones cuneated, obovate or orbicular deeply toothed at the apex, cauline ones divided into 5 or 7 entire lobes; stem 1-flowered; calyx hairy, shorter than the emarginate petals. ♃. H. Native of Northern Asia on mountains as well as on the Altaian mountains in Siberia near springs. R. sulphùreus, D. C. syst. 1. p. 274. exclusive of the synonyms of Mart. and Wahl. R. Altàicus. Laxm. nov. comm. Gœtt. acad. petrop. 1774. vol. 18. p. 533. t. 8. Like *R. glaciàlis* and *R. nivàlis*.

Frigid Crowfoot. Fl. May, July. Pl. $\frac{1}{2}$ foot.

94 R. ESCHSCHÓLZII (Schlecht. anim. ran. 2. p. 16. t. 1.) leaves ciliated, radical ones stalked, 3-parted, with the partitions lobed; stem usually 2-flowered; calyx hairy, shorter than the petals; carpels obliquely ovate, pointed. ♃. H. Native of the islands of Unalaschka and St. George, N. W. America; near the limits of perpetual snow on the borders of streams upon the Rocky Mountains.

Var. β, *Hookèri*, petals small or abortive.

Eschscholz's Crowfoot. Pl. $\frac{1}{2}$ foot.

95 R. PERUVIA'NUS (Pers. ench. 2. p. 103.) leaves rather hairy, radical ones stalked, semiorbicular, crenated, cauline ones sessile, cleft into many linear entire lobes; calyx very villous. ♃. G. Native of Peru, in marshes on mount Antisana. Deless. icon. sel. 1. t. 37. Petals 5, orbicular. Carpels ovate, compressed, smooth.

Peruvian Crowfoot. Pl. $\frac{1}{2}$ foot.

96 R. PEDUNCULA'TUS (Viv. app. fl. cors. in Schlecht. Linnæa. p. 501. Spreng. syst. 2. p. 652.) radical leaves somewhat orbicular, crenate-toothed, the rest 3-parted, with the middle lobe stalked, trifid, and cut; scape usually leafless, 1-flowered; calyx spreading. ♃. H. Native of Corsica. Plant pubescent or hairy.

Peduncled Crowfoot. Pl. $\frac{1}{2}$ foot.

97 R. HU'MILIS (D. Don. in herb. Lamb.) plant pilose; radical leaves stalked, cordate, obtuse, slightly 3-lobed and crenate; stem short; peduncles long, radical, axillary, and terminal; carpels rather inflated, beaked. ♃. H. Native of Mexico. Flowers small, yellow.

Dwarf Crowfoot. Pl. 1-2 inches.

98 R. MULTICAU'LIS (D. Don. in herb. Lamb.) plant pilose;

stems numerous, prostrate, or ascending; radical leaves cordate-roundish, stalked, 3-lobed; lobes crenate; cauline leaves sessile, entire, opposite; calyx reflexed, much shorter than the petals, which are emarginate; carpels rather inflated, pointed; heads ovate. ♃. H. Native of Mexico. Allied to *R. repens*. Flowers middle-size, yellow.

Many-stemmed Crowfoot. Pl. ¼ foot.

99 R. POLYRHÌZOS (Steph. in Willd. spec. 2. p. 1324.) leaves smooth, radical ones stalked, 3-5-cleft, with ovate entire lobes: cauline leaves sessile, cleft into many linear-entire lobes; stem somewhat prostrate, 1-3-flowered; calyx spreading, smooth. ♃. H. Native of Caucasus, frequent about the colony of Sarepta, and at the rivers Terek and Volga; of the Caspian deserts, and the Altaian mountains. Deless. icon. sel. 1. t. 38. Bieb. pl. rar. ross. 1. t. 19. Petals obovate. Carpels smooth, awned.

Many-rooted Crowfoot. Fl. April, May. Pl. ¼ to ½ foot.

100 R. DEMÍSSUS (D. C. syst. 1. p. 275.) leaves smooth, radical ones stalked, 3-5-parted, with the partitions divided into linear lobes; scape almost naked, lying on the ground, 1-2-flowered; calyx spreading, pubescent. ♃. H. Native of Mount Lebanon. Trunk of root thick. Cauline leaves wanting or solitary, linear, simple or divided almost to the base into 3 linear lobes. Flowers smaller than those of *R. montànus*. Carpels somewhat orbicular, compressed, almost awnless.

Low Crowfoot. Pl. trailing.

101 R. PEDATÍFIDUS (Smith, in Rees' cyclop. no. 72. Hook. fl. bor. amer. p. 18. t. 8. B.) leaves somewhat pubescent, radical ones palmately or pedately cut into 3 or 5 linear quite entire lobes; scapes almost naked, erect, 1 or 2-flowered; calyx spreading, rather villous. ♃. H. Native of Siberia and North America on the barren summits of the Rocky Mountains. Stems usually simple 1-flowered, rarely bifid 2-flowered, with the two cauline leaves sessile. Flowers a little smaller than those of *R. àcris*. Carpels terminated by the somewhat recurved styles.

Pedate-leaved Crowfoot. Fl. May, June. Pl. ¼ to ½ foot.

102 R. MONTA'NUS (Willd. spec. 2. p. 1321.) radical leaves smooth, 3-parted, orbicular, with trifid blunt segments, cauline ones sessile, 3-5-parted into linear quite entire lobes; stem 1-flowered, clothed with pressed pubescence at the top; calyx smoothish. ♃. H. Native of the Alps of Austria, Switzerland, France, and the Pyrenees in rugged meadows. R. nivàlis, Scop. carn. ed. 2. no. 686. Jacq. austr. t. 325 and 326. but not of Lin. R. montànus, var. f. Bir. ren. 39. This is a common species on the higher mountains of Europe, where it is often confounded with *R. Villársii*, but differing in the stem usually bearing only two leaves, and in having an almost smooth spreading calyx, not villous with spreading hairs, as well as in the floral leaves being linear-entire, not as in *R. Gouàni*, deeply-toothed. Flowers a little larger than those of *R. àcris*. Stigmas beautifully revolute.

Var. β, *tenuifòlius* (D. C. syst. 1. p. 276.) segments of leaves acute. ♃. H. Native of the Alps of Provence and Jura. R. grácilis, Schleicher, pl. helv.

Mountain Crowfoot. Fl. May, July. Clt. 1775. Pl. ½ foot.

103 R. AFFÌNIS (R. Br. Parry, voy. app. p. 265. Hook. fl. bor. amer. p. 12. t. 6. A. a.) radical leaves pedately-multifid, stalked, cauline ones almost sessile; lobes of all linear; stem erect, 1-2-flowered, and is as well as the calyxes and ovaries pubescent; carpels with recurved beaks, collected into an oblong cylindrical head. ♃. H. Native of North America from Canada to the Arctic sea, on the Rocky Mountains and elsewhere. The whole plant is somewhat hairy. Radical leaves sometimes somewhat kidney-shaped, deeply crenated. Calyx hairy, spreading, or slightly reflexed; petals twice as large as the sepals.

Var. β, *apétalus* (petals somewhat shorter than the calyx or wanting; leaves less profoundly divided.) Hook. fl. bor. amer. p. 13. t. 6. f. A. b. Native of Melville Island and shores of the Arctic sea.

Var. γ, *subintegrifòlius* (radical leaves roundish, almost entire.) Native of Melville Island and shores of the Arctic sea. (Hook.)

Allied Crowfoot. Fl. May, June. Clt. 1826. Pl. ½ foot.

104 R. VILLA'RSII (D. C. fl. fr. ed. 3. vol. 4. p. 896.) leaves pubescent, radical ones almost orbicular, 3-parted, with trifid toothed acute segments; cauline leaves sessile, 3-5-parted into linear entire lobes; stem 1-flowered, pubescent at the top; calyx spreading, villous. ♃. H. Native of the Alps of Savoy, Dauphiny, and Provence, in rugged meadows. R. Breyniànus, Crantz. austr. 2. p. 91. t. 4. f. 2. R. Lappónicus, Vill. dauph. 4. p. 743. but not of Lin. R. montànus, var. d, Bir. ren. p. 39. R. Gouàni, Smith in Rees' cyclop. no. 41. R. oreophìlus, Bieb. suppl. 383. A doubtful species between *R. montànus*, *R. àcris*, and *R. Gouàni*, but differs from the first in the calyx being villous, not almost smooth, and in the lobes of the radical leaves being more toothed and acute, as well as in the trunk of root being oblique and blackish, from the second in the stem being 1-flowered, not many-flowered, as well as in the structure of its roots.

Villar's Crowfoot. Fl. May, July. Clt. 1819. Pl. ½ to ¾ ft.

105 R. INSULA'RIS (Viv. app. fl. cors. in Schlecht. Linnæa, 1. p. 502.) plant hairy; root fascicled-tuberous; radical leaves 3-parted; segments bifid and trifid; stem leaves trifid, on stem-clasping petioles; calyx spreading; sepals ovate acute, clothed with close-pressed hairs. ♃. H. Native of Corsica.

Island Crowfoot. Pl. ½ to ¾ foot.

106 R. UNCINA'TUS (D. Don. in herb. Lamb.) stem erect; radical leaves? cauline ones on long stalks, 3-parted; segments 3-lobed; lobes toothed or lobed, acute; floral leaves ternate; leaflets linear-lanceolate, acute, quite entire; peduncles slender, 1-flowered, terminal, and lateral; carpels few, ending in hooked points; heads globose. ♃. H. Native of Mexico. Flowers small, yellow. Root fibrous. Plant smooth.

Hooked-carpelled Crowfoot. Pl. 1 foot.

107 R. GOUA'NI (Willd. spec. 2. p. 1322.) radical leaves orbicular, divided into 5-deeply toothed lobes, cauline ones sessile, palmately-parted into toothed lobes; calyx somewhat villous. ♃. H. Native of the Pyrenees, Alps of Dauphiny, Hungary, in meadows. R. Pyrenæ'us, Goua. ill. 33. f. 1 and 2. not of Lin. R. furcàtus, Berg. fl. Bass. pyr. 2. p. 406. R. montànus, var. g, Bir. ren. 40. A very distinct species from *R. montànus*, in its larger habit and more ample flowers. Its stature is very variable; for instance, when growing on the tops of the higher Pyrenees it does not exceed 3 inches in height, but in lower moist situations it will grow to the height of 2 feet. Stem 1 or many-flowered. Flowers sometimes rather umbellate on short pedicels, sometimes on long pedicels. Floral leaves sometimes alternate and distant, but usually in the approximating mode of an involucre under the flower.

Gouan's Crowfoot. Fl. May, Aug. Clt. 1818. Pl. ½ to 2 ft.

108 R. A'CRIS (Lin. spec. 779.) leaves pubescent or somewhat smooth, 3-5-parted; segments trifid, jagged, those of the uppermost leaves linear and entire; stem erect, many-flowered, covered with pressed hairs; peduncles round and even; calyx rather villous; carpels somewhat orbicular, compressed, with short recurved points. ♃. H. Native throughout Europe; Siberia, Tauria, North America, in meadows and pastures, very common even on the loftiest mountains. Smith, eng. bot. t. 652. Curt. lond. fasc. 1. t. 39. Mart. rust. t. 30. Woods' suppl. t. 246. Bull. fr. t. 109. R. Sículus Presl. R. napellifòlius, var. Crantz. austr. 2. p. 90. t. 4. f. 1. Root somewhat tuberous; lower leaves sometimes blotched, with black in the middle. Calyx

spreading. This plant is very acrid and dangerous. Curtis says, that even pulling up the plant, and carrying it to some little distance, has produced a considerable inflammation in the palm of the hand: that cattle in general will not eat it; yet that sometimes when they are turned hungry into a new field of grass, or have but a small spot to range in, they will feed on it, and hence their mouths have become sore and blistered. According to Linnæus, sheep and goats eat it; but kine, horses, and swine refuse it. When made into hay it loses its acrid quality, but then it seems to be too stalky and hard to afford much nourishment; if it be of any use it must be to correct by its warmth the insipidity of grasses. It is called vulgarly *butter-flower*, or *butter-cup*, as well as *R. repens* and *R. bulbòsus*, under a notion that the yellow colour of butter is owing to these plants. It is richness of the pasture that communicates this colour and not these flowers, which the cattle seldom eat.

Var. β, múltiplex (flowers double). 4. H. Curt. bot. mag. t. 215. This plant is cultivated in gardens under the name of *Yellow Bachelor's buttons*.

Var. γ, sylváticus (D. C. syst. 1. p. 278.) petioles and leaves velvety-villous on the under surface. 4. H. Native of Europe in woods. R. sylváticus, Thuil. fl. par. ed. 2. vol. 1. p. 276. R. lanuginòsus, *β*. Fl. fr. ed. 3. vol. 4. p. 899. This variety is perhaps a proper species; it is much larger than the var. *α*, and the flowers more numerous, but smaller, and somewhat corymbose.

Var. δ, multifidus (D. C. l. c.) lobes of leaves deeply multifid. 4. H. R. polyánthemus, Lob. icon. 686. f. 1. This plant has the appearance of *R. polyánthemus*, in the leaves being many-parted, but it is more closely allied to *R. àcris*, in the carpels being terminated by straight points, not almost awnless, as well as in the stem being covered with pressed pubescence, not pilose.

Acrid, or Upright meadow Crowfoot. Fl. June, July. Pl. 2 ft.

109 R. BRU'TIUS (Tenore. fl. neap. prod. suppl. 1. p. 61.) leaves pubescent 3-5-parted, with 3-parted partitions, and lanceolate bifid lobes; stem erect, villous, many-flowered; calyx pressed, one-half shorter than the petals. 4. H. Native of Naples on Mount Pollino. Tenore. fl. neap. 1. t. 50. Like *R. àcris*, but differing in the segments of the leaves being broader and serrated, smoothish, not villous, as well as in the flowers being twice the size. It differs from *R. polyánthemus* in the leaves being digitately-parted, smoothish, and in the peduncles being round and even, not striated.

Brutian Crowfoot. Fl. June, July. Clt. 1823. Pl. 1 to 2 feet.

110 R. STEVE'NI (Bess. enum. volhy. no. 683.) leaves 3-5-parted, with wedge-shaped deeply toothed trifid segments, those of the upper ones linear; root with numerous fibres; stem almost naked; peduncles round; calyx hairy, spreading; stigmas spreading. 4. H. Native of Volhynia and Podolia in meadows. Like *R. àcris*.

Steven's Crowfoot. Fl. June, July. Clt. 1819. Pl. 1 to 2 feet.

111 R. CAUCA'SICUS (Bieb. fl. cauc. 2. p. 27.) radical leaves on long stalks, somewhat pubescent, 3-parted, with deeply toothed trifid lobes; stem leaves stalked, ternate, the uppermost ones with linear lobes; stem erect, fibrous at the neck; pedicels round; calyx spreading. 4. H. Native of Caucasus in subalpine situations. On grassy hills about Narza frequent. In habit like *R. àcris*, but with rather smaller flowers. Roots fibrous, with black fibres rising from the base. Carpels compressed, smooth, with hooked beaks.

Caucasian Crowfoot. Fl. Ju. Jul. Clt. 1820. Pl. 1½ to 2 feet.

112 R. RU'FULUS (Brot. fl. lus. 2. p. 367.) radical leaves 3-5-parted; lobes many-cleft; lower cauline leaves stalked, 3-parted, upper ones linear; stem erect, solid, not fistular, and is, as well as the round peduncles, villous; calyx spreading. 4. H. Native of Portugal, at the bottom of hills near Coimbra and elsewhere in Biera. R. chærophýllos, var. e, Bir. ren. 42. Very nearly allied to *R. àcris*. Root fascicled white. Stem clothed with subrufous hairs. Carpels compressed, acuminated.

Rufous-haired Crowfoot. Fl. June, July. Pl. 1 to 1½ foot.

113 R. POLYA'NTHEMUS (Lin. spec. 779.) leaves 3-5-palmate-parted, with deeply multifid partitions and linear lobes; stem erect, many-flowered, and is, as well as the petioles, covered with spreading pili; peduncles furrowed; calyx hairy; carpels almost awnless. 4. H. Native of Holland, Germany, Hungary, Russia, Sweden, Norway, in bushy places, coppices, and woods. R. polyánthos, Neck. Gallop. 240. R. napellifòlius, Crantz. austr. 2. p. 90. t. 4. f. 1.? R. multiflòrus, Gilib. in ust. del. 2. p. 418. Similar to *R. àcris*, var. *γ*, but differs in the leaves being much more dissected into narrower linear lobes, which are not toothed on the margins; stem and petioles more hairy; peduncles furrowed, not round; calyx more hispid, as well as in the ovaries being about 20, not 50.

Many-flowered Crowfoot. Fl. May, Ju. Clt. 1796. Pl. 1 to 2 ft.

114 R. NEMORÒSUS (D. C. syst. 1. p. 280.) radical leaves 3-5-cleft beyond the middle into wedge-shaped lobes, which are again divided into lobules, which are toothed at the apex; stem erect and is, as well as the petioles, covered with spreading hairs; peduncles furrowed; carpels terminated by hooked awns. 4. H. Native of Switzerland and France in woods. Like *R. polyánthemus*.

Var. α, multiflòrus (D. C. syst. 1. p. 280.) stem many-flowered; upper leaves divided into entire linear lobes. 4. H. Native of mountains at the foot of the Alps of Jura. R. polyánthemus Sut. fl. helv. 1. p. 341. Habit of *R. àcris*.

Var. β, pauciflòrus (D. C. syst. 1. p. 280.) stem 1-3-flowered; upper leaves somewhat lobed and deeply toothed, uppermost ones small. 4. H. Native of Vallais, Cevennes, Pyrenees, in subalpine situations. R. áureus Schleich. pl. helv. R. villòsus. St. Amand. fl. agr. 227. bouq. t. 5. Habit of *R. montànus*.

Grove Crowfoot. Fl. May, Jul. Clt. 1810. Pl. 1 to 2 feet.

115 R. BREYNIA'NUS (Crantz. aust. ex Spreng. syst. 2. p. 654.) stem erect, many-flowered, and is, as well as the leaves, villous; radical leaves palmate, 3-5-parted; lobes obovate-oblong, toothed; floral leaves quite entire; peduncles furrowed; calyx spreading; carpels with hooked points. 4. H. Native of the south of Europe in subalpine situations. R. nemoròsus var. *β*, D. C. syst. 1. p. 280. prod. 37 ?

Breynius's Crowfoot. Fl. May. July. Clt.? Pl. 1 foot.

116 R. LANUGINÒSUS (Lin. spec. 779.) leaves trifid, silky, with broad toothed rather cut lobes; stem erect, many-flowered, and is, as well as the petioles, clothed with reflexed hairs; peduncles round; carpels flat, terminated by hooked awns. 4. H. Native of Montpelier, Dauphiny, Switzerland, Austria, Germany, Denmark, Hungary, Tauria, Greece, in wooded mountains. Fl. dan. t. 397. Smith fl. græc. t. 519. A very distinct species from its congeners in the leaves being much broader and silky on both surfaces with pressed hairs.

Var. β, geraniifòlius (D. C. syst. 1. p. 281.) upper leaves 3-parted into oblong acuminate coarsely serrated lobes. 4. H. R. montànus subhirsùtus, &c. C. Bauh. pin. 182. Tourn. inst. 291.

Var. γ, párvulus (D. C. prod. 1. p. 37.) stem 1-2-flowered; leaves very minute. 4. H. Native of the Alps of Jura.

Var. δ, Constantinopolitànus (D. Urv. enum. pl. arch. no. 476.) radical leaves very large, on very long footstalks, trifid, with broad cut lobes, upper ones jagged, with linear segments all silky lanuginous; stem erect, lanuginous, many-flowered; calyx reflexed; carpels flat, somewhat orbicular, terminated by hooked awns. 4. H. Native in hedges about Constantinople, frequent.

Woolly-leaved Crowfoot. Fl. Ju. Jul. Clt. 1683. Pl. 1 to 1½ ft.

117 R. TUBERÒSUS (Lapeyr. abr. pyr. 320.) radical leaves large, 3-lobed; lobes distant, lateral ones 2-lobed, intermediate one wedge-shaped, 3-lobed, with cut lobules; stem rather ascending, pubescent; peduncles round, divaricating; calyx pressed. ♃. H. Native of the Pyrenees in meadows. Plant large. Trunk of root about the thickness of a finger. Like *R. nemoròsus*.

Tuberous-rooted Crowfoot. Fl. May, Jul. Clt. 1820. Pl. 1 ft.

118 R. ANEMONEFÒLIUS (D. C. syst. 1. p. 282.) radical leaves 3-parted, pubescent, with deeply toothed lobes, cauline ones ternate, with entire lobes; upper leaves long, linear, entire; stem erect, 1-2-flowered, smooth at the base, pubescent at the top; calyx reflexed. ♃. H. Native of Cappadocia. Petals obovate, very blunt, about the size of those of *R. gramíneus*.

Anemone-leaved Crowfoot. Fl. May, July. Pl. 1 foot.

119 R. NAPELLIFÒLIUS (D. C. syst. 1. p. 282.) radical leaves 3-parted, with the partitions divided into many linear lobes, floral ones 3-parted, with linear lobes; stem erect, 1-3-flowered, fibry at the neck and covered with pressed hairs; calyx pressed. ♃. H. Native of Cappadocia and in fields about Constantinople. Calyx hairy.

Napellus-leaved Crowfoot. Fl. Ju. Jul. Clt. 1822. Pl. ½ foot.

120 R. PLATYSPE'RMUS (Fisch. in litt. D. C. prod. 1. p. 37.) radical leaves many-cleft, cauline ones 3-parted, with linear lobes; stem erect, carpels compressed, orbicular, membranous, terminated by hooked awns. ♃. H. Native of Russia at the salt lake Inder, in the steppe Kirghisian. A very distinct species, nearly allied to *R. oxyspérmus* and *R. disséctus*.

Broad-seeded Crowfoot. Pl. ½ to 1 foot.

121 R. DISSE'CTUS (Bieb. fl. cauc. 2. p. 25. suppl. p. 381.) radical leaves somewhat pinnately-many-parted, with acute linear lobules; cauline leaf divided into very entire linear lobes; stem erect, 1-2-flowered, pubescent; calyx hairy, spreading. ♃. H. Native of Siberia towards the top of Mount Tschaturdag and elsewhere, and in Eastern Caucasus.

Dissected-leaved Crowfoot. Fl. May, Aug. Clt. 1818. Pl. ½ to 1 foot.

122 R. VILLÒSUS (D. C. syst. 1. p. 283.) leaves villous, ternate, with ovate, deeply toothed segments; floral leaves 3-parted with oblong almost entire lobes; stem erect, forked, covered with rather deflexed hairs; calyx hispid, spreading. ♃. H. Native of Persia. Ovaries terminated by hooked awns.

Villous Crowfoot. Pl. 1 foot.

123 R. CAPPADÒCICUS (Willd. spec. 2. p. 1326.) leaves pubescent, radical ones cordate, trifid, with toothed acuminated lobes; lower cauline leaves stalked, upper ones sessile, entire; stem erect, generally 2-flowered; calyx spreading; root præmorse. ♃. H. Native of Cappadocia. R. chærophýllos var. g. Bir. ren. 43. An intermediate plant between *R. àcris* and *R. lanuginòsus*. Stem simple or bifid at the top. Carpels ovate, rather compressed, smooth, terminated by hooked awns.

Cappadocian Crowfoot. Pl. 1 foot.

124 R. SERÍCEUS (Poir. dict. 6. p. 109) leaves silky-villous, radical ones stalked, 3-5-parted, cauline ones ternate, with stalked, 3-parted segments; lobes of all deeply serrated; stem erect, villous, many-flowered; calyx spreading. ♃. H. Native of the Mauritius. Deless. icon. sel. 1. t. 39. Habit of *R. àcris* or *R. polyánthemus*. Flowers about the size of those of *R. arvénsis*, with oblong petals. Carpels compressed, acuminated.

Silky Crowfoot. Pl. 1½ foot.

125 R. RHÆADIFÒLIUS (D. C. syst. 1. p. 284.) leaves nearly smooth, pinnately ternate, lower ones stalked, long, with oval 3-lobed deeply toothed segments; lobes of upper leaves linear; stem erect, branched, almost smooth; calyx reflexed. ♃. H. Native of Mogador in fields, and perhaps also in the Canary islands. Deless. icon. sel. 1. t. 40. Flowers small.

Rhæas-leaved Crowfoot. Pl. 1 foot.

126 R. RE'PENS (Lin. spec. 779.) leaves ternate, with wedge-shaped, 3-lobed, deeply-toothed segments; runners creeping, rising from the neck of the stem; flower bearing stems rather erect; calyx pressed; carpels terminated by straight points. ♃. H. Native throughout Europe in meadows, moist pastures, and shady waste places, in towns, neglected gardens, very common; also in the mountains of North America. Smith eng. bot. 516. Curt. lond. fasc. 4. t. 38. Mart. rust. t. 29. Fl. dan. t. 95.—Gmel. fl. sib. 4. p. 206. no. 54. t. 84. R. prostràtus, Poir. dict. 6. p. 113. R. inféstus Sal. prod. 373. This plant varies much according to the soil and situation where it grows. It is very acrid in taste and blisters the skin.

Var. β, flore pleno (flowers double) Tab. icon. 53. f. 1.—Ger. herb. 957. f. 2.—Besl. Eyst. vern. 1. t. 13. f. 2.

Var. γ, eréctus (D. C. syst. 1. p. 285.) flowering stems erect, without runners.

Var. δ, glabràtus (D. C. syst. 1. p. 285.) leaves and stems very smooth. R. lúcidus, Poir. dict. 6. p. 113.

Var. ε, linearílobus (D. C. prod. 1. p. 38.) runners creeping, very long, bearing flowers; lobes of leaves very narrow.

Creeping Crowfoot. Fl. May, Aug. Brit. Pl. ½ to 1 foot.

127 R. CALEYA'NUS, plant pilose; stem prostrate, many-flowered; radical leaves on long stalks, upper cauline ones sessile, all ternate; segments 3-parted, lobed, middle one on a long stalk; calyx reflexed; carpels compressed, terminated by short points, disposed in ovate heads. ♃. H. Native near London in dry places, particularly in the late Mr. Caley's garden at Bayswater.

Caley's Crowfoot. Fl. May, Aug. Britain. Pl. trailing.

128 R. MARGINA'TUS (D. Urv. enum. pl. arch. no. 479.) root fibrous; stem branched at the base, spreading, rather hairy; leaves surrounded by a callose margin, lower ones stalked, ternate, with crenated blunt segments; stem leaves with linear segments; calyx reflexed; carpels rounded, flat, marginated, terminated by rather hooked points. ♃. H. Native on hills about Trapesus. Petals small.

Marginated-carpelled Crowfoot. Fl. May, July. Pl. 1 foot.

129 R. JAPÓNICUS (Langsd. ex Fisch. in litt. D. C. prod. 1. p. 38.) leaves palmately ternate, with roundish deeply and bluntly toothed segments; stem creeping; calyx reflexed. ♃. H. Native of Japan, near Nagasaki, R. Langsdorfii, Spreng. syst. 2. p. 652. Carpels compressed, smooth, terminated by hooked points. This plant is called in Japan *Kimbu-Nohanwa*.

Japan Crowfoot. Pl. creeping.

130 R. DIFFU'SUS (D. C. prod. 1. p. 38.) plant villous; leaves roundish, 3-lobed, toothed, cordate at the base; stem creeping, diffuse; pedicels 1-flowered, opposite the leaves; calyx pressed; carpels oval, smooth, dotted, terminated by straight points. ♃. H. Native of Nipaul in inundated places. Flowers small. Stem creeping.

Diffuse Crowfoot. Pl. creeping.

131 R. GERANOÌDES (H. B. et Kth. nov. gen. et spec. amer. 5. p. 44.) plant villous; radical leaves ternate; segments stalked, trifid, cuneated at the base, deeply toothed; stem ascending, few-flowered; pedicels 1-flowered opposite the leaves; petals oblong; calyx somewhat reflexed. ♃. G. Native of New Granada on Mount Quindiu, also of the island of Java, according to Blume. Carpels smooth, compressed, terminated by straight points.

Geranium-like Crowfoot. Pl. ½ foot.

132 R. CHILE'NSIS (D. C. syst. 1. p. 286.) stems procumbent, and are hispid as well as the petioles; leaves rather villous, cordate, orbicular, 3-5-cleft, with deeply toothed lobes; calyx very villous. ♃. F. Native of Chili near Talcacuano. The affinity of this plant is doubtful, owing to the carpels being unknown.

Chili Crowfoot. Pl. ½ to 1 foot.

133 R. lappa'ceus (Smith in Rees' Cyclop. no. 61.) leaves villous, stalked, pinnate or pinnatifid, with ovate, trifid, sharply and deeply lobed segments; stem erect, many-flowered; calyx spreading; carpels terminated by hooked points. ♃. H. Native of New Holland near Port Jackson. This species is allied to *R. pinnátus*, but the carpels are not tuberculated.

Var. β, *obtusàtus* (D. C. syst. 1. p. 287.) leaves shorter and blunter, 3-parted; stem almost naked, 2-flowered.

Var. γ, *pubescens* (D. C. syst. i. p. 287.) stem and petioles clothed with pressed hairs; calyx hispid.

Burdock Crowfoot. Pl. 1 foot.

134 R. pilòsus (H. B. et Kth. nov. gen. and spec. amer. 5. p. 45.) stem forked, ascending; petioles beset with spreading hairs; leaves pinnate, with trifid grossly toothed segments, those of the upper ones linear, oblong, all clothed with close pressed hairs; calyx reflexed, nearly smooth; carpels terminated by straight points. ♃. F. Native of South America, particularly about Santa-fe-de-Bogota. Carpels disposed into globose heads.

Pilose Crowfoot. Pl. ½ foot.

135 R. Nepaule'nsis (D. C. prod. 1. p. 39.) stem erect, dichotomous, hairy as well as the leaves, lower leaves ternate; leaflets oblong-cuneated, lobed and toothed, upper ones 3-parted, entire; calyx villous, reflexed, a little longer than the oblong, blunt petals; carpels ovate, with straight points. ♃. H. Native of Nipaul. R. trilobàtus. D. Don. prod. fl. nep. p. 194. R. ternàtus. Thunb.

Nipaul Crowfoot. Pl. 1 foot.

136 R. petiola'ris (H. B. et Kth. nov. gen. et spec. amer. 5. p. 45.) radical leaves on very long stalks, clothed with close-pressed silky-pubescence; partitions, trifid, deeply toothed; floral leaves 3-parted, with linear lobes; stem erect, forked; calyx reflexed. ♃. F. Native of Mexico near Santa-Rosa. Carpels ovate. glabrous, terminated by very short straight points.

Long-stalked Crowfoot. Pl. 1-2 feet.

137 R. dichótomus (Moc. et Sess. fl. mex. ic. ined. D. C. syst. 1. p. 288.) leaves smoothish, radical ones on very long stalks, bipinnate; stem erect, dichotomous; calyx reflexed. ♃. F. Native of Mexico. Flowers like those of *R. bulbòsus*. Carpels terminated by straight points. Radical leaves longer than the flowering stem.

Dichotomous-stemmed Crowfoot. Pl. 1 foot.

138 R. Pe'rsicus (D. C. syst. 1. p. 288.) leaves smooth, radical ones stalked, pinnate, with 3-lobed segments: lobes ovate, cuneated at the base, and regularly toothed at the apex; stem leaves ternate, uppermost ones 3-parted, rather pubescent; stem erect, dichotomous, clothed with close-pressed pubescence; calyx spreading, villous on the outside. ♃. H. Native of Persia. Flowers about the size of those of *R. repens*, or a little larger.

Persian Crowfoot. Pl. 1 foot.

139 R. plebe'ius (R. Br. prod. nov. holl. vol. 2. ined. D. C. syst. 1. p. 288.) stem erectish, dichotomous at the base, and is, as well as the petioles, beset with spreading hairs, but smoothish towards the apex; leaves ternate, villous, with stalked, ovate, deeply toothed segments; upper leaves linear, entire; calyx somewhat reflexed. ♃. F. Native of New Holland at Hunters-river, Hawkesbury. Carpels compressed, smooth, terminated by somewhat hooked points.

Plebeian Crowfoot. Fl. May, June. Clt. 1820. Pl. 1½ foot.

140 R. hirtus (Banks and Sol. MSS. D. C. syst. 1. p. 289.) stem erect, dichotomous; petioles and peduncles very hairy; cauline leaves stalked, lower ones ternate, with stalked ovate-toothed segments; middle segment 3-lobed; upper leaves oval-oblong; calyx somewhat reflexed. ♃. H. Native of New Zealand in grassy places near Tigadus, Tolago, Opuragi, and Totaranui. Very like *R. plebèius*. Carpels compressed, ending in short straight points.

Hairy Crowfoot. Fl. May, July. Pl. 1 foot.

141 R. híspidus (Michx. fl. bor. amer. 1. p. 321.) stem erect, branched, clothed with spreading hairs, as well as the petioles; leaves on long stalks, ternate, upper ones almost sessile: leaflets trifid cut, with lanceolate segments, which are callose at the apex; pedicels covered with close-pressed pubescence; calyx pilose, at length reflexed. ♃. H. Native of North America in wet fields and on the banks of ditches and rivers, from Canada to Carolina, and from the shores of Hudson's Bay to the Pacific. Flowers the size of those of *R. àcris*. Carpels orbicular compressed, terminated by very short points. Neck of root somewhat tuberous.

Hispid Crowfoot. Fl. June, Aug. Clt.? Pl. 1 foot.

142 R. recurva'tus (Poir. dict. 6. p. 123.) stem erect, clothed with spreading hairs as well as the petioles; leaves 3-parted, villous, with oval toothed partitions; calyx pilose, reflexed; carpels with hooked points. ♃. H. Native of North America in shady woods, from New York to Carolina, Labrador, mouth of the Columbia, and on the eastern declivity of the Rocky Mountains. Deless. icon. sel. 1. p. 41. R. lanuginòsus, Walt. fl. carol. 159. R. Pennsylvánicus, var. Bir. ren. p. 41. R. saniculæfórmis, Muhl. ex. Rafin. Like *R. Pennsylvánicus*, but differing in the leaves being 3-parted, not ternate, that is to say, not cleft to the base but confluent, as well as in the carpels being collected into a somewhat globose head, not an ovate head, and in having hooked not straight points. Root almost bulbous, especially with the neck clothed with the sheaths of the petioles of the old leaves. Flowers small. Petals elliptical, almost white, sometimes abortive.

Var. β, *Nelsònii* (D. C. syst. 1. p. 290.) lobes of leaves approximate; pedicels clothed with close-pressed hairs, length of leaves. ♃. H. Native of the island of Unalaschka.

Var. γ, *Hookerii* (stem and leaves smoothish.) Native of North America in mountain woods, north of Smoking River.

Recurved-styled Crowfoot. Fl. May. Clt.? Pl. 1½ foot.

143 R. Pennsylva'nicus (Lin. suppl. 272.) stem erect, branched, covered with stiff spreading hairs, as well as the petioles; leaves on long stalks, ternate, villous, with stalked, acutely 3-lobed, and deeply serrate segments; calyx spreading at length, reflexed, longer than the petals; carpels with straight points. ♃. H. Native of North America in low, moist, gravelly meadows, from Canada to Pennsylvania, and from the shores of Hudson's Bay to the Pacific. R. Canadénsis, Jacq. misc. 2. p. 343. icon. rar. 1. t. 105. Flowers the size of those of *R. àcris*.

Pennsylvanian Crowfoot. Fl. Jul. Aug. Clt. 1785. Pl. 1 to 2 ft.

144 R. fasciula'ris (Muhl. in Big. fl. bost. ed. 2. p. 226.) stem erect, branched; leaves ternate, quinate, pinnate, covered with close-pressed hairs; leaflets oblong-obovate, or cuneated pinnatifid-lobed; calyx spreading, villous underneath, shorter than the petals; carpels roundish, compressed, terminated by long recurved beaks, disposed in round heads. ♃. H. Native of North America in dry places and hills about Boston, and from Canada to the south of Lake Winepeg. Roots numerous, fascicled, rather fleshy.

Fascicled-rooted Crowfoot. Fl. April, May. Clt.? Pl. ½ foot.

145 R. Schlechtenda'lii (Hook. fl. bor. amer. p. 21. Graham in edinb. phil. jour. for 1829.) radical leaves stalked, 3-parted, cut, pilose; segments wedge-shaped, fringed, with a callose point at the apex; stem leaves stalked, with ovate-lanceolate entire pilose segments; stem erect, branched, pilose; carpels smooth, with rather straight beaks, collected into a globular head. ♃. H. Native of North America on the Rocky

Mountains. R. fasciculàris, Schlecht. anim. ran. sect. 2. p. 30. t. 2. Stem hollow, flattened. Radical leaves 3-parted, with the middle lobe trifid and the lateral ones 2-cleft, and cut again into 2-3 minor lobes. Calyx hairy, reflexed.

Schlechtendal's Crowfoot. Fl. May, June. Clt. 1826. Pl. ½ ft.

146 R. BE'CKII; leaves all radical, pubescent, stalked, 3-5-cut; scape villous, 1-flowered, longer than the leaves; calyx permanent; petals oblong-ovate. ♃. H. Native of Missouri in plains. R. nov. spe. Beck in amer. jour. scienc. vol. 12. April, 1828.

Beck's Crowfoot. Pl. ½ foot.

147 R. BELVÌSII (D. C. syst. 1. p. 291.) stem erect, branched, furnished with a few spreading hairs as well as the petioles; leaves smooth, ternate, with 3-lobed segments; lobes oblong acutely-cut at the apex; calyx smooth, spreading, shorter than the petals. ♃. H. Native of North America. Flowers a little smaller than those of *R. àcris*. Carpels compressed, even, terminated by short straight points.

Belvis's Crowfoot. Fl. June, July. Pl. 1½ foot.

148 R. MARYLA'NDICUS (Poir. dict. 6. p. 126.) stem erect, a little branched, clothed with soft hairs at the base as well as the petioles, and with close-pressed pubescence at the top; leaves smoothish, ternate, with 3-lobed segments, and oblong acute deeply toothed lobes; calyx smooth, spreading shorter than the petals. ♃. H. Native of North America in shady woods, Maryland, Pennsylvania to Virginia. Root fibrous, fascicled. Stem 2-3-flowered. Flowers pale yellow, a little larger than those of *R. àcris*. Carpels compressed, with straight points.

Maryland Crowfoot. Fl. May, July. Clt. 1811. Pl. 1 foot.

149 R. NÍTIDUS (Muhl. cat. Elliott. carol. 2. p. 61.) plant smoothish; radical leaves on long stalks, ternate; leaflets stalked, profoundly trifid or 3-parted; lobes broad-lanceolate trifid cut; lobes of the cauline leaves almost linear, entire, or trifid; calyx spreading, at length reflexed, rather hairy; carpels orbicular, compressed, marginate, terminated by short points. ♃. H. Native of North America on the lower plains of Columbia; Canada; Lower Carolina, &c. R. septentrionàlis, Poir. dict. 6. p. 123. Pursh. fl. amer. sept. 2. p. 395. R. Caroliniànus, D. C. syst. 1. p. 292. R. híspidus, var. Mich. fl. bor. amer. 1. p. 321. R. lanuginòsus, var. Pursh. fl. amer. sept. 2. p. 394.

Shining Crowfoot. Fl. June, July. Clt. 1826. Pl. 1 to 2 feet.

150 R. TOMENTO'SUS (Poir. dict. 6. p. 127.) stem ascending, very villous, 1-2-flowered; leaves stalked, downy, ternate, upper ones sessile, ovate, entire; calyx very villous, somewhat reflexed. ♃. H. Native of Upper Carolina. R. lanuginòsus, Pursh. ex. Lamb. herb. Like *R. pubéscens* and *R. Marylándicus*. Roots fibrous, fascicled. Flowers yellowish-white; petals a little longer than the calyx.

Downy Crowfoot. Fl. May, July. Clt. 1820. Pl. ½ foot.

151 R. PRÆMÒRSUS (H. B. et Kth. nov. gen. et spec. amer. 5. p. 47.) stem erect, usually 2-flowered, villous as well as the petioles; leaves ternate, with bluntly and deeply-toothed segments, lateral ones bifid, middle ones trifid, stalked; calyx reflexed; petals 10 to 15, wedge-shaped. ♃. H. Native of South America on mount Antisana. Like *R. Marylándicus* in habit, but differing in having 10 to 15 petals. Carpels with short straight points.

Præmorse-rooted Crowfoot. Pl. ½ foot.

152 R. BONPLANDIA'NUS (H. B. et Kth. nov. gen. et spec. amer. 5. p. 46.) stems erect, 2-3-flowered, rather hairy; leaves trifid, 3-parted and ternate, upper surface smooth, under surface pilose-pubescent, with crenate-serrated 2-3-lobed segments; calyx hairy, reflexed; petals 10 to 12, rounded at the apex. ♃. H. Native of New Granada at the height of 3000 feet.

Bonpland's Crowfoot. Pl. ½ to 1 foot.

153 R. GEOÌDES (H. B. et Kth. nov. gen. et spec. amer. 5. p. 47.) stem erect, 1-3-flowered, very villous as well as the petioles; leaves villous, trifid, or 3-parted, with ovate-toothed lobes; calyx reflexed; petals 10, oblong-linear. ♃. F. Native of Mexico in the mountains. Habit of *Gèum montànum*. Petals twice as long as calyx. Hairs of the stem spreading, those of the leaves closely pressed.

Geum-like Crowfoot. Pl. ½ foot.

154 R. SIBBALDIOÌDES (H. B. et Kth. nov. gen. et spec. amer. 5. p. 48.) stem almost naked, 1-flowered; leaves pilose, pinnate, with ovate-toothed segments; terminal segment 3-lobed; floral leaves pinnatifid; calyx spreading, shorter than the oblong petals. ♃. F. Native of South America on the high mountain of Quindiu or Antisana. A very dwarf herb, with the habit of *Sibbáldia procùmbens*. Radical leaves crowded, dark green. Carpels ovate, rather compressed, terminated by short straight points.

Sibbaldia-like Crowfoot. Pl. ¼ foot.

155 R. DELPHINIFO'LIUS (H. B. et Kth. nov. gen. et spec. amer. 5. p. 48.) stems erect, few-flowered, hairy; leaves ternate; lateral segments bifid, middle one 3-parted, with deeply-serrated bifid or trifid laciniæ and lanceolate lobes; calyx pilose, reflexed; petals 15. ♃. F. Native of Mexico on the mountains at the height of 5000 feet.

Larkspur-leaved Crowfoot. Pl. 1 foot.

156 R. PEDUNCULA'RIS (Smith in Rees' cyclop. no. 49.) leaves smoothish; radical ones stalked, ternate, with 3-lobed segments, which are acutely cut at the apex; cauline leaves 1 or 2, linear or trifid; stem erect, 1-leaved, 1 or 2-flowered; calyx at length reflexed; petals 8-10, oblong. ♃. H. Native of the Straits of Magellan on the borders of woods, at a place called *Fresh-water Bay* or *Baye Duclos*. Habit of *R. bulbòsus*. Carpels globose, even, with hooked points. Stem more or less hairy.

Peduncled-flowered Crowfoot. Fl. Dec. Pl. 1 foot.

157 R. GRANDIFLO'RUS (Lin. spec. 781.) leaves rather villous, radical ones stalked, ternate, with unequally jagged segments; stem-leaves linear or divided into linear lobes; stem erect, villous, few-flowered; calyx reflexed. ♃. H. Native of Cappadocia and about Constantinople. Desf. Choix. 57. t. 44. Flowers larger than those of *R. bulbòsus*.

Great-flowered Crowfoot. Fl. May. Clt. 1817. Pl. ½ to 1 ft.

158 R. PALU'STRIS (Lin. MSS. Smith in Rees' cyclop. no. 52.) leaves rather hairy, stalked, cleft in 3 beyond the middle, with blunt recesses and ovate-cut toothed lobes; stem erect, branched, almost naked; carpels even, terminated by straight short points. ♃. H. Root a little like that of *R. bulbòsus*.

Var. α, orientàlis (D. C. syst. 1. p. 294.) stem trichotomous; radical leaves on short stalks. ♃. H. Native of the Levant. R. orientàlis, palústris, apii folio, &c. Tour. cor. 20. Stems numerous.

Var. β, Córsicus (D. C. syst. 1. p. 295.) stems dichotomous; radical leaves on very long stalks. ♃. H. Native of Corsica. R. Corsicus, D. C. fl. fr. 5. p. 637. Herb dark green; style hardly hooked.

Marsh Crowfoot. Pl. 1 foot.

159 R. CYMBALARIFO'LIUS (Balb. in Mor. 1. p. 2.) root fascicled; leaves rather hairy, radical ones on long stalks, orbicular 3-lobed: lobes coarsely-crenate, cauline leaves trifid and simple; stem branched dichotomous, rather naked, filiform; sepals reflexed; carpels smooth, hooked. ♃. H. Native of the island of Sardinia in rivulets.

Cymbalaria-leaved Crowfoot. Pl. ½ foot.

160 R. ORTHORY'NCHUS (Hook. fl. bor. amer. p. 21. t. 9.) plant beset with adpressed hairs; stem erect, slender, branched, and rather leafy; radical leaves stalked, ternate; leaflets linear-multifid, with white callose tips; calyx reflexed; styles straight, longer than the carpels, which are broadly semi-ovate, com-

pressed, and marginate. ♃. H. Native of North America, not unfrequent on the low points of land near rivers on the north-west coast. This species comes very near to *R. dichótomus*, D. C. and *R. fasciculàris*, Muhl.

Hard-beaked-leaved Crowfoot. Fl. May, Jul. Clt. 1826. Pl. 1 ft.

161 R. bulbo'sus (Lin. spec. 778.) radical leaves stalked, ternate or quinate-pinnate, with trifid or quinquifid deeply-toothed 3-lobed segments; middle segment stalked; stem erect, bulbous at the neck; calyx reflexed; petals obcordate. ♃. H. Native throughout Europe in pastures, meadows, grass-plats, and waste ground every where; also in North America. Smith, eng. bot. 8. t. 515. Curt. lond. fasc. 1. t. 38. Mart. rust. t. 28. Mill. illustr. t. 51. Fl. dan. t. 551. Plant more or less hairy. This species though acrid is commonly eaten along with other herbage, by domestic cattle. The root, which is said to be the most acrid part of the plant, and which is said to raise blisters with less pain and more safety than Spanish flies; hence these roots have been applied for that purpose, particularly to the joints in cases of gout. According to Hoffman, beggars make use of them to blister their skin, with a view of exciting compassion. The juice of the herb is said to be more acrid than that of *R. sceleràtus*, and if applied to the nostrils excites sneezing. The roots lose their stimulating quality by drying, and are even eatable when boiled. Hogs are fond of them, and frequently dig them up. The flowers are vulgarly called *butter-flower*, *butter-cups*, *king's-cups*, *gold-cups*, and they are the *cuckoo buds of yellow hue* of Shakspeare. *R. rèpens* and *R. àcris*, however, are all confounded under these names by the vulgar.

Var. β, *múltiplex*; flowers double. This, with the double flowering *R. àcris*, is called in the gardens *Double yellow Bachelor's buttons*.

Var. γ, *bracteàtus* (Schleich. pl. helv. or brachiatus, Schleich. cat.)

Bulbous-rooted Crowfoot. Fl. May, Ju. Britain. Pl. ½ to 2 ft.

Sect. V.—Echine'lla (εχινος, *echinos*, a hedge-hog; in allusion to the prickly or tubercled carpels,) D. C. prod. 1. p. 41. carpels scabrous, with tubercles or prickles (f. 9. *e*.) Annual plants with small yellow flowers.

§ 1. *Leaves dissected.*

162 R. philonòtis (Retz. obs. 6. p. 31.) leaves 3-lobed or ternate, with deeply-toothed blunt lobes; middle lobe stalked; calyx reflexed; stem erect, many-flowered; carpels bearing a row of small tubercles at the margin. ⊙. H. Native of south and middle Europe in moist meadows and waste or cultivated ground that is liable to be overflowed by water; also in North America in old meadow and low wet grounds, from New England to Pennsylvania. R. bulbòsus, var. β. Huds. 241. R. agràrius, All. auct. p. 27. R. sardòus, Crantz. austr. 2. p. 84. R. pallídior, Vill. dauph. 4. p. 751. R. hirsùtus, Ait. hort. kew, ed. 1. vol. 2. p. 268. Curt. lond. 2. t. 40. Smith, engl. bot. t. 1504. R. pállidus, Reiss. in Schrad. journ. bot. 1. p. 425. R. Palénsis, Berg. fl. bass. pyr. 2. p. 405. Herb very variable in luxuriance, of a paler hue than most of this genus, and clothed with fine silky spreading hairs. The name sardous, given by Jacquin, on account of its being supposed to be the plant that caused the sardonic laugh.

Var. β, *intermèdius* (Poir. dict. 6. p. 116.) leaves almost without hairs. ⊙. H. Native in humid places. R. púmilus, Thuil. fl. par. ed. 2. vol. 1. p. 277, but not of Poir.

Var. γ, *párvulus* (Lin. mant. 76.) stem dwarfish, usually 1-flowered. ⊙. H. Native in dry, stony, arid, exposed places. R. parviflòrus, Gouan. fl. monsp. 270.

Moisture-loving or Pale-hairy Crowfoot. Fl. June, Oct. Britain. Pl. ¼ to 1 foot.

163 R. lacinia'tus (Baugm. enum. str. trans. 2. p. 131. Schlecht. anim. 2. p. 36.) stem erect, silky-villous as well as the leaves, which are ternate-3-parted; segments trifid, linear, toothed; peduncles elongated, filiform, densely pilose; calyx spreading; carpels muricated and mucronate. ⊙. H. Native of Transylvania on dry mountains.

Jagged-leaved Crowfoot. Fl. June, July. Clt. 1828. Pl. 1 ft.

164 R. tubercula'tus (Kit. ex. Balb. cat. hort. taur. 1813. p. 64.) leaves smooth, deeply multifid, with linear acute lobes; stem erect, many-flowered; carpels compressed, furnished with very blunt tubercles at the sides. ⊙. H. Native of Hungary, Iberia, and north of Tauria in corn fields. Very like *R. arvénsis*, but differing in the carpels being tubercled, not prickly.

Tubercled-carpelled Crowfoot. Fl. Ju. Jul. Clt. 1817. Pl. 1 ft.

165 R. arve'nsis (Lin. spec. 780.) leaves smooth, first ones toothed at the apex; radical ones 3-parted; cauline ones multifid, with linear lobes; stem erect, many-flowered; carpels very prickly at the sides. ⊙. H. Native throughout middle and south Europe in corn fields common; in North America about Charlestown. Engl. bot. t. 135. Curt. lond. fasc. 6. t. 36. Mart. rust. t. 56. Fl. dan. t. 219. R. echinàtus, Crantz. aust. 2. p. 118. but not of Lin. This plant is very acrid and dangerous to cattle, though they are said to eat it greedily. M. Brugnon, who has given a particular account of its qualities, relates that three ounces of the juice killed a dog in 4 minutes. Several sheep were killed by feeding on this herb near Turin, which first led to an investigation of the matter. Cholic, with inflammation of the stomach, were the symptoms, which were best removed by pouring vinegar down the animals' throats. Hence, like most vegetable poisons, this Crowfoot seems to act on the nerves, and yet black spots were found in the sheep's stomachs.

Var. β, *orientàlis* echinatus, arvensis, crassiore fructu, Vaill. herb. The carpels of this variety are almost double the size of those of var. *a*, and the prickle much longer.

Corn-field Crowfoot. Fl. June, Aug. Britain. Pl. 1 foot.

166 R. murica'tus (Lin. spec. 780.) leaves smooth, stalked, somewhat orbicular, 3-lobed, and coarsely toothed; stem rather erect, or diffuse; peduncles opposite the leaves; calyx spreading; carpels beset with prickly tubercles, each ending in a straight acuminated horn. ⊙. H. Native throughout the whole region of the Mediterranean, from Portugal to Tauria in low humid places. A very variable plant, therefore many names have been given to it by authors. Smith, fl. græc. t. 522. Lam. ill. 498. —Clus. hist. 233. f. 2.

Var. β, *Creticus* (D. C. prod. 1. p. 42.) stem erect.—Mor. hist. 2. p. 440. sect. 4. t. 29. f. 24. Native of Crete.

Var. γ, *Carolìnus* (D. C. prod. 1. p. 42.) petals longer than the calyx. Native of Carolina and Virginia. R. muricàtus, Michx. fl. bor. amer. 1. p. 321. R. echinatus, Vent. cels. t. 73.

Var. δ, *Tucumánicus* (D. C. prod. 1. p. 42.) carpels less acuminated. Native of South America near the river Plate. R. palústris echinàtus. Fewill. obs. 3. p. 58. t. 18.

Var. ε, *Brasiliànus* (D. C. prod. 1. p. 42.) sheaths of petioles dilated. Native of Brazil by the sea-side in humid places. R. ventricòsus, Vent. cels. 73. R. muricàtus, St. Hil. fl. bras. p. 7.

Muricated-carpelled Crowfoot. Fl. Jul. Aug. Clt. 1683. Pl. ½ ft.

167 R. chìus (D. C. syst. 1. p. 300.) leaves rather villous, cordate, orbicular, broadly toothed; stems erect, villous; pedicels opposite the leaves; calyx reflexed; carpels tubercled, each ending in an acuminated hooked horn. ⊙. H. Native of the island of Scio. Root calyx, and petals like those of *R. philonòtis*. Leaves like those of *R. parviflòrus*, and with the carpels of *R. muricàtus*.

Scio Crowfoot. Fl. June, July. Clt. 1827. Pl. ½ foot.

168 R. cornu'tus (D. C. syst. 1. p. 300.) leaves smooth, biternate; segments 3-lobed, with the lobes oblong-linear, acute;

pedicels opposite the leaves; calyx reflexed; carpels finely tubercled, each ending in a long acuminated horn. ⊙. H. Native of Syria. This species is intermediate between *Ranúnculus* and *Ceratocéphalus*.

Horned Crowfoot. Pl. ½ foot.

169 R. PINNA'TUS (Poir. dict. 6. p. 126.) leaves villous, pinnate; leaflets stalked, oblong, acute, somewhat pinnatifid; pedicels opposite the leaves, calyx reflexed; carpels oval, finely tubercled, mucronate with the short styles. ⊙. H. Native of the East Indies and the Cape of Good Hope. Root with blackish fibres. Stem branched, hispid.

Var. α, Sonneràtii (D. C. prod. 1. p. 42.) Native of India. R. parviflòrus, var. c. Bir. ren. 46.

Var. β, Hermánni, (D. C. prod. 1. p. 42.) Native of Cape of Good Hope. R. Africanus pratensi hirsuto similis. Herm. cat. pl. afr. p. 18.

Pinnate-leaved Crowfoot. Pl. 1 foot.

170 R. PARVIFLÒRUS (Lin. spec. 780.) leaves villous, orbicular, 3-lobed, coarsely toothed or cut; stem decumbent, covered with soft hairs; pedicels opposite the leaves; calyx a little reflexed, equal in length to the petals; carpels granular-tubercled. ⊙. H. Native almost throughout Europe in low humid places; plentiful in Britain. Smith. eng. bot. t. 120.—Ray. angl. 3. p. 248. t. 12. f. 1.—Mor. hist. 2. p. 440. sect. 4. t. 28. f. 1. Hairy Crowfoot. Petiv. engl. herb. t. 38. f. g.

Var. β, acutílobus, (D. C. prod. 1. p. 42.) leaves deeply 3-lobed; lobes cut at the apex; teeth acute. Native of Teneriffe.

Var. γ, eréctus, (D. C. prod. 1. p. 42.) stem erect; leaves 5-lobed or coarsely 5-toothed. Native of Syria.

Small-flowered Crowfoot. Fl. May, Ju. Eng. Pl. trailing.

171 R. TRÍLOBUS (Desf. atl. 1. p. 437. t. 113.) leaves somewhat villous or smooth; first ones roundish, crenated, the rest 3-parted; lobes diverging, cuneated at the base, toothed at the apex; stem erect; pedicels opposite the leaves; calyx at length somewhat reflexed, shorter than the petals; carpels granularly-tubercled. ⊙. H. Native of the regions of Mediterranean, Barbary, Cyprus, Greece, Naples, France, and of Teneriffe. R. parviflòrus, var. b, Bir. ren. 46. R. Rosàni Tenore. prod. fl. neap. This species is allied on the one hand to *R. parviflòrus* and on the other to *R. philonòtis*.

Three-lobed-leaved Crowfoot. Fl. Ju. Jul. Clt. 1823. Pl. ½ ft.

172 R. CORDÍGERUS (Viv. app. fl. cors. in Schlecht. Linnæa 1. p. 502.) plant clothed with silky hairs; radical leaves cordate, roundish-ovate, crenate-toothed, entire, or 3-lobed, stem ones cut or quite entire; stem usually 2-flowered, or with radical, naked, 1-flowered peduncles; calyx reflexed; carpels tubercled. ⊙. H. Native of Corsica.

Heart-bearing Crowfoot. Pl. ½ foot.

173 R. SESSILIFLÒRUS (R. Br. prod. fl. holl. vol. 2. ined. D. C. syst. 1. p. 302.) leaves rather villous, kidney-shaped, 3-parted or coarsely toothed; stems procumbent; flowers sessile, opposite the leaves; carpels granularly-tubercled. ⊙. H. Native of New Holland about Port Jackson. The disposition of the flowers is very near to that of *R. nodiflòrus*.

Sessile-flowered Crowfoot. Fl. June, July. Pl. prostrate.

174 R. VERRUCÒSUS (Sternb. in gaz. bot. ratisb. 1826.) leaves villous, stalked, ternate; segments trifid, acutely and deeply toothed, all stalked; stem erect, villous; root bulbous; calyx reflexed; carpels tubercled. ♃. H. Native about Trieste.

Warted-fruited Crowfoot. Pl. 1 foot.

§ 2. *Leaves entire.*

175 R. OPHIOGLOSSIFÒLIUS (Vill. dauph. 4. p. 732. t. 49.) lower leaves stalked, cordate, obtuse, upper ones oblong, sessile; stem erect, fistulous; peduncles opposite the leaves; carpels granularly-tubercled. ⊙. H. Native of the south of Europe in moist meadows and bogs, particularly in France, about Montpelier, Portugal, Italy, &c. R. flámmula var. f. Bir. ren. p. 37. R. ophioglossoìdes, Willd. spec. 2. p. 1320. R. cordifòlius, Bast. fl. main. et loir. 207. R. Telonénsis Robert. R. fistulòsus, Brign. fasc. rar. pl. forogul 25. R. uliginòsus, Tenore in litt. Carpels ovate, compressed.

Adders'-tongue-leaved Crowfoot. Fl. Ju. Clt. 1823. Pl. ½ ft.

176 R. ULIGINO'SUS (Willd. enum. 586.) leaves ovate and lanceolate, serrated, smooth; stem ascending, fistulous; peduncles opposite the leaves; petals length of calyx. ⊙. H. Native of Teneriffe. Very like *R. flámmula* and *R. ophioglossifòlius*. Flowers as small as those of the *abortìvus*. The immature fruit has only been seen; they are disposed in a globose head, and appear to be granularly-tubercled.

Bog Crowfoot. Fl. June, July. Clt. 1829. Pl. ½ foot.

177 R. NODIFLO'RUS (Lin. spec. 773.) radical leaves stalked, oval-oblong; flowers sessile opposite the leaves; carpels granularly-tubercled, scarcely beaked. ⊙. H. Native of France and Hungary, &c. in low places where the rain remains a considerable time. Carpels collected into a globose head.

Var. α, dentàtus (D. C. prod. 1. p. 43.) leaves 3-nerved, toothed at the apex, Native of Hungary. R. nodiflòrus. Walds. et Kit. hung. 2. p. 192. t. 176. R. nodiflòrus, var. β, Sims, bot. mag. t. 2171. var. γ, sículus, &c.—Petiv. gaz. 39. t. 24. f. 9.

Knot-flowered Crowfoot. Clt. 1714. Pl. ½ foot.

178 R. LATERIFLO'RUS (D. C. syst. 1. p. 251.) leaves radical, stalked, oval-oblong; flowers sessile, opposite the leaves or axillary; carpels granularly-tubercled, beaked by the elongated styles. ⊙. H. Native of Syria. Deless. icon. sel. 1. t. 30.—Cuss. hort. cath. 185.

Lateral-flowered Crowfoot. Pl. ¾ foot.

† *Species not sufficiently known.*

§ 1. *Leaves entire.*

179 R. OBTUSIU'SCULUS (Raf. in journ. bot. 1808. vol. 1. p. 225.) Native of North America, in marshes of New Jersey. Stem erect, simple; leaves stalked, lanceolate, bluntish; flowers few, terminal.

Bluntish-leaved Crowfoot. Pl. 1 foot.

§ 2. *Leaves multifid.*

180 R. DE'BILIS (Raf. in journ. bot. 1808. vol. 1. p. 225.) Native of Pennsylvania near German-town. Stem weak; leaves few, bifid, cut, serrated, on long half-jointed stalks; flowers terminal, solitary.

Weak Crowfoot. Pl. procumbent.

181 R. FORSKŒ'HLII (D. C. syst. 1. p. 303.) R. multífidus, Forsk. fl. ægyp. 102. R. chærophýllos, Var. a. Bir. ren. 42. Native of Arabia. Leaves multifid, lower ones pinnately jagged. Stem 2 feet high, erect, many-flowered, round at the base, striated at the apex, pilose; calyx equal in length to the corolla.

Forsköhl's Crowfoot. Pl. 2 feet.

182 R. CANTONE'NSIS (D. C. prod. 1. p. 43.) Native of China near Canton. Hecatònia pilòsa, Lour. coch. 371. D. C. syst. 1. p. 228. Stem erect, branched, pilose; leaves pilose, ternate, lanceolate, serrated; flowers terminal, solitary; carpels acuminated, collected into a globose head. (Lour.)

Canton Crowfoot. Pl. 2 feet.

183 R. LAGASCA'NUS (D. C. prod. 1. p. 43.) Native of Spain. R. pubéscens. Lag. cat. hort. madr. p. 19. Plant hairy; peduncles elongated, 1-flowered; calyx pilose, reflexed; leaves 3-parted, 3-lobed, crenated, upper ones lanceolate, quite entire. (Lag.)

Lagasca's Crowfoot. Pl. ?

184 R. HORNEMA'NNI (Schlecht. anim. 2. p. 36.) Native of North America. R. tuberòsus, Horn. hort. hafn. 2. p. 527. Calyx reflexed, pilose; peduncles furrowed; leaves triternate;

leaflets 3-lobed, hairy; root tuberous? bulbous? Very like *R. philonòtis*.

Hornemann's Crowfoot. Pl. 1½ foot.

185 R. OBTUSIFÒLIUS (Horn. hort. hafn. 2. p. 528. Schlecht. anim. 2. p. 36.) Native of Spain. Very like *R. lanuginòsus*, but the lobes of the leaves are blunt.

Blunt-leaved Crowfoot. Pl. ?

Cult. The species belonging to section *Batrachium* require to be grown in water: those belonging to sections *Ranunculàstrum* and *Thòra* will grow in any common garden soil, either in a moist or dry situation, and being all grumose-rooted plants, they should be increased by offsets from the roots, or by seeds; those belonging to section *Hecatònia*, being all fibrous-rooted plants, should be increased by dividing the plants at the root or by seeds; they will thrive very well in any kind of soil, but a moist situation suits most of them best, and some of them will grow in water, such as *R. biternàtus*, *flámmula*, *lingua*, &c. and those belonging to section *Echinélla*, being all trifling annual plants, only require to be sown in the open ground; they will thrive in any kind of soil, either in a wet or dry situation. The species most worth the cultivator's care are the following: *R. rutæfòlus*, *isopyroìdes*, *glaciàlis*, *alpéstris*, *aconitifòlius*, *platanifòlius*. *Pyrenæ'us*, *amplexicaúlis*, *parnassifòlius*, *gramíneus*, *grácilis*, *fumariæfòlius*, *Illýricus*, *Asiaticus*, *àcris var. flore-plèno*, *repens var. flore-plèno*, *Krapfia*, and *macropétalus*, &c. In the cultivation of all, the situations where each grow naturally should be consulted.

XV. CASA'LEA (in honour of Abbate Manuel Ayres de Casal, who in his Corographia Brasiliana mentions many plants.) St. Hil. fl. bras. 1. p. 8.

Lin. syst. *Polyándria*, *Polygýnia*. Calyx of 3-coloured, petal-like sepals. Petals 3, sometimes only 1 or 2 from abortion, usually shorter than the sepals, unguiculate, each furnished with a fleshy orbicular scale on the inside at the base. Stamens 4-18, but generally 6. Carpels numerous, compressed, smooth, each ending in a point, disposed in hemispherical or globular heads. Small, smooth, marsh herbs, with fibrous roots and erect or decumbent rooting stems. Leaves entire or parted. Peduncles 1-flowered opposite the leaves. Flowers small, white, or yellow.

1 C. SESSILIFLÒRA (St. Hil. fl. bras. 1. p. 9.) stems prostrate, hairy; leaves 3-parted, cut, pilose, ciliated, radical ones stalked, rather orbicular, upper ones almost sessile, somewhat triangular, truncately-cuneated at the base; flowers sessile; stamens 5-6. ⊙. H. Native of Brazil in marshes in the province of Cis Platine. Flowers yellowish; petals white at the base.

Sessile-flowered Casalea. Fl. Nov. Pl. prostrate.

2 C. PHYTEUMÆFÒLIA (St. Hil. fl. bras. 1. p. 9.) stem erect; leaves stalked, radical ones usually cordate, lower stem ones ovate, middle ones oblong-rhomboid, uppermost ones almost linear acute; fruit bearing peduncles erectish; stamens usually 12; heads of carpels ovate. ⊙. H. Native of Brazil in marshes in the province of Minas Geraes. Ranúnculus phyteumæfòlius, Spreng. syst. app. 218. Sepals white, a little shorter than the petals, which are also white.

Var. β, Bonariénsis (St. Hil. fl. bras. 1. p. 10.) flowers a little larger than in the species; stem more branched; leaves all toothed, radical ones a little smaller; stamens 5-12. ⊙. H. Native of Brazil in the province of St. Paul, in marshes, and of Buenos Ayres. Ranúnculus Bonariénsis. Pers. ench. 1. p. 103. C. heterophýllus, Smith in Rees' cycl. no. 12. Flowers white.

Phyteuma-leaved Casalea. Fl. Sep. Pl. 1 to 2 feet.

3 C. FICARIÆFO'LIA (St. Hil. fl. bras. 1. p. 10.) plant quite smooth; stem rather decumbent; leaves cordate, angular, quite blunt, upper ones rather truncate at their base, orbicularly-triangular or ovate; fruit bearing peduncles spreading; flowers small; petals elliptical-lanceolate; stamens 5-6; heads of carpels globose. ⊙. H. Native of Brazil in the province of Rio Grande do Sul in humid places and rivulets. Petals and sepals whitish.

Var. β, mìnor (St. Hil. fl. bras. 1. p. 10.) stem much smaller, erect; leaves smaller, crenate-angular, or slightly or coarsely crenated; radical ones more orbicular than the rest; flowers yellow. ⊙. H. Native of Brazil and Buenos Ayres in marshes. Ranúnculus Bonariénsis, Poir. dict. 6. p. 102. Deless. icon. sel. 1. p. 29. D. C. syst. 1. p. 250. R. cochleariæfòlius, Horn. cat. hort. hafn.

Ficaria-leaved Casalea. Fl. May, Jul. Clt. 1817. Pl. ¼ to ½ ft.

4 C. ASCE'NDENS (St. Hil. fl. bras. 1. p. 11. t. 1.) plant quite smooth; stems ascending, slender; leaves stalked, radical ones cordate-roundish; coarsely crenate, stem ones cordate, crenated, upper ones rather obovate, or somewhat obovate 3-lobed, uppermost ones very small, usually linear; petals obovate-oblong; stamens usually 4; heads of carpels cylindrically-oblong. ⊙. H. Native of Brazil near Monte Video in marshes. Ranúnculus cordifòlius, Spreng. syst. app. p. 218. Flowers white; sepals longer than the petals.

Ascending Casalea. Fl. Nov. Pl. ¼ to ½ foot.

5 C. FLAGELLIFO'RMIS (St. Hil. fl. bras. 1. p. 11.) plant quite smooth; stem creeping, rooting; leaves rather orbicular, cordate at the base, obsoletely angular; flowers minute; stamens usually 5; heads of carpels globose. ⊙. H. Native of Brazil in the provinces of Minas Geraes and St. Paul in marshes, as well as of Chili and Peru. Ranúnculus flagellifórmis, Smith in Rees' cyclop. no. 13. D. C. syst. 1. p. 251. R. hydrocótile, Domb. ined. R. renifórmis, Lamb. herb. Flowers white; petals very minute, usually 2.

Var. β, lutéscens (St. Hil. fl. bras. 1. p. 12.) leaves less cordate; calyx and corolla yellowish. ⊙. H. Native of Brazil in the province of Rio Grande do Sul. in bogs.

Whip-formed Casalea. Fl. Sept. March. Pl. creeping.

Cult. Casalea is a genus of trifling annual plants not worth cultivating, except in the gardens of the curious. They only require to be sown in the open ground about the middle of April, in a moist warm situation, however many of them will grow in a dry situation.

XVI. APHANOSTE'MMA (*a, priv.*; *φαινω, phaino*, to appear, *στεμμα, stemma*, a crown, in allusion to the small petals.) St. Hil. fl. bras. 1. p. 13.

Lin. syst. *Polyándria*, *Polygýnia*. Calyx of 5, coloured, petal-like deciduous sepals. Petals 5, scarcely manifest, distant, orbicular, somewhat bilabiate, in the form of glands, unguiculate, with a nectariferous hollow at the base of each, deciduous. Stamens and ovaries indefinite. Stigmas minute. Carpels rather orbicular, compressed, somewhat marginate, collected into a small ovate head. A smooth herb, with lobed multifid leaves. Peduncles opposite the leaves. Corolla valvate in the bud.

1 A. APIIFO'LIUM (St. Hil. l. c.) ⊙. H. Native of Brazil near Monte Video, as well as of Buenos Ayres in marshes. Ranúnculus apiifòlius, Pers. ench. 2. p. 105. Deless. icon. sel. 1. t. 26. Stem glaucous, branched, but sometimes almost simple, with corymbose branched panicles. Leaves almost cordate, orbicular, obtuse, divided into 5-6 lobes beyond the middle; lobes usually trifid, middle one profoundly 5-cleft or trifid; segments more or less toothed, bluntish; upper leaves almost sessile 3-parted, with linear, narrow acute, quite entire segments, uppermost leaves sessile, linear, narrow, with two membranous auricles at the base of each. Sepals obtuse, white, or reddish. Petals much smaller than the stamens.

Parsley-leaved Aphanostemma. Pl. 1 to 2 feet.

Cult. The seeds of this plant may be sown in a pot of earth and placed in a hot-bed, taking care to keep it moist, and when

the plants are of sufficient size they may be planted out in a moist or boggy situation, where they will probably ripen their seeds.

XVII. FICA'RIA (from *ficus*, a fig, so named, because the grumose roots bear tubercles resembling little figs,) Dill. nov. gen. p. 108. t. 5. D. C. syst. 1. p. 304. prod. 44.

LIN. SYST. *Polyándria*, *Polygýnia*. Calyx of 3-sepals, soon falling off. Petals 9, foveolate on the inside at the base. Stamens and ovaries numerous. Carpels smooth, compressed, blunt. Smooth perennial herbs with yellow flowers. Petals 8 to 12.

1 F. RANUNCULOÌDES (Mœnch. meth. 215.) roots grumose; stem leafy; leaves cordate; sepals 3. ♃. H. Native throughout the whole of Europe, in meadows, bushy places, and about hedge banks. Plentiful in Britain. Ranúnculus Ficària, Lin. spec. 774. Smith, engl. bot. t. 584. Curt. lond. fasc. 2. t. 39. Mart. rust. t. 21. Fl. dan. 499. F. vérna, Huds. 244. D. C. syst. 1. p. 304. Flowers golden yellow. The young leaves of this plant, according to Linnæus, are sometimes used as greens in Sweden. The particular form of the roots probably recommended this plant as a cure for the piles, hence its English name Pilewort. These roots or tubercles lie near the surface, and are sometimes laid bare by the rains, and in this state have induced the ignorant, under the influence of superstition, to fancy that it rained wheat, which the tubercles somewhat resemble. The plant is injurious in moist grass lands, but is effectually destroyed by a dressing of coal or wood ashes. We usually find the flower closed from five in the evening to nine in the morning, and in wet weather.

Var. β, multiplex; flowers double yellow.

Crowfoot-like Pile-wort or Lesser Celandine. Fl. April. Britain. Pl. ¼ to ½ foot.

2 F. GLACIA'LIS (Fisch. in litt. icon.) roots fibrous, fascicled; leaves ovate; scapes naked, 1-flowered; sepals 5. ♃. H. Native of Dauria on the top of Mount Tchockondo. Cáltha glaciàlis, Spreng. syst. 2. p. 660. Stamens and ovaries numerous, about the length of the calyx. Fruit unknown. Having the petals of *Ficaria*, but differing in the calyx being of 5 leaves. Habit of *Cáltha appendiculàta*, D. C. syst. 1. p. 305.

Icy Pilewort. Fl. April? Pl. ½ foot.

Cult. Ficaria will thrive well in any common garden soil, and will succeed best under the shade of trees. The double variety of *F. Ranunculoìdes* is a very desirable plant. They are easily increased by separating the tubers of the roots in the autumn.

Tribe IV.

HELLE'BOREÆ (plants agreeing with Helléborus,) D. C. syst. 1. p. 306. prod. 1. p. 44. Calyx and corolla imbricated in the bud (f. 14. *a*.) Petals sometimes wanting (f. 10. *a*.) sometimes irregular, bilabiate, nectariferous (f. 11. *e*. f. 12. *b*.) Calyx of 5 petal-like sepals (f. 11. *b*. f. 12. *a*.) Carpels capsular, opening on the inside (f. 11. *c*. f. 12. *c*.) many-seeded.

XVIII. CA'LTHA (a syncope of καλαθος, *kalathos*, a goblet, in allusion to the form of the corolla, which may be likened to a golden cup.) Pers. ench. 2. p. 107. D. C. syst. 1. p. 306. prod. 1. p. 44.

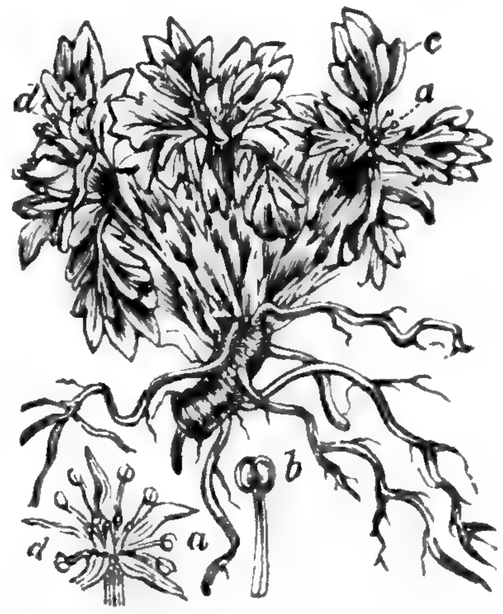
LIN. SYST. *Polyándria*, *Polygýnia*. Calyx coloured, of 5 orbicular petal-like sepals (f. 10. *a*.) Petals wanting; stamens numerous (f. 10. *b*.) Ovaries 5 to 10. Capsules 5 to 10 compressed, spreading, 1-celled, many-seeded. Herbs perennial, very smooth, somewhat acrid. Flowers golden coloured, and their juice gives a yellow colour to butter. *C. nàtans* has white flowers.

The English name of the genus *Marsh Marigold* is given to it because the species inhabit humid places, and in the flowers resembling those of the Marigold.

SECT. I. PSYCHROPHÌLA (ψυχρος, *psychros*, cold, and φιλεω, *phileo*, to love; inhabitants of cold countries,) D. C. syst. 1. p. 307. prod. 1. p. 44. Calyx permanent. Scapes 1-flowered. Radical leaves halbert-shaped, with the appendages rising upwards.

1 C. APPENDICULA'TA (Pers. ench. 2. p. 107.) scape 1-flowered, very short; leaves trifid; wedge-shaped; sepals 5; pistils 8. ♃. H. W. Native on humid mountains in the Straits of Magellan, and on subalpine hills in Terra del Fuego. C. paradóxa, Sol. mss. Forst. Lin. soc. trans. 8. p. 34. Two lateral lobes of leaves elevated in the form of appendages. Scapes length of leaves. Sepals oblong-lanceolate marcescent (f. 10.)

FIG. 10.



Appendiculate-leaved Marsh Marigold. Pl. ¼ foot.

2 C. SAGITTA'TA (Cav. icon. 5. no. 456. t. 414.) scape 1-flowered; leaves halbert-shaped, auricled; auricles inflexed; sepals 9-10; pistils 25. ♃. F. W. Native at Port Egmont, in one of the Falkland islands, and in rivulets at Success Bay in South America. C. multicapsulàris, Sol. mss. Forst. Lin. soc. trans. 8. p. 324. Flowers yellow. Stamens one-half shorter than the ovate blunt sepals.

Halbert-leaved Marsh Marigold. Pl. ¼ foot.

3 C. KAMTSCHA'TICA (Spreng. syst. 2. p. 666.) scape 1-flowered; leaves ovate, quite entire, somewhat 3-nerved; outer sepals 5, inner ones deciduous; carpels 1-seeded. ♃. H. Native of Kamtschatka. R. Kamcháticus, D. C. syst. 1. p. 43. prod. 1. p. 48. Flowers yellow. Perhaps *Ficària glaciàlis* will prove to be a species of *Cáltha*.

Kamtschatka Marsh Marigold. Pl. ½ foot.

SECT. II. POPULA'GO (from *populus*, the poplar-tree, in allusion to the species growing in humid places among poplar-trees, or perhaps from the shape of the leaves, which they somewhat resemble.) Tourn. inst. 273. t. 145. D. C. syst. 1. p. 308. prod. 1. p. 44.—Cáltha, Lin. gen. no. 703. Calyx deciduous. Stems leafy. Leaves cordate or kidney-shaped, with the auricles not inflexed.

4 C. PALU'STRIS (Lin. spec. 784.) stem erect; leaves cordate, somewhat orbicular, roundly-crenate, with rounded auricles. ♃. H. W. Native almost throughout the whole of Europe, as well as of Western Asia and North America, in marshy meadows, and about the margins of ponds, rivers, and brooks. Fl. dan. 668. Smith, engl. bot. 506. Curt. lond. fasc. 1. t. 40. Stems dichotomous; peduncles furrowed. Flowers large golden-coloured, and if gathered before they expand are said to be a good substitute for capers. The juice of the petals boiled with alum stains paper yellow. Cows will not eat it, unless compelled by extreme hunger; it is therefore a vulgar notion wholly unfounded, that the yellowness of butter in the spring is caused by this plant. Boerhaave says, that when kine eat the plant it occasions such an inflammation, that they generally die.

Var. β, multiplex; flowers double. ♃. H. W. Cultivated in gardens.

Var. γ, minor (Mill. dict. no. 2.) stem generally 1-flowered, ascending. ♃. H. Native of the north of England and Scotland on the tops of mountains, in marshy places. This plant in a wild state does not exceed in size the *Ficària ranunculoìdes*, but when cultivated it grows to the size of *C. radìcans*, bearing

two or three flowers on each stem. C. Ficaroìdes, Don, in Hed. stat. Forf. appendix.

Common *Marsh* Marigold. Fl. March, April. β. in May. Britain. Pl. α, 1 foot, γ, ¼ foot.

5 C. RIPA'RIA; leaves broad-kidney-shaped sharply crenate-toothed; auricles or lobes rounded, distant, coarsely-toothed; stem erect, many-flowered. ♃. H. W. Native of Britain in several places, particularly on the banks of the river Thames in marshes. Plant large, pale green. This plant appears to be the type of the *Double-flowered Caltha*, cultivated in gardens.

River Marsh Marigold. Fl. Ap. May. Britain. Pl. 1½ foot.

6 C. RADÌCANS (Forst. in trans. Lin. soc. 8. p. 321. t. 17.) stem creeping; leaves triangular, somewhat cordate, sharply crenate. ♃. H. Native of Scotland by the sides of lakes and rivulets, near Forfar; about the Pentland hills and in Roslin woods; more common in some spots near Edinburgh than *C. palústris;* in marshes near Collace, Perthshire. Smith, engl. bot. 2175.

Rooting Marsh Marigold. Fl. May, Ju. Scotland. Pl. ½ foot.

7 C. HIMALE'NSIS (D. Don prod. fl. nep. p. 195.) stem ascending, dichotomous; branches 2-flowered; leaves sagittate-cordate, on long stalks, crenate, with a wide recess at the base; lobes toothed, somewhat truncate; sepals 6, ovate. ♃. H. W. Native of Nipaul at Gosaingsthan in overflowed places. C. Emodòrum, Spreng. syst. app. p. 220. Flowers deep yellow. Capsules elliptical, smooth, each with a long beak.

Himmaleh Marsh Marigold. Fl. Aug. Pl. ½ foot.

8 C. INTEGE'RRIMA (Pursh. fl. amer. sept. 2. p. 390.) stem erect, corymbose; leaves orbicular, cordate, quite entire, floral ones sessile, kidney-shaped, obsoletely crenate at the base; sepals oval. ♃. H. W. Native of North America in wet meadows and small rivulets, from New England to Virginia. Flowers smaller than those of *C. palústris;* sepals subobovate, very blunt.

Very-entire-leaved Marsh Marigold. Fl. May, July. Pl. 1 ft.

9 C. ASARIFO'LIA (D. C. syst. 1. p. 309.) stem rather erect, 1-flowered; leaves cordate, kidney-shaped, crenate, with a broad recess; sepals 6 or 7, oval. ♃. H. W. Native of the island of Unalaschka and the Aleutian isles. Radical leaves stalked. Very like *C. palústris*, but smaller.

Asarabacca-leaved Marsh Marigold. Fl. Ap. May. Clt. 1824. Pl. ½ foot.

10 C. PARNASSIFO'LIA (Raf. new york. med. rep. 2. p. 351. no. 28. and in journ. bot. 1808. 1. p. 229.) stem only bearing one flower and one leaf; radical leaves stalked, lanceolate, cordate, very blunt, many-nerved; sepals elliptical. ♃. H. W. Native of North America in shady cedar swamps of New Jersey and Carolina. R. ficarioìdes, Pursh. fl. amer. sept. 2. p. 389. Ranúnculus Ficària, Walt. fl. car. 159. Flowers deep yellow, about the size of those of *Ficaria*.

Parnassia-leaved Marsh Marigold. Fl. June, July. Clt. 1815. Pl. ¼ to ½ foot.

11 C. LEPTOSTA'CHYA (D. C. syst. 1. p. 310. Hook. fl. bor. amer. p. 22. t. 10.) stem bearing one leaf and 1-2-flowers; radical leaves stalked, ovate, cordate, crenate, many-nerved; sepals 10, linear or oblong. ♃. H. W. Native of the western coast of North America, at a place called Prince William's Sound, and in alpine swamps on the Rocky Mountains. Capsules 8 or 10, on very short stipes, pointed.

Slender-spiked Marsh Marigold. Pl. 1 foot.

12 C. BIFLO'RA (D. C. syst. 1. p. 310.) stem bearing only one leaf and 2-flowers; radical leaves stalked, kidney-shaped, crenate, with a very broad recess; sepals oblong. ♃. H. W. Native on the western coast of North America on Banks's Islands. Petioles dilated at the base into a membranous sheath.

Two-flowered Marsh Marigold. Pl. ½ foot.

13 C. FLABELLIFO'LIA (Pursh. fl. amer. sept. 2. p. 390. t. 17.) stem procumbent, many-flowered; leaves dilated, kidney-shaped, with very spreading sharply-toothed lobes; sepals obovate; capsules terminated by hooked points. ♃. H. W. Native of Pennsylvania in a large sand spring on Pokono-mountain. Flowers middle sized. Allied on one side to *C. nàtans*, and on the other to *C. radìcans*.

Fan-leaved Marsh Marigold. Fl. Jul. Aug. Clt. 1818. Pl. procumbent.

14 C. ARCTICA (Br. Br. in app. to capt. Parry's voy. p. 265.) stem creeping; leaves kidney-shaped, repand-crenate, obtuse; capsules 12-16, imbricate, with recurved beaks; anthers linear, 20 or more. ♃. H. M. Native of Melville Island and along the coast of the Arctic Sea, from long. 107° to 150°. Flowers white.

Arctic Marsh Marigold. Pl. ¼ foot.

15 C. NA'TANS (Pall. itin. ed. min. 3. p. 248.) stem floating; leaves cordate, kidney-shaped, with the lobes rather approximate, obsoletely crenate behind, and toothed in front; sepals oval; capsules terminated by straight beaks. ♃. H. W. Native in the most eastern parts of Siberia, and about the town of Irkousk, floating in stagnant water; North America on the surface of deep spagnous bogs in the woody central districts, from Canada to lat. 60°.—Gmel. fl. sib. 4. p. 192. t. 82. Flowers white, with a tinge of red. C. Baikalénsis Demidow.

Floating Marsh Marigold. Fl. May, July. Clt. 1816. Pl. floating.

Cult. Being all natives of marshes or shallow water, they must be kept in a moist situation. C. natans requires to be planted in a pond or water cistern. All are easily increased by dividing the plants at the roots or by seeds.

XIX. TRO'LLIUS (a name given to this plant by Conrad Gesner. It is derived from *trol* or *trolen*, an old German word signifying something round, in allusion to the form of the flowers, whence also the English name *Globe Flower*.) Lin. gen. no. 700. D. C. syst. 1. p. 311. prod. 1. p. 45.

Lin. syst. *Polyándria Polygýnia.* Calyx of 5-10-15 deciduous. petal-like coloured sepals. Petals 5 to 20, small, linear, flattened, unilabiate. Stamens and ovaries numerous. Capsules numerous, sessile, columnar, many-seeded. Smooth, perennial, upright, slightly acrid herbs. Leaves deeply divided and cut. Referable to *Ranúnculus* and *Chrysánthemum* in habit, but in character to *Helléborus*.

1 T. EUROPÆ'US (Lin. spec. 782.) sepals about 15, converging into a globe; petals from 5-10, length of stamens; leaves divided into many deep, pinnatifid, cut lobes. ♃. H. Native almost throughout the whole of Europe in shady mountain, rather moist situations. Not rare in Westmoreland, Cumberland, Durham, Wales, and the Lowlands of Scotland. Smith, engl. bot. t. 28. Fl. dan. 133. Lois. herb. amat. t. 69. T. altíssimus, Wend. flor. 1818. p. 578. Flowers bright yellow, rather pale. The country people of Westmoreland, Scotland, and Sweden consider this as a sort of festival flower, going in parties to gather it for the decoration of their doors and apartments, as well as their persons.

Var. β, *húmilis* (D. C. prod. 1. p. 45.) plant smaller, only bearing one flower on each stem; flower hardly raised above the leaf. T. húmilis, Crantz. austr. 2. p. 124. exclusive of synon. of Buxb. T. mínimus, Wendl. l. c. p. 579. ♃. H. Native of Austria.

European Globe Flower. Fl. May, Ju. Britain. Pl. 1½ to 2 ft.

2 T. LEDEBOU'RII (Rchb. icon. t. 272. ex. Spreng. syst. app. p. 220.) sepals 5-spreading; petals 10-12, linear, longer than the stamens. ♃. H. Native of Siberia.

Ledebour's Globe Flower. Fl. May, June. Clt. 1829. Pl. 2 ft.

3 T. EMARGINA'TUS; sepals numerous, converging into a globe; petals linear, emarginate, almost twice as long as the stamens. ♃. H. Native of? common in gardens. Flower orange.

Emarginate-petalled Globe Flower. Fl. May, June. Clt.? Pl. 1½ to 2 feet.

4 T. NAPELLIFO'LIUS (Rœp. in flor. 1820. p. 105.) sepals 12, converging into a globe; petals from 5 to 10, length of stamens; styles recurved; leaves usually 7-parted. ♃. H. Native of? T. mèdius, Wend. in flor. 1818. p. 579. Stems and branches straight or stems spreading, with recurved branches. Flowers golden-yellow.

Napellus-leaved Globe Flower. Fl. May, Ju. Clt.? Pl. 2 ft.

5 T. ASIA'TICUS (Lin. spec. 782. exclusive of the synonyms of Buxb. and Tourn.) sepals 10, spreading; petals 10, longer than the stamens. ♃. H. Native of Siberia in woods and meadows. About Barnaoul, and perhaps about Petersburgh. Curt. bot. mag. t. 225. Very like *T. Europæ'us*, but the stems are usually 1-flowered. Flowers dark yellow.

Asiatic Globe Flower. Fl. May, Ju. Clt. 1759. Pl. 1 to 1½ ft.

6 T. CAUCA'SICUS (Stev. in mem. nat. mosc. 3. p. 265.) sepals 10, spreading; petals 10, shorter than the stamens. ♃. H. Native of the eastern parts of Caucasus on Alp. Schahdaghad. Like *N. Asiáticus*, but the petals are shorter than the stamens. Flowers yellow.

Caucasian Globe Flower. Fl. May, June. Clt. 1817. Pl. 1 ft.

7 T. PA'TULUS (Sal. trans. Lin. soc. 8. p. 303.) sepals 5, spreading; petals from 1 to 5, equal in length with the stamens. ♃. H. Flowers golden-yellow.

Var. α, *pedunculàtus* (D. C. prod. 1. p. 46.) flower elevated considerably above the upper leaf. ♃. H. Native of Siberia.

Var. β, *subinvolucràtus* (D. C. syst. 1. p. 313.) flower not elevated above the upper leaf. ♃. H. Native of Cappadocia on the highest mountains in places moistened by the melting of the snow. Helléborus ranunculìnus, Smith, icon. ined. 1. p. 37. t. 37.—Buxb. cent. 1. p. 15. t. 22. Plant hardly the length of a finger.

Spreading-flowered Globe Flower. Fl. May, June. Clt. 1800. Pl. α 1, β ¼ foot.

8 T. AMERICA'NUS (Muhl. and Gaissenh. in Donn. cat. hort. cant.) sepals from 5-10-15, spreading; petals from 5 to 20, retuse, shorter than the stamens. ♃. H. Native of Pennsylvania and New York, in shady wet places on the mountains, and in alpine rivulets on the eastern declivities of the Rocky Mountains. Lodd. bot. cab. t. 56. Sims, bot. mag. t. 1988. T. láxus, Sal. in Lin. trans. 8. p. 303. Gaissènia vérna, Raf. schm. in journ. bot. 1808. vol. 2. p. 168. Flowers pale yellow, smaller than those of the other species. Drummond affirms they are white in the plant he discovered on the Rocky Mountains.

American Globe Flower. Fl. May, Jul. Clt. 1805. Pl. ½ to ¾ ft.

9 T. PU'MILUS (D. Don. prod. fl. nep. p. 195.) sepals roundish-oval; petals 12, linear-lingulate, blunt, one-half shorter than the stamens; radical leaves 5-parted and jagged; stem 1-flowered. ♃. H. Native of Nipaul at Gasaingsthan. Stem almost naked, erect, smooth; segments of leaves pinnatifid, with the lobes lanceolate, entire, or acutely 3-toothed. Flowers large, orange-coloured.

Dwarf Globe Flower. Fl. Aug. Pl. ¼ to ½ foot.

Cult. Shewy border flowers. They will do well in any common garden soil, and are easily increased by dividing the plants at the root or by seeds. A shady moist situation suits them best.

XX. ERA'NTHUS (from ερα, *era*, the earth, and ανθος, *anthos*, a flower; because the bright yellow blossoms seem to lie upon the earth.) Sal. in Lin. soc. trans. 1807. vol. 8. p. 303. D. C. syst. 1. p. 314. prod. 1. p. 46.—Kóllea *Bir.*—Robértia *Merat.*

LIN. SYST. *Polyándria, Polygýnia.* Involucrum situated under the flower (f. 11. *a.*) cleft into many segments. Flower sessile (f. 11. *b.*) Calyx of from 5 to 8, coloured petal-like, oblong, deciduous sepals (f. 11. *b.*) Petals from 6 to 8, tubular, very short, with an unequally two-lipped mouth (f. 11. *e.*) Stamens from 20 to 30. Ovaries 5-6. Capsules on pedicels (f. 11. *c.*) Seeds globose, disposed in a single row.—Pretty little tuberous rooted plants, with divided leaves, valuable for the early period at which they flower.

The English name of the genus, *Winter Aconite*, is given to it from its time of flowering, and from the leaves resembling those of Aconite.

1 E. HYEMA'LIS (Sal. in Lin. soc. trans. 8. p. 303.) sepals from 6 to 8, oblong. ♃. H. Native of France, Switzerland, Italy, Austria, in humid shady places, at the bottoms of mountains, on hills, and in groves. Helléborus hyemàlis, Lin. spec. 783. Jacq. aust. t. 202. Curt. bot. mag. t. 3. Helléborus monánthus. Mœnch. Flowers yellow. (f. 11.)

FIG. 11.

Winter Aconite. Fl. Jan. Mar. Clt. 1596. Pl. ⅛ foot.

2 E. SIBI'RICUS (D. C. syst. 1. p. 315.) sepals 5, oval. ♃. H. Native of the eastern parts of Siberia, in moist places. Habit of *E. hyemàlis.* Seeds globose, rather compressed. Flowers yellow.

Siberian Winter Aconite. Fl. Mar. Ap. Clt. 1826. Pl. ⅛ ft.

Cult. Winter Aconite is a well-known flower. Being a low growing plant, it is well adapted for the front of flower borders, where it will thrive in common garden soil; and it is increased rapidly by offsets from the tubers.

XXI. HELLE'BORUS (from ελειν, *helein*, to cause death, and βορα, *bora*, food; poisonous qualities of plants). Adans. fam. 458. Lin. gen. no. 702. Lam. ill. 499. D. C. syst. 1. p. 315. prod. 1. p. 46.

LIN. SYST. *Polyándria, Polygýnia.* Calyx permanent of 5 roundish, obtuse, large sepals, which are generally green. Petals from 8-10, very short, tubular, narrowest in the lower part, nectariferous. Stamens from 30 to 60. Ovaries from 3-10; stigmas terminal, orbicular. Capsules coriaceous. Seeds oval, disposed in two rows, on a linear double notched receptacle. Fetid, stiff, coriaceous, nearly smooth herbs with divided leaves, of dangerously cathartic qualities, especially the roots.

§ 1. *Scapes leafless bearing* 1 *or* 2 *flowers.*

1 H. NI'GER (Lin. spec. 783.) radical leaves pedate, quite smooth; scape leafless, bearing 1 or 2 flowers and bracteas. ♃. H. Native of woody mountains in many parts of Europe, particularly in Provence, Piedmont, Austria, Styria, Greece, &c. Jacq. aust. t. 201. Curt. bot. mag. t. 8. Woodw. med. bot. 1. p. 50. t. 18. Flower large, with a white or rose-coloured corolla-like calyx. The fibres of the root only are used in medicine. They are of a deep brown on the outside, white or yellowish-white within, and of a nauseous and bitterish taste, exciting a sense of heat and numbness in the tongue, and of a nauseous smell. Neuman got from 2880 grains 380 alcoholic and 181 watery extract; and inversely 362 watery and 181 alcoholic. Its active constituent seems to be of a volatile nature, for it loses its virtues by keeping. In large doses

Black Hellebore is a drastic purgative; in smaller doses it is diuretic and emmenagogue. It has been used as a purgative in cases of mania, melancholy, coma, dropsy, worms, and psora. But its use requires very great caution, for its effects are very uncertain, and affected by many circumstances.—It may be exhibited in the form of an extract, although its activity be much dissipated by the preparation. An infusion and tincture certainly promise to be medicines of more uniform powers. Edin. new disp. p. 360.

Black Hellebore, or Christmas Rose. Fl. Jan. Mar. Clt. 1596. Pl. ½ to 1 foot.

§ 2. *Stem few-flowered, somewhat dichotomous, bearing an almost sessile, cleft, or cut floral leaf.*

2 H. orienta'lis (Gars. exot. t. 19. f. B. ex. Lam. dict. 3. p. 92.) radical leaves pedate, pubescent on the under surface; floral leaves almost sessile, palmate; peduncles usually bifid; sepals oval, coloured. ♃. H. Native of the Levant on mountains. Plentiful on mountains about Thessalonica and near Constantinople. Desf. choix. pl. cor. p. 58. t. 45. H. officinàlis. Sal. in Lin. trans. 8. p. 305. Smith fl. græc. t. 583. Calyx purplish, permanent; stamens and petals soon falling off. An intermediate species between *H. nìger* and *H. víridis*. This is the *black hellebore* of the ancients, formerly celebrated as a medicine in mania, epilepsy, and dropsy. It is called *Zopleme* by the Turks, and by the Greeks Σναρφη, and is still kept in the shops of the East. The medicinal qualities of the root are acrid and violently purgative.

Eastern Hellebore. Pl. 1 foot.

3 H. purpura'scens (Walds. et Kit. pl. hung. 2. p. 105. t. 101.) radical leaves pubescent on the under surface, palmate, with the segments cuneated at the base, and from 3-5-lobed at the apex; stem 2-flowered; floral leaves almost sessile; sepals roundish, coloured. ♃. H. Native of Hungary, Podolia, and Volhynia. Flowers purplish.

Var. β, Boccòni (D. C. prod. 1. p. 47.) stem longer than the leaves.—Boc. Mus. 2. p. 26. t. 11. f. R. ♃. H. Native of the Apennines of Etruria. Perhaps a distinct species.

Purplish Hellebore. Fl. Mar. April. Clt. 1817. Pl. 1 ft.

4 H. odo'rus (Walds. et Kit. ex Willd. enum. p. 592.) radical leaves palmate, pubescent on the under surface; segments oblong, undivided, quite entire at the base, but serrated at the apex; stem bifid; sepals ovate-oblong, acutish, green. ♃. H. Native of Hungary. Like *H. purpuráscens* and *H. víridis*, differing from the first in the flowers being green, not purplish.

Sweet-scented Hellebore. Fl. Mar. Apr. Clt. 1817. Pl. 1 ft.

5 H. vi'ridis (Lin. spec. 784.) radical leaves very smooth, cauline ones almost sessile, palmate; peduncles generally bifid; sepals roundish-ovate, green. ♃. H. Native in woods and thickets, on a chalky soil, particularly in Germany, Italy, France, and England in Oxfordshire, Cambridgeshire, Sussex, and other chalk counties, indubitably wild, although not common; near Hartfield, Middlesex, about Great Marlow and High Wickham, Bucks, and in the north-west part of Norfolk. Smith eng. bot. t. 200. Curt. lond. fasc. 6. t. 34. Jacq. aust. t. 106. Schkuhr. handb. no. 1536. t. 154. Blackw. herb. t. 509 and 510. Flowers green. Haller reckons up all the reputed virtues of *Hellebore* under this species; which indeed seems to be what German practitioners have substituted for the true plant of the ancients *H. orientàlis*.

We learn from the *Flora Londinensis*, that the roots of this plant are used in London for the true *Black Hellebore;* and probably their qualities are the same, for this species is even more nearly allied to the ancient Greek plant *H. orientàlis* than the *H. nìger*.

Green Hellebore. Fl. Ap. May. Britain. Pl. 1½ foot.

6 H. atroru'bens (Walds. et Kit. pl. hung. 3. p. 301. t. 271.) radical leaves very smooth, pedate, paler and shining underneath; cauline leaves almost sessile, palmate; stem somewhat angular, bifidly branched; sepals roundish, coloured. ♃. H. Native of Hungary in woods and bushy places, in great plenty at Korenicza. Flowers dark purple, particularly the edges of the sepals.

Dark-purple-flowered Hellebore. Fl. Feb. Apr. Clt. 1820. Pl. 1½ foot.

7 H. dumeto'rum (Walds. et Kit. ex Willd. enum. p. 592.) radical leaves very smooth, pedate; cauline leaves almost sessile, palmate; stem round, bifidly branched; sepals roundish, green. ♃. H. Native of Hungary. Flowers green.

Thicket Hellebore. Fl. Mar. Apr. Clt. 1817. Pl. 1 foot.

8 H. multi'fidus (Robert. de Visiani in fl. bot. zeit. 1829. p. 13.) stem tall, angular, bifid; branches few-flowered; radical leaves on long stalks, large, coriaceous, smooth, pedate-parted; lobes dichotomous, with an entire cuneated base; segments narrow, lanceolate, acuminated, sharply serrated and very veiny; floral leaves palmate-parted almost sessile; sepals broad, ovate. ♃. H. Native of Dalmatia on the mountains. Resembles *H. dumetòrum* but larger in size, and flowers more copious, but also greenish.

Multifid-leaved Hellebore. Fl. April, May. Pl. 1½-3 feet.

§ 3. *Stem leafy, many-flowered; peduncles furnished with bracteas.*

9 H. fœ'tidus (Lin. spec. 784.) stem many-flowered, leafy; leaves pedate, very smooth; segments oblong-linear. ♃. H. Native in thickets and waste ground on a chalky or gravelly soil, particularly in Portugal, Spain, Italy, Switzerland, France, Germany. England more common than H. viridis in chalky counties. Smith eng. bot. 613. Woodv. med. bot. t. 19. Bull. herb. t. 71. An evergreen plant with green flowers, which are tinged with purple on the edges. The whole herb is fœtid, acrid, violently cathartic, with a nauseous taste, especially when fresh. The leaves, when dried, are sometimes given as a domestic medicine to destroy worms; but they must be used sparingly, being so violent in their operation that many instances of their fatal effects are recorded. A dose of about 15 grains of the powder of the dried leaves is given to children, which proves gently emetic and purgative. The decoction of about a drachm of the fresh leaves being considered equal to 15 grains of the dry ones; it is usually repeated on two, and sometimes three successive mornings, and seldom fails to bring away worms, if there be any in the intestinal canal.

Fœtid Hellebore. Fl. Mar. Apr. Britain. Pl. 1 to 2 feet.

10 H. lívidus (Ait. hort. kew. ed. 1. vol. 2. p. 272.) stem many-flowered, leafy; leaves ternate, very smooth, glaucous on the under surface; segments ovate, lanceolate. ♃. H. Native of Corsica. Curt. bot. mag. t. 72. H. argutifòlius Viv. An evergreen plant with livid flowers, a little larger than those of *H. fœ'tidus*.

Var. β, integrílobus (D. C. prod. 1. p. 47.) segments of leaves quite entire. ♃. H. H. trifòlius. Mill. dict. no. 4. but not of Lin.

Livid-flowered Hellebore. Fl. Jan. May. Clt. 1710. Pl. 1 ft.

Cult. All the species of this genus will thrive well in any common garden soil, but they will grow best if planted under the shade of trees. They are easily increased by dividing the plants at the roots or by seeds.

XXII. CO'PTIS (from κοπτω, *kopto*, to cut, in reference to the numerous divisions of the leaves). Salisb. Lin. soc. trans. 8. p. 305. D. C. syst. 1. p. 321. prod. 1. p. 47.

Lin. syst. *Polyándria, Polygýnia.* Calyx of 5 or 6 coloured, petal-like, deciduous sepals. Petals small, cucullate. Stamens

from 20 to 25. Capsules from 6 to 10, on long stalks, somewhat membranous, 4-6-seeded, pointed with the style, stellately disposed. Small, smooth, stiffish, perennial tufted herbs, with divided leaves and small white flowers.

1 C. trifòlia (Sal. in Lin. soc. trans. 8. p. 305.) leaves ternate, leaflets obovate, blunt, toothed, hardly 3-lobed; scape 1-flowered. ♃. H. Native of Iceland, Norway, Greenland, Siberia, and Kamtschatka in swamps in woods, North America in cedar swamps and mountain bogs, (but according to Dr. Richardson it is found in dry sandy and mossy places) from Canada to Virginia and Labrador. Helléborus trifòlius, Lin. amœn. 2. p. 355. t. 4. f. 18. Lodd. bot. cab. 173. Big. med. bot. 1. p. 60. t. 5. Anemòne Greenlándica, Oed. fl. dan. t. 566. A small plant with white flowers and yellow roots. It is called *Tissavoyanne-jaune* by the French, all over Canada. The leaves and stalks are used by the Indians for giving a fine yellow colour to several kinds of work which they make of skins. The French dye wool, &c. yellow with this plant. The root is used about Boston in North America as a remedy for *aphthoric* affections of the mouth, and also affords an agreeable stomachic bitter infusion.

Three-leaved Coptis. Fl. Ap. Jul. Clt. 1782. Pl. $\frac{1}{8}$ foot.

2 C. asplenifo'lia (Sal. in Lin. soc. trans. 8. p. 306.) leaves biternate; leaflets rather pinnatifid, very acutely serrated; scape 2-flowered. ♃. H. Native on the north-west coast of America and Japan. Hook fl. bor. amer. p. 23. t. 11. Thalíctrum Japónicum, Thunb. in Lin. soc. trans. 2. p. 337. Willd. spec. 2. p. 1303. Flowers white, larger than those of *C. trifòlia*.

Spleenwort-leaved Coptis. Pl. $\frac{1}{4}$ foot.

Cult. These pretty little plants will thrive best in a bed of peat earth, in a moist situation, or to be kept in pots and placed among other alpine plants. They may be increased by dividing the plants at the root or by seeds.

XXIII. ISOPY'RUM, (from ισος, *isos*, equal, πυρος, *pyros*, wheat. A name given by the Greeks to a plant resembling *Nigélla*, the seeds of which had the same taste). Lin. gen. 701. Gært. fruct. 1. p. 312. t. 65. f. 5. D. C. syst. 1. p. 323. prod. 1, p. 48.

Lin. syst. *Polyándria, Polygýnia.* Calyx of 5, petal-like deciduous sepals (f. 12. *a.*). Petals 5, equal, tubular, 2-lipped (f. 12. *b.*), with the outer lip bifid. Stamens from 15 to 20. Ovaries from 2 to 20. Styles longitudinally stigmatose on the inside. Capsules sessile, 1-celled (f. 12. *c.*), oblong, compressed, membranous, many-seeded. Seeds minute, dotted (f. 12. *d.*). Small slender, smooth, erect herbs. Leaves ternate; leaflets stalked, 3-lobed, or cut, membranous. Flowers small, stalked, white.

1 I. thalictroi'des (Lin. spec. 783.) capsules from 1 to 3; sepals blunt; root creeping, fascicled, or grumose; leaf-stalks dilated at the base into membranous auricles. ♃. H. Native of the Pyrenees, Italy, Dauphiny, Carniolia, Silesia, Hungary, Greece, &c. in mountain woods. Jacq. aust. t. 105. I. aquilegioìdes. Lin. spec. 783. Helléborus thalictroìdes. Lamb. dict. 3. p. 98. I. thalictrifòlium. Sal. in Lin. soc. trans. 8. p. 306. Capsules ovate, somewhat compressed, awned with the elongated styles. Flowers small, white (f. 12.)

FIG. 12.

Meadow-rue-like Isopyrum. Fl. Mar. Apr. Clt. 1759. Pl. $\frac{3}{4}$ foot.

2 I. grandiflòrum (Fisch. in litt. D. C. prod. 1. p. 48.) capsules from 4-5; scape radical, 1-flowered; sepals oval, greatly exceeding the size of the leaflets. ♃. H. Native of the Altaian Mountains. Stamens one half shorter than the sepals. Flowers white.

Great-flowered Isopyrum. Fl. May, June. Pl. $\frac{1}{2}$ foot.

3 I. fumarioi'des (Lin. spec. 783.) capsules from 10 to 20; root slender, simple, perpendicular; leaf-stalks not dilated at the base. ⊙. H. Native of Siberia in groves, and among nitrous rubbish in Dauria. Schkuhr. handb. 2. no. 1531. t. 153. Helléborus fumarioìdes, Lam. dict. 3. p. 99. I. aquilegioìdes, Spreng. pug. 1. p. 40. no. 72. exclusive of the synonyms. Capsules compressed, pointed with the short styles. Flowers small, white.

Fumitory-like Isopyrum. Fl. Ju. Clt. 1741. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

4 I. adoxoi'des (D. C. syst. 1. p. 324.) capsules from 2 to 5; sepals bluntish; root tuberous; leaf-stalks not dilated at the base. ♃. H. Native of Japan near Nagasaki. I. capnoìdes, Fisch. in litt. Capsules from 3 to 4 oblong, many-seeded. Flowers small, white.

Adoxa-like Isopyrum. Pl. $\frac{1}{4}$ foot.

Cult. These pretty little plants will thrive well in any common garden soil. The perennial species may be either increased by dividing the plants at the roots or by seeds. The annual species only require to be sown where they are intended to remain.

XXIV. ENE'MION (apparently a corruption of *Anemòne.*) Raf. journ. phys. 1820. g. 1. p. 70. D. C. prod. 1. p. 48.

Lin. syst. *Polyándria, Tetragýnia.* Calyx of 5 petal-like deciduous sepals. Stamens from 20 to 30, with club-shaped filaments, and roundish 2-lobed anthers. Pistils from 2 to 6, but generally 4, with the style about the length of the ovaries; capsules from 2 to 6, ovate, stellately disposed, compressed, pointed with the styles, 2-seeded; seeds oval. Perhaps sufficiently distinct from *Isopỳrum.*

1 En. biterna'tum (Rafin. l. c.) ♃. H. Native of Kentucky at Lexington. Flowers the size of those of *Anemòne quinquefòlia*, and probably white.

Biternate-leaved Enemion. Pl. $\frac{1}{2}$ foot.

Cult. This plant will require to be planted in a border of peat soil, or in pots in the same kind of soil. It may be either increased by dividing the plants at the roots or by seeds.

XXV. GARIDE'LLA (in honour of Pierre Garidel, M.D. physician at Aix in Provence, author of Histoire des Plantes qui naissent en Provence, 1719, with many figures). Tourn. inst. 655. t. 43. Lin. gen. 541. Gært. fruct. 2. p. 174. t. 118. D. C. syst. 1. p. 325. prod. 1. p. 48.

Lin. syst. *Polyándria, Decándria, Trigýnia.* Calyx of 5, deciduous, hardly petal-like sepals. Petals 5, 2-lipped, bifid. Stamens from 10 to 40. Ovaries 3, connected; styles very short. Capsules from 2 to 3, many-seeded, connected together into a 2 or 3-celled capsule, hardly 2 or 3-horned. Small, slender, erect, inconspicuous herbs. Leaves multifid, with linear segments. Flowers small, whitish, solitary on the tops of the peduncles. Differing from *Nigélla* in having only 3 capsules terminated by very short styles, not 5-10 capsules with elongated styles.

1 G. nigella'strum (Lin. spec. 753.) petals sessile, spreading; stamens from 10 to 12. ⊙. H. Native in sunny places among olives and vines in Provence, &c. Leaves finely divided like those of *Delphìnium consólida.* Calyx purplish; corolla white. Lam. ill. t. 379. f. 1. Sims, bot. 1266. Bois. fl. europ. 6. t. 320.

Nigella-like Garidella. Fl. Ju. July. Clt. 1736. Pl. 1½ foot.

2 G. unguicula'ris (Lam. ill. t. 379. f. 2.) petals erect, converging, with long claws; stamens 40. ⊙. H. Native about Aleppo. Stem angular branched. Leaves stalked, pinnately jagged, with acute spreading segments. Flowers greenish brown;

bracteas solitary tricuspidate. Ovaries 2 or 3 connected, ovate, scabrous.

Clawed-petalled Garidella. Fl. June, July. Pl. 1 foot.

Cult. Inconspicuous annual plants; only require to be sown in the open border.

XXVI. NIGE'LLA (from *niger*, black, because of the colour of the seeds, which is the part of the plant known in cookery.) Tourn. inst. 258. t. 134. Lin. gen. no. 685. Gært. fruct. 2. p. 174. t. 118. D. C. syst. 1. p. 326. prod. 1. p. 48.

LIN. SYST. *Polyándria, Pentagýnia.* Calyx of 5 coloured petal-like spreading deciduous sepals. Petals small, from 5 to 10, 2-lipped, with a hollow nectariferous claw. Stamens numerous. Ovaries from 5 to 10, more or less joined together at the base, each terminated by the long simple style. Capsules more or less connected together, terminated by the elongated styles, opening on the inside, many-seeded. Embryo linear.—Erect, annual, smoothish herbs. Root slender, perpendicular, fibrous at top. Leaves finely cut, like *Fennel.* Flowers solitary, on the top of the stems or branches. Capsules usually ornamented with callose dots or glands. The seeds have an acrid aromatic taste, especially those of the species in Section II., and are therefore used as a popular condiment.

The genus is called *Fennel-Flower* in English, because the leaves resemble those of *Fennel.*

SECT. I. NIGELLA'STRUM (from *Nigella* and *astrum*, an affixed signification, like) Mœnch. meth. 313 and 311. D. C. syst. 1. p. 326. prod. 1. p. 48. Sepals yellow. Stamens disposed in one row. Capsules compressed, connected at their base. Seeds flat, orbicular.

1 N. CORNICULA'TA (D. C. syst. 1. p. 326.) capsules from 3 to 5, smooth, connected at their base, diverging and reflexed at the top; styles arched outwardly. ⊙. H. Native —? Flowers yellow.

Horned-capsuled Fennel Flower. Fl. June, Sep. Clt. 1822. Pl. ¾ foot.

2 N. CILIA'RIS (D. C. syst. 1. p. 327.) capsules from 8 to 10, hispid, connected at their base, stellately spreading; styles straight. ⊙. H. Native of the Levant near Bairout. Deless. icon. sel. 1. t. 45. Flowers yellow.

Ciliary-fruited Fennel Flower. Fl. Ju. Sep. Clt.? Pl. 1 foot.

3 N. ORIENTA'LIS (Lin. spec. 753.) capsules from 5 to 10, smooth, connected together from the base almost to the middle, hardly diverging; styles straight. ⊙. H. Native about Aleppo in corn fields, and in fields in Eastern Caucasus and Middle Iberia. Sims, bot. mag. t. 1264. Gært. fruct. 2. p. 174. t. 118. f. 1. Flowers yellow. Seeds girded by a membranous margin.

Eastern Fennel Flower. Fl. June, Sep. Clt. 1699. Pl. 1½ foot.

SECT. II. NIGELLA'RIA (altered from *Nigella*, see) D. C. syst. 1. p. 328. prod. 1. p. 49. Sepals spreading, bluish. Stamens disposed in many rows, collected into 8 or 10 bundles. Seeds ovate, angular.

4 N. HISPA'NICA (Lin. spec. 753.) anthers pointed; styles from 8 to 10, erect: capsules smooth, with one nerve on the back, connected beyond the middle into an obconical fruit; stem erect, smooth, with erect branches. ⊙. H. Native of the South of Spain, and Barbary, in corn fields. Desf. fl. atl. p. 430. t. 212. Sims, bot. mag. t. 1265. Flowers usually blue, but are sometimes white or cream-coloured.

Spanish Fennel Flower. Fl. Ju. Sep. Clt. 1629. Pl. 1 to 2 ft.

5 N. FŒNICULA'CEA (D. C. syst. 1. p. 328.) anthers pointed; styles from 5 to 6, erect; capsules smooth, 3-nerved on the back, connected beyond the middle into an obconical fruit; stem erect, smooth, with somewhat divaricating branches. ⊙. H. Native of Tauria in corn fields.—Moris. hist. 3. p. 516. sect. 12. t. 18. f. 6.? Seeds triquetrous. Flowers from white to blue.

Fennel-like Fennel Flower. Fl. June, Sep. Clt.? Pl. 1 foot.

6 N. DIVARICA'TA (Beaupre in D. C. syst. 1. p. 329.) anthers pointed; styles 5, erectish; capsules smooth, connected beyond the middle into an obconical fruit; stem smooth, with very divaricating branches. ⊙. H. Native of Tauria and Egypt. Deless. icon. sel. 1. t. 46. Flowers blueish.

Divaricate-branched Fennel Flower. Fl. Ju. Sep. Clt.? Pl. 1½ ft.

7 N. ARVE'NSIS (Lin. spec. 753.) anthers pointed; styles from 5 to 7, circinnately revolute outwardly; capsules smooth, connected beyond the middle into an obconical fruit, which is narrowest at the base; stem smooth, with rather diverging branches. ⊙. H. Native of middle and south Europe in corn fields, also in the north of Africa. Bull. herb. t. 126. Lam. ill. t. 888. f. 1. Smith, fl. græc. t. 512. Schkuhr. handb. 2. p. 92. t. 146. Flowers white or blue, single or double. The seeds are sometimes used instead of those of *N. satìva;* but they are not so aromatic, nor have they the same pleasant smell.

Corn-field Fennel Flower. Fl. Ju. Sep. Clt. 1683. Pl. 1 to 1½ ft.

8 N. ARISTA'TA (Sibth. and Smith, fl. græc. t. 510. prod. 1. p. 373.) anthers pointed; capsules connected into a turbinate fruit; stem smooth; flowers surrounded by a leafy involucrum. ⊙. H. Native near Athens. Habit almost of *N. Damascèna.* Flowers blue.

Awned Fennel Flower. Fl. June, Sep. Pl. 1½ foot.

9 N. SATÌVA (Lin. spec. 753.) anthers blunt; capsules muricated, connected almost to the top into an ovate fruit; stem erect, rather hairy; flowers naked. ⊙. H. Native of Montpelier and Barbary in corn fields. Smith, fl. græc. t. 511. Flowers blueish.

Var. β, *Crética* (D. C. syst. 1. p. 331.) styles longer than the flowers.—Clus. hist. 2. p. 108.—Moris. hist. 3. p. 515. sect. 12. t. 18. f. 2. N. segetatis, Bieb. fl. taur. 2. p. 16. Flowers blue.

Var. γ, *citrìna* (D. C. l. c.) seeds yellow; flowers double.—Moris. hist. 3. p. 516. sect. 12. t. 18. f. 5.

Var. δ, *Indica* (Roxb. mss. ex. Fleming in jour. bot. 1814. 4. p. 203. jour. pharm. 1814. p. 253.) stem and leaves smooth. Native of the East Indies.

Formerly the seeds of *N. sativa* were much in use as a carminative, stimulant, and errhine, but this medicine is become deservedly obsolete. They are still used in some parts of Germany and Asia in cookery instead of spice, being a pleasant aromatic. They are said to be extensively used in the adulteration of pepper as well as those of *N. arvénsis.* The leaves are also sometimes used.

Cultivated Fennel Flower. Fl. Ju. Sep. Clt. 1548. Pl. 1½ ft.

SECT. III. EROBA'TOS (from ερος, *eros*, love, and βατος, *batos ?*) D. C. prod. 1. p. 49. Sepals white or blue. Stamens numerous, disposed in many rows. Capsules 5, connected together into a 10-celled fruit, with the 5 inner cells seminiferous, and the 5 outer ones empty. Involucrum multifid, leafy, situated under the flower.

10 N. DAMASCE'NA (Lin. spec. 753.) anthers blunt; carpels 5, 2-celled, connected even to the top into an ovate-globose capsule; flowers surrounded by a leafy involucrum; sepals spreading. ⊙. H. Native of the south of Europe, from Portugal to Tauria, in cultivated fields. Curt. bot. mag. t. 22. Smith, fl. græc. t. 509. Schkuhr. hand. t. 146. Gært. fruct. 2. p. 174. t. 118. f. 1. Flowers white or blue, single or double.

Damascus Fennel Flower. Fl. Ju. Sep. Clt. 1570. Pl. 1 to 2 ft.

11 N. COARCTA'TA (Gmel. fl. bad. 2. p. 502.) anthers blunt;

flowers involucrate; sepals erect, connivent. ♃. H. Native — ? Flowers small, white.

Strained Fennel Flower. Fl. Ju. Sep. Clt. 1793. Pl. ½ foot.

Cult. Plants of easy culture, only requiring to be sown in the open border. They are curious and ornamental.

XXVII. AQUILE'GIA (*aquila*, an eagle, because of the form of each petal, separated with two sepals attached to it. *Columbine*, its English name, from *columbus*, a pigeon, from the same cause.) Tourn. inst. t. 242. Lin. gen. no. 275.

LIN. SYST. *Polyándria, Pentagýnia.* Calyx of 5-coloured petal-like deciduous sepals. Petals 5, gaping above, 2-lipped, outer lip large, flat; inner lip very small, each petal drawn out into a hollow spur, which is callous at the apex, and protruding between the sepals. Capsules 5, erect, many-seeded, pointed with the styles.—Erect perennial herbs, with fibrous roots. Radical leaves on long stalks twice or thrice ternate, with trifid-toothed, usually blunt segments; upper ones divided into linear lobes. Flowers white, blue, rose, or purple rarely dirty yellow. Qualities hardly acrid, bitterish, somewhat astringent and tonic. Seeds acrid.

1 A. VULGA'RIS (Lin. spec. 752.) spurs incurved; capsules villous; stem leafy, many-flowered, and is as well as the leaves smoothish; styles not exceeding the stamens in length. ♃. H. Native of most parts of Europe, as well as of Japan; in meadows, pastures, and thickets. Smith, engl. bot. t. 295. Fl. dan. t. 695. Flowers either single or double, blue, white, rose-coloured, purple or variegated, or spotted with the same colours.

Var. β, alpìna (Huds. angl. 235.) stem usually 1-flowered; spurs less curved than in var. *α*. ♃. H. Native of England at Matlock, Bath.

Var. * *corniculàta* (D. C. syst. 1. p. 334.) flower double; petals spurred; spur drawn out downwards. ♃. H.—Clus. hist. 2. p. 204. f. 1.

* * *invérsa* (D. C. syst. 1. p. 334.) flower double; petals horned: horn inverted. ♃. H.—Clus. hist. 2. p. 204. f. 2.

* ** *stellàta* (D. C. syst. 1. p. 335.) flower double; petals flat, spurless, coloured. ♃. H.—Clus. hist. 2. p. 205. f. 1.

* *** *degèner* (D. C. syst. 1. p. 335.) flower double; petals and sepals flat, spurless, green. ♃. H.—Clus. hist. 2. p. 205. f. 2.—Barrl. icon. t. 608.

The whole plant has been recommended to be used medicinally, but it belongs to a suspicious natural order, and Linnæus affirms that children have lost their lives by an over-dose of it. The virtues ascribed to a tincture of the flowers as an antiphlogistic, and for strengthening the gums and deterging scorbutic ulcers in the mouth, appear to be better founded; the tincture being made with an addition of the vitriolic acid, and differing but little from our officinal tincture of roses.

Common Columbine. Fl. May, July. Britain. Pl. 1 to 2 ft.

2 A. CÆRU'LEA (Torrey. ann. lyc. nat. hist. new york, vol. 2. p. 161.) spurs straight, almost twice the length of the limb of the petals; styles and stamens shorter than the corolla; stipulas acute; segments of leaves deeply lobed. ♃. H. Native of North America on the Rocky Mountains. Flowers blue.

Blue Columbine. Pl. 1 foot?

3 A. BREVISTY'LA (Hook. fl. bor. amer. p. 24.) plant rather pubescent; spurs incurved, shorter than the limb; styles short, inclosed; stamens rather shorter than the corolla. ♃. H. Native of North America in the western parts of Canada, and as far north as Bear Lake. A. vulgàris? Richards. in Frankl. 1st. journ. ed. 2. app. p. 21. Stem and leaves as in *A. vulgàris*, but the flowers are one-half smaller, blue.

Short-styled Columbine. Fl. May, July. Pl. 1 to 2 feet.

4 A. VISCÒSA (Gouan. fl. monsp. p. 267. illustr. 33. t. 19.) spurs incurved; capsules villous; stem bearing one, two, or three flowers, almost naked, and is as well as the leaves clothed with clammy pubescence; styles not exceeding the stamens in length. ♃. H. Native of Spain, Portugal, south of France, Piedmont, Naples, &c. in rugged mountainous places, exposed to the sun.—Lachen. act. helv. 8. p. 146. t. 5. Scarcely distinct from *A. vulgàris*, unless by being clothed with clammy pubescence, and the flowers being larger, purple.

Clammy Columbine. Fl. May, June. Clt. 1752. Pl. 1½ foot.

5 A. GLANDULÒSA (Fisch. ined. Link. enum. 2. p. 84.) spur incurved; one-half shorter than the limb; upper part of the herb as well as capsules clothed with glandular hairs. ♃. H. Native of the Altaian mountains. A. speciòsa, D. C. syst. 1. p. 336.

Var. α, discolor (D. C. prod. 1. p. 50.) petals white; sepals blue.

Var. β, cóncolor (D. C. prod. 1. p. 50.) petals, as well as sepals, blueish-violet.

Glandular Columbine. Fl. May, July. Clt. 1822. Pl. 2 feet.

6 A. SIBÍRICA (Lam. dict. 1. p. 150.) spur incurved; capsules very smooth; stem 1 or 2-flowered, almost naked, smooth: sepals very blunt. ♃. H. Native of Dauria in woods. A. vulgàris Dahùrica, Willd. spec. 2. p. 1246.—Deless. icon. sel. 1. t. 47. Flowers with blue sepals and white petals.

Siberian Columbine. Fl. May, July. Clt. 1806. Pl. 1 foot.

7 A. ALPÌNA (Lin. spec. 752.) spurs straight, but somewhat incurved at the apex, one-half shorter than the petals; stem leafy, 2 or 3-flowered; segments of leaves deeply divided into linear lobes. ♃. H. Native on the Alps of Piedmont and Switzerland in shady humid places. Deless. icon. sel. 1. t. 48. Sweet. brit. fl. gard. t. 218. A. alpìna, var. *α*, D. C. fl. fr. 4. p. 912. Flowers large, blue. The most shewy of all the species.

Var. β, grandiflòra (D. C. syst. 1. p. 337.) sepals oval; spur length of limb. ♃. H. Native of Siberia on the Altaian Alps. A. grandiflòra, Patr. ined. Perhaps A. glandulòsa cóncolor?

Alpine Columbine. Fl. May, July. Clt. 1731. Pl. 1 foot.

8 A. PYRENA'ICA (D. C. fl. fr. 4. p. 912. syst. 1. p. 337.) spurs straight, hardly shorter than the limb; stem almost naked, 1-flowered; segments of leaves deeply divided into linear lobes. ♃. H. Native of the Pyrenees and Apennines on the higher pastures and on rocks. A. viscòsa, Trev. delph. p. 23. t. 2. A. alpìna, var. *β*. D. C. fl. fr. 4. p. 912. Flowers middle sized, blue. Like *A. alpìna*, but smaller in all its parts.

Pyrenean Columbine. Fl. May, July. Clt. 1818. Pl. 1 foot.

9 A. CANADE'NSIS (Lin. spec. 752.) spurs straight, longer than the limb; styles and stamens protruding; sepals acutish, a little longer than the petals; segments of leaves 3-parted, bluntish, and deeply toothed at the apex. ♃. H. Native of North America, from Canada to Carolina, in the crevices of rocks. Abundant at the mouth of the Columbia river, especially about Fort Vancouver. Curt. bot. mag. 246. Schkuhr. handb. no. 1434. t. 146. Lois. herb. amat. t. 305.—Mill. icon. t. 47. Flowers scarlet, mixed with yellow.

Var. β, hýbrida (Hook. fl. bor. amer. p. 24.) spurs a little incurved at the apex; stamens shorter than in var. *α*; flowers for the most part purple. ♃. H. Native of North America among the Rocky Mountains.

Canadian Columbine. Fl. April, May. Clt. 1640. Pl. 1 to 2 ft.

10 A. FORMÒSA (Fisch. in litt. with a figure D. C. prod. 1. p. 50.) spurs straight, much longer than the petals and stamens, which are very short; styles not protruding; sepals lanceolate, much longer than the petals. ♃. H. Native of Kamtschatka. Like *A. Canadénsis* in habit, as well as in colour and form of the flowers.

Beautiful Columbine. Fl. April, June. Clt. 1822. Pl. 1 to 1½ ft.

11 A. VIRIDIFLÒRA (Pall. act. petrop. 1779. p. 262. t. 11.) spurs straight, longer than the petals; stamens equal in length with the petals; styles protruding; sepals oval-oblong, shorter

than the petals. ♃. H. Native of Siberia. Jacq. icon. rar. 1. t. 102. Murr. comm. Gœt. 1780. p. 8. t. 2. A. flàva, Lam. dict. 1. p. 149. Stem almost naked, 2-3-flowered. Flower about the size of those of *A. Canadénsis*, of a yellowish-green colour.

Green-flowered Columbine. Fl. May, Jul. Clt. 1780. Pl. 1½ ft.

12 A. atropurpu'rea (Willd. enum. 577.) spurs straight, equal in length with the petals; styles and stamens about the length of the sepals; sepals length of petals. ♃. H. Native of Siberia. Ker. bot. reg. t. 922. A. viridiflòra β. Willd. spec. 2. p. 1247. Flowers dark-purple or blueish-violet.

Var. α, brevistyla (Willd. enum. p. 577.) styles not so long as the stamens. ♃. H.

Var. β, Dahùrica (Patr. in D. C. syst. 1. p. 338.) styles protruding beyond the other parts of the flower; leaves smooth. ♃. H. Native of Dauria on hills and mountains. Deless. icon. sel. 1. t. 49.

Var. γ, Fischeriàna (D. C. prod. 1. p. 51.) styles protruding beyond the other parts of the flower; leaves villous on the under surface. ♃. H. A. atropurpùrea, Fisch. ined.

Dark-purple-flowered Columbine. Fl. May, Jul. Clt. ? Pl. 1½ ft.

13 A. hy'brida (Sims, bot. mag. t. 1221.) spurs straight, hardly incurved at the apex, longer than the petals, which are very blunt; styles hardly exceeding the length of the stamens and petals; sepals acute, length of petals; stem and leaves clothed with very delicate pubescence. ♃. H. Native of Siberia. A. Sibírica, Donn, cant. ? A. speciòsa, var. α, D. C. syst. 1. p. 336. Stem many-flowered. Flowers twice the size of those of *A. Canadénsis*, with dark purple sepals, yellowish petals and purple spurs, which are green at the tips.

Hybrid Columbine. Fl. May, Ju. Clt. 1827. Pl. 1 to 2 feet.

14 A. parviflòra (Ledeb. act. petrop. 1815. 5. p. 514. no. 32.) spurs straight, short, almost equal in length with the blunt petals; stamens recurved, length of the acute sepals; stem 2 or 3-flowered, and is as well as the leaves smooth. ♃. H. Native of Siberia in woods at the river Lena.—Gmel. sib. 4. p. 186. t. 47. Stem almost naked. Flowers blue, smaller than those of *A. Canadénsis*. Ovaries pubescent.

Small-flowered Columbine. Fl. May, July. Clt. 1819. Pl. 1 ft.

15 A. anemonoìdes (Willd. gess. naturf. berl. 1811. t. 9. f. 6.) spurs straight, very short, equal in length with the petals; petals thrice as short as calyx; peduncles radical, 1-flowered, almost naked. ♃. H. Native of Siberia on the Altaian mountains. Perhaps a variety of *A. glandulòsa*, according to Fischer. Flower purple ?

Anemone-like Columbine. Fl. My. Ju. Clt. 1827. Pl. ¼ to ½ ft.

Cult. All the species of Columbine are very ornamental, and deserve to be cultivated in every garden. They will thrive in any common garden soil, and are easily increased by dividing the plants at the roots or by seeds, which generally ripen in abundance.

XXVIII. DELPHI'NIUM (from δελφιν, *delphin*, a dolphin, on account of the resemblance between the nectary of the plant, and the imaginary figures of the dolphin.) Tourn. inst. 426. t. 241. Lin. gen. no. 681. Gært. fruct. 1. p. 310. t. 65. Lam. illust. t. 432. D. C. syst. 1. p. 340. prod. 1. p. 51.)

Lin. syst. *Polyándria, Tri-Pentagýnia*. Calyx deciduous, petal-like, irregular, with the upper sepal drawn out below into a spur. Petals 4; 2 upper ones drawn out at the base into appendages within the spur.—Erect branching herbs. Leaves stalked, cauline ones palmately-multifid. Flowers racemose, usually blue or violet, seldom white.

The genus is called *Pied d' Alouette* in French, because of the long spur resembling the talon of a lark, whence also the English name *Larkspur*.

Sect. I. Conso'lida (from *consolido*, to reunite, because the *D. consólida* being formerly reputed as a most powerful vulnerary. The name is applied to this section, because all the plants it contains resemble *D. consólida*.) D. C. syst. 1. p. 341. prod. 1. p. 51. Ovary one. Petals 4, connected together. Spur containing only the appendage of one of the petals. Annual herbs.

1 D. axillariflòrum (D. C. syst. 1. p. 341.) stem almost simple, smoothish, with the branches hardly diverging; flowers axillary, almost sessile; bracteas multifid, situated under the flower. ⊙. H. Native of the Levant. Deless. icon. sel. 1. t. 50. Sepals oblong, acute, pale-blue. Leaves ternate or biternate, with multifid segments.

Axillary-flowered Larkspur. Fl. June, July. Pl. 1 foot.

2 D. Oliveria'num (D. C. syst. 1. p. 341.) stem smooth, a little branched, with the branches hardly diverging; flowers few, loosely racemose; pedicels length of bracteas; capsules smooth. ⊙. H. Native between Bagdad and Vermancha in cultivated fields. Flowers blueish-purple, twice the size of those of *D. Ajàcis*.

Oliver's Larkspur. Fl. June, July. Clt. 1825. Pl. 1½ foot.

3 D. Aja'cis (Lin. spec. 748.) stem erect, smoothish, almost simple, with the branches hardly diverging; flowers in long dense racemes; pedicels length of bracteas; capsules pubescent. ⊙. H. Native of Tauria.—Clus. hist. 2. p. 206. f. 1. Flowers either white, blue, rose, flesh-coloured, or purple, or variegated, with the same colours, double or single. Called *Ajàcis*, because some traces may be perceived in the flower of what may be likened to the letters A J A.

Ajax's or Rocket Larkspur. Fl. Ju. Jul. Clt. 1573. Pl. 1½ ft.

4 D. conso'lida (Lin. spec. 748.) stem erect, smoothish, with divaricating branches; flowers few, loosely racemose; pedicels longer than the bracteas; capsules smooth. Native in corn-fields throughout Europe, also in Pennsylvania and Virginia. Smith, engl. bot. 1839. Fl. dan. t. 683. Lam. illust. t. 482. f. 1. D. segetum, Lam. Flowers either single or double, white, blue, red or purple, or variegated with these colours. The name is derived from *consólido*, to unite; it being formerly reputed as a most powerful vulnerary. It is said to be ingredient in those French cosmetics, which are so destructive of the surface of the skin. It is called *Pied d' Alouette* in France, and *Rittersporn* in Germany. It is a common garden annual, as well as *D. Ajàcis*. The seeds are acrid and poisonous.

Uniting or Branched Larkspur. Fl. June, July. England. Pl. 1 to 3 feet.

5 D. pauciflòrum (D. Don. prod. fl. nep. p. 196.) stem erect, branched, upper part villous, the rest smooth, as well as leaves; flowers solitary, remote, on long peduncles; capsules smooth? ⊙. H. Native of Nipaul at Narainhetty. D. consólida, Hamilt. mss. Flowers violet. Spur shorter than the flower.

Few-flowered Larkspur. Fl. June, July. Pl. 1 foot.

6 D. pube'scens (D. C. fl. fr. 5. p. 641. syst. 1. p. 343.) stem straight, pubescent, somewhat branched at the top; flowers in loose racemes; pedicels longer than the bracteas; leaves and capsules pubescent. ⊙. H. Native of the south of France in corn-fields. D. consólida, Sibth and Smith, fl. græc. t. 504. D. ambíguum, Lois. not. p. 85. but not of Lin. Flowers blue.

Pubescent Larkspur. Fl. Ju. July. Clt. 1816. Pl. 2 or 3 feet.

7 D. rígidum (D. C. syst. 1. p. 144.) stem erect, much branched, stiff; leaves and capsules velvety-canescent; pedicels 3-times longer than the bracteas. ⊙. H. Native of the Levant. Deless. icon. sel. 1. t. 52. Flowers pale-purple, smaller than those of *D. consólida*.

Stiff Larkspur. Fl. June, July. Pl. 1 foot.

8 D. pusíllum (Labill. syr. dec. 4. p. 5. t. 2. f. 1.) stem erect, very slender, 2-4-flowered, and is as well as the leaves pubescent; pedicels a little longer than the linear bracteas. ⊙. H.

Native near Damascus at the bottom of the mountain called Dgebel-cher, D. pygmæ'um, Poir. dict. 2. p. 458. Leaves pedately 3 or 5-cleft, with oblong or linear lobes. Flowers very few, small, of a pale-violet colour, and pubescent on the outside, with a straight awl-shaped spur.

Small Larkspur. Fl. May, June. Pl. 2 inches.

9 D. TENUÍSSIMUM (Sibth. and Smith, fl. græc. t. 505.) stem erect, slender, a little branched, and rather pubescent at the apex; pedicels much longer than the awl-shaped bracteas. ⊙. H. Native of Greece about Athens. Flowers small, blueish-violet; capsules smooth.

Very slender Larkspur. Fl. June, July. Pl. ½ foot.

10 D. ACONÌTI (Lin. mant. p. 77.) stem erect, much branched, rather pubescent; leaves pedately-multifid; pedicels very long; spur horizontal, incurved and cleft at the top. ⊙. H. Native of the Dardanelles and about Damascus. Vahl. symb. 1. p. 40. t. 13. Aconìtum monógynum, Forsk. cat. pl. const. p. 27. no. 248. D. incànum, Clark. in Spreng. new. entd. 3. p. 162.? Flowers livid, variegated with purple and green on the inside.

Aconite-like Larkspur. Fl. June, July. Clt. 1801. Pl. 1 foot.

11 D. EXSE'RTUM (D. C. syst. 1. p. 345.) stem erect, branched, smooth; leaves ternate; segments stalked, palmately-multifid; pedicels hardly longer than the bracteas; spur straight; stamens protruding. ⊙. H. Native of the Levant. Flowers blue, very small for the size of the plant. Deless. icon. sel. t. 53.

Exserted-stamened Larkspur. Fl. June, July. Pl. ¾ foot.

12 D. FLA'VUM (D. C. syst. 1. p. 346.) stem erect, branched, upper part pubescent; leaves palmately many-parted; pedicels distant, length of flowers; spur straight, spreading; stamens protruding a little; capsules cylindrical, pubescent. ⊙. H. Native of the Levant. Deless. icon. sel. t. 54. Flowers like those of *D. aconìti*, but yellowish.

Var. a, velutìnum (D. C. syst. 1. p. 346.) the whole plant is pubescent; bracteoles in the middle of pedicel.

Var. β, glaúcum (D. C. syst. 1. p. 346.) plant smooth at the base, but pubescent at the top; bracteoles at the base of the pedicels.

Yellow-flowered Larkspur. Fl. June, July. Pl. ¾ foot.

SECT. II. DELPHINE'LLUM (a dim. of *Delphinium*, which see). D. C. syst. 1. p. 346. prod. 1. p. 52. Ovaries 3. Petals free, smooth. Spur usually containing the appendage of one petal only. Annual plants.

13 D. AMBI'GUUM (Lin. spec. 749.) stem erect, rather velvety; leaves 3 or 5-parted, with pinnatifid partitions; racemes loose; spur straight, pubescent, shorter than the calyx; ovaries villous. ⊙. H. Native of Mauritania. Flowers like those of *D. consólida*, blue, pubescent on the outside.

Ambiguous Larkspur. Fl. Jul. Aug. Clt. 1759. Pl. 2 ft.

14 D. CARDIOPE'TALUM (D. C. syst. 1. p. 347.) stem erect, a little branched; leaves smooth, ternate, with multifid segments and linear lobes, those of the branches as well as the lower bracteas are multifid; racemes crowded; petals stipitate, orbicular, and cordate at the base. ⊙. H. Native of the Pyrenees in valleys. D. peregrìnum, Lam.—Moris. hist. 3. p. 466. sect. 12. t. 4. f. 3. Flowers dark blueish-violet.

Heart-petalled Larkspur. Fl. Ju. Jul. Clt. 1818. Pl. 1 ft.

15 D. GRA'CILE (D. C. syst. 1. p. 347.) stem erect, a little branched; leaves smoothish, stiff, ternate, many-cleft, with linear lobes; those of the branches as well as the bracteas are linear; racemes lax; petals stipitate, ovate, cordate at the base. ⊙. H. Flowers pale blue, variegated with white.

Var. a, glàbrum (D. C. l. c.) stem and leaves smooth. ⊙. H. Native of Andalusia in Spain.

Var. β, velutìnum (D. C. syst. 1. p. 348.) stem and leaves velvety-pubescent. ⊙. H. Native of Spain about Aranjuez.

Weak Larkspur. Fl. June, July. Pl. 1 foot.

16 D. JU'NCEUM (D. C. fl. fr. 5. p. 641. syst. 1. p. 348.) stem erect, much branched; leaves smooth, stiff, lower ones multifid, those of the branches as well as the bracteas are linear and entire; racemes lax; petals stipitate, elliptical. ⊙. H. Native of Italy near Nice, Sicily, Tunis near Sfax, and all the islands in the Archipelago; in rugged sunny places and fields. D. peregrìnum. Lin. spec. 749. All. pedem. no. 1508. t. 25. f. 3. Smith græc. t. 506. Flowers blueish-violet; petals variegated with white.

Var. β, subvelutìnum (D. C. syst. 1. p. 348.) stem and leaves velvety-pubescent. ⊙. H. Native on Mount Lebanon.

Rush Larkspur. Fl. June, Jul. Clt. 1629. Pl. ½ to 1 foot.

17 D. FORSKŒ'LII (Rchb. ill. t. 5.) stem erectish, dwarf, a little branched, downy; lower leaves 3-toothed, upper ones linear, acute, all sessile and puberulous; racemes loose, few-flowered; lower petals obovate-lanceolate. ⊙. H. Native of the Dardanelles. D. grandiflòrum, Forsk. fl. æg. arab. p. 212. Stem white with down and curled hairs above; branches and branchlets terminated by 1-3-flowers, bearing 2 small bracteas in the middle of each peduncle. Flowers a little larger than those of *D. peregrìnum*, of a violet colour; young ones puberulous. Capsules 3, pubescent.

Forsköl's Larkspur. Fl. June, July. Pl. ½ foot.

18 D. NA'NUM (D. C. syst. 1. p. 349.) stem erectish, dwarf, and is, as well as leaves, velvety-pubescent; lower leaves 3 or 5-lobed, upper ones linear; racemes loose, 2 or 3-flowered; lower petals orbicular. ⊙. H. Native about Alexandria in sandy places and of the Dardanelles. D. peregrìnum. Delile, ill. fl. ægypt. 17. but not of Lin. Like *D. júnceum, var. β.* Flowers blueish-violet, with whitish petals, large for the size of the plant.

Dwarf Larkspur. Fl. June, July. Pl. ¼ to ½ foot.

19 D. HALTERA'TUM (Sibth. and Smith, fl. græc. t. 507.) stem erect, branched; leaves smooth, many-parted; lower floral ones trifid, upper ones entire; racemes loose; petals spreading, lower ones stipitate, orbicular. ⊙. H. Native of Sicily. Flowers blueish-purple. Like *D. júnceum.*

Small-winged Larkspur. Fl. June, July. Pl. 1 foot.

20 D. VIRGA'TUM (Poir. suppl. 2. p. 458.) stem erect, branching from the base; leaves smooth, lower ones trifid with toothed lobes, those of the branches and flowers entire and acute; racemes loose; lower petals stipitate, ovate. ⊙. H. Native of Syria. Deless. icon. sel. 1. t. 55. Herb pale green. Flowers blueish-purple.

Twiggy Larkspur. Fl. June, Jul. Clt. 1823. Pl. 1 foot.

21 D. MACROPE'TALUM (D. C. syst. 1. p. 350.) stem erect, much branched; leaves smooth, membranous, lower ones palmately-multifid, upper ones linear, very acute; racemes loose; lower petals stipitate, ovate. ⊙. H. Native of the north of Africa about Mogador. Deless. icon. sel. 1. t. 55. Flowers blueish-violet.

Long-petalled Larkspur. Fl. June, July. Pl. 1 to 2 feet.

22 D. OBCORDA'TUM (D. C. syst. 1. p. 350.) stem erect, branched: leaves smooth, cauline ones 3-lobed, with the lobes somewhat bifid; branch and floral leaves entire, acute; racemes loose; lower petals stipitate, obcordate. ⊙. H. Native of Barbary. Flowers blue, distant from each other.

Obcordate-petalled Larkspur. Fl. June, July. Pl. 1½ foot.

23 D. TRIBRACTEOLA'TUM (D. C. syst. 1. p. 350.) stem erect, branched; lower leaves palmately-lobed; racemes loose; pedicels bearing 3 bracteas; lower petals stipitate, orbicular, cordate at the base. ⊙. H. Native of Barbary. Flowers middle-sized, blue, with a straight spur, which is about 4 lines long.

Three-bracted-pedicelled Larkspur. Fl. June, July. Pl. 1 foot.

SECT. III. DELPHINA'STRUM (an alteration from *Delphinium*, which see). D. C. syst. 1. p. 351. prod. 1. p. 53.

Ovaries 3 or 5. Petals free, lower ones usually bifid with a bearded disk. Spur elongated, containing the appendages of two petals. Perennial plants, they are usually called *Bee Larkspur*, because the bearded petals resemble a *Bee*.

§ 1. *Limb of lower petals entire.*

24 D. GRANDIFLÒRUM (Lin. spec. ed. 1. p. 531. ed. 2. p. 749. Richb. ill. t. 12.) leaves palmately-many-parted into distant linear lobes; pedicels longer than the bracteas; petals shorter than the calyx, two lower ones somewhat orbicular, with obliquely inflexed, entire borders; racemes spreading, few-flowered, diverging. ♃. H. Native of Siberia near the Volga, and in Dauria, about Oulcapin, &c. Sims, bot. mag. 1686. D. virgàtum, Jacq. fil.—Mill. icon. t. 250.—Gmel. sib. 4. p. 187. t. 78. Flowers either double or single, large, blue, and the intermediate shades to white. A very ornamental plant.

Var. β, *Chinénse* (Fisch. in litt. Lod. bot. cab. t. 71. Rchb. ill. t. 13.) stem stiff, straight; racemes many-flowered, lateral ones erectish; lower petals suborbicular; colour of flowers easily changed by cultivation. ♃. H. Native of China. Flowers blue and the intermediate shades to white, with the two lower petals bearded with yellow hairs. A very ornamental plant.

Var. γ, *Fischèri* (Rchb. ill. t. 14.) racemes many-flowered, lateral ones twiggy, erectish; petals quadrate-oblong, two lower ones obovate. ♃. H. Native of China. Flowers pinkish-purple.

Great-flowered Larkspur. Fl. Ju. Sep. Clt. 1816. Pl. 1 to 2 ft.

25 D. CHEILA'NTHUM (Fisch. in litt. D. C. syst. 1. p. 352.) stem erect, branched; leaves 5-parted, with oblong, acuminated, subtrifid and somewhat toothed lobes; petals shorter than the calyx, two lower ones with obliquely inflexed, ovate, entire limbs; capsules reticulately-painted, pubescent. ♃. H. Native of Dauria about Doroninsk. Ker. bot. reg. t. 473. Schrank. pl. rar. 52. with a figure. D. Dahùricum. Stev. ined.—Gmel. sib. 4. p. 187. t. 76. Flower size and colour of those of *D. grandiflòrum*.

Lip-flowered Larkspur. Fl. Ju. Sep. Clt. 1819. Pl. 2 to 3 ft.

26 D. VIRE'SCENS (Nutt. gen. amer. 2. p. 14.) stem simple, pubescent; leaves on long footstalks, 3 or 5-parted, with linear subtrifid segments; racemes few-flowered; spur longer than the flower. ♃. H. Native of North America in the plains of the Missouri. Flowers greenish?

Greenish-flowered Larkspur. Fl. June, Sept. Pl. 2 feet.

§ 2. *Limb of lower petals bifid.*

27 D. PUNI'CEUM (Pall. voy. 8. p. 327. no. 336. Lin. fil. suppl. 267.) petioles dilated and sheathing at the base; leaves many-parted, even to the base, into linear lobes; recemes elongated; spur straight, blunt, rather longer than the pedicel, but shorter than the flower. ♃. H. Native in the arid desert of Tartary about the Volga, &c. Flowers dark purple, pubescent on the outside.

Var. β, *Damæcòrnu*, segments of leaves stalked, with diverging lanceolate lobes. ♃. H.—Gmel. sib. 4. t. 77? Flowers larger than in var. α.

Scarlet Larkspur. Fl. June, Sept. Clt. 1785. Pl. 1 foot.

28 D. ALBIFLO'RUM (D. C. syst. 1. p. 353.) petioles dilated and sheathing at the base; leaves many-parted, with linear lobes; racemes elongated, crowded; bracteas membranous, broad-lanceolate; spur straight, blunt, rather longer than the pedicel. ♃. H. Native of Armenia. Deless. icon. sel. 1. t. 58. Flowers like those of *D. puníceum*, but white, and smooth on the outside.

White-flowered Larkspur. Fl. Jul. Aug. Clt. 1823. Pl. 3 ft.

29 D. OCHROLEU'CUM (Stev. diss. ined. D. C. prod. 1. p. 54. syst. 1. 546.) petioles dilated and sheathing at the base; leaves many-parted, with linear awl-shaped segments; racemes short; spur acute, longer than the flower; capsules smooth. ♃. H. Native of Iberia. D. puníceum, var. Bieb. fl. taur. cauc. 2. p. 13. Flowers white or cream-coloured, pubescent on the outside.

Cream-coloured-flowered Larkspur. Fl. Ju. Sept. Clt. 1817. Pl. 2 feet.

30 D. HY'BRIDUM (Willd. spec. 2. p. 1229.) petioles dilated and sheathing at the base; leaves many-parted, with linear lobes; racemes crowded; spur straight, longer than the flower. ♃. H. Native of Tauria and Caucasus. D. hirsùtum, Pers. ench. 2. p. 81. Lower part of plant smooth, upper part velvety-pubescent. Flowers blue, with the two lower petals bearded with white hairs.

Var. β, *fissum* (Waldst. et Kit. pl. hung. 1. p. 83. t. 81.) racemes elongated; lobes of lower petals narrower and longer than in var. α. ♃. H. Native of Hungary near Walachia in bushy places, Flowers darker blue than those of var. α.

Hybrid Larkspur. Fl. Ju. Aug. Clt. 1794. Pl. 3 to 4 feet.

31 D. VELUTI'NUM (Bert. exc. p. 12.) petioles dilated and sheathing at the base; leaves 5-parted, multifid, with linear lobes; racemes loose, and are, as well as the stems, clothed with very soft down; spur curved; lower bracteas longer than the flowers. ♃. H. Native of Italy on the mountains. D. hýbridum var. γ. D. C. syst. 1. p. 554. Flowers blue.

Var. β, D. orientale perenne aconiti folio, flore cæruleo. Tourn. cor. 30. ♃. H. Native of Armenia.

Velvety Larkspur. Fl. July, Aug. Clt. 1819. Pl. 3-4 feet.

32 D. PENTA'GYNUM (Lam. dict. 2. p. 264.) petioles dilated and sheathing at the base; lower leaves 5-lobed, with the lobes cut and bluntish at the apex: upper leaves 5-parted, many-cleft into linear lobes; petals shorter than the calyx. ♃. H. Native in corn-fields at Algiers, on cretaceous hills in Portugal, also Gibraltar. Desf. atl. 1. p. 427. t. 111. Herb branched, velvety, or smooth at the bottom. Flowers large, blue or violet.

Five-styled Larkspur. Fl. Ju. Jul. Clt. 1819. Pl. 1 to 2 ft.

33 D. MENSI'ESII (D. C. syst. 1. p. 355.) petioles hardly dilated at the base; leaves 5-parted, with trifid entire linear lobes; bracteas trifid; root grumose. ♃. H. Native of the north-west coast of America, Kotzebue's Sound, Puget Sound, Columbia River, and in California. D. tuberòsum. Menz. MSS. Lindl. bot. reg. t. 1192. Flowers about the size and colour of those of *D. grandiflòrum*, pubescent on the outside, with a straight spur.

Menzies's Larkspur. Fl. June, July. Clt. 1826. Pl. 1 to 2 ft.

34 D. E'LEGANS (D. C. syst. 1. p. 355.) petioles hardly dilated at the base; leaves smooth, 5-parted, with 3-5-cleft lobes, and linear-lanceolate acute lobules; racemes loose, few-flowered; petals shorter than the calyx; spur curved, shorter than the sepals. ♃. H. Native of North America? Flower beautiful dark-blue, smaller than those of *D. grandiflòrum*.

Var. β, *múltiplex*. Flower double, of a beautiful dark-blue colour. Moris. fl. consp. t. 43. D. grandiflòra flòre pleno, Hort. This has been long known in the gardens under the name of *Double Larkspur*.

Elegant Larkspur. Fl. June, July. Clt. 1741. Pl. 1½ foot.

35 D. AMŒ'NUM (Stev. ined. D. C. syst. 1. p. 546.) petioles hardly dilated at the base; leaves pubescent underneath, 5-parted, with lanceolate pinnatifid lobes, and linear acute lobules; racemes branched; petals shorter than the calyx; spur straight. ♃. H. Native of Siberia.—Gmel. sib. 4. p. 187. t. 77. exclusive of the synonym of Amman. Flowers beautiful blue.

Pleasing Larkspur. Fl. Ju. Jul. Clt. 1818. Pl. 2 or 3 ft.

36 D. TRICO'RNE (Mich. fl. bor. amer. 1. p. 314.) petioles smooth, hardly dilated at the base; leaves 5-parted, with 3-5-cleft lobes, and linear lobules; petals shorter than the calyx; capsules 3, reflexed, arched, spreading from the base. ♃. H. Native of North America on the sides of shady and fertile hills, on

the banks of rivers from Virginia to Carolina; particularly plentiful about Harper's Ferry on the Potowmac, Virginia. A small plant with beautiful blue flowers. Deless. icon. sel. 1. t. 59.

Var. β, multiflòrum (D. C. syst. 1. p. 356.) plant much more pubescent; flowers from 15 to 20 in dense racemes.

Three-horned Larkspur. Fl. May, June. Pl. $\frac{3}{4}$ foot.

37 D. SI'MPLEX (Doug. MSS. in Hook. fl. bor. amer. p. 25.) petioles dilated at the base; leaves 3-parted, profoundly jagged, with linear lobes, and are pubescent as well as the stems; racemes strict, almost simple; petals bearded; spur straight, longer than the limb. ♃. H. Native of North America on the subalpine range, west of the Rocky Mountains near the Columbia, plentiful. Allied to *D. azùreum*, but that has the leaves smooth, the racemes shorter, and the flowers with a much smaller spur, which is curved inwards. Flowers deep blue.

Simple-stemmed Larkspur. Fl. May, Jul. Clt. 1826. Pl. 3 ft.

38 D. AZU'REUM (Mich. fl. bor. amer. 1. p. 314.) petioles hardly dilated at the base; leaves 3-5-parted, many-cleft, with linear lobes; racemes straight; petals all bearded at the apex, lower ones very villous. ♃. H. Native of North America on the borders of woods in a sandy soil, from Carolina to Georgia. On the banks of the Missouri and Mississippi. Flowers large, beautiful sky-blue.

Sky-blue Larkspur. Fl. May, July. Clt. 1805. Pl. 3 feet.

39 D. EXALTA'TUM (Ait. hort. kew. ed. 1. vol. 2. p. 244.) petioles not dilated at the base; leaves flat, cleft into 3-5-7-parts beyond the middle, with wedge-shaped lobes which are trifid or jagged, and acuminated at the apex; racemes straight; spur straight, length of the calyx. ♃. H. Native of North America in rocky shady places in the mountains of Virginia and Carolina and on the Rocky Mountains. D. tridáctylum, Mich. fl. bor. amer. 1. p. 314. Flowers blue, middle sized, sometimes white.

Exalted or Bee Larkspur. Fl. Jul. Aug. Clt. 1758. Pl. 3 to 6 feet.

40 D. URCEOLA'TUM (Jacq. coll. 1. p. 153. icon. rar. 1. t. 101.) petioles not dilated at the base; leaves concave, cleft beyond the middle into three, with wedge-shaped lobes, which are cut and acuminated at the apex; racemes straight; spur straight, rather longer than the calyx. ♃. H. Native of North America? Sims, bot. mag. t. 1791. Upper part of stem smooth, lower part pubescent. Flowers blue, suffused with red, not pure blue.

Urceolate-leaved Larkspur. Fl. Ju. Jul. Clt. 1801. Pl. 5 feet.

41 D. REVOLU'TUM (Desf. cat. h. par. ed. 2. p. 148.) petioles not dilated at the base; leaves orbicular, cordate, 5-cleft, with cut, acute, deflexed lobes; pedicels furnished with 3 bracteas; ovaries smooth. ♃. H. Native? Stem fistular, mealy. Flowers pale blue with brown petals.

Revolute-leaved Larkspur. Fl. June, July. Pl. 4 or 5 feet.

42 D. MESOLEU'CUM (Link. enum. hort. berl. 2. p. 80.) leaves rather dilated at the base, with wedge-shaped segments, which are deeply serrated at the top; upper part of the stem as well as the peduncles pubescent. Native of? Moris, fl. consp. t. 25. Flowers blue, with pale yellow or whitish petals.

Middle-white-flowered Larkspur. Fl. June, Aug. Clt. 1822. Pl. 3 feet.

43 D. PALMATI'FIDUM (D. C. syst. 1. p. 358.) petioles not dilated at the base; leaves ciliated, 5-cleft, somewhat truncate at the base, with the lobes cut at the apex: upper leaves of 3 entire trifid lobes; with the nerves hairy underneath; bracteoles, capsules, and calyxes smooth. ♃. H. Native of Siberia. Flowers blue, with brownish petals.

Var. α, hispidum (D. C. syst. 1. p. 358.) stems hispid with spreading hairs; pedicels smoothish.—Gmel. sib. 4. p. 187. t. 79.

Var. β, glabéllum (D. C. l. c.) stem almost smooth; pedicels rather hispid with spreading hairs.—Gmel. sib. 4. p. 187. t. 75.?

Palmate-cleft-leaved Larkspur. Fl. June, July. Clt. 1827. Pl. 2 or 3 feet.

44 D. INTERME'DIUM (Ait. hort. kew. ed. 1. vol. 1. p. 243.) petioles not dilated at the base; leaves cordate, 5-7-cleft, upper ones 3-lobed, with all the lobes deeply serrated; pedicels, bracteoles, calyxes and ovaries smooth. ♃. H. Native of Silesia, Hungary, Switzerland, and the Pyrenees, in alpine valleys. Flowers blue. D. elàtum, Lin.?

Var. α, pilosíssimum (D. C. syst. 1. p. 358.) stem very hairy; leaves villous, with the nerves on the upper surface pilose; racemes branched. ♃. H. Native of Siberia.—Gmel. sib. 4. p. 167. t. 80.?

Var. β, alpìnum (Waldst. et Kit. pl. hung. 3. p. 273. t. 246.) stem almost smooth; leaves pubescent; racemes branched. ♃. H. Native of Hungary.—Clus. hist. 2. p. 94. f. 2.

Var. γ, leptostàchyum (D. C. syst. 1. p. 359.) stem and petioles smooth; leaves pubescent; racemes short and simple. ♃. H. Native of the Pyrenees. D. intermèdium, Lapeyr. abr. p. 304.?

Var. δ, ranunculifòlium (D. C. syst. 1. p. 359.) stem smooth; petioles pilose; leaves pubescent; racemes simple, lax. ♃. H. Native of Switzerland.

Var. ε, láxum (D. C. l. c.) stem and leaves smooth, with acutely cut lobes: racemes lax, branched. ♃. H.—Mill. icon. t. 119.

Intermediate Larkspur. Fl. Ju. Jul. Clt. 1710. Pl. 4 to 8 ft.

45 D. CUNEA'TUM (Stev. diss. ined. D. C. syst. 1. p. 359.) petioles not dilated at the base; leaves wedge-shaped at the base, 5-7-lobed, with the lobes cut and acute; racemes lax, branched; bracteas and calyxes smooth; capsules rather pubescent. ♃. H. Native of Russia at the lower Volga. Deless. icon. sel. 1. t. 61. Ker. bot. reg. 327. D. hýbridum, Lin. herb. D. azùreum. hort. D. elàtum β, Lam. dict. 2. p. 265. Flowers beautiful blue, with brownish petals, two lower petals bearded with yellow hairs.

Var. β, pubiflòrum, (D. C. prod. 1. p. 55.) pedicels, bracteoles, calyxes and younger capsules velvety with fine dense down. ♃. H. Native about Saratof.

Wedge-leaved Larkspur. Fl. Ju. Jul. Clt. 1816. Pl. 3 or 4 ft.

46 D. VILLO'SUM (Stev. in litt. hort. dorp. D. C. prod. 1. p. 53.) petioles hardly dilated at the base; leaves smooth, cuneated at the base, 3-5-lobed, with the lobes cut and acute; racemes lax; pedicels bracteate, and are, as well as capsules, villous; spur straight. ♃. H. Native of? Flowers blue. An intermediate plant between *D. cuneàtum* and *D. dyctiocárpum*.

Villous Larkspur. Fl. Ju. Jul. Clt. 1818. Pl. 4 or 6 feet.

47 D. DYCTIOCA'RPUM (D. C. syst. 1. p. 360.) petioles not dilated at the base; leaves 5-7-lobed; lobes, oblong, acute, and deeply pinnatifid; upper leaves somewhat 3-parted, with narrow entirish lobes; racemes lax, branched; bracteas and calyxes smooth; capsules reticulated, with the keel and margin ciliated. ♃. H. Native of Siberia. Habit of *D. elàtum* or *D. cuneàtum*. Flowers beautiful blue with brown petals, two lower petals hispid, with yellow hairs. Spur straight. A smooth plant.

Netted-capsuled Larkspur. Fl. Ju. Jul. Clt. 1817. Pl. 4 or 6 ft.

48 D. LAXIFLO'RUM (D. C. syst. 1. p. 360.) petioles not dilated at the base; leaves 3-7-lobed, with the lobes oblong, acute, and deeply pinnatifid: upper leaves somewhat 3-parted, with narrow, entire lobes; racemes loose, branched; bracteoles and ovaries pubescent. ♃. H. Native of Siberia. Stems hispid at the bottom. Flowers blue.

Lax-flowered Larkspur. Fl. June, July. Clt.? Pl. 4 or 6 feet.

49 D. MONTA'NUM (D. C. fl. fr. 5. p. 641. syst. 1. p. 360.) petioles not dilated at the base; leaves pubescent, 5-lobed, lobes wedge-shaped at the base, but trifid and cut at the apex; racemes simple; bracteas, calyxes, and capsules pubescent; spur bent inwards. ♃. H. Native of the Pyrenees and the Alps of

Provence, Piedmont, and Switzerland. D. hirsùtum, Roth. Beitr. 88. D. elàtum, All. pedem. no. 1504. D. elátum, var. *a*, Lam. dict. 2. p. 265. D. intermèdium, Lois. not. p. 86. Herb velvety, with down. Flowers blue, pubescent.

Var. β, bracteòsum (D. C. syst. 1. p. 361.) lower bracteas longer than the flowers; petals all bearded at the top. ♃. H. Native on the Alps about Barcelonne. A more luxuriant plant than *var. a.*

Mountain Larkspur. Fl. June. July. Clt. 1816. Pl. 4 to 6 ft.

50 D. dasyca'rpum (Stev. ined. D. C. syst. 1. p. 547.) petioles not dilated at the base; leaves pubescent, 5-lobed; lobes lanceolate, somewhat trifid, deeply toothed at the apex; racemes simple, pubescent; pedicels thrice as long as the bracteas; sepals rather villous, twice as long as the petals; spur straight. ♃. H. Native of Caucasus about Nartsa. Flowers a little larger than those of *D. montànum*, of a beautiful blue, with dark brown petals. Capsules pubescent.

Thick-capsuled Larkspur. Fl. Ju. Jul. Clt. 1819. Pl. 4 or 6 ft.

51 D. care'la (Hamilt. mss. D. Don, prod. fl. nep. p. 195.) petioles not dilated at the base; leaves 5-lobed, hairy, with deeply-lobed wedge-shaped segments; bracteas and calyxes pilose; spurs curved, obtuse, length of pedicels; capsules smooth. ♃. H. Native of Nipaul at Narainhetty. D. scabriflòrum, D. Don. in Wern. mem. 3. p. 412. Stem pilose towards the top. Racemes straight, few-flowered. Flowers of a dirty-blue colour. Capsules 3. *Carela* is the name of the plant in Nipaul.

Carela Larkspur. Fl. July, Aug. Pl. 4 feet.

52 D. speciòsum (Bieb. fl. taur. cauc. 2. p. 12.) petioles not dilated at the base; leaves pubescent, 5-lobed; lobes deeply serrated; bracteas lanceolate, villous, clammy; spur curved; capsules smooth. ♃. H. Native of Caucasus on Alp Kraischaur. Deless. icon. sel. 1. t. 62. Flowers blue, with dark-brown petals, the two lower ones bearded with yellow hairs in the disk and white hairs on the margins.

Shewy Larkspur. Fl. July, Aug. Clt. 1816. Pl. 2 to 4 feet.

53 D. flexuòsum (Bieb. fl. taur. cauc. 2. p. 12.) petioles not dilated at the base; leaves 5-lobed; lobes cut; stem flexuous, and is as well as petioles hairy; bracteas linear; capsules smooth. ♃. H. Native of Caucasus and Iberia. Trev. delp. obs. p. 15. t. 1 and 2. f. a. b. c. and d. D. ciliàtum, suppl. enum. hort. dorp. 1811. ex Stev. Stems reddish, and furnished with a few white hairs. Flowers smaller than those of *D. speciòsum*, blue, with dark-brown petals.

Flexuous-stemmed Larkspur. Fl. July, Aug. Clt. 1817. Pl. 3 or 4 feet.

54 D. tríste (Fisch. in litt. D. C. syst. 1. p. 362.) petioles not dilated at the base; leaves 3-5-parted; lobes narrow, somewhat pinnatifid, acute; upper leaves 3-parted, with entire lobes; racemes loose; capsules pubescent. ♃. H. Native of Dauria and Siberia. D. obscùrum, Stev. diss. ined. Flowers dark-brown, suffused with a little red at the edges of the sepals, and with a somewhat violaceous spur, (Fisch.) but according to Steven. they are dark-purple; they smell somewhat like bugs.

Sad-coloured Larkspur. Fl. July, Sept. Clt. 1819. Pl. 2 ft.

Sect. IV. staphisa'gria (σταφις, *staphis*, a bunch of dry raisins; αγρια, *agria*, wild, in allusion to the dry wrinkled seed bearing some resemblance to a dry raisin.) C. and J. Bauh. D. C. syst. 1. p. 362. prod. 1. p. 56. Ovaries from 3 to 5. Petals free. Spur short, containing the appendages of two petals. Capsules ventricose. Seeds few, large, rather globose.—Biennials.

55 D. Requie'nii (D. C. fl. fr. 5. p. 642. syst. 1. p. 362.) spur almost as long as the calyx; bracteas inserted on the middle of the pedicels. ♂. H. Native of the Stœchades Islands Deless. icon. sel. 1. t. 63. Lower part of herb smooth, or scarcely pubescent, upper part hispid with long crowded spreading hairs. Leaves on long stalks, lower ones cleft into 5 broad cuneated 3-5-toothed lobes, upper ones divided into 5-linear entire lobes. Flowers blueish, hispid.

Requien's Larkspur. Fl. June, July. Clt. 1819. Pl. 1½ foot.

56 D. pictum (Willd. enum. 574.) spur about the length of the calyx; bracteas inserted at the base of the pedicels; petioles pubescent; pedicels hardly longer than the flowers. ♂. H. Native of the south of Europe. Sweet. fl. gard. t. 123. D. staphysàgria, Woodv. med. bot. t. 154. D. marítimum, Cav. Differing from *D. pictum* in the leaves being 5-7-cleft, usually variegated with white; racemes more crowded, and the pedicels longer. Flowers lead-coloured, or variegated with white. The seeds of this plant, as well as the preceding, possess the same medical qualities as *D. staphysàgria.*

Painted-leaved Larkspur. Fl. Ju. Jul. Clt. 1800. Pl. 1 to 2 ft.

57 D. mixtum (Lois. fl. gen. fr. pt. 2.) spur short, hooked; bracteas inserted at the base of the pedicels; flowers large, longer than the pedicels; leaves sub-5-lobed; lobes entire. ♂. H. Native of Provence. Flowers blue, variegated with white.

Mixed Larkspur. Fl. June, July. Pl. 2 feet.

58 D. staphysa'gria (Lin. spec. 750.) spur very short; bracteoles inserted at the base of the pedicels; petioles hairy; pedicels twice as long as flower. ♂. H. Native among rubbish in the south of Europe and Teneriffe. Smith fl. græc. 508.—Trag. stirp. p. 902.—Bauh. hist. 3. p. 641 and 642. f. 1. Cam. epit. 947. A large erect herb. Leaves 5-9-cleft. Flower lax blue, with whitish petals. The seeds are usually brought from Italy. They are large and rough, of an irregular triangular figure, of a blackish colour on the outside and yellowish within; they have a disagreeable smell, and a very nauseous bitterish-burning taste. A new alkaloid, called *Delphìnia*, is obtained from the seed in the usual manner, either by boiling the decoction with pure magnesia, separating the fluid by filtration, and boiling the residium with alcohol, which lets fall as it cools the alkaloid in white flakes; or by acting upon the bruised seeds by diluted sulphuric acid, and adding sub-carbonate of potass, which precipitates the alkaloid. *Delphinia* is soluble in alcohol and ether, sparingly so in water, saturates acids, and is precipitated by alkalies. Its salts rarely form regular crystals, but a hard transparent mass.—Stavesacre was employed by the ancients as a cathartic, but it operates with so much violence both upwards and downwards, that its internal use has been for some time almost laid aside. It is chiefly employed in external applications for some kinds of cutaneous eruptions, and for destroying lice and other insects; insomuch that from this virtue it has received its name in different languages.

Stavesacre or Lousewort Larkspur. Fl. May, June. Clt. 1596. Pl. 2 or 3 feet.

N.B. D. Verdue'nse of Balbis, a native of Gascony, we are not acquainted with. It may probably prove a synonym of one or other of the species above.

Cult. All the species of Larkspur are very ornamental border flowers, and will grow in any common garden soil. The herbaceous perennial species are increased by dividing the plants at the roots or by seeds. The biennial and annual species only require to be sown in the open border, where they will flower and seed freely. The perennial species of *Delphínium* are very apt to mix with each other in the gardens, and on that account very few of the unadulterated species are to be met with in cultivation, most of them being hybrids.

XXIX. ACONI'TUM (said to be derived from *Acona*, a town in Bithynia: some species grow plentiful there.) Tourn.

inst. 1. p. 424. t. 239 and 240. Lin. gen. no. 682. D. C. syst. 1. p. 364. prod. 1. p. 56. Ser. mus. helv. 1. p. 115. Rchb. Uebers. p. 13. illus. gen. Acon. atque. Delp.

Lin. syst. *Polyándria, Tri-Pentagýnia.* Calyx of 5 petal-like, irregular, deciduous or marcescent sepals, with the upper sepal concave and helmet-shaped. Petals 2 (or hollow nectaries), hidden within the helmet, on long stalks, expanded into a hollow inverted tube at the apex, drawn out at the ends into a spur, which is either straight, hooked, or twisted.—Herbaceous perennial herbs, with tuberous, fibrous or napiform roots, and palmate-parted leaves, with the partitions deeply toothed or multifid. Racemes terminal, with 1-flowered pedicels rising from the axils of the bracteas, each furnished with two bracteoles. Flowers large, irregular, yellow, cream-coloured, blue or white, or mixed with these colours. The species are all poisonous; the root is the most powerful part.

This genus is called in English *Monks-hood* and *Wolfs-bane;* the former from the shape of the flower; the latter from the poisonous quality of the plants.

Sect. I. Anthoroìdea (applied to this section because the plants it contains agree with *A. Anthòra*, a syncope of *Anti-thora*, that is to say, counter-poison.) Rchb. uebers. p. 13. Sect. 1. Anthòra, D. C. syst. 1. p. 364. Calyx permanent. Petals (nectaries) supine, somewhat hooked, lip obcordate, tapering into the pedicel. Stamens smoothish. Capsules 5, erect. Helmet arched. Flowers cream-coloured, sometimes variegated with blue. Leaves palmately cut into linear lobes. Roots napiform.

1 A. Anthòra (Lin. spec. 751. Rchb. ill. t. 59.) spur refracted; germens equally pubescent. ♃. H. Native of the Pyrenees, Switzerland, Hungary, Italy, &c. A ochroleùcum, Salisb.—Lob. Stirp. ed. 1576. p. 385.—Clus. hist. V. p. 98.—Barrel. icon. 609, &c. Flowers pale yellow. This species was formerly made use of in *medicine*, and recommended as an antidote to the poisonous species: whence by some writers it is called *Anthora* and *Antithora*, the poisonous ones having been named *Thora*. The taste of the root is sweet, with a mixture of bitterness and acrimony. The smell is pleasant. It purges vehemently when fresh, but loses its qualities when dried; it is disused in the present practice; and is certainly poisonous, but perhaps in a less degree than those of the other sections. Haller regards it as one of the most dangerous.

Var. β, *grandiflòrum* (Rchb. uebers. p. 15. acon. p. 63. t. 1. f. B.) panicle flowers and fruit pubescent; flowers yellow, large; helmet rather conical. ♃. H. Native of the Alps of Jura, &c.

Var. γ, *eúlophum* (Rchb. uebers. p. 15. acon. p. 69. t. 5.) panicles and flowers puberulous; helmet conical; flowers yellow. ♃. H. Native of Caucasus and the Alps of Jura, &c.

Var. δ, *Decandóllii* (Rchb. uebers. p. 16. acon. p. 67. t. 3.) panicle and flowers pubescent; helmet rather conical, bent, with a short, abrupt, and acuminated beak. Lobes of leaves rather broad, and are as well as the stem dark green. ♃. H. Native of the mountains of Gavarn and at Port Espagne in the Pyrenees. A. Anthòra β, atrovírens, D. C. syst. 1. p. 366. Flowers yellow.

Var. ε, *nemoròsum* (Bieb. ex Rchb. uebers. p. 16. acon. p. 71. t. 6. f. *) panicle and flowers pubescent; helmet somewhat conical, bent, beak short. Lobes of leaves broad. Flowers yellow. ♃. H. Native of Siberia and Caucasus. A. tuberòsum, Patrin, A. Anthòra δ, latílobum, Ser. mus. helv. 1. p. 131.

Var. ζ, *glabriflòrum* (Rchb. uebers. p. 15.) flowers smooth, yellow. ♃. H. Native of the Eastern Pyrenees in the valley called *d' Eynes.*

Var. κ, *Jacquínii* (Rchb. uebers. p. 17. acon. p. 65. t. 2.) flowers smooth; helmet somewhat conical, drawn out into an elongated beak; flowers yellow. ♃. H. Native of Austria and the Pyrenees. A. Anthòra, Jacq. austr. t. 382. γ, Jacquiniànum, Ser. mus. helv. 1. p. 131.

Var. λ, *inclinàtum* (Ser. mus. helv. 1. p. 131. t. 15. f. 2.) panicle flowers and fruit pubescent; helmet high, conical, with an incumbent beak; flowers yellow. ♃. H. Native of the Alps of Jura.

Var. θ, *multicucullàtum* (Ser. mus. helv. 1. p. 132. t. 16.) lateral petals cucullate; lateral sepals helmet-shaped. ♃. H. Native of the Alps of Jura.

Counter-poison Aconite. Fl. Ju. Aug. Clt. 1596. Pl. 1 to 2 ft.

2 A. Pall'asii (Rchb. uebers. p. 18. acon. p. 72. t. 6. f. A. ill. t. 60.) spur continuous. ♃. H. Native of Siberia. A. Anthòra, Pall. Bieb. Flowers yellow, and are as well as the fruit pubescent.

Pallas's Aconite. Fl. Ju. Aug. Clt. 1821. Pl. 1 to 2 feet.

3 A. anthoroìdeum (D. C. syst. 1. p. 366. Rchb. uebers. p. 19. acon. p. 68. t. 4. ill. t. 61.) spur refracted; germens bearded. ♃. H. Native of Siberia. A. Anthòra, Bieb.? Pall.? Panicle flowers and fruit pubescent.

Var. β, *versícolor;* flowers smoothish, yellow variegated with blue; helmet low, rather conical. ♃. H. Native of Iberia. A. Anthòra, var. versícolor, Stev. ined.

Anthora-like Aconite. Fl. Ju. Aug. Clt. 1821. Pl. 1 to 2 ft.

Sect. II. Napelloi'dea (a name applied to this section on account of the plants it contains agreeing in character with *A. Napéllus*, which is derived from *napus*, a turnip, on account of the form of the roots, they having the appearance of little black turnips.) Rchb. uebers. p. 13. Sect. IV. Napéllus, D. C. syst. 1. p. 371. prod. 1. p. 62. Calyx deciduous. Petals (nectaries) supine, obtuse or capitate, with a bifid lip. Stamens pilose. Capsules usually 3 (rarely 2 to 7) young ones diverging. Peduncles nodding. Helmet convex, hemispherical or arched (semicircular, rarely navicular, D. C.) Lobes of leaves cuneate, bipinnate. Roots tuberous. Flowers blue, white, whitish-blue, and yellowish-blue.

§ *Peduncles smooth.*

4 A. Koellea'num (Rchb. uebers. p. 19. acon. t. 11. f. 1.) spur blunt; filaments smooth. ♃. H. Native of Switzerland and Carinthia, &c. Rchb. ill. t. 72. A. Napéllus, Wulfen. Koelle. spicel. with a figure. A. manuàle, Sieb. A. Taúricum, Hoppe. pl. exsicc. A. Napéllus, β, spicàtum, Ser. mus. 1. p. 154. D. C. prod. 1. p. 62. Flowers disposed in loose spikes of a deep blue colour; bracteas short; helmet semicircular.

Var. β, *crassicaúle* (Rchb. uebers. p. 19.) stem thick. ♃. H. Native of Switzerland and Carinthia.

Var. γ, *pymæ'um* (Rchb. acon. t. 21. f. 1.) flowers 3-8 in a spike, deep blue. Leaves crowded. A. Napéllus, δ pygmæ'um, Ser. mus. helv. 1. p. 154. ♃. H. Native of Switzerland.

Koelle's Aconite. Fl. June, July. Clt. 1820. Pl. 2 to 4 feet.

5 A. Tauricum (Wulf. in Jacq. coll. 2. p. 112. icon. rar. 3. t. 49. Rchb. acon. p. 87. t. 12. f. 2-3.) spur blunt; filaments pilose; helmet closed, hemispherical; peduncles erect. ♃. H. Native of Germany and Switzerland. Rchb. illus. t. 63. Koelle. acon. A. densiflòrum, Hoppe. bot. Z. 1818. p. 142. A. læ'tum, Rchb. acon. 89. t. 13. f. 2. Koehlèri, commutàtum and plicàtum, Rchb. uebers. are hardly varieties of this species. A. Napellus ϖ lætum, Ser. mus. helv. 1. p. 157. A. Napéllus γ, bracteòsum, Ser. mus. helv. 1. p. 154. A. Napéllus, Haenk. Koell.—Clus. hist. 2. p. 95. f. 2.—Gerard, herb. 973. f. 6. Very like *A. Napéllus*, but the lateral sepals are smooth, not pilose inside. Flowers deep blue, disposed in dense racemes. Segments of leaves almost pedately disposed and divided into linear acuminate lobes.

Var. β, squarròsum (Rchb. uebers. p. 20.) Native of Switzerland. Flowers deep blue.

Taurian Aconite. Fl. June, July. Clt. 1752. Pl. 3 to 4 feet.

6 A. formòsum (Rchb. uebers. p. 36. acon. t. 18. f. 2.) spur obtuse; filaments pilose; helmet spreading; lip short. ♃. H. Native of Switzerland, Austria; Salzburg on mount Untersberg. Rchb. ill. t. 64. A. Napéllus, Hoppe, cent exsicc. A. híans, Clùsii, confértum, and rígidum, Rchb. Flowers blueish-purple in loose racemes. A. paniculàtum, var. κ, cérnuum, D. C. prod. 1. p. 60.

Beautiful Aconite. Fl. Ju. July. Clt. 1824. Pl. 2 to 3 feet.

7 A. acu'tum (Rchb. uebers. p. 21. acon. t. 14. f. 2.) spur capitate; filaments smooth; helmet closed, arched, beaked. ♃. H. Native of Switzerland, Tyroles, and Alps above Judenburg. Carinthia and Transylvania. A. Napéllus, Sieb. Wahl. Schultz. A. Kœlleànum, fi'rmum, Rchb. acon. t. 14. f. 2. A. Napéllus, W. rostellàtum, Ser. mus. helv. 1. p. 156.

Var. β, pygmæ'um (Vest. Rchb. uebers. p. 21.) plant small. ♃. H. Native of the Alps of Styria 6000 feet above the level of the sea and Transylvania. A. Napéllus, β nànum, Baumg. A. fi'rmum, β pygmæ'um, Rchb. uebers. p. 21.

Acute-beaked Aconite. Fl. June, Jul. Clt. 1820. Pl. 2 to 3 ft.

8 A. Hoppea'num (Rchb. illus. t. 65.) spur capitate; filaments smooth; helmet gaping. ♃. H. Native of Carinthia. A. Hóppii. Rchb. uebers. p. 24. A. Napéllus ι, Hoppeànum. Ser. mus. helv. 1. p. 155. A. Mielichhóferi, Rchb. Flowers blue in loose spikes; helmet falcate-navicular, beaked. Lobes of leaves bluntish.

Hoppe's Aconite. Fl. June, July. Clt. 1823. Pl. 1-3 feet.

9 A. angustifo'lium (Bernh. Willd. Rchb. acon. 95. t. 15. f. 2. ueber. p. 24.) spur capitate; filaments smooth; helmet closed hemispherical; lip bifid. ♃. H. Native of Siberia and Syria. A. Napéllus χ, anthoræfòlium, Ser. mus. helv. 1. p. 159. Flowers deep blue in spiked panicles. Leaves like those of *A. Anthòra*.

Var. β, tenuifòlium (Rchb. uebers. p. 24.), lobes of leaves very fine, bluntish, scarcely diverging. ♃. H. Native of the Alps of Vochin and Styria. A. venústum β, ramòsum, Rchb. uebers. p. 28. A. Napéllus β, β, tenuifòlium, Ser. mus. helv. 1. p. 159.

Narrow-leaved Aconite. Fl. Ju. Jul. Clt. 1824. Pl. 2-3 ft.

10 A. eusta'chium (Rchb. uebers. p. 24. acon. t. 15. f. 3.) spur capitate, filaments and lip pilose; helmet gaping, hemispherical. ♃. H. Native of Mount Baldo. A. Napéllus, Pona. A. Napéllus λ, falcàtum, Ser. mus. helv. 1. p. 155. Flowers intense purple in spiked panicles. Pedicels long. Limb of helmet entire. Leaves like those of *A. Anthòra*.

Well-spiked Aconite. Fl. Ju. Jul. Clt. 1824. Pl. 2-3 feet.

§ 6. *Peduncles pubescent.*

11 A. Nape'llus (Lin. spec. 751. Rchb. uebers. p. 25. illus. t. 1.) spur capitate; helmet convex-hemispherical, gaping, smoothish; lip of nectary revolute; peduncles erect; leaves pedately 5-parted. ♃. H. Native of Switzerland and Styria, &c.

Var. A. N. Schleichèri (Rchb. ill. t. 1.) stem straight (or infracted) simple, slender; partitions of leaves finely jagged; racemes short; petals somewhat exserted. ♃. H. Native of Europe. A. vulgàre, D. C. syst. 1. p. 371. Stem smooth. Racemes short, never much crowded. Flowers middle sized, blue or violet, pubescent when young. Pistils 3, smooth.

Var. α, A. N. Schleichèri normàle (Rchb. ill. t. 1. f. 1.) leaves more finely cut; racemes denser. ♃. H. Native of Switzerland. A. Taúricum, Schleich. cat. 1815. A. Nap. Taúricus Ser. cat. A. Nap. d. densum, Gaud. fl. helv. ined. A. Schleichèri, Rchb. ueber. p. 35. A. tenuifòlium, Schleich. in litt. A. Schleichèri elongàtum, Schleich. cat. 1821. p. 5. A. vulgàre β, pubéscens, D. C. syst. 1. p. 372.

Var. β, A. N. Schleichèri Luxùrians (Rchb. ill. t. 1. f. 2.) peduncles long; bracteas large, jagged, longer than the flowers; racemes loose. ♃. H. Native of Switzerland. A. Napéllus spicâ foliosâ, Schleich. cat. 1815, p. 5. A. Schleichèri β, comòsum, Rchb. uebers. p. 36.—Moris. hist. 3. p. 464. sect. 12. t. 3. f. 19.

Var. γ, A. N. Lobelìanum (Rchb. ill. t. 3.) stem erectish; partitions of leaves elongated with diverging segments; racemes elongated, loose, with a few small racemes at the base. ♃. H. Native of Dauphiny and Switzerland.—Lobel. stirp. ed. 1576. p. 387. icon.—Clus. hist. 5. p. 76. with a figure.—Dod. pempt. ed. 1583. p. 438, with a good figure. Flowers violet or white, smooth. Pistils 3, smooth. Fruit veiny; stem 2-4 feet. *N. Lob.* 1. *Luxùrians* (Rchb. ill. t. 3. f. 2.) plant strong. *N. Lob.* 2. *albiflòrum* (Rchb. ill. t. 2. f. 3.) flowers white.

Var. δ, A. N. Bauhìni (Rchb. ill. t. 4.) stem straight, long, branched; partitions of leaves linear, dilated, very long. ♃. H. Native of Switzerland, &c.—Bauh. hist. 3. p. 655, with a middling figure.—Chabr. Sciagr. p. 531. f. 2. and p. 527. f. 2. A. neomontànum, Schleich. cat. 1815. p. 5. A. Hallèri γ, ramòsum, Rchb. uebers. p. 28. and A. Hallèri. A. Napéllus ζ, ramosum, Schleich. 1822. Ser. mus. helv. 1. p. 154. Racemes elongated, loose, with a few lateral ascending ones. Flowers of an opaque violet-colour. Fruit veiny. Stem 4-6 feet.

Var. ε, A. N. β, compáctum (Rchb. ill. t. 2.) stem straight, simple, thickish, densely leafy; segments of leaves elongated; racemes compact, nearly simple. ♃. H. Native of the Pyrennees and Switzerland. A. Napéllus, D. C. fl. fr. 5. p. 917. No. 4682. Lapeyr. hist. pl. pyr. p. 305. A. compáctum. Rchb. uebers. p. 27.

1. *Flore violacea-cyaneo* (Rchb. ill. t. 2. f. 1.) flowers violet-blue.

2. *Flore-rubello* (Rchb.) flowers red. ♃. H. Native of Switzerland. A. compáctum, var. β, floribus rubéllis, Rchb. uebers. p. 27. A. Napéllus. τ. rubéllum, Ser. mus. helv. 1. p. 158.

Var. ξ, viridiflòrum (Ser. mus. helv. 1. p. 158.) flowers in loose spikes; helmet semicircular, hardly emarginate, blue, marked with green lines.

Var. η, maculàtum (Ser. mus. helv. 1. p. 159.) flowers spiked, blue spotted with white.

Var. ϑ, multicucullàtum (Ser. icon. ined. and. mus. helv. 1. p. 156.)

Var. ι, laciniòsum (Ser. mus. helv. 1. p. 159.) flowers loosely spiked and panicled, large, blue, somewhat conical; segments of leaves profound, linear, acute.

Var. κ, Hallèri bícolor (Rchb. uebers. p. 28.) flowers white variegated with blue, disposed in spikes or panicles. ♃. H. Native of Switzerland on Mount Stockhorn. A. bícolor, Schultz. obs. bot. 101. A. vulgàre γ, bícolor. D. C. syst. 1. p. 372. A. Napéllus υ, bícolor. Ser. mus. helv. 1. p. 158.

Linnæus says, that *A. Napéllus* is fatal to kine and goats, especially when they come fresh to it, but that it does no injury to horses who eat it only when dry. He also relates in the Stockholm acts, that an ignorant surgeon prescribed the leaves, and on the patient refusing to take them, he took them himself and died. The ancients, who were unacquainted with chemical poisons, regarded the Aconite as the most violent of all poisons; and accordingly fabled it to be the invention of Hecate, and to have sprung from the foam of Cerberus. Its real virulence is, however, sufficiently established by fatal experiment. Some persons, only by taking in the effluvia of the herb in full flower by the nostrils, have been seized with swooning fits, and have lost their sight for two or three days. But the root is unquestionably the most powerful part of the plant. Matthiolus relates that a criminal

was put to death by taking one drachm of it. Dodonæus gives us an instance of five persons at Antwerp who ate of the root by mistake and all died. Dr. Turner also mentions that some Frenchmen at the same place, eating the shoots of this plant for those of Masterwort, all died in the course of two days, except two players, who quickly evacuated all they had eaten by vomiting. We have an account, in the Philosophical Transactions, of a man who was poisoned in the year 1732 by eating some of the plant in a salad instead of celery, and Dr. Willis in his *De Anima Brutorum*, gives an instance of a man who died in a few hours by eating the tender leaves of this plant, also in a salad. He was seized with all the symptoms of mania.

The Aconite, thus invested with terrors, has however been so far subdued as to become a powerful remedy in some of the most troublesome disorders incident to the human frame. Baron Stoerck led the way by administering it in violent pains in the side and joints, in glandulous Scirrhi, tumours, ulcerous tubercles of the breast, &c. to the quantity of from ten to thirty grains in a dose of an extract, the method of making which he describes. In Sweden successful experiments have been made of an extract of the juice of the leaves, in cases of rheumatisms and intermittent fevers, given in doses of from a grain to a scruple twice a day or oftener. A much larger dose has also been safely administered. It is recommended, however, to begin with a small quantity; a caution the more necessary, when we consider the fatal effects which ignorantly eating the recent herb has sometimes produced. According to Dr. Murray, in his app. med. the chief virtue of the plant is in rheumatic and other chronic disorders. In all these cases the extract above mentioned is the best preparation. It has also been said to be of considerable service in venereal cases, even those of a confirmed nature: to have even discussed nodes, and cured obstinate ulcers, &c. In the *Gutta Serena* its efficacy has been commended; but perhaps not so certainly as in the forementioned disorders. The powder of the dried leaves is now more commonly used. All the species belonging to this section possess the same qualities, and indeed nearly the whole genus.

Napel, or Monks'-wood. Fl. Ju. Jul. Clt. 1596. Pl. 2-3 ft.

12 A. LA'XUM (Rchb. mon. t. 15. f. 4.) spur capitate; lip orbicular, obcordate; filament with a few long hairs; helmet gaping, arched. ♃. H. Native of Switzerland. A. Napéllus ψ microphýllum, Gaud. ined.? Flowers blue, few, disposed in a loose panicle.

Loose-flowered Aconite. Fl. Ju. Jul. Clt. 1820. Pl. 2-3 ft.

13 A. FUNCKIA'NUM (Rchb. ill. t. 66.) spur capitate; filaments pilose; helmet open, convex; peduncles loose, erect, elongated. ♃. H. Native of Salzburg on Mount Untersberg, Switzerland, and the Pyrenees. A. Fùnckii. Rchb. uebers. p. 28. A. pubéscens, Mœnch. Rchb. A. Napéllus β, pubéscens, D. C. syst. 1. p. 372. A. angustifòlium and squarròsum, Koch. Willd. enum. suppl. Flowers blue. Plant pubescent.

Funck's Aconite. Fl. June, July. Clt. 1825. Pl. 2-3 feet.

14 A. NEUBERGE'NSE (Clus. D. C. syst. 1. p. 373. Rchb. ill. t. 69.) spur capitate; filaments pilose; helmet closed, hemispherical; peduncles spreading; lip revolute. ♃. H. Native of Styria at Neuberg, Carinthia, Austria, Carniola, and the Pyrennees, &c. A. Napéllus, Jacq. fl. aust. 4. t. 381. A. neomontànum, Wulf. Kœll. acon. 16. A. Cámmarum. Var. β. Lin. spec. 751. exclusive of the synonyms. A. Bràunii, Rchb. A. Napéllus ξ, Neubergénse, Ser. mus. helv. 1. p. 156.—Clus. hist. v. p. 96.—Bauh. hist. 3. p. 657.—Chabr. sciagr. 531. f. 5.—Moris. hist. 3. t. 3. f. 11. Racemes loose. Flowers blueish-purple, in loose racemose panicles. Segments of leaves short, bluntish.

Neuberg Aconite. Fl. June, July. Clt. 1822. Pl. 2-3 feet.

15 A. BERNHARDIA'NUM (Rchb. uebers. p. 34.) spur capitate; filaments pilose; helmet closed, hemispherical. ♃. H. Native of Europe. A. hùmile Bernhardi, but not of Salisb. Flowers blue. A very elegant species.

Var. β, *álbidum* (Bernh. Rchb. uebers. p. 31.). ♃. H. Native of Austria, the Pyrenees, and Switzerland. A. Napéllus flore albo, Crantz. A. Napéllus φ albiflòrum, Ser. mus. helv. 1. p. 158. Flowers white, disposed in loose spikes.

Bernhardi's Aconite. Fl. June, July. Pl. 2-3 feet.

16 A. E'MINENS (Koch. ex Rchb. uebers. p. 35.) spur capitate; filaments pilose; helmet closed; lip very long, refracted; peduncles erectly spreading. ♃. H. Native of Europe. A. neomontànum, hort. paris. Flowers blue.

Eminent Aconite. Fl. June, July. Clt. 1800. Pl. 2-4 feet.

17 A. AUTUMNA'LE (Clus. ex Rchb. acon. t. 17. f. 2.) spur capitate; filaments pilose; helmet open, convex; peduncles rigidly spreading. ♃. H. Native of Europe. Rchb. ill. t. 67. A. Napéllus ε, gróssum. Ser. mus. helv. 1. p. 157. Flowers in loose panicles of a blueish-purple colour.

Autumnal Aconite. Fl. July, Aug. Pl. 3-4 feet.

18 A. PYRAMIDA'LE (Mill. dict. Rchb. uebers. p. 48. acon. t. 17. f. 2. ill. t. 68.) spur capitate; filaments pilose; helmet closed; peduncles erectly-spreading, longer than the flowers. ♃. H. Native of Thuringia, Bohemia, and Styria. A. Napéllus Leysser. A. neomontànum, Spreng. Flowers blueish-purple.

Var. β, *densiflòrum* (Rchb. uebers. p. 48.) racemes elongated, crowded, with numerous axillary small racemes. ♃. H. A. pyramidàle, true, Mill. dict.

Var. γ, *elongàtum* (Rchb. uebers. p. 48.) racemes elongated, with very few short axillary racemes.

Var. δ, *bícolor* (Rchb. uebers. p. 48.) flowers white, edged with blue. ♃. H. A. variegàtum Hortul. with A. versícolor and Stoerkiànum bícolor.

Pyramidal Aconite. Fl. July, Aug. Pl. 4 feet.

19 A. ACUMINA'TUM (Rchb. ill. uebers. p. 48.) spur capitate, filaments pilose; helmet closed, conical, beaked. ♃. H. Native of? Supposed to be a hybrid between *A. cérnuum* and *A. Napéllus*. Flowers blueish-purple. A. paniculàtum β, acuminàtum, Ser. mus. helv. 1. p. 144.

Acuminated Aconite. Fl. July, Aug. Pl. 2-4 feet.

20 A. MULTI'FIDUM (Koch. Rchb. ill. t. 70.) spur capitate; filaments pilose; helmet closed, arched; peduncles erectly-spreading. ♃. H. Native of Switzerland and Siberia. A. gigantèum Amman. A. venústum laxiflòrum virgàtum and callibótrys, Rchb. A. volùbile, Kœll. 21. A. eriostèmum, D. C. syst. 1. p. 377. A. Napéllus η, virgàtum ε, macrostàchyum, Ser. mus. helv. 1. p. 155. p. 154. Flowers blueish-purple, disposed in long beautiful spikes.

Multifid Aconite. Fl. June, July. Pl. 4 feet.

21 A. AMBI'GUUM (Rchb. ill. t. 23.) spur capitate; filaments smooth; helmet closed, hemispherical, arched, obtuse; lip obcordate. ♃. H. Native of Siberia. Leaves smooth. Racemes loose, very seldom bearing many small lateral racemes. Flowers smooth, pale blue.

Ambiguous Aconite. Fl. June, July. Pl. 2-3 feet.

† *Species not sufficiently known, belonging to section Napelloìdea.*

22 A. AMŒ'NUM (Rchb. uebers. p. 23. acon. 93. t. 14. f. 1.) peduncles smooth; spur capitate, bent. ♃. H. Native of Germany and Switzerland. A. N. 9. ampléxum, Ser. mus. helv. 1. p. 155. Flowers in loose spikes, deep blue. Bracteas short. Helmet semicircular; limb entire, clasping the lateral sepals.

Pleasing Aconite. Fl. June, July. Pl. 2-3 feet.

23 A. OLIGOCA'RPUM (Rchb. uebers. p. 24.) spur capitate, bent; peduncles smooth; capsules 2. ♃. H. Native of Styria. Flowers blue.

Few-capsuled Aconite. Fl. June, July. Pl. 1-3 feet.

24 A. ela'tum (Salisb. Rchb. uebers. p. 30.) peduncles pubescent; spur capitate, inclining; segments of leaves linear, acute. ♃. H. Native of Styria and Carinthia. A. Taúricum, Willd. spec. 2. p. 1236. A. neomontànum, Bernh. A. Napéllus ∂ grossum, Ser. mus. helv. 1. p. 157.? Flowers in loose panicled spikes, very large, blueish-purple. Segments of leaves large.

Tall Aconite. Fl. June, July. Pl. 3-4 feet.

25 A. Meye'ri (Rchb. uebers. p. 33.) peduncles pubescent; spur capitate, inclining. ♃. H. Native of Bavaria and Styria, &c. A. neomontànum, var. Schrank, Hoppe pl. exsic. A. elàtum, Meyer, fl. gött. ined. Flowers blueish-purple.

Meyer's Aconite. Fl. June, July. Clt. 1823. Pl. 2-4 feet.

26 A. Sprenge'lii (Rchb. uebers. p. 35.) spur obtuse, straight; segments of leaves blunt. ♃. H. Native of Europe. A. exaltàtum, Willd. enum. suppl. but not of Bernh. Flowers blueish-purple.

Sprengel's Aconite. Fl. June, July. Clt. 1820. Pl. 3-4 ft.

27 A. Willdeno'wii (Rchb. uebers. p. 35.) spur obtuse, straight; segments of leaves blunt. ♃. H. Native of Carniola. A. Napéllus, Willd. hort. berl. Flowers blueish-purple.

Willdenow's Aconite. Fl. Ju. Jul. Clt. 1823. Pl. 2-3 feet.

28 A. microsta'chyum (Rchb. uebers. p. 36.) spur obtuse, straight; segments of leaves blunt. ♃. H. Native of Hungary. A. Taúricum, Roch. exsic. Flowers blueish-purple.

Small-spiked Aconite. Fl. June, July. Pl. 2-3 feet.

29 A. ampliflo'rum (Rchb. uebers. p. 37.) spur obtuse, straight; segments of leaves blunt; flowers large. ♃. H. Native of Austria. Flowers blueish-purple.

Ample-flowered Aconite. Fl. June, July. Pl. 2-3 feet.

Sect. III. Callipa'ria (from καλλιπαρειος, *kallipareios*, having beautiful cheeks; flowers.) Rchb. uebers. 13. Calyx deciduous. Petals (nectaries) supine, truncate, or a little hooked, with the lip scarcely emarginate. Stamens smoothish. Capsules 3-8 erect. Helmet depressed, conical, or hemispherical. Sack of petals large. Beautiful plants with multifid leaves, blue flowers, and napiform roots.

§ 1. *Spurs of petals truncate.*

30 A. bifloʻrum (Fisch. in litt. with a figure. D. C. syst. 1. p. 380. Rchb. ill. t. 40.) Spur truncate; helmet depressed; beak drawn out. ♃. H. Native of Siberia on the Altaian mountains, and on the Sayansk mountains. A. grandiflòrum, Fisch. cat. hort. gor. 1808, p. 77. Root napiform, larger than a pea. Stem a hand high, smooth, but a little pubescent towards the top. Lower leaves on long stalks, with linear segments. Flowers usually twin, very rarely solitary or tern, sessile, pale blue, with the middle rather obscure and with yellowish edges, puberulous on the back. Ovaries 3, pubescent. Styles smooth. Stamens smooth.

Two-flowered Aconite. Fl. June, July. Clt. 1817. Pl. ½ ft.

§ 2. *Spur of petals hooked.*

31 A. semigalea'tum (Pall. herb. Rchb. uebers. 38. ill. t. 41.) Spur hooked; helmet convex, navicular, peduncles elongated. ♃. H. Native of Kamtschatka. A. delphinifòlium γ, Kamtscháticum, D. C. syst. 1. p. 380. A. Napéllus κ, semigaleatum, Ser. mus. helv. 1. p. 155. Root a tuber about the size and form of a pea. Stem ½ to 2 feet high, pubescent at the top. Leaves few, membranous, smooth. Racemes very loose. Flowers pale blue, at first pubescent, but at length becoming smooth. Pistils 5-8. Stamens smooth.

Half-helmetted Aconite. Fl. June, July. Pl. ½ to 2 feet.

32 A. delphinifòlium (D. C. syst. 1. p. 380. Rchb. uebers. p. 38. ill. t. 42.) spur a little hooked; helmet hemispherical; filaments smooth; stem slender, few-flowered. ♃. H. Native of the western coast of North America in Hedge Island, Rocky Mountains. Rchb. acon. t. 9. f. 1, 2, 3. A. delphinifòlium α, Americànum, D. C. syst. 1. p. 380. A. Napéllus α α, delphinifòlium, Ser. mus. helv. 1. p. 159. Root napiform. Stem ½ to 2 feet high, a little pubescent towards the top. Leaves smooth, deeply cut into 5 parts. Racemes loose. Flowers large, pale-blueish-purple, young ones puberulous. Pistils 4-6. Fruit smooth. A. paradóxum, Rchb.

Var. β, *speciòsum* (Rchb. uebers. p. 38.) plant taller and a little branched, many-flowered; flowers large. ♃. H. Native of Chamisso's Island.

Var. γ, *hùmile* (Rchb. uebers. p. 38.) stem humble, rather prostrate, few-flowered. ♃. H. Native of the island of St. Lawrence.

Larkspur-leaved Aconite. Fl. Ju. Jul. Clt. 1820. Pl. ½ to 2 ft.

33 A. Chamissonia'num (Rchb. uebers. p. 37. ill. t. 43.) spur a little hooked; helmet hemispherical; filaments pilose; stem humble, and is, as well as the flowers, pubescent. ♃. H. Native of the islands of Chamisso and Unalaschtka in the fissures of Rocks. Leaves smooth. Racemes loose, few, or many-flowered. Flowers large, violet. Pistils 3.

Chamisso's Aconite. Fl. June, July. Pl. 1-2 feet.

Sect. IV. Euchylòdea (from ευ, *eu*, good; χυλωδης, *chylodes*, juice; the juice of the plants belonging to this section is supposed to be harmless, and not poisonous, as in the rest of the genus.) Rchb. uebers. p. 13. Sect. V. Anabàtes, D.C. syst. 1. p. 377. Calyx deciduous. Petals (nectaries) supine or erect, inflated, somewhat hooked, gibbous. Stamens pilose or smooth. Capsules 3-5, young ones converging. Peduncles erect. Helmet depressed or high, conical or arched. Flowers blue or violet. Racemes loose. Stems twining or flexuous. Leaves multifid.

34 A. Kamtscha'ticum (Pall. Rchb. uebers. p. 39. ill. t. 15.) petals erect; gibbo continuous; filaments smooth; lip revolute; helmet closed, and is as well as the leaves pilose. ♃. H. Native of Kamtschatka. Lower leaves on long stalks. Racemes few-flowered. Flowers large, pubescent, pale-blue. Pistils 3, a little pubescent.

Var. a, normàle (Rchb. ill. t. 15.) stem hardly more than 2 feet high.

Var. β, *luxùrians* (Rchb. ill. t. 17.) plant larger in every part; bracteas very large.

Kamtschatka Aconite. Fl. June, July. Pl. 2 to 6 feet.

35 A. Ochote'nse (Rchb. illus. t. 18.) petals erect; gibbo continuous; filaments smooth; helmet hemispherico-conical, obtuse, closed; lip 2-lobed; peduncles spreading. ♃. H. Native of Siberia near Ochotskoi. Racemes loose. Flowers large, pubescent, pale-violet. Pistils 3, smooth. Leaves rather pilose?

Ochotskoi Aconite. Fl. June, July. Pl. 4 to 6 feet.

36 A. gibbíferum (Rchb. ill. t. 19.) petals with a distinct swelling. ♃. H. Native of Siberia. Leaves smooth. Racemes somewhat panicled, loose. Flowers large, smooth, pale-violet. Pistils 5, smooth.

Gibbiferous Aconite. Fl. June, July. Pl. 4 feet.

37 A. Kusnezóffii (Rchb. ill. t. 21.) petals erect; gibbo continuous; filaments smooth; helmet hemispherico-conical, beaked, closed. ♃. H. Native of Kamtschatka. Root tuberous. Leaves smooth. Racemes many-flowered, dense, and furnished with small racemes at the base. Flowers large, smooth, pale-violet. Pistils 5, smooth.

Kusnezoff's Aconite. Pl. 6 to 8 feet.

38 A. Fische'ri (Rchb. ill. t. 22.) petals erect; gibbo continuous; filaments smoothish; helmet arched, conical, gaping; peduncles ascending. ♃. H. Native of Kamtschatka. Leaves

smooth. Racemes loose, leafy. Flowers middle-sized, pale-blue, with the middle sepal fringed.

Fischer's Aconite. Fl. June, July. Pl. 4-6 feet.

39 A. Luba'rskii (Rchb. ill. t. 20.) petals erect; gibbo continuous; filaments smooth; helmet hemispherico-conical, obtuse, closed; peduncles spreading; lip somewhat orbicular. ♃. H. Native of Kamtschatka. Leaves smooth, with broad segments. Racemes loose, leafy. Flowers middle-sized, pale-blue.

Lubarsky's Aconite. Pl. 4-6 feet.

40 A. tortuòsum (Willd. enum. 1. p. 576. D. C. syst. 1. p. 378.) petals supine; beak blunt; helmet subconical; spur thick, long, abruptly pointed (neither arched, nor convolute,) filaments rather pilose. ♃. H. Native of North America, and probably of Siberia. Ser. mus. helv. 1. p. 147. t. 15. f. 28-29. A. tortuòsum, var. *α*, napellifòlium, Ser. mus. helv. 1. p. 148. Root tuberous. Leaves smooth, with narrow wedged-shaped lobes, and acute lobules. Panicle loose, bearing few-flowered branches. Flowers large, pale or deep violet. Ovaries 3-5 smooth, connivent.

Var. β, illinìtum (Ser. plant. sel. cent. 1. et mus. helv. 1. p. 148.) panicle much branched, very loose; branches and peduncles quite smooth; ovaries 3, smooth; leaves with broad cuneiform lobes, and obtuse lobules. ♃. H. Native of? A. illinìtum, Rchb. uebers. p. 54. A. neomontànum, Panz. fl. norimb. ined.

Var. γ, recógnitum (Rchb. uebers. p. 42.) ♃. H. Native of? A. volúbile, Bernh. A. volùbile and tortuòsum, Hortul. A. exaltàtum, Wenderoth. Flowers crowded or distant.

Twisted Aconite. July, Aug. Clt. 1812. Pl. 6-8 feet.

41 A. volu'bile (Pall. Willd. spec. 2. p. 1237.) petals supine; beak acuminated; helmet conical; spur hooked at the apex; filaments smooth. ♃. H. Native of Siberia in the Altaian mountains. A. ciliàre, *α* oligotrìchum, D. C. syst. 1. p. 378. prod. 1. p. 61. Root tuberous. Stem pubescent, and covered with spreading hairs, slender, twining 12-16 feet high. Panicle loose, with ascending branches, which are for the most part pendulous. Lobes of leaves pinnate, with linear lobules. Flowers smooth, middle-sized, violet. Ovaries 5. Rchb. ill. t. 25.

Twining-stemmed Aconite. Fl. July, Aug. Clt. 1799. Pl. 12-16 feet.

42 A. ma'ximum (Pall. herb. D. C. syst. 1. p. 380.) petals erect; gibbo continuous; filaments smooth; helmet hemispherico-conical, obtuse; spur short, incurved; peduncles erect. ♃. H. Native of Kamtschatka. Ser. mus. helv. 1. p. 149. t. 15. f. 31 and 32. Rchb. ill. t. 17. Stem smooth. Panicle loose, furnished with a few long distant few-flowered branches, which are pubescent with curved hairs. Leaves large, smooth. Lower bracteas like the leaves, but smaller. Flowers pubescent, pale-blue. Ovaries 3, smooth.

Largest Aconite. Fl. July, Aug. Clt. 1823. Pl. 6 feet.

43 A. villòsum (Rchb. uebers. p. 39. ill. t. 26.) petals erect; gibbo continuous; filaments smooth; helmet conical, arched, closed; spur hooked. ♃. H. Native of Siberia. Rchb. ill. t. 20. Root tuberous. Stem slender, 2-4 feet high, a little flexuous, villous, with spreading hairs, and furnished with ascending branches towards the top. Young leaves villous, adult ones hardly so. Racemes furnished with small lateral branches, forming as it were a small pyramidal panicle. Flowers violet.

Var. β, flexuòsum (Rchb. ill. t. 27.) stem slender, 4-8 feet high, densely villous, a little twining, branched, with the branches rather pendulous; partitions of leaves less jagged than in the species. Racemes loose, panicled, many-flowered. ♃. H.

Villous Aconite. Fl. June, Aug. Pl. 2 to 8 feet.

44 A. fla'ccidum (Rchb. uebers. p. 39. ill. t. 29.) petals erect; gibbo continuous; filaments smooth; helmet high, arched, inclining forwards, gaping; spur hooked at the apex. Peduncles erectly spreading, pubescent. ♃. H. Native of Siberia. A. ciliàre *β*, polýtrichum, D. C. syst. 1. p. 378. Ser. mus. helv. 1. p. 149. t. 15. f. 30. A. ciliàre, Deless. icon. sel. 1. t. 65. Stem slender, villous, branched a little towards the apex. Young leaves ciliated as well as the petioles. Racemes branched, few-flowered. Flowers large, pubescent, pale-violet. Pistils 5.

Flaccid Aconite. Fl. July, Aug. Clt. 1822. Pl. 6 feet.

Sect. V. Corythæòla (from *κορυθαιολος, korythaiolos*, ornamented with a variegated helmet.) Rchb. uebers. p. 14. Sect. III. Cámmarum, D. C. syst. 1. p. 347. Calyx deciduous. Petals (nectaries) supine, somewhat hooked. Stamens pilose. Capsules 3-5, converging. Helmet arched or conical, variegated. Young peduncles nodding. Root tuberous. Lobes of leaves trapeziform, pinnate. Helmet of flower usually variegated with white or blue.

45 A. palmatífidum (Rchb. uebers. p. 48.) filaments smooth; helmet arched. ♃. H. Native of the Carpathian mountains. A. Breiteriànum and Ottonianum, Rchb. uebers. A. Taúricum latifolium, Rochel. A. speciòsum, Otto, cat. hort. berl. Deless. icon. sel. 1. t. 64. Ser. mus. helv. 1. p. 147. t. 15. f. 28. 27. Flowers blue, variegated with white.

Palmatifid-leaved Aconite. Fl. July, Aug. Pl. 2 to 4 feet.

46 A. Stoerkia'num (Rchb. uebers. p. 49. ill. t. 71.) stamens pilose; helmet arched. ♃. H. Native of the Alps of Europe. A. Napéllus, Stoerk. Sturn. deutsch. fl. heft. 6. with a figure. A. neomontànum, Willd. A. mèdium, Schrad. hort. gött. but not of Willd. enum. A. intermèdium, D. C. syst. 1. p. 374. but not of Gaudin. nor A. intermèdium hýbridum, Hoppe.—Trag. stirp. p. 248.—Cord. 3. p. 245.—Sturn. fl. germ. 2. t. 6. good. —Barrel. icon. t. 610.—Weinm. phyt. t. 21. f. d. Plant quite smooth. Panicle loose, with ascending stiff branches. Flowers blue. Ovaries 3-5-7, smooth.—A. intermèdium var. *α*. glàbrum, Ser. mus. helv. 1. p. 152. f. 39. 40. 49.

Var. β, laxiflòrum (Rchb. uebers. p. 49.) racemes simple, elongated, loose. ♃. H.—Black. 561. Flowers blue.

Var. γ, bícolor (Rchb. uebers. p. 49.) plant quite smooth; flowers white, variegated with purple. ♃. H. A. mèdium *β*. Schrad. hort. gött. A. intermèdium *β*, versícolor, Ser. mus. helv. 1. p. 152. A. versícolor, Rchb. uebers. p. 50. Lodd. bot. cab. 794. A. variegàtum, Bernh.

Var. δ, latílobum; lobes of leaves broad; flowers blue. ♃. H. A. Taúricum, Rœm. in herb. D. C. A. intermèdium *γ*, latílobum, Ser. mus. helv. 1. p. 152.

Var. ε, pubéscens; stem and peduncles puberulous; flowers blue. A. intermèdium *δ*, pubéscens, Ser. mus. helv. 1. p. 152.

Stoerck's Aconite. Fl. June, Aug. Clt. 1820. Pl. 3 to 4 feet.

47 A. exalta'tum (Bernhardi. ex specim. hort. gœtt. 1818.) stamens pilose; helmet conical. ♃. H. Native of the Pyrenees? Rchb. ill. t. 72. Ser. mus. helv. 1. p. 151. t. 15. f. 37, 38. A. hamàtum and decòrum, Rchb. uebers. A. uncinàtum, Bernh. cat. hort. erf. A. stríctum, Willd. enum. suppl. but not of Bernh. A. rostràtum, Bernh. not D. C. A. mèdium, Willd. enum. suppl. Panicle loose, with ascending stiff branches. Beak elongated, ascending. Spur thick, incurved. Ovaries 3-5, smooth.

Exalted Aconite. Fl. July. Clt. 1819. Pl. 6 feet.

Sect. VI. Toxicoidea (a name applied to this section on account of the plants it contains agreeing in character with *A. Tóxicum*, from *τοξικον, toxicon*, poison; qualities of plants.) Rchb. uebers. p. 14. Sect. IV. Cámmarum, D.C. syst. 1. p. 374. Calyx deciduous. Petals (nectaries) supine, capitate or a little hooked. Stamens smooth. Capsules 3-5, erectish. Helmet arched or conical. Roots tuberous. Lobes of leaves trapesiform, pinnate. Flowers blue or violet, rarely flesh-coloured.

§ 1. *Helmet arched.*

48 A. tóxicum (Rchb. uebers. p. 43. ill. t. 37.) helmet large, arched, with a blunt beak: spur hooked. ♃. H. Native of Transylvania. A. neomontànum, Baugm. transylv.? A. Cámmarum, Hoppe. herb. Stem flexuous, almost simple. Leaves smooth. Racemes loose, pubescent. Flowers large, violet, pubescent. Ovaries 5.

Poison Aconite. Fl. June, Aug. Clt. 1825. Pl. 2 feet.

49 A. cérnuum (Koelle. acon. 17. Willd. spec. 2. 1237. Rchb. ill. t. 33.) helmet large, arched, beaked. ♃. H. Native of the south of Europe in many parts. Lodd. bot. cab. 810. A. Cámmarum, Schleich. cat. Gaud. and Vill. A. flexicaúle, Hoppe and Hornsch. pl. sel. A. cámmarum α, Lin. A. cérnuum and refléxum, Rchb. uebers. p. 43. A. Wilmetiànum and húmile, Delarb. fl. auv. ed. 2. p. 499. A. paniculàtum, var. β, D. C. syst. 1. p. 375. A. pan. δ, flexicaúle, Ser. mus. helv. 1. p. 145. A. pan. Tomaséllì, Lam. and D. C. fl. fr. ed. 3. vol. 5. p. 918. A. variegàtum, Seguier, pl. ver. A. neomontànum, Baugm. transyl. 1857.—Cam. epit. 852.—Clus. hist. 2. p. 97. f. 1.—J. Bauh. hist. 3. p. 658.—Chabr. sciagr. 531. f. 6. Stem usually flexuous. Leaves smooth. Racemes nodding, loose, pubescent, with spreading branches rising from the axils of the leaves. Flowers largeish, violet, rarely blue or reddish, puberulous or smooth. Pistils usually 5.

Var. β, *pauciflòrum* (Rchb. uebers. p. 44.) racemes terminal, few-flowered, sub-corymbose; peduncles equal in length with the flowers. ♃. H. Native on mounts Pennino and Cenis. A. paniculàtum var. α, Pennìnum, Ser. mus. helv. 1. p. 144.

Var. γ, *laciniàtum* (Rchb. uebers. p. 44.) peduncles equal in length to the flowers; branches spreading; leaves finely jagged with long acuminated segments; ovaries smoothish. ♃. H. Native of Calabria. Ser. mus. helv. 1. p. 145.

Var. δ, *patentíssimum;* stem flexuous; helmet conical, inflexed; beak short. Native of Siberia. A. paniculàtum γ, D. C. syst. 1. p. 375. A. cèrnuum flexicaúle, Rchb. A. paniculàtum ζ, patentí'ssimum, Ser. mus. helv. 1. p. 145.

Drooping Aconite. Fl. Jul. Aug. Clt. 1800. Pl. 2 to 4 feet.

§ 2. *Helmet conical.*

50 A. mo'lle (Rchb. uebers. p. 47. ill. t. 31.) helmet irregularly-conical, obtuse; front erect. ♃. H. Native of? A. cérnuum var. α, laxiflòrum, Rchb. uebers. p. 43. A. paniculàtum δ, flexicaúle, Ser. mus. helv. 1. p. 145. Leaves smooth. Racemes panicled, pubescent. Flowers large, puberulous, violet. Ovaries usually 3.

Soft-panicled Aconite. Fl. June, Aug. Clt. Pl. 2 to 6 feet.

51 A. panicula'tum (Lam. fl. fr. ed. 1. suppl. 1224. D. C. syst. 1. p. 375.) helmet conical, beaked; front sinuated, ♃. H. Native of France and Switzerland. Rchb. ill. t. 32. A. Stóerckii Borkaus. spec. 18. A. Cámmarum, All. ped. no. 1500. A. parviflòrum, Rchb. uebers. p. 46. A. hebégynum, D. C. syst. 1. p. 376. exclusive of the synonyms. Stem pubescent towards the top. Leaves smooth. Panicle terminal, much branched, loose or contracted, more or less pubescent. Flowers largeish, violet. Ovaries 3, seldom 5, puberulous?

Var. β, *Stoerkiànum* (Ser. mus. helv. 1. p. 145.) stem flexuous; panicle loose, weak; beak short. ♃. H. Native of Switzerland. A. Napéllus, officinàlis, Störk. libel. de stram. &c. p. 69. This is said to be the plant which Baron Stoerck made use of in medicine, see A. No. 11.

Panicled Aconite. Fl. June, Sep. Clt. 1815. Pl. 2 to 3 feet.

Sect. VII. Ca'mmaroi'dea (applied to this section on account of the plants it contains agreeing in character with *A. cámmarum*, from *cammarum*, a crab, lobster, or crawfish; because the superior part of the flower very much resembles the recurved tail of a crawfish.) Rchb. uebers. p. 14. Sect. IV. Cámmarum and V. Anabàtes, D. C. syst. 1. p. 374. 377. Calyx deciduous. Petals (nectaries) erect, clavated-hooked. Capsules usually 5 (rarely 3-4) erect, fringed at the suture. Stamens smooth. Helmet conical. Lobes of leaves trapesiform, pinnate. Flowers violet or blue, seldom white or variegated.

§ 1. *Helmet with a middle sized beak.*

52 A. Ca'mmarum (Jacq. aust. 5. t. 224.) helmet arched-conical; beak streached. ♃. H. Native of Austria, Switzerland, Hungary, &c. &c. A. rostrátum β, Jacquiniànum, Ser. mus. helv. 1. p. 142. Racemes somewhat corymbose few-flowered; pedicels smooth. Flowers large, pale-blue or violet. Ovaries 3, smooth. For the derivation of cámmarum see Section VII.

Var. α, *símplex* (Rchb. uebers. p. 52.) stem simple. ♃. H. Native of Austria.—Barrel. p. 97. no. 873. t. 610. Flowers blue.

Var. β, *ramòsum* (Rchb. uebers. p. 52.) stem branched. ♃. H. Native of Switzerland in the Alps of Bern. Jacq. aust. 5. t. 424. Hoffm. fl. germ. t. 8. Peduncles and ovaries smooth. A. lævigàtum, Schleicher. A. Itálicum, Tratt.

Var. γ, *mutábile* (Rchb. uebers. p. 52.) lower peduncles very long; colour of flower changeable. ♃. H. Native of Bavaria. A. Cámmarum var. Schrank.

Var. δ, *grácile* (Rchb. ill. t. 7. uebers. 55.) stem slender; racemes loose. ♃. H. Native of Dauphiny, Italy, Bohemia, &c. Leaves smooth. Flowers large, pale-blue or violet.

Var. ε, *Judenbergénse* (Rchb. ill. t. 8.) stem firm; racemes somewhat contracted. ♃. H. Native of Styria about Judenberg and the Alps of Switzerland. A. Cámmarum, Lam. ency. 1. p. 33. Schleich. cat. 1821. A. laciniòsum, Schleich. cat. 1821. A. rostràtum var. α, Judenbergénse, Ser. mus. helv. 1. p. 142. A. Bernhardiànum, Wallr. Sched. crit. 1. p. 250. Flowers large, pale-blue or with a white base. Ovaries 3, rarely 4-5.

1. *Judenbergénse var. pílipes* (Rchb. ill. t. 8. f. 2.) peduncles and ovaries pilose. ♃. H. Native of Switzerland and the Carpathian mountains. A. Cámmarum, Wahl. fl. carp. no. 533. Helmet inclined. A. rostràtum var. γ, pilosiúsculum, Ser. mus. helv. 1. p. 142.

Var. ζ, *latiflòrum* (Ser. mus. helv. 1. p. 142.) helmet conical, dilated, with an inclined scarcely prominent beak. ♃. H. Native in the Alps of Bern in Switzerland.

Var. η, *macránthum;* flowers large, violet. ♃. H. Native of Salzburg. A. macrànthum, Rchb. uebers. p. 51. ill. t. 39. A. Cámmarum var. grandiflòrum, Braune.

Crawfish or Purple Aconite. Fl. June, Sep. Pl. 1 to 4 feet.

§ 2. *Helmet with a drawn-out beak.*

53 A. lasioca'rpum (Rchb. uebers. p. 55.) petals (nectaries) erect; capsules hairy. ♃. H. Native of Hungary. The character of this plant is not sufficiently known.

Hairy-fruited Aconite. Fl. June, July. Pl. 2 to 4 feet.

54 A. produ'ctum (Rchb. uebers. t. 38. ill. t. 38.) helmet straight, irregularly convex-conical, drawn out. ♃. H. Native of Siberia and Kamtschatka, Ser. mus. helv. 1. p. 150. t. 15. f. 33, 34. Rchb. acon. p. 75. t. 7. f. 3. A. delphinifòlium β, Sibíricum, D. C. syst. 1. p. 380. A. grandiflòrum, Pall. herb. Stem about a foot high, few-leaved. Leaves on long stalks, with 3-parted lobes. Racemes few-flowered, loose, pubescent. Flowers violet, puberulous. Ovaries 4-5 pubescent.

Drawn-out-beaked Aconite. Pl. 1 foot.

55 A. rostra'tum (Bernh. monog. ined. Rchb. uebers. p. 56. ill. t. 11.) helmet bending forward (compressed with vertex obliquely reflexed); beak stretched out. Lodd. bot. cab. 208. Ser. mus. helv. 1. p. 141. t. 15. f. 16-17. ♃. H. Native of Switzerland and Styria. A. alpìnum, Mill. dict. A. Cámmarum, Lam. dict. 1. p. 38. A. lùridum, Sal. prod. 375.

Panicle rather loose. Flowers violet. Helmet conical, elongated, abruptly mucronate in front. Spur thick depressed globose. Ovaries 3, rarely 4-5, smooth or rather pilose. There are varieties with broader and narrower leaves.

Var. β, álbum; flowers white or suffused with blue lilac or violet. ♃. H. Native of Switzerland or the Levant. A. álbum, Ait. hort. kew. ed. 1. vol. 2. p. 123. A. lævigàtum, Schleich. cat. ?

Beaked Aconite. Fl. June, Aug. Clt. 1752. Pl. 1 to 2 ft.

56 A. nasu'tum (Fisch. in litt. Rchb. uebers. p. 56. ill. t. 9, 10.) helmet conical, bending forward; beak short. ♃. H. Native of Caucasus and North West America on a mountain near the source of Wallawalli River, a branch of the Columbia. A. Cámmarum, Bieb. fl. taur. and suppl. no. 1054. A. gibbòsum, Ser. mus. helv. 1. p. 141. t. 15. f. 14-15. Panicle contracted, quite smooth. Flowers violet. Spur elongated, arched. Lobes of leaves broad. Ovaries usually 3.

Great-nosed Aconite. Fl. June, July. Clt. 1818. Pl. 3 feet.

57 A. variega'tum (Lin. spec. 751.) helmet bent forward, inflated; beak ascending. ♃. H. Native of middle Europe, in the Alps, Rchb. ill. 34. A. hùmile, Sal. prod. p. 375.—Clus. hist. 2. p. 98. f. 1.—Ger. herb. 971. f. 2.—Lob. icon. 678. f. 2. Stem erect, branched, smooth, a little flexuous. Lower leaves on long stalks, upper ones sessile, smooth, thickish. Racemes panicled, loose. Flowers large, blue, smooth. Ovaries 5, smooth.

Var. α, pauciflòrum (Ser. mus. helv. 1, p. 140.) helmet straight; flowers pale-blue.—Clus. hist. 2. p. 98. f. 1.

Var. β, bícolor; helmet straight; flowers white, edged with blue or lilac. ♃. H. A. variegàtum, Schrad. hort. gœtt. Mœnch. A. rhynchánthum β, bícolor, Rchb. uebers. p. 56. A. leucánthum β, bícolor, Rchb. ueber. p. 55.

Var. γ, pallidiflòrum (Ser. mus. helv. 1. p. 140.) helmet inclined; flowers white, variegated with blue. A. variegàtum, Lin. spec. 751. A. variegàtum β, bícolor, Rchb. uebers. p. 58.

Var. δ, cærùleum (Ser. mus. helv. 1. p. 140.) helmet inclined; flowers blue. ♃. H. A. Cámmarum, Schleich. cat. 1821. A. glàbrum. D. C. syst. 1. p. 379.

Var. ε, angustílobum (Ser. mus. helv. 1. p. 140.) helmet inclined; lobes of leaves very narrow; flowers blue.

Var. ζ, albiflòrum (Ser. mus. helv. 1. p. 140.) helmet straight; flowers small, white. ♃. H. A. leucánthum, Richb. uebers. p. 55. A. álbum, Mœnch and Hortul. A. Japónicum, Hortul.

Var. η, grandiflòrum (Ser. mus. helv. 1. p. 140.) helmet large; flowers blue. ♃. H. A. variegàtum. D. C. herb. sent to him by Bernhardi.

Var. θ, rhynchánthum (Rchb. uebers. p. 56.) helmet somewhat conical, falcately-navicular. ♃. H. A. variegàtum η, falcatum. Ser. mus. helv. 1. p. 141. Flowers blue.

Var. ι, hùmile; racemes simple, few-flowered. ♃. H. A. rhynchánthum γ, humile. Rchb. uebers. p. 56.

Var. κ, bulbíferum (Rchb. uebers. p. 55.) bulbs in the axils of the leaves. A. Napéllus δ δ, bulbíferum. Ser. mus. helv. 1. p. 160.

Var. λ, mixtum (Rchb. uebers. p. 61,) flowers mixed with blue and white.

Variegated Aconite. Fl. Aug. Clt. 1597. Pl. 1 to 6 feet.

58 A. Japo'nicum (Thunb. fl. jap. 231.) helmet exactly conical, abruptly mucronate; beak acute, straight. ♃. H. Native of Japan, where it is called *So-Huso*. Stem round, smooth. Leaves stalked, trifid; lateral lobes bifid, middle lobe trifid, all blunt and deeply toothed. Panicle loose, with ascending branches. Ovaries 3. Plant quite smooth. Ser. mus. helv. 1. p. 146. t. 15. f. 22 and 23.

Var. α, cárneum (Ser. pl. sel. cent. 1. and mus. helv. 1. p. 146.) flowers flesh-coloured. A. álbum, D. C. syst. 1. p. 377. ?

Var. β, cærùleum (Ser. mus. helv. 1. p. 146.) flowers blue. A. glàbrum, D.C. syst. 1. p. 379. ?

Japan Aconite. Fl. July, Sep. Clt. 1790. Pl. 6 feet.

59 A. uncina'tum (Lin. spec. 750.) helmet regularly conical, compressed. ♃. H. Native of North America on the high mountains of Virginia and Carolina in swamps and by the sides of rivulets. Sims, bot. mag. t. 1119. Rchb. ill. t. 35 and 36. A. scándens, Muhl. Stem with branches rising from the axils of the leaves. Racemes loose, rather umbellate at the apex, very rarely panicled. Flowers middle sized or large, of a lilac colour, smooth, with a somewhat spiral inclined spur. Ovaries 5, villous.

Var. α, Linnæànum (Ser. mus. helv. 1. p. 147.) helmet pointed, hooked. ♃. H. Native near Philadelphia. A. uncinàtum, Lin. spec. 750. var. α. D. C. syst. 1. p. 379.

Var. β, Michauxiànum (Ser. mus. helv. 1. p. 147. t. 15. f. 24 and 25.) helmet awnless in front. ♃. H. A. uncinàtum, Mich. fl. bor. amer. 315. Sims, bot. mag. t. 1119. A. uncinàtum β. D. C. syst. 1. p. 379.

Hooked-helmetted Aconite. Fl. July, Aug. Clt. 1768. Pl. 4 to 8 feet.

† *Species doubtful whether they belong to the present section.*

60 A. palma'tum (D. Don. prod. fl. nep. p. 190.) leaves 5-cleft, palmate, smooth, paler beneath; segments cuneated, deeply lobed and toothed; stem simple, smooth. ♃. H. Native of Nipaul at Gosaingsthan. Stem about the thickness of a common writing quill. Leaves on long stalks. Flowers not seen.

Palmate-leaved Aconite. Pl. 2 feet.

61 A. fe rox (Wall. in litt. D. C. prod. 1. p. 64.) helmet convex, curved, on short stipes; spur thick, inclined; lip very narrow, divaricate; stem simple. ♃. H. Native of Nipaul. A. viròsum, D. Don, prod. fl. nep. p. 190. Stem clothed with brown tomentum. Leaves many-parted, villous beneath, with revolute edges; cauline leaves almost sessile, 3-4-parted; segments pinnatifid; lobes linear, stiff, obtuse, entire, or toothed. Ovaries 3, villous. The root of this species is very poisonous. Flowers shewy violet in loose woolly racemes. Ser. mus. helv. 1. p. 160. t. 15. f. 43, 44.

Ferocious Aconite. Pl. 2 to 6 feet.

Sect. VIII. Lyco'ctonoi'dea (applied to this section on account of the plants it contains agreeing in character with *A. Lycóctonum*, from λυκος, *lykos*, a wolf; κτεινω, *kteino*, to kill; because the *A. Lycóctonum* was used to poison wolves, before a more efficacious method was discovered). Rchb. uebers. p. 14. Sect II. Lycóctonum. D. C. syst. 1. p. 367. Calyx deciduous. Petals (nectaries) oblique; spur clavate, straight, arched, hooked, or spiral. Capsules 3, adult ones erect, or diverging. Stamens smoothish. Helmet conical or cylindrical. Root tuberous, emitting numerous fibres. Lobes of leaves wedge-shaped, pinnate, rarely bipinnate. Flowers cream-coloured, white, or livid-blue.

§ 1. *Spur clavate, nearly straight. Young capsules silky-pubescent.*

62 A. barba'tum (Patrin. in Pers. ench. 2. p. 83) spur straightish, obtuse; bottom of helmet conical; middle sepals densely bearded. ♃. H. Native of Siberia. Deless. icon. sel. 1. t. 64. Rchb. ill. t. 45. Ser. mus. helv. 1. p. 138. t. 15. f. 10 and 11. A. boreàle. Ser. ex Rchb. uebers. p. 62. A. squarròsum. Lin. spec. 751. D. C. syst. 1. p. 368. Stem pubescent. Leaves opaque, with the lobes divided into many linear segments, on long stalks which are villous as well as the nerves. Racemes dense, puberulous, with a few axillary racemules. Flowers middle-sized, cream-coloured. Ovaries 3, silky. Sweet, fl. Gard. 164.

Bearded Aconite. Fl. Jul. Aug. Clt. 1807. Pl. 2 to 6 ft.

63 A. Gmeli'ni (Rchb. uebers. p. 63. ill. t. 46.) spur straight, obtuse; bottom of helmet rounded, cylindrical. ♃. H. Native

of Siberia. A. hìspidum, D. C. syst. 1. p. 367. A. pyrenàicum, Koelle acon. A. nítidum, Fisch. A. barbàtum β, hìspidum, Ser. mus. helv. 139.—Gmel. sib. 4. p. 188. t. 81. Stem villous below, but almost smooth at the top. Leaves on long stalks, villous beneath and shining above, with the lobes divided into narrow segments. Flowers middle-sized, cream-coloured. Ovaries 3, silky. Racemes very long, puberulous, at length becoming loose.

Gmelin's Aconite. Fl. June, Aug. Clt. 1817. Pl. 2 feet.

64 A. Lepta'nthum (Rchb. ill. t. 64.) spur straight, blunt; bottom of helmet conical, elongated-attenuated; capsules ventricose. ♃. H. Native of Dauria on the Baikal Mountains. Root a branched rhyzoma. Stem slender, villous at the base, but puberulous at the top. Leaves on long, flattish, villous stalks. Racemes elongated, loose, furnished with a few small axillary racemules. Flowers middle-sized, yellow, canescent when in bud. Ovaries silky-puberulous.

Slender-flowered Aconite. Fl. Jul. Aug. Clt. 1820. Pl. 2 to 4 ft.

§ 2. *Spur clavate, arched, or hooked. Young capsules silky-pubescent.*

65 A. pa'llidum (Rchb. uebers. p. 65. ill. t. 50.) spur arched; bottom of helmet conico-cylindrical; middle sepals covered with short hairs. ♃. H. Native of Russia in the government of Rasan, in groves at Kurbatowa. A. ochroleùcum, hort. hal. Root large, branched, fibrous. Stem puberulous, truly canescent at the apex. Leaves 5-7-parted, deep green, the first ones are puberulous above. Racemes puberulous, rather loose with a few ascending racemules. Flowers large, cream-coloured, ovaries 3, puberulous.

Var. β, *melóctonum* (Rchb. uebers. p. 65.) panicle large, with diverging branches; flowers cream-coloured, loose, pubescent; germens villous. ♃. H. Native of Piedmont. A. Lycóctonum, All. pedm, no. 1498. Balb. fl. pedm. p. 87. A. Lycóctonum η, laxiflòrum, D. C. syst. 1. p. 369. Ser. mus. helv. 1. p. 135.

Pale-flowered Aconite. Fl. July, Aug. Pl. 2 to 4 feet.

66 A. lasio'stomum (Rchb. ill. t. 49.) spur arched; bottom of helmet conical; middle sepals densely bearded. ♃. H. Native of Russia near a town called Modyn in the government of Kaluga. Stem puberulous, or densely and softly villous. Leaves with villous petioles and pubescent veins. Racemes elongated, loose, puberulous, furnished with a few racemules. Flowers largeish, cream-coloured, or yellow. Ovaries 3, silky-villous.

Hairy-mouthed Aconite. Fl. Ju. Jul. Clt. 1820. Pl. 1 to 2 ft.

67 A. disse'ctum (Tauch. in cat. hort. Rchb. ill. 48.) spur arched; bottom of helmet conical, bending down in a short front. ♃. H. Native of Siberia. Stem puberulous? Leaves like those of *A. barbàtum*, but the partitions are broader. Racemes elongated, dense, puberulous, furnished with a few spreading axillary racemules. Flowers largeish, cream-coloured. Ovaries 3, silky.

Dissected-leaved Aconite. Fl. June, July. Pl. 1 to 2 feet.

68 A. Hamilto'nii; leaves 5-parted, smooth, and pinnatifid, with linear acute segments; stem simple, smooth. ♃. H. Native of Nipaul at Gosaingsthan. A. disséctum, D. Don, prod. fl. nep. p. 197. Root tuberous. Stem about the thickness of a crow's quill. Flowers not seen. Very like *A. Pyrenàicum*, in habit it is doubtful whether it may belong to this section.

Hamilton's Aconite. Pl. ½ to 1 foot.

§ 3. *Spur spiral. Young capsules silky-pubescent.*

69 A. Lama'rkii (Rchb. ill. t. 40.) spur spiral; helmet constricted, clavate. ♃. H. Native of the Pyrenees. A. Pyrenàicum. Lam. dict. 1. p. 33. D. C. syst. 1. p. 368. A. Lycóctonum, var. β, Pyrenàicum. Ser. mus. helv. 1. p. 133. D. C. prod. 1. p. 57. Stem smooth. Leaves large, 7-9-parted, with the partitions unequally cleft. Racemes long, cylindrical, crowded, branched at the base. Flowers cream-coloured, pubescent; sepals about equal in length. Ovaries 3, villous.

Var. β, *Pennìnum;* pubescent; flowers large, spiked, or somewhat panicled, yellow; helmet conical; beak large; ovaries 3-5, villous. ♃. H. Native of Mount Pennino. A. Lycóctonum δ, Pennìnum. Ser. pl. sel. cent. 1. and mus. helv. 1. p. 134. D. C. prod. 1. p. 57.

Var. γ, *pubérulum;* flowers spiked, or somewhat panicled, yellow; helmet large; stem leaves and flowers clothed with horizontal hairs. ♃. H. Native of Mount Cenis. A. Lycóctonum ε, pubérulum. Ser. mus. helv. 1. p. 134. D. C. prod. 1. p. 58.

Var. δ, *laxiflòrum;* panicle ample, with diverging branches; flowers loose, pubescent; ovaries villous; lobes of leaves somewhat quadrately divaricate.

Lamark's Aconite. Fl. Jul. Aug. Clt. 1800. Pl. 2 to 3 ft.

§ 4. *Spur arched or hooked. Capsules smooth.*

70 A. Pyrena'icum (Lin. spec. 751.) spur hooked; bottom of helmet cylindrical-rounded. ♃. H. Native of the Pyrenees and Siberia. Rchb. ill. t. 48. A. squarrósum, Lin. herb. D. C. syst. 1. p. 368. A. Sibíricum, Poir. suppl. 1. p. 113. Stem pubescent at the base, but smooth above. Leaves parted almost to the base with pinnatifid lobes, rather hispid beneath, but smooth above, on long stalks. Racemes elongated, dense, puberulous. Flowers largeish, yellow. Ovaries 3, smooth.

Pyrenean Aconite. Fl. June, Aug. Clt. 1739. Pl. 2 feet.

71 A. orienta'le (Mill. dict. Rchb. ill. t. 29.) spur arched; helmet cylindrical, straight, elongated; beak drawn out, incumbent. ♃. H. Native of Georgia, Persia, and Caucasus. A. ochroleùcum, Willd. spec. 2. p. 1233. Pall. fl. ross. 1. t. 12. Root a branched rhyzoma. Stem puberulous. Leaves with the lobes distinct beyond the middle, deeply serrated, on long channeled petioles, young ones pubescent, adult ones only at the nerves. Racemes ½ to 2 feet long, dense, many-flowered, with numerous, small, lateral racemules, forming a pyramid. Flowers large, cream-coloured, or white, suffused with yellow. Sepals edged with yellow hairs on the inside.

Var. β. *strictìssimum* (Rchb. uebers. p. 69.) flowers numerous, yellow; helmet cylindrical; spur arched; ovaries smooth; stem quite upright. ♃. H. Native of Bairont.

Var. γ, *altìssimum* (Mill. dict. no. 2.) flowers panicled, numerous, yellow; helmet large, somewhat ventricose at the apex. ♃. H. Native of Germany and Switzerland. A. macrophyllum, Hortul. A. Lycóctonum, var. altíssimum, D. C. syst. 1. p. 368. Leaves large, more or less dissected.

Var. δ, *pubérulum;* hairs straight, spreading. A. galeàtum, Stev. in herb. D. C.

Oriental Aconite. Fl. July, Aug. Clt. 1794. Pl. 4 to 8 feet.

72 A. myo'ctonum (Rchb. uebers. p. 68. ill. t. 51.) spur subannular and somewhat refracted; bottom of helmet cylindrical rounded, scarcely higher than the diameter of the aperture; beak short, inflexed. ♃. H. Native of Thuringia and France. A. ægóphonum, Rchb. ueber. p. 68. A. intermèdium hýbridum, Hoppe. A. perniciòsum, Rchb. uebers. p. 68. are hardly varieties. A. Monauénse, Smidth. Stem smoothish below, but covered with yellowish pubescence above. Racemes furnished with lateral racemules. Flowers small, pale yellow. Ovaries 3, smooth.

Mousebane Aconite, Fl. July, Aug. Pl. 1 to 3 feet.

§ 5. *Spur spiral. Capsules smooth, but in some of the varieties of A. vulpària they are pubescent.*

73 A. vulpa'ria (Rchb. uebers. p. 70. ill. t. 56, 57, and 58.) spur spiral; helmet cylindrical, large; beak streached out, acute. ♃. H. Native of the Cevennes. A. Lycóctonum β, glabriflòrum, D. C. syst. p. 369. A. Lyc. γ, grandiflòrum, Ser. mus. helv. 1. p. 134. A. réctum, Bernhardi ex Schleich. A. lupícida, therióphonum, Rchb. ueber. These two last are hardly varieties. Stem smooth, or a little pubescent. Leaves 3 or 5-lobed, ciliated. Racemes crowded, furnished with lateral racemules. Flowers pale yellow, smooth. Ovaries 3, smooth.

Var. β, phthòra (Rchb. uebers. p. 71.) flowers yellow. ♃. H. Native of Hungary. A. Lycóctonum, Rochel.

Var. γ, cynóctonum (Rchb. uebers. p. 73.) flowers panicled, numerous, yellow; stems and flowers smoothish. ♃. H. Native of Thuringia. A. Lycóctonum, Leysser.—Blackw. t. 563.

Var. δ, galéctonum (Rchb. uebers. p. 67.) flowers yellow. Capsules pubescent. ♃. H. Native of Hungary.

Vàr. ε, tragóctonum (Rchb. uebers. p. 70.) flowers yellow, panicled; capsules smooth. ♃. H. Native of Carinthia. A. pyramidàle, Hoppe.

Var. ζ, rubicúndum (Fisch. in litt. Ser. mus. helv. 1. p. 135. D.C. prod. 1. p. 58. Lycóctonum, var. κ, rubicúndum) flowers panicled, livid-violet, variegated with yellow; helmet conico-cylindrical, compressed; flowers and peduncles villous. Ovaries pilose, elongated. ♃. H. Native of Siberia.

Var. η, Carpàthicum (Ser. mus. helv. 1. p. 136. Lycóctonum, var.) flowers panicled, of a lurid purple colour, sometimes variegated with yellow; helmet conico-cylindrical, compressed; stems and peduncles smooth; leaves profoundly cut. ♃. H. Native of the Carpathian mountains. A. septentrionàle β, Carpáthicum, D. C. syst. 1. p. 370. Sims, bot. mag. t. 2196. A. austràle, Rchb. ueber. p. 71.

Var. ϑ, septentrionàle (Willd. spe. 2. p. 1235.) flowers panicled, blue; helmet conico-cylindrical, compressed; flowers and peduncles villous; ovaries smooth or pilose? ♃. H. Native of Lapland, Norway, and Siberia. A. Lycóctonum μ, septentrionàle, Ser mus. helv. 1. p. 136.

Var. ι, Moldávicum (Haquet. Rchb. uebers. p. 67.) flowers panicled, violet; helmet cylindrical, compressed; ovaries silky-villous. ♃. H. Native of Moldavia and Bohemia.

Fox-bane Aconite. Fl. Jul. Aug. Clt. 1800. Pl. 1-3 ft.

74 A. exce'lsum (Rchb. ill. t. 53.) spur spiral; bottom of helmet clavate, and with the beak elongated; middle sepals very short. ♃. H. Native of Russia near Moscow in shady groves. Stem slender, 6-8 feet high or more, furrowed, puberulous. Leaves large, thin, a little pubescent, smoothish above. Racemes very long, loose, many-flowered. Flowers large, of a livid violet-colour. Ovaries 3, smooth?

Tall Aconite. Fl. July, Aug. Pl. 6 to 8 feet.

75 A. thely'phonum (Rchb. uebers. p. 73. ill. t. 54.) spur spiral; bottom of helmet conical-elongated. ♃. H. Native of Europe, particularly in Austria, Bavaria, Transylvania, and Switzerland, &c. A. réctum zoóctonum, and Lycóctonum, Rchb. uebers, p. 65, 69, and 73. A. lupària, Rchb. uebers. 74? A. alièнum, Rchb. 73.? A. lagóctonum, Rchb. ueber. 71. A. arctóphonum, Rchb. uebers. 71. A. Lycóctonum, Elwert, fasc. pl. Baruth. D. C. syst. 1. p. 369. and other authors, but not of Lin. Gært. fruct. 1. p. 311. t. 65. A. Pyrenàicum and réctum, Balbis. A. Lycóctonum, var. α, vulgàre, Ser. mus. helv. 1. p. 132. t. 15. f. 5, 6. 4. 8. Stem ½ to 6 feet pubescent, with yellow hairs, hispid at the base. Leaves 7-parted, ciliated. Racemes loose, furnished with a few axillary racemules. Flowers large, yellow, pubescent, or smooth. Ovaries 3, smooth, rarely pubescent.

Var. β, latiflòrum, plant smoothish; flowers spiked or panicled, yellow; helmet short and broad; hairs of peduncles arched; ovaries smooth. ♃. H. Native on the Alps of Bern. A. Lycóctonum θ, latiflòrum, Ser. mus. helv. 1. p. 135. D.C. prod. 1. p. 58.

Var. γ, ramosíssimum; stem much branched, and is, as well as the peduncles, smooth; flowers yellow; helmet conico-cylindrical, compressed; ovaries smooth. ♃. H. Native of the Alps of Bern. A. Lycóctonum ι, ramosíssimum, Ser. in D. C. prod. 1. p. 58.

Var. δ, Seringei; flowers panicled, yellow; helmet elongated, cylindrical, inclined, deformed; stem and peduncles smoothish; spur broad; leaves large, smoothish. ♃. H. Native of the Alps of Bern. A. Lycóctonum, var. Ser. mus. helv. 1. p. 137. D. C. prod. 1. p. 58. last variety.

Female's-bane Aconite. Fl. Jul. Aug. Clt. 1821. Pl. ½ to 6 ft.

76 A. lyco'ctonum (Lin. spec. 532. Rchb. ill. t. 52.) spur subannular; bottom of helmet cylindrical; beak elongated, stretched out; middle and lower sepals equal in length. ♃. H. Native of Lapland, Sweden, Norway, &c. A. Lycóctonum, var. fl. cær. Ström. scand. 1. p. 67. Gunn. norv. no. 14. Oed. fl. dan. t. 123. Wahl. Lapp. 275. A. septentrionàle, Kœlle, spicel. p. 22. no. 9. D. C. syst. 1. p. 370. Stem slender, simple, quite upright, pubescent. Leaves large, 7-parted. Racemes more or less pubescent, branched at the base. Flowers largeish, of a livid-violet colour. Ovaries 3, smooth.

A decoction or the powder of the root of this plant is used for destroying flies and other insects. Linnæus gives an account of its being eaten in Medelpadia, a province of Sweden, without injury. It seems indeed to be milder than some of the other species; and goats and horses are said to eat it.

True *Wolf's-bane* Aconite. Fl. July, Aug. Clt. 1596. Pl. 4-6 feet.

Cult. All the species of Aconite are of easy culture. They are very ornamental, and are well adapted for ornamenting flower borders. Most of them will grow under the shade of trees, therefore they are proper to plant in ornamental woods and wildernesses. They are easily increased by separating the roots or by seeds.

Plants referred to Caltha by F. Hamilton, M.D., to which, from the descriptions, they do not appear to belong. We therefore propose the name Nirbisia for the genus.

XXIX. (2) NIRBI'SIA (Nirbishi or Nirbikhi, the aboriginal name of one of the species). Caltha Hamilt. in edinb. jour. scienc. vol. 1. Aug. 1824. p. 249.

Lin. syst. *Polyándria, Tetragýnia.* Calyx of 4, ovate, concave, thick, obtuse, coloured, petal-like sepals. Petals wanting. Stamens numerous, very short. Ovaries 4, awl-shaped. Styles thick, awl-shaped, crowned by simple, acute stigmas. Capsules 4 awl-shaped, many-seeded. Smooth plants with tuberous roots, cordate or peltate alternate leaves and terminal panicles of small greenish or yellowish flowers. Qualities poisonous.

1 N. Bi'sma; stem simple, smooth; cauline leaves numerous, stalked, cordate, roundish, smooth, somewhat 5-nerved and veiny, 5-lobed; lobes cuneated, cut at the apex; petioles very long, stem-clasping at the base. ♃. F. Native of Nipaul on the Himalaya Mountains at the river Kosi. Cáltha Bísma, Hamilt. l. c. Panicle terminal; peduncles elongated, few-flowered, rising from the top of the stems or from the axils of the upper leaves. Bracteas sessile, trifid, small, situated a little below the flower. Flowers small, erect, green, blackish on the outside. Sepals 4, thickish, rude. *Bishma, Bíkhma, Bish*, or *Bikh*, is the name of the plant in Nipaul.

The root of this plant is truly poisonous, and is used by the inhabitants of Nipaul, near the river Kosi, (the Corkhalese) to poison their darts, and they regard it as their most powerful means of repelling the invasions of their enemies, by the facility with which they can impoison water with it.

Bishma. Pl. 1½.

2 N. Codu'a; stem erect; cauline leaves numerous, pilose, nervous and veiny, ovate, peltate, with many cuneated, cut, lobate lobes; lobules bluntish, with two deep incisures towards the top of the leaf. ♃. F. Native of Nipaul with the preceding Cáltha Codùa, Hamilt. l. c. The root of this species is more poisonous than the last, and is used by the Corkhalese for the same purposes. *Kodoya* is the name of this plant in Nipaul.

Kodoya. Pl. 1½ foot.

3 N. Hamilto'nii, stem simple, smooth; cauline leaves numerous, stalked, cordate, triangular, somewhat 5-nerved, and veiny, with a few short hairs on the edges; lobes cuneated, cut, acute, quinquefariously divided; petioles very long, stem-clasping. ♃. F. Native of Nipaul, along with the two preceding species, where it is called Nirbishi or Nirbikhi. Cáltha Nirbìsia, Hamilt. l. c. The root of this species is a powerful bitter, and is employed by the natives of Nipaul to cure fevers.

Hamilton's Nirbishi. Pl. 1½ foot.

Cult. None of the species of Nirbisia has yet been introduced into the gardens of Europe, therefore the mode of cultivating them is unknown; however, should they be, we would recommend their being grown in small pots filled with loam and peat, and treated as other alpine plants; they may be either increased by separating the tubers or by seeds.

Tribe V.

Pæonia'ceæ, D. C. prod. 1. p. 64. Ranunculàceæ Spùriæ, D. C. syst. 1. p. 381. Anthers bursting outwards. Perhaps a distinct order. Herbs rarely shrubs.

XXX. CIMICI'FUGO (from *cimex*, a bug, *fugo*, to drive away; indicating certain virtues the plants possess, particularly *C. fœ'tida.*) Lin. amœn. 7. p. 435. Schreb. gen. 933. Actæ'a, Sect. 1. Cimicífugo, D. C. syst. 1. p. 382. prod. 1. p. 64.

Lin. syst. *Polyándria, Mono-Polygýnia.* Calyx of 4 deciduous sepals. Petals 4. Styles 1 to 15. Carpels dry, dehiscent, many-seeded. Perennial herbs, with variously divided leaves, and racemes of whitish flowers. Roots drastic and poisonous.

§ 1. *Actæ'a, sect. Cimicífugo, D. C. syst.* 1. *p.* 383. *Carpels* from 1 to 15.

1 C. fœ'tida (Lin. syst. ed. 12. p. 659.) ovaries 4, almost sessile, very villous; racemes panicled; leaves ternate or biternate; leaflets ovate-oblong, deeply toothed. ♃. H. Native of the Carpathian mountains, Dauria, Eastern Siberia, and north-west coast of America. Gært. fruct. 2. p. 275. t. 140. Actæ'a cimicífugo, Lin. amœn. 2. p. 354. D. C. syst. 1. p. 382. Plánta cimicífugo, Lin. amœn. 8. p. 193. t. 4. A very fetid herb, used in Siberia for driving away bugs, as tansy is by the peasants of this country.

Var. β, símplex (Wormsk ined. ex. Fisch. in litt.) ♃. H. Native of Kamtschatka, very common. Actæ'a cimicífugo β, simplex, D. C. prod. 1. p. 64. Stem simple, undivided; racemes solitary or rarely twin. Perhaps a distinct species.

Fœtid Bugwort. Fl. June, July. Clt. 1777. Pl. 2 feet.

2 C. America'na (Michx. fl. bor. amer. 1. p. 316.) ovaries 4 or 5, smooth, stipitate; racemes panicled; leaves decompound. ♃. H. Native of Carolina in shady woods on mountains. Actæ'a podocárpa, D. C. syst. 1. p. 382. Del. icon. sel. 1. t. 66. Habit of *C. serpentària.*

American Bugwort. Fl. Aug. Sep. Clt. 1824. Pl. 2 to 3 ft.

3 C. cordifòlia (Pursh. fl. amer. sept. 2. p. 307. exclusive of the synonyms,) ovaries from 2 to 3, sessile; racemes panicled; leaves biternate; leaflets 4-5-lobed, serrated, cordate at the base. ♃. H. Native of North America in shady woods, on high mountains of Carolina. Actæ'a cordifòlia, D. C. syst. 1. p. 383. Resembles *C. serpentària.* Ovaries smooth. Bot. mag. 2069.

Heart-leaved Bugwort. Fl. July, Aug. Clt. 1812. Pl. 2 or 3 ft.

4 C. palma'ta (Michx. fl. bor. amer. 1. p. 316.) ovaries from 12 to 15, collected into a roundish head; racemes dichotomously panicled; leaves palmate, with the lobes serrated at the apex. ♃. H. Native of North America in the beds of mountain rivulets in Virginia and Carolina, also on the north-west coast. Actæ'a palmàta, D. C. syst. 1. p. 383. Hydrástis, Lam. ill. t. 500. Hydrástis Caroliniànus, Walt. carol. 156. ? Hydrástis Canadénsis, Poir. suppl. 3. p. 71.—Bot. mag. 1630. Herb glabrous.

Palmate-leaved Bugwort. Fl. July, Aug. Clt. 1812. Pl. 2 ft.

§ 2. *Actæ'a, Sect. Macròtys, D. C. syst.* 1. *p.* 383. *prod.* 1. p. 64. *Carpels solitary.*

5 C. serpenta'ria (Pursh. fl. amer. sept. 2. p. 372.) racemes compound, very long; leaves triternate, with serrated or rather cut leaflets. ♃. H. Native of North America in shady stony woods, from Canada to Florida. Actæ'a monógyna, Walt. car. 151. Actæ'a racemòsa, Lin. spec. 722. C. racemòsa, Bart. philad. 2. p. 12.—Pluk. amalth. 54. t. 383. f. 3.—Dill. elth. 79. t. 67. f. 78. Resembles *Actæ'a spicàta*, but larger. Flowers white. This plant is used with success by the native practitioners of North America, for curing the dangerous bite of the Rattlesnake.

Black *Snakeroot* or Bugwort. Fl. July, Aug. Clt. 1732. Pl. 3 to 5 feet.

6 C. Japo'nica; spikes very long; leaves ternate, with 5 or 7 lobed cordate segments. ♃. H. Native of Japan. Actæ'a Japónica, Thunb. jap. 221. D. C. syst. 384. Leaves large. Flowers sessile.

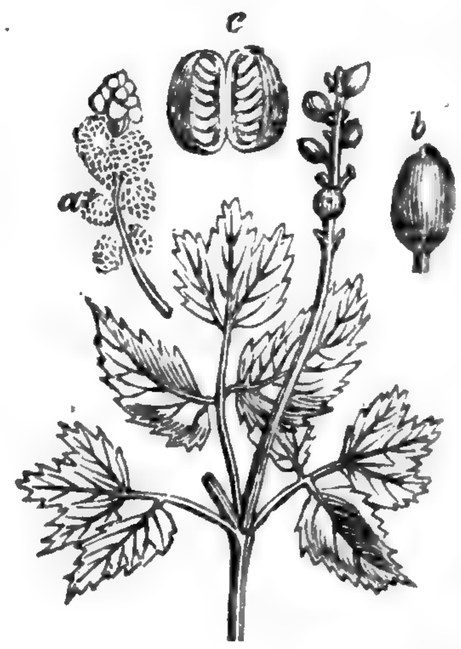
Japan Bugwort. Pl. 3 feet.

Cult. Plants of easy culture, will grow in any common garden soil, prefer a shady moist situation. All the species are easily increased by dividing the plants at the root or by seeds.

XXXI. ACTÆ'A (*ακτη, akte*, was the Greek name of the Elder, which these plants much resemble in foliage and fruit.) Lin. gen. no. 644. Christophoriàna, Tourn. inst. 299. t. 154. Actæ'a, Sect. III. Christophoriàna, D. C. syst. 1. p. 384.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 4 deciduous sepals. Petals 4. Style 1. Carpels baccate indehiscent (f. 13. *b.*) many-seeded (f. 13. *e.*) Perennial herbaceous plants, with bi or triternate leaves, and racemes of whitish flowers. Berries poisonous.

FIG. 13.



1 A. spica'ta (Lin. spec. 722.) berry oblong; petals length of stamens; racemes ovate; leaves bi or triternate, with ovate-lanceolate, serrated or cut segments, terminal one trifid. ♃. H. Native almost throughout the whole of Europe. In England in bushy mountainous limestone situations, rare. In the north-west corner of Yorkshire, as about Malham Cove, Clapham, Askrigg, and the base of Ingleborough hill, &c. Smith, engl. bot. 918. Fl. dan. 498. Lam. illus. t. 448. f. 1. Gært. fr. 2. p. 154. t. 114. Flowers white, with a slight blush colour. This plant is a powerful repellent. The root is useful in some nervous cases, but must be administered with caution. The berries are black and poison-

ous; the juice of them with alum yields a black die. Toads are reported to enjoy the fetid odour of this plant. (f. 13.)

Spiked-flowered or Common Bane-berry. Fl. May, July. England. Pl. 1 foot.

2 A. ru'bra (Willd. enum. p. 560.) leaves bi or triternate; leaflets ovate-lanceolate, serrated or cut; petals acute, shorter than the stamens; racemes simple hemispherical; pedicels slender; berries ovate-oblong. ♃. H. Native of North America in shady rocky woods in rich vegetable soil, from Canada to Virginia, and from Hudson's bay to the Rocky Mountains. A. brachypétala var. *β*, rùbra, D. C. syst. 1. p. 385. Berries red. Flowers, fruit, and seeds larger than those of *A. àlba*. This plant is known in North America by the name of *Red Co-hosh*, and is considered by the natives a valuable medicine.

Var. β, cærùlea; berries blue. ♃. H. Native of Florida, where it is known by the name of *Blue Co-hosh*. A. brachypétala *γ*, cærùlea, D. C. syst. 1. p. 385.

Red Bane-berry. Fl. May, June. Clt. Pl. 1 to 1½ foot.

3 A. a'lba (Bigl. fl. bost. ed. 2. p. 211.) leaves bi or triternate; leaflets ovate-lanceolate, serrate or cut; petals truncate, equal in length to the stamens; racemes simple, oblong; pedicels a little thickened; berries ovate-oblong. ♃. H. Native of North America in shady rocky woods in rich vegetable soil, from Canada to Virginia; in Canada, particularly about Lake Huron. A. brachypétala *α*, álba, D. C. syst. 1. p. 385. Berries white. This plant is known in North America by the name of *White Co-hosh*, and is considered a valuable medicine by the natives.

Var. β, microcárpa; berries small white or reddish, on thick pedicels. ♃. H. Native about Boston. A. brachypétala *δ*, microcárpa, D. C. syst. 1. p. 385.

White Bane-berry. Fl. May, June. Clt. Pl. 1 to 1½ foot.

Cult. These plants will thrive well in any common garden soil. They succeed best under the shade of trees. They are easily increased by dividing the plants at the root, or by seeds, which usually ripen in abundance.

XXXII. ZANTHORHI'ZA (from ξανθος, *zanthos*, yellow, ριζα, *rhiza*, a root; deep yellow colour of the roots.) Marsh. arb. 167. Lam. ill. t. 854. D. C. syst. 1. p. 286. prod. 1. p. 65.

Lin. syst. *Polyándria, Mono-Trigýnia.* Calyx of 5 deciduous sepals. Petals 5. Carpels 2-3-seeded, but usually solitary from abortion. A small shrub, with yellow creeping roots, irregularly pinnate leaves, branched racemes, and small purplish flowers rising from the scaly buds.

1 Z. apiifo'lia (Lher. stirp. nov. p. 79. t. 38.) ♄. H. Native of North America on shady banks of rivers; from Virginia to Georgia. Bart. elem. bot. t. 12. ex. coll. mat. med. amer. 2. p. 11. A small shrub, with irregularly pinnate leaves; leaflets 5-7; deeply serrated. Racemes branched, pendulous, rising with the leaves from the scaly buds. Flowers small, dark-purple, usually unisexual from abortion. Bark of the root intensely and adhesively bitter, and somewhat acrid.

Parsley-leaved Yellow-root. Fl. May, June. Clt. 1766. Sh. 1 to 2 feet.

Cult. Zanthorhiza will thrive in any common garden soil. It is easily increased by suckers from the root, which are thrown out in great numbers.

XXXIII. PÆO'NIA (The physician Pæon was the first to use this in medicine. The Greek legend adds, that he used it to cure Pluto of a wound inflicted by Hercules.) Lin. gen. no. 678. Gært. fruct. 1. p. 309. t. 65. D. C. syst. 1. p. 386. prod. 1. p. 65.

Lin. syst. *Polyándria, Di-Pentagýnia.* Calyx of 5 leafy inequal permanent sepals (f. 14. *b. a.*) Petals from 5 to 10, somewhat orbicular (f. 14. *c.*) Stamens indefinite. Disk fleshy, girding the ovaries. Carpels follicular, from 2 to 5 (f. 14. *e.*) large, many-seeded, terminated with thick bilamellate stigmas (f. 14. *e.*) Seeds rather globose, shining.—Roots fascicled. Cauline leaves biternate. Flowers large, white or purplish, usually with a strong disagreeable smell. The root is acrid, bitter, and fetid, and its qualities are reported to be narcotic and dangerous, which we can readily believe. The seeds are somewhat emetic.

Sect. I. Mo'utan (the name of the tree Pæony in Japan and China.) D. C. prod. 1. p. 65. Stem shrubby. Disk expanded into a membranous urceolus, involving the carpels more or less. The flowers of the Moutan Pæony are generally fragrant. In China the shrubs sometimes exceed 10 feet in height, but in Britain they scarcely ever exceed 5 feet.

1 P. Mo'utan (Sims, bot. mag. t. 1154.) segments of leaves oval-oblong, glaucous underneath; carpels 5, villous. ♄. H. Native of the North of China on mount Ho-nan. Cultivated in the gardens throughout China and Japan for the beauty of their blossoms. Flowers single, purple. All the varieties of Moùtan are very ornamental.

Var. α, papavaràcea (Andr. bot. rep. t. 463.) petals from 8 to 13. white, with a purple spot at the base of each; capsules altogether inclosed in the unceolus or disk. ♄. H. Lodd. bot. cab. 547. Sims, bot. mag. 2175.

Var. β, Bànksii (Anders. Lin. trans. v. p.) flowers double; petals reddish in the middle; segments of leaves, withblunt fissures. ♄. H. Andr. bot. rep. t. 448. Ker. bot. reg. 379. Sims, bot. mag. t. 1154. The petals are slightly tinged with blush, becoming nearly white at the edges, and are marked at the base with purplish red. Clt. 1794.

Var. γ, Hùmei (Ker, bot. reg. t. 379.) flowers double, with a bunch of long petals rising from the middle of the flower, of the same colour as *Banksii*. ♄. H. Clt. 1817.

Var. δ, ròsea (D. C. prod. 1. p. 65.) flowers semi-double, rose-coloured; segments of leaves, with very blunt fissures at the apex. ♄. H. Andr. bot. rep. t. 373. Lodd. bot. cab. t. 1035. Petals large, of a fine deep pink. Clt. 1794.

Var. ε, ròsea-plèna (Hort. trans. 6. p. 477.) flowers very double, of a fine deep pink, nearly scentless.—Bonpl. pl. rar. p. 61. t. 23. P. suffruticòsa, Andr. bot. rep. t. 373. Petals jagged.

Var. ζ, Ranèsii (Hort. trans. 6. p. 479.) flowers single, pale, slightly tinged with pink. The foliage much resembles that of an herbaceous Pæony. ♄. H. Clt. 1820.

Var. η, Carnea-plena (Hort. trans. 6. p. 481.) flowers very double, of a delicate purplish pink, with a rich purple rayed spot at the top of each. Very like *Banksii*, but without the central elongated petals, which sometimes in that variety appear to rise from amongst the germens.

Var. ϑ, álbida-plena (Hort. trans. vol. 6. p. 482.) flowers double, very pale, though not decidedly white, suffused with purple. ♄. H.

Var. ι, Anneslèi (Hort. trans. 6. p. 482. t. 7.) flowers small, almost single, of a rich purplish pink; petals usually 9, obcordate, slightly jagged at the margins, of a darker colour at their bases. ♄. H.

Moutan or Tree Pæony. Fl. April, June. Clt. 1789. Shrub 3 to 10 feet.

Sect. II. Pæon (applied to this section on account of its containing the original Pæonys, for the derivation see *genus.*) D. C. prod. 1. p. 65. Stems herbaceous. Disk of flower hardly or not expanded, and therefore only surrounding so much of the base of the carpels (f. 14. *d.*) Roots fascicled, composed of fusiform tubers.

§ 1. *Leaves glabrous.*

FIG. 14.

2 P. coralli'na (Retz. obs. 3. p. 34.) carpels tomentose; segments of leaves ovate, entire, glabrous. 4. H. Native of many parts of Europe; France, Balearic Islands, Greece, and Siberia; in England abundantly on the rocky clefts of the steep Holmes in the Severn, Smith, engl. bot. t. 1513. P. officinàlis β, màscula, Lin. spec. 747.—Lob. icon. 684. f. 2. Flowers crimson. Leaves broad, of a dark shining green. (f. 14.)

Coralline or Male Pæony. Fl. May, June. England. Pl. 1 to 2 feet.

3 P. festi'va (Tausch. in Sitz. bot. gesell. vol. 4. nov. 1827.) carpels tomentose, erect; segments of leaves unequally jagged, smooth, with the divisions crowded, oblong-lanceolate. 4. H. Native of many parts of Europe, in mountain woods, France, Switzerland, Carinthia, Carniola, Greece, and Crete, &c. P. officinàlis, Retz. obs. 8. p. 35. Sims, bot. mag. t. 1784. Smith, fl. græc. 369. P. ambígua, Lois?

Var. α, Sabìni (Anders. in Lin. trans. 12. p. 265.) flowers dark-purple. P. officinàlis, Sims, bot. mag. 1784.

Var. β, ròsea (Anders. l. c. p. 266.) flowers deep rose-coloured; stems loose.—Lob. icon. 697.

Var. γ, rùbra (Anders. l. c. p. 267.) flowers very double, dark-purple.—Lob. icon. 684. This is the most common variety in gardens.

Var. δ, carnéscens (Anders. l. c. p. 268.) flowers very double, of a deep rose colour.

Var. ε, álbicans (Anders. l. c.) flowers very double, blush.—Tabern. icon. 785.—Park. par. p. 342 and 343. f. 4.

Common or *Handsome* Pæony. Fl. My. Ju. Clt. 1548. Pl. 2 ft.

4 P. triterna'ta (Pall. nov. act. petrop. vol. 10.) carpels tomentose, erect; segments of leaves glaucous underneath, somewhat lobed with obovate blunt lobules. 4. H. Native of Tauria. P. Dàurica, Andr. bot. rep. t. 486. Sims, bot. mag. t. 1441. Flowers of a pleasant pale rose-colour.

Triternate-leaved Pæony. Fl. My. Ju. Clt. 1790. Pl. 1½ to 2 ft.

5 P. loba'ta (Desf. cat. hort. par. 126.) carpels tomentose, erectish; segments of leaves smooth, decurrent, pinnate-parted, 3-lobed at the apex. 4. H. Native of Portugal. Flowers purple, sweet-scented.

Lobed-leaved Pæony. Fl. May, June. Clt. 1821. Pl. 2 feet.

6 P. tenuifo'lia (Lin. spec. 748.) carpels tomentose, spreading; segments of leaves smooth, divided into many fine linear lobes. 4. H. Native of the Ukraine, Siberia and Tauria, among broken rocks on the banks of rivers. Pall. fl. ross. 2. p. 95. t. 87. Sims, bot. mag. t. 926. Flower fine dark-red, and nestled as it were among the finely divided leaves.

Var. β, laciniàta (Willd. enum. 573.) stem higher, and with the segments of the leaves broader than in the species.

Fine-leaved Pæony. Fl. May, June. Clt. 1765. Pl. 1 to 1½ ft.

7 P. hy'brida (Pall. fl. ross. 2. p. 94. t. 86.) carpels pubescent, spreading; segments of leaves smooth, many-parted into linear lobes. 4. H. Native of the Ukraine between the Volga and Tanais. Flowers dark red. Lindl. bot. reg. t. 1208. Perhaps only a variety of the preceding.

Hybrid Pæony. Fl. May, June. Clt.? Pl. 1 to 1½ foot.

8 P. ano'mala (Lin. mant. 247.) carpels 5, smooth, depressed, obtuse; segments of leaves smooth, pinnatifid; lobes lanceolate, acuminated. 4. H. Native of Siberia. Andr. bot. rep. 514. Sims, bot. mag. t. 1754. P. laciniàta, Pall. fl. ross. 2. p. 93. t. 85. Flowers crimson, drooping. The root dried is used by the Mongols and some Tartars as sauce for their meat, and Boetcher, an army surgeon, found it to be useful in intermittent fevers.

Anomalous Pæony. Fl. May, June. Clt. 1788. Pl. 2 to 3 ft.

9 P. Cre'tica (Clus. hist. 1. p. 281. D. C. syst. 1. p. 394. Tausch. l. c.) carpels 5, tomentose; leaves ternately cut; leaflets quinate-pinnatifid; segments lanceolate, acuminated, decurrent at the base, smooth on both surfaces. 4. H. Native of Crete. Flowers white or blush.

Cretan Pæony. Fl. May, June. Clt.? Pl. 1 to 2 feet.

10 P. Co'rsica (Sieb. pl. cors. Tausch. Vorgel in Sitz. bot. gesell. vol. 4. 1827.) carpels smooth, erect; leaves biternate-cut; segments entire ovate, acuminate, nearly quite smooth. 4. H. Native of Corsica on mount Gagna. P. paradóxa β, leocárpa, D. C. prod. 1. p. 66.? Flowers purplish, large.

Corsican Pæony. Fl. May, June. Clt.? Pl. 2 feet?

11 P. albiflo'ra (Pall. fl. ross. 2. p. 84.) carpels smooth, recurved; segments of leaves smooth, shining, 3-parted, with ovate-lanceolate lobes. 4. H. Native from Siberia to China. Flowers white. P. édulis, Sal. par. lond. 78.

Var. α, vestàlis (Anders. in Lin. trans. 12. p. 257.) leaflets broader, flat, purplish; flowers white, of 8 petals; stigmas pale-yellow; stem 2-3-flowered. A. albiflòra, Andr. bot. rep. t. 64.

Var. β, cándida (Anders. l. c.) leaflets broader, flat, dark-green; flowers pale flesh-coloured, of 8-petals; stigmas flesh-coloured; stem 2-flowered.

Var. γ, Tatárica (Anders. l. c. p. 258.) leaflets broader, flat, purplish; flowers flesh-coloured, of 9 to 14 petals, with flesh-coloured stigmas; stem 2-3-flowered. P. édulis, Sal. par. lond. 78. P. albiflòra, Ker. bot. reg. t. 42.

Var. δ, Sibírica (Anders. l. c.) leaflets concave, pale green; flowers altogether white, with flesh-coloured stigmas; stem 2-flowered.

Var. ε, rubéscens (Anders. l. c. p. 259.) leaflets concave, narrower, purplish; flowers reddish, of 8 petals, with pale-yellow stigmas; stem 3-flowered. A dwarf plant.

Var. ζ, uniflòra (Anders. l. c.) leaflets concave, narrow; flowers white, of 8 petals, with pale yellow stigmas; stem 1-flowered. P. albiflòra, Sims, bot. mag. t. 1756. Petals pink at the base.

Var. η, Whitlèji (Anders. l. c.) leaves more wrinkled, unequally jagged; flowers pale-blush; stem 3 feet high, usually bearing 5 flowers. Ker. bot. reg. t. 630.—Andr. bot. rep. 612. Outside petals reddish, inside ones pale straw-coloured, the whole becoming nearly white before they drop off, emitting a scent somewhat like that of *Elder-flowers*. Flowering in June. Native of China. Clt. 1808.

Var. ϑ, Hùmei (Anders. l. c. p. 260.) leaflets wrinkled, unequally jagged; flowers very double, red; stem 4 feet high, usually 3-flowered. P. édulis var. Sinénsis, Sims, bot. mag. t. 1768. Native of China. Clt. 1808.

Var. ι, fràgrans (Anders. l. c.) leaflets wrinkled, narrow, pale green; flowers double, rose-coloured; stem erect, 3 feet high, 1-3-flowered. Ker. bot. reg. 485. Hort. trans. vol. 2. t. 18. Native of China. Clt. 1805.

The roots of many of the varieties of this plant are boiled in broth by the Daurians and Monguls. They also grind the seeds and put them into their tea.

White-flowered or Edible Pæony. Fl. May, June. Clt. 1548. Pl. 1 to 4 feet.

12 P. Bro'wnii (Doug. mss. in Hook. fl. bor. amer. p. 27.) carpels 5, quite smooth, erect; leaves smooth on both surfaces; leaflets ternately divided or pinnatifid, jagged; segments oblong, those of the upper leaves are very blunt; stem erect, branched, striated. 4. H. Native of North West America, near the

limits of perpetual snow on the subalpine range of Mount Hood. Flowers purplish-red.

Brown's Pæony. Fl. June, July. Clt. 1826. Pl. 1 to 2 feet.

§ 2. *Leaves puberulous on the under surface.*

13 P. Ru'ssi (Biv. mant. sic. 4. p. 12.) carpels hairy; segments of leaves elliptical, entire, hardly puberulous underneath. ♃. H. Native of Sicily in the mountains about Panorma. Sweet. brit. fl. gard. t. 122. Root fusiform. Flowers crimson. Very like *P. hùmilis*.

Russ's Pæony. Fl. May, June. Clt.? Pl. 1 to 2 feet.

14 P. hu'milis (Rets. obs. 3. p. 35.) carpels toméntose, erectish; segments of leaves multifid or 3-5-parted, villous underneath, with narrow lanceolate lobes. ♃. H. Native of Spain. Sims, bot. mag. 1422.—Lob. icon. 683. f. 1.—Mor. hist. 3. p. 455. sect. 12. t. 1. f. 8. Flowers of a purplish-blood-colour. Petals a little jagged. Stigmas erect. Lobes of leaves channelled.

Humble Pæony. Fl. May, June. Clt. 1633. Pl. 1 to 2 feet.

15 P. deco'ra (Anders. in Lin. trans. 11. p. 273.) carpels pubescent, spreading; segments of leaves 3-parted-jagged, oblong, blunt, hairy underneath. ♃. H. Native of Turkey about Constantinople. P. Bysantìna prior, Clus. hist. p. 279.—Park. par. p. 342 and 343. t. 2.? Flowers deep-crimson. Petals small, narrow, with curled margins. Stigma lunate, pale-red, recurved.

Var. α, *Pallàsii* (Anders. l. c.) leaflets narrow, oblong. Native of the Crimea.

Var. β, *elàtior* (Anders. l. c.) leaflets broad, oblong.

Comely Pæony. Fl. May, June. Clt.? Pl. 2 to 3 feet.

16 P. arieti'na (Anders. l. c. p. 275.) carpels downy, arched, spreading; segments of leaves, 3-lobed and pinnatifid, decurrent, oval-oblong, flattish, hairy underneath. ♃. H. Native of the Levant.

Var. α, *Andersònii* (Anders. l. c.) flowers of a deep rose-colour; petals a little curled.—J. Bauh. hist. 3. p. 493.

Var. β, *Oxoniénsis* (Anders. l. c. p. 276.) flowers flesh-coloured; petals jagged-curled. P. arietìna cárnea, D. C. prod. 1. p. 66.—Mor. hist. 2. p. 454.

Ram's-horn capsuled Pæony. Fl. May, June. Clt.? Pl. 2 ft.

17 P. peregri'na (Mill. dict. no. 3.) carpels downy, straight; segments of leaves unequally jagged, with entire ovate-lanceolate wrinkled lobes, hairy and glaucous underneath. ♃. H. Native of the south of Europe in mountain meadows. Sims, bot. mag. t. 1050. P. peregrina γ, D. C. syst. 1. p. 390. P. promíscua, Lobel. icon. 683. Tausch. l. c. Flowers crimson, with erose petals.

Var. β, *Grevíllei* (Anders. l. c. p. 280.) leaflets deeply jagged and undulated, sometimes twisted, narrow, acute, wrinkled, glaucous, particularly beneath, with reddish margins; calyx smooth.

Var. γ, *compácta* (Anders. l. c. p. 279.) leaflets dark green, broad-ovate, flat, not waved nor jagged, with very blunt segments; lateral leaflets 3-lobed or ternate, crowded so as to overlap each other; calyx hairy at the base; carpels generally two.

Var. δ, *múltiplex;* flowers double, purplish; lobes of leaves elongated, rather hairy. P. hirsùta, Mill. dict. no. 4.—Mor. hist. 3. p. 455. sect. 12. t. 1. f. 17.

Foreign Pæony. Fl. May, June. Clt. 1629. Pl. 1 to 2 ft.

18 P. officina'lis (Lin. spec. 747. var. α fæmina,) carpels recurved, tomentose; segments of leaves unequally jagged, with the divisions oblong-lanceolate, smooth, glaucous, and somewhat pilose beneath. ♃. H. Native of Europe in shady places on mountains.—Lobel. icon. 682.—Besl. eyst. vern. ord. 6. p. 15. f. 1.—Mor. hist. 3. sect. 12. t. 1. f. 7. P. Tatárica, Mill. dict. no. 5. D. C. syst. 1. p. 392. P. peregrina var. β, D. C. syst. 1. p. 390. P. paradòxa var. γ. Tatárica, D. C. prod. 1. p. 66. Dioscorides celebrates this plant as useful in promoting natural discharges when deficient, and restraining some of them when too abundant. Flowers red or crimson.

Var. β, *múltiplex;* leaves difformly lobed, pubescent. Mill. icon. 2. t. 199.

Officinal Pæony. Fl. May, June. Clt. 1548. Pl. 2 feet.

19 P. parado'xa (Anders. l. c. p. 288.) carpels downy, straight; segments of leaves many-parted, blunt, and somewhat waved, glaucous and hairy underneath. ♃. H. Native of Spain and the south of France on mountains. A. Lusitánica, Mill. dict. no. 6. Tausch. Vorgel. in Sitz. bot. Gesell. vol. 4. 1827. Flowers of a violet crimson-colour, with obovate jagged petals, which are often bifid.

Var. α, *simpliciflòra* (Anders. l. c. p. 289.) stem altogether smooth; flowers of 8 petals.—Besl. hort. eyst. ord. 6. t. 14. f. 3.

Var. β, *fimbriàta* (Anders. l. c. p. 290.) stem hardly hairy; flowers double; petals more linear and divided than any of the varieties of *P. festìva*. Sweet, fl. gard. t. 19. P. hùmilis, Willd. enum. 572. Hort. Prague. Double-fringed Pæony, Hort. trans. 2. p. 276.

Var. γ, *leocárpa* (D. C. prod. 1. p. 66.) carpels quite smooth.

Paradoxical Pæony. Fl. June. Clt.? Pl. 1 to 1½ foot.

20 P. mo'llis (Anders. l. c. p. 282.) carpels downy, straight; segments of leaves oval-lanceolate, flat, lobed, overlapping each other, clothed with greyish hairs underneath. ♃. H. Native of Siberia? Lod. bot. cab. 1263. Calyx pubescent on the outside. Flowers small, of a dull purplish red.

Soft-leaved Pæony. Fl. May, June. Clt.? Pl. 1 foot.

21 P. pu'bens (Sims, bot. mag. 2264.) leaves biternate; leaflets lanceolate, acuminated, densely clothed with soft pubescence beneath; ovaries clothed with whitish tomentum, each crowned by a somewhat orbicular stigma; stem, petioles, and peduncles hairy. ♃. H. Native of? Flowers large, dark-purple; anthers yellow.

Downy Pæony. Fl. May, June. Clt. 1821. Pl. 1½ foot.

22 P. villo'sa (Sweet, fl. gard. t. 113.) carpels densely tomentose, erect, but somewhat incurved at the apex; leaves villous, pubescent, and whitish-glaucous beneath, lower ones somewhat triternate, upper ones ternate; leaflets pinnatifid; segments oblong-lanceolate, elongated, incurved at the apex. ♃. H. Native of France? Flowers white. P. sessiliflòra, Sims, bot. mag. t. 2648.

Villous Pæony. Fl. May, July. Clt. 1820. Pl. 1½ foot.

Cult. The *Moutan* or *Tree Pæony* and its numerous varieties are much esteemed for the beauty of their flowers. They are quite hardy, but as their blossoms are apt to be injured by the cold blasts of spring; glass-frames to answer the size of the plants should be placed over them, under which they will blossom in great perfection. A rich loamy soil suits them best. Cuttings taken off in August or September, with a part of the wood of the preceding year attached, and planted in a sheltered situation, will root freely. They may be also increased by layers: the shoots before they are layed down require to have a longitudinal slit made on the under side; however, in this way they are longer in emitting roots than the cuttings. The hardy herbaceous species are amongst the most shewy of border-flowers. They thrive best in a rich loamy soil, and are easily increased by dividing the plants at the roots, taking care to leave a bud to each slip, or by seeds; by the last method many new varieties may be raised.

ORDER II. DILLENIA'CEÆ. (plants agreeing with Dillenia in many important characters.) D. C. ann. mus. 17. p. 400. syst. 1. p. 395. prod. 1. p. 67.

Parts of flower imbricate in the bud. Calyx of 4 or 5 permanent sepals (f. 15. *a.* f. 16. *a.*) but in *Empedoclea* numerous. Petals 4-5, permanent (f. 19. *a.*) or deciduous (f. 16. *a.*) alternating with the sepals. Stamens indefinite, free, (f. 17. *a.* f. 19. *b.*) or polydelphous. Anthers adnate, bursting inwards or laterally (f. 17. *c.*). Carpels 1-celled, numerous, usually from 2 (f. 16. *d.*) to 5 (f. 15. *a.*) but sometimes solitary from abortion, capsular, baccate (f. 19. *c.*), or 2-valved (f. 15. *e.*), free (f. 15. *a.*), or connected into one fruit (f. 19. *c.*). Seeds attached to the inner angle of the cells of the carpels, usually in 2 rows, numerous or few, sometimes solitary from abortion (f. 15. *e.* f. 16. *e.*). Embryo small, placed in the base of a cartilaginous albumen. Elegant evergreen trees, shrubs, or climbing shrubs, with alternate simple, feather-nerved, entire (f. 17.), or toothed (f. 19.) leaves. Flowers solitary (f. 16, 18, 19.), racemose (f. 17.) or panicled (f. 15.), terminal or lateral, usually yellow, emulating those of *Cistus*. This order differs from *Ranunculàceæ* in the sepals being permanent, as well as in the anthers never bursting outwards, and from *Magnoliàceæ* and *Anonàceæ* in the parts of the flowers being disposed in a quinary order, not often ternary as in these orders.

The medical properties of this order are hardly known; a decoction of their leaves or bark is astringent, but it is neither bitter nor aromatic, and is used for gargles, and the acid juice of the fruit of some species of *Dillènia* is used in India, mixed with water, as a pleasant beverage in fevers. The foliage of many of the species being extremely scabrous, are used, when dried, for the same purposes as fish-skin and sand-paper in Europe; those of *Trachytélla áspera* are even employed in China for polishing works of metals.

The seeds of the plants belonging to this order, retain their vegetative power but for a very short time, therefore the sooner they are sown after their arrival the more likely they will be to vegetate. Many of them will not retain their power of vegetating more than 6 weeks or 2 months after they have been collected from the plant.

Synopsis of the Genera.

TRIBE I.

DELIMA'CEÆ. (*D. C. syst.* 1. *p.* 396. *prod.* 1. *p.* 67.) *Filaments of stamens dilated at the apex, bearing on both sides the separated roundish cells of the anthers.*

1 TETRA'CERA. Flowers usually dioecious or polygamous; male flowers with an indefinite number of stamens; female ones with 1-5 capsular 1-seeded carpels, which are girded by 4 or 6 imbricate sepals (f. 15. *a. d.*). Petals 3-6 (f. 15. *b.*).

2 DAVI'LLA. Stamens indefinite. Carpel 1-3, capsular, indehiscent, testaceous, 1-2-seeded, inclosed within the two inner sepals which are concave, and joined together in the form of valves, the three outer ones are small. Petals 2-3.

3 EMPEDO'CLEA. Stamens indefinite. Carpel 1, oblong, pyramidal, 6-seeded, baccate? trigonal, with one of the angles bearded. Sepals numerous, imbricate. Petals 3.

4 DOLIOCA'RPUS. Stamens indefinite. Carpel baccate, 1-2-seeded. Sepals 5, concave, unequal. Petals 3-5.

5 DELI'MA. Stamens indefinite. Carpel 1, capsular, 1-2-seeded. Sepals 5. Petals 4-5.

6 CURATE'LLA. Stamens numerous. Carpels 2, capsular, 1-2-seeded. Sepals and petals 4-5.

7 TRACHYTE'LLA. Stamens indefinite. Carpels 1-2, baccate, many-seeded. Sepals and petals 4-5.

8 RE'CCHIA. Stamens 10. Ovaries 2. Sepals and petals 5.

TRIBE II.

DILLE'NEÆ. (*D. C. syst.* 1. *p.* 397. *prod.* 1. *p.* 70.) *Filaments of stamens not dilated at the apex* (f. 16. *c.* f. 17. *a.*) *bearing on both sides the elongated oblong cells of the anthers* (f. 17. *e.*).

9 PACHYNE'MA. Stamens 7, 10, free. Filaments broad, and thick at the base (f. 16. *b.*). Ovaries 2 (f. 16. *d.*) or 3; styles awl-shaped (f. 16. *d.*). Sepals and petals 5 (f. 16. *a.*), but the petals soon fall off.

10 HEMISTE'MMA. Stamens indefinite, all leaning to one side (f. 17. *a.*), outer ones sterile, of the form of scales. Ovaries 2 (f. 17. *b.*), styles filiform. Sepals and petals 5 (f. 17. *d.*).

11 PLEURA'NDRA. Stamens 5-20, all leaning to one side and fertile (f. 18. *e.*). Ovaries 2 (f. 18. *c.*); styles filiform. Sepals and petals 5 (f. 18. *a.*).

12 CANDO'LLEA. Stamens indefinite, collected into many bundles. Ovaries 2-5; styles filiform. Sepals and petals 5.

13 ADRASTÆ'A. Stamens 10, free, equal; filaments flat, bearing the oblong cells of the anthers on the margin. Ovaries 2; styles conical-awl-shaped. Sepals and petals 5.

14 HIBBE'RTIA. Stamens indefinite, free, filiform, equal; anthers, oval-oblong. Ovaries from 1-15; styles filiform, inflexed. Sepals and petals 5.

15 WO'RMIA. Stamens indefinite, free, filiform, equal. Ovaries 5, distinct; styles filiform; stigmas emarginate. Sepals and petals 5.

16 COLBE'RTIA. Stamens indefinite, 10-50 of which are much longer than the rest. Ovaries 4-12, joined together into one baccate fruct, crowned by the diverging styles. Sepals and petals 5.

17 CAPE'LLIA. Stamens indefinite, the inner ones much longer than the rest in one row. Capsules membranous, connected together into dry globose fruit. Sepals and petals 5.

18 DILLE'NIA. Stamens indefinite, free, equal (f. 19. *b.*); carpels 10-20, joined together into a spurious, many-celled, baccate fruit (f. 19. *c.*), and crowned by the radiating stigmas (f. 19. *d.*). Sepals and petals 5, both permanent (f. 19. *a.*).

Tribe I.

DELIMA'CEÆ (plants agreeing with Delima in some characters). D. C. syst. 1. p. 397. prod. 1. p. 67. Filaments of stamens dilated at the apex, bearing on both sides the roundish separated cells of the anthers. Styles filiform (f. 15. *d.*), acute. Carpels capsular (f. 15. *a.*), bladder-formed or baccate. Mostly climbing shrubs, seldom trees, with terminal racemes or panicles of flowers (f. 15.).

1 TETRA'CERA (from τετρας, *tetras*, four-fold, and κερας, *keras*, a horn; because of the four capsules, recurved like as many horns. However, the genus has received an accession of

species with 1-5 capsules, which invalidate the strict propriety of its name, and render its situation in the Linnean System truly ambiguous). Lin. gen. no. 683. Gært. fruct. 1. p. 336. t. 69. D. C. syst. 1. p. 397. prod. 1. p. 67.

LIN. SYST. *Diœ'cia or Polygàmia, Polyándria.* Calyx of 4-6 permanent sepals. Petals 3-6, deciduous. Flowers usually dioecious or polygamous, female ones with an indefinite number of stamens, male ones with 1-5, but usually 4, capsular carpels, girded by the imbricate sepals (f. 15. *a.*). Seeds 1 (f. 15. *e.*) or 2, ovate, shining, arillate. Flowers yellow or white. Mostly climbing shrubs rarely erect.

1 T. VOLU'BILIS (Lin. spec. 617.) leaves obovate, blunt, very rough, somewhat toothed at end; flowers panicled, rather loose; peduncles velvety. ♄. ⌒. S. Native of the island of Barbadoes, Brazil, and South America about Panama. Gært. fruct. 1. p. 336. t. 69. f. 3.—Breyn. exot. 20. t. 6. Capsules clothed with some hairs at the apex.

Twining Tetracera. Fl.? Clt. 1818. Shrub. cl.

2 T. OBLONGA'TA (D. C. syst. 1. p. 399.) leaves oblong, blunt, sinuately-toothed, scabrous on both surfaces; flowers crowded, in simple, dense racemes; peduncles smooth. ♄. ⌒. S. Native of Brazil, about Rio Janeiro. Deless. icon. sel. 1. t. 67. Like *T. volúbilis*, but differing from it in the branches and peduncles being very smooth. Capsules 3, smooth. Petals 3, white.

Oblong-leaved Tetracera. Fl. March. Shrub cl.

3 T. LI'MA (Willd. ined. in herb. Bonpl. D. C. syst. 1. p. 399.) leaves oblong, blunt, cuneated at the base, entire, scabrous on both surfaces; peduncles panicled, pubescent. ♄. ⌣. S. Native of Brazil. Petals oblong, blunt, narrow, a little longer than the calyx. The two outer sepals small, the three inner ones connivent and concave.

Rasp-leaved Tetracera. Shrub cl.

4 T. ACUMINA'TA (D. C. syst. 1. p. 399.) leaves oval-oblong, acuminated, serrulated, scabrous on both surfaces; peduncles racemose, pubescent. ♄. ⌣. S. Native of South America? The two outer sepals are very short; the three inner ones orbicular.

Acuminated-leaved Tetracera. Shrub cl.

5 T. HI'SPIDA (Spreng. syst. 2. p. 629.) leaves lanceolate, tapering to both ends, serrulated, smooth above, but discoloured below, and strigose at the veins; peduncles axillary, racemose, and are, as well as the branchlets, hairy. ♄. ⌣. S. Native of Brazil.

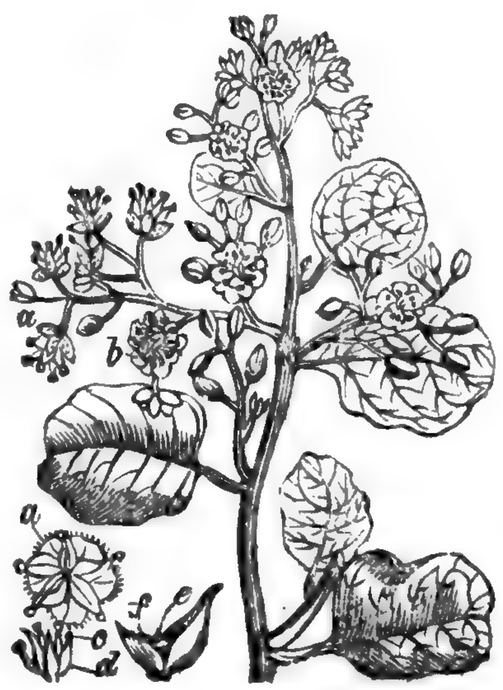
Hispid Tetracera. Shrub cl.

6 T. JAMAICE'NSIS (D. C. syst. 1. p. 399.) leaves oval-oblong, acutish, somewhat serrulated, drawn out at the base along the petioles, smoothish on both surfaces; peduncles racemose, glabrous, rather roughish. ♄. S. Native of Jamaica.

Jamaica Tetracera. Shrub. cl.

7 T. OVALIFO'LIA (D. C. syst. 1. p. 400.) leaves oval, obtuse, quite entire, roughish on both surfaces; peduncles racemosely panicled, somewhat velvety. ♄. ⌣. S. Native of Cayenne. Deless. icon. sel. 1. t. 68. Sepals roundish, exterior ones velvety on the back, interior ones ciliated at their margins (f. 15. *a.*).

FIG. 15.



Oval-leaved Tetracera. Shrub cl.

8 T. ROTUNDIFO'LIA (Smith, in Rees, cycl. vol. 35.) leaves roundish-elliptical, entire, scabrous on both surfaces; panicles terminal; flowers hermaphrodite, with four styles, smooth inside. ♄. S. Native of Guiana. Capsules 3-4, oval, smooth, shining, compressed, inflated, smaller than those of *T. volùbilis*.

Round-leaved Tetracera. Shrub cl.

9 T. MULTIFLO'RA (D. C. syst. 1. p. 400.) leaves oval, rather obtuse, sinuately toothed at the apex, smooth, drawn out along the petiole; panicle many-flowered; pedicels smooth. ♄. S. Native of Para. Deless. icon. sel. 1. t. 69. Flowers monogynous.

Many-flowered Tetracera. Shrub cl.

10 T. ALNIFO'LIA (Willd. spec. 2. p. 1243.) leaves oval-oblong, blunt, or somewhat acute, glabrous, upper surface roughish, under surface smooth, somewhat denticulated at the top; peduncles panicled, somewhat pubescent. ♄. ⌣. S. Native in woods along the coast of Guinea from the river Senegal to Congo. Petals obovate, scarcely longer than the calyx.

Alder-leaved Tetracera. Fl. Jan. Feb. Clt. 1793. Shrub cl.

11 T. POTATO'RIA (Afz.) leaves oblong, glabrous, dark-green, toothed, sessile, somewhat sheathing at the base; panicle large, terminal. ♄. ⌣. S. Native of Sierra Leone on the mountains. Leaves large, sometimes more than half a foot long.

This shrub, when cut across, yields a quantity of clear, wholesome water; hence it has obtained the name of Water Tree in the colony of Sierra Leone.

Drinking Tetracera or Water Tree. Fl.? Clt. 1822. Shrub cl.

12 T. OBOVA'TA (D. C. syst. 1. p. 401.) leaves large, obovate, obtuse, tapering to the base, smooth, entire, brownish velvety on the under surface; flowers panicled. ♄. ⌣. S. Native of the coast of Guinea from the river Senegal to Cape Coast.

Obovate-leaved Tetracera. Fl. Jan. Feb. Clt. 1822. Shrub cl.

13 T. SENEGALE'NSIS (D. C. syst. 1. p. 401.) leaves oval, rather acute, quite entire, smooth; peduncles panicled, many-flowered. ♄. ⌒. S. Native of Senegal. Calyx of 5, nearly orbicular sepals. Petals 3.

Senegal Tetracera. Shrub cl.

14 T. LÆ'VIS (Vahl. symb. 3. p. 71.) leaves oblong, acuminated, nearly entire, smooth; racemes terminal, simple. ♄. S. Native of the East Indies. Capsules 4, roundish, ventricose, mucronate, very smooth, shining.

Smooth Tetracera? Shrub cl.

14 T. EURYA'NDRA (Vahl. symb. 3. p. 71.) leaves oval, obtuse, quite entire, smooth; peduncles paniculately-racemose, pubescent. 5. ⌣. S. Native of New Caledon. Euryándra scándens. Forst. prod. no. 228, gen. no. 41. t. 41. Deless. icon. sel. 1. t. 70. Petals 3, oblong, longer than the calyx.

Broad-stamened Tetracera. Shrub cl.

16 T. RHEE'DII (D. C. syst. 1. p. 402.) leaves oblong, acuminated at both ends, quite entire, smooth; panicle branched, somewhat dichotomous; flowers of 4 sepals. ♄. ⌣. S. Native of Malabar in mountainous and rocky places. Acara-pats jotti. Rheed. mal. 5. p. 15. t. 8. Very like *T. Assa*, but differing from it in the leaves being large, oblong, and entire. Flowers white, sweet-scented; anthers flesh-coloured. Carpels dark-red, shining.

Rheede's Tetracera. Fl. Sept. Oct. Shrub cl.

17 T. A'SSA (D. C. syst. 1. p. 402.) leaves oval, acuminated at both ends, a little denticulated, upper surface smooth, under surface, as well as peduncles, pubescent; panicle 4-5 flowered; sepals 4, smoothish. ♄. ⌣. S. Native of the East Indies. T. Malabàrica, Lam. ill. t. 485. f. 1. A'ssa exótica, Gmel. syst. 839. Ay-assa, Rumph. amb. 7. p. 20?

Ay-assa Tetracera. Shrub cl.

18 T. WAHLBO'MIA (D. C. syst. 1. p. 403.) leaves elliptical, acuminated at the top, and serrated, stipulate at base, with the under surface, as well as peduncles, pubescent; panicle 4 or 5-flowered; sepals 4, villous on the outside. ♄. S. Native of Java. Wahlbòmia I'ndica. Thunb. act. holm. 1790. p. 215. t. 9. Lam. ill. t. 485.

Wahlbom's Tetracera. Shrub cl.

19 T. TIGA'REA (D. C. syst. 1. p. 403.) leaves roundish, somwehat repand, rough on both surfaces as well as branches; panicles, branched, many-flowered. ♄. ◠. S. Native of Guiana and Cayenne in woods. Tigàrea áspera, Aubl. guian. 2. p. 920. t. 350. Tetr. áspera, Willd. spec. Calyx persistent, outer sepals a little reflexed, inner ones conniving. This species, as well as the following, is called *Liane rouge* in French Cayenne, from its colour in an infusion of water, which the natives consider a remedy for syphilis. Flowers monogynous with 4 white petals. *Tigàrea* is the name of this plant in Guiana.

Tigarea Tetracera. Fl. Jan. Shrub cl.

20 T. TOMENTO'SA (Willd. spec. pl. 2. p. 1241.) leaves ovate, acuminated, toothed, upper surface smooth, under surface, as well as the branches, are tomentose. ♄. ◡. S. Native of Cayenne in woods. Tigàrea dentàta, Aubl. Guian. 2. p. 920. t. 351. Flowers white, monogynous.

Tomentose Tetracera. Fl. Jan. Shrub cl.

21 T. CUSPIDA'TA (Mey. prim. fl. esseq. p. 205.) leaves oval-oblong, with cuspidate serratures, under surface tomentose; peduncles 1-flowered, in axillary fascicles. ♄. ◡. S. Native of the island of Arowabish in Guiana in dry woods. Flowers monogynous.

Cuspidate-toothed Tetracera. Shrub cl.

22 T. SERI'CEA (Blum. bijd. fl. ned. ind. ex Schlecht. Linnæa 1. p. 491.) leaves oblong, acuminated, acute at the base, serrulated at the apex, pubescent beneath, as well as the branchlets and pedicels; racemes 4-5-flowered; flowers trigynous; sepals and petals silky on the inside. ♄. ◡. S. Native of Java.

Silky-flowered Tetracera. Shrub cl.

23 T. ERE'CTA (Sesse, et Moc. fl. mex. icon. et D. C. syst. 1. p. 404.) leaves obovate, rather bluntish at end, acutely toothed, attenuately-cuneated at the base; panicle much branched. ♄. S. Native of Mexico. The flowers are either hermaphrodite, polygamous or monoecious.

Erect Tetracera. Shrub 10 feet.

24 T. LU'TEA (Spreng. neue. entd. 1. p. 164.) leaves elliptical-oblong, quite entire, shining; peduncles lateral, racemose. ♄. S. Native of Brazil. Calyx coloured. Corolla yellow. Flowers monogynous. Capsules 3.

Yellow-flowered Tetracera. Shrub cl.

25 T. PERRINIA'NA (Spreng. neue. entd. 1. p. 164.) leaves elliptical, shining on both surfaces, obsoletely serrulated; corymbs of flowers axillary. ♄. S. Native of South America? Calyx 4-5-sepals. Corolla white. Flowers monogynous. Capsules 4.

Perrin's Tetracera. Shrub. cl.

26 T. ARBORE'SCENS (Mal. misc. 1. no. 2. p. 45.) leaves obovate, quite entire, smooth; flowers disposed in axillary and terminal panicles. ♄. S. Native of Sumatra. Arillus jagged, yellowish.

Arborescent Tetracera. Shrub 16 feet.

27 T. DICHO'TOMA (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 492.) leaves elliptical, acute at both ends, toothletted from the middle to the apex, with the veins on the under surface, as well as the pedicels pubescent; peduncles sub-dichotomous; sepals smooth and ciliated. ♄. ◡. S. Native of Java. Flowers trigynous, subumbellate.

Dichotomous-peduncled Tetracera. Shrub cl.

28 T. GRA'CILIS (Blum. l. c.) leaves oval, acute at both ends, serrulated at the apex, rather villous beneath, as well as the branchlets and pedicels; peduncles 1-2-flowered; sepals 4, ciliated. ♄. ◡. S. Native of Java. Flowers trigynous.

Slender Tetracera. Shrub cl.

29 T. RI'GIDA (Blum. l. c.) leaves oval, tapering to both ends, repand at the apex, stiff, scabrous beneath; panicle divaricating, tomentose; sepals and petals silky-villous on the inside. ♄. ◡. S. Native of Java. Flowers trigynous.

Stiff-leaved Tetracera. Shrub cl.

30 T. FAGIFO'LIA (Blum. l. c.) leaves ovate-elliptical, acute, serrated at the apex, scabrous beneath; panicle compound, pyramidal, tomentose; sepals and petals ciliated. ♄. ◡. S. Native of Java. Flowers trigynous.

Beech-leaved Tetracera. Shrub cl.

Cult. Handsome shrubs, well adapted for covering rafters in stoves. They succeed best in a mixture of turfy loam and peat, and ripened cuttings will strike root freely if planted in a pot of sand and placed in heat under a hand-glass.

II. DAVI'LLA (in honour of Henry Catherine Davilla, a celebrated Italian historian, died 1599.) Vand. fl. lus. et bras. prod. 115. t. 2. f. 14. D. C. syst. 1. p. 404. prod. 69.

LIN. SYST. *Polyándria, Mono-Digýnia.* Calyx of 5 permanent sepals, the three outer ones small. Petals 2-3, deciduous. Stamens indefinite. Carpels 1-2, capsular, indehiscent, testaceous, 1 or 2-seeded, inclosed by the two interior joined, concave, opposite, valvæform sepals. Seed somewhat globose. The habit of the shrubs is very near *Tetrácera* or *Delíma*, and appears to be the link between these two genera.

1 D. FLEXUO'SA (St. Hil. fl. bras. 1. p. 17. t. 2.) plant quite smooth; leaves elliptical, obtuse at both ends, quite entire, coriaceous; racemes nearly simple; carpels 3, opening irregularly. ♄. S. Native of Brazil, at the mouth of the Rio Doce near the Fort called *Quartel da Regencia.* An upright shrub, branching from the base; branches reddish and flexuous. Leaves 2-3-inches long. Flowers yellow.

Flexuous-branched Davilla. Shrub 6 feet.

2 D. ELLI'PTICA (St. Hil. fl. bras. 1. p. 17.) stem erect, much branched, leaves elliptical, quite blunt at both ends, quite entire, coriaceous, rough above, but pubescent beneath and reticulately veined; petioles villous beneath; racemes villous, bracteate; calyxes silky; petals 1-6 rather obcordate; pistils twin. ♄. S. Native of Brazil in the province of Minas Novas, where it is called by the natives *Cambaibinha*, and is considered by them to be a vulnerary. The natives of Brazil usually wash wounds with a decoction of Quinquina; in the Certao or Great Desert they make a similar use of the inner bark of this shrub, as well as that of *Curatella Cabàiba.* It is a powerful astringent.

Elliptical-leaved Davilla. Fl. May. Shrub 6 feet.

3 D. CASTANEÆFO'LIA (St. Hil. fl. bras. 1. p. 17.) branches rather hairy; leaves oblong-elliptical, quite obtuse at the base, somewhat pointed at the apex, remotely serrated, and furnished with parallel nerves, pilose above, pubescent beneath, and reticulately veined, rather wrinkled on both surfaces; calyx silky; petals 5, obcordate; pistils twin. ♄. S. Native of Brazil in the province of St. Paul in grassy fields. Shrub branched from the base. Flowers yellow.

Var. β, *floribúnda* (St. Hil. fl. bras. 1. p. 18.) leaves broader, shorter, and blunt, less toothed, and the flowers more crowded and smaller than in the species.

Chesnut-leaved Davilla. Fl. May. Shrub 3-5 feet.

4 D. RUGO'SA (Poir. dict. suppl. 2. p. 457.) stem climbing; branches hairy; leaves oblong, very remotely and obsoletely serrated, wrinkled above and villous beneath on the nerves; petioles very villous beneath; peduncles and pedicels hairy; petals 2-3; pistils usually only 1. ♄. ◡. S. Native of Brazil from the mouth of the Rio Doce to the confines of the province of St. Catherine, and in the province of Rio Janeiro, where it is called *Cisso de Carijo*, in the province of Minas Geraes *Cambaibinha*, and in the southern parts of St. Paul *Cipo de Coboclo.* St. Hil. pl. usu. bras. t. 23. D. Braziliàna, D. C. syst. 1. p. 405. Deless. icon. sel. 1. t. 71. but not of Kunth. Flowers yellow. The natives of the interior make use of the pliant stems of this plant for bands, and they employ a fomentation of the leaves for

the purpose of allaying swellings of the legs, so common in that country.

Wrinkled-leaved Davilla. Fl. May, July. Shrub cl.

5 D. macrophy'lla (St. Hil. fl. bras. 1. p. 18.) stem climbing; branches roughish; leaves oblong-elliptical, acuminated, repand, smooth, but pilose on the nerves beneath; petals 5, quite entire; pistil 1. ♄. ◡. S. Native of Brazil in the northern parts of the province of Minas Geraes called Minas Novas. Flowers yellow.

Long-leaved Davilla. Fl. July. Shrub cl.

6 D. angustifo'lia (St. Hil. fl. bras. 1. p. 19.) stem climbing; branches villous; leaves oblong-linear, acute, quite entire, smooth on both surfaces, but pilose on the nerves beneath; petioles villose; petals 3, obcordate; pistils twin. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Flowers yellow.

Narrow-leaved Davilla. Fl. March. Shrub cl.

Cult. Fine upright or climbing shrubs, requiring the same treatment as that recommended for *Tetràcera*.

III. EMPEDO'CLEA (to the memory of Empedocles, a famous philosopher of Agrigentum in Sicily, who, among other things, wrote on the nature of plants.) St. Hil. fl. bras. 1. p. 19.

Lin. syst. *Polyándria, Monogýnia.* Calyx of many ovate permanent sepals, usually 13, closely imbricated and very obtuse. Petals 3, hypogynous, deciduous. Stamens indefinite. Ovary 1, oblong, pyramidal, trigonal, with one of the angles bearded, 1-celled, 6-seeded. Fruit baccate, crowned by one awl-shaped style.—A shrub with simple leaves and white flowers.

1 E. alnifo'lia (St. Hil. fl. bras. 1. p. 20. t. 3.) ♄. S. Native of Brazil in the province of Minas Geraes, among bushes in humid places. An erect shrub, with broad-elliptical leaves, which are blunt at both ends, and running into the petiole at the base, coarsely serrated, smooth above but rusty beneath. Racemes terminal and rising from the axils of the upper leaves.

Alder-leaved Empedoclea. Shrub 4 feet.

Cult. This handsome shrub will grow well in a mixture of loam and peat, and ripened cuttings will strike root, if planted in a pot of sand and placed under a hand-glass, in heat.

IV. DOLIOCA'RPUS (from δολιος, *dolios*, deceitful, καρπος, *karpos*, a fruit; because though beautiful are poisonous). Roland. act. holm. 1759. p. 249. t. 9. D. C. syst. 1. p. 405. prod. 1. p. 69.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5, concave, unequal, permanent sepals. Petals 3-4, roundish, deciduous. Stamens indefinite. Carpel 1, baccate, 1 or 2-seeded. Mostly sarmentose shrubs, with the appearance of *Tetràcera*.

1 D. rola'ndri (Gmel. syst. 805.) scandent; leaves oblong, acuminated, toothed at the apex; peduncles lateral, 1-flowered, glomerate; flowers 3-petalled. ♄. ◡. S. Native of Surinam, and Brazil in the province of Minas Geraes.—Rol. act. holm. 1756. p. 260. t. 9. f. 1-2-3. Tetràcera doliocárpus, Willd. spec. 2. p. 1241. D. scándens, Poir. suppl. 2. p. 497. Flowers white, axillary glomerate. (St. Hil.)

Rolander's Doliocarpus. Fl. May, Oct. Shrub cl.

2 D. stri'ctus (Poir. suppl. 2. p. 498.) stem strict; leaves ovate-lanceolate, toothed, deflexed; flowers terminal, 3-petalled. ♄. S. Native of Surinam. Tetràcera stricta, Willd. spec. 2. p. 1241. D. màjor, Gmel. syst. 805.

Upright Doliocarpus. Shrub 6 feet.

3 D. Cali'nea (Gmel. syst. 805.) stem scandent; leaves oblong, acuminated, quite entire; peduncles lateral, many-flowered: flowers 3-petalled. ♄. ◡. S. Native of Guiana in woods. Calìnea scándens, Aubl. guian. 1. p. 556. t. 221. Tetràcera scándens, Willd. spec. 2. p. 1241. Soràmia, Lam. ill. t. 463. f. 2. Petals white. The name Calinea is of doubtful origin, it is perhaps the name of the shrub in Guiana.

Calinea Tetracera. Fl. April. Clt. 1822. Shrub cl.

4 T. Sora'mia (D. C. syst. 1. p. 406.) stem scandent, leaves obovate, quite entire; peduncles lateral, somewhat corymbose; flowers 5-petalled. ♄. ◡. S. Native of Guiana on the banks of the river Sinemari. Soràmia Guianénsis, Aubl. guian. 1. p. 552. t. 219. Tetràcera obovàta, Willd. spec. 2. p. 1241. Máppia Schreb. gen. no. 1755. Berries about the size and colour of a cherry. Petals white. *Soramia* is the name of this shrub in Guiana.

Soramia Doliocarpus. Fl. May. Shrub cl.

Cult. A genus of fine upright, or climbing shrubs, requiring the same treatment as that recommended for *Tetràcera*.

V. DELI'MA (from *delimo*, to file or shave off; because the leaves of some of the species are used for polishing). Lin. amœn. 1. p. 403. Juss. gen. p. 339. Gært. fruct. 2. p. 112. t. 106. D. C. syst. 1. p. 406. prod. 1. p. 69.

Lin. syst. *Polyándria, Monogynia.* Calyx of 5 permanent sepals. Petals 3-5, roundish, deciduous. Stamens indefinite. Carpel 1, capsular, 1-2-seeded. Flowers sometimes dioecious from abortion. Climbing shrubs, with the habit of *Tetràcera*.

1 D. sarmento'sa (Lin. spec. 736.) leaves ovate-oblong, serrated, rigid, scabrous; flowers hermaphrodite, panicled, apetalous; ovaries and capsules smooth. ♄. ◡. S. Native of the island of Ceylon. Burm. ind. 122. t. 37. f. 1. Tetràcera sarmentòsa, Vahl. symb. 3. p. 70. This shrub is called in Ceylon *Koroswael* and *Korossawael*, from the verb *Korossa*, to smooth, in allusion to the leaves, which are used for polishing utensils.

Sarmentose Delima. Fl. Clt. 1820. Shrub. cl.

2 D. tripe'tala (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 492.) leaves obovate, mucronately toothed at the apex; flowers hermaphrodite, panicled, 3-petalled; capsule pubescent. ♄. ◠. S. Native of Java.

Three-petalled Delima. Shrub cl.

3 D. castaneæfo'lia; leaves crowded, oblong, serrated, smoothish; flowers lateral, sessile. ♄. ◡. S. Native of Brasil. O'thlis. castaneæfòlia, Schott. in Spreng. syst. app. 407. Calyx of 5 permanent sepals and 2-bracteas, they are imbricate and concave. Petals 5, deciduous. Anthers linear, continuous, with lateral very slender cells. Capsules usually 1-seeded. Seeds arillate. A rambling shrub.

Chesnut-leaved Delima. Shrub cl.

4 D. interme'dia (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa, 1. p. 492.) leaves oval, hardly acute at the ends, repand-serrated at the apex; stiff, scabrous; panicle compound, leafy; flowers hermaphrodite, 5-petalled; ovaries and capsules pubescent. ♄. ◡. S. Native of Java.

Intermediate Delima. Shrub cl.

5 D. hebeca'rpa (D. C. syst. 1. p. 407.) leaves obovate, somewhat crenulate, scabrous; flowers hermaphrodite, panicled, 5-petalled; ovaries and capsules pubescent. ♄. ◡. S. Native of Java and the Philippine Islands. Deless. icon. sel. 1. t. 72. Seeds semi-arillate. This shrub is called in the Philippine islands *Bois de rape*, in allusion to the use of its leaves for polishing.

Downy-fruited Delima. Shrub cl.

6 D. Mexica'na (Sesse et Moc. fl. mex. icon. ined. D. C. syst. 1. p. 407.) leaves oval, bluntish, tapering a little to the base, smooth, serrated; flowers dioecious, panicled, 5-petalled, disposed in sessile fascicles along the branches. ♄. ◡. S. Native of Mexico. Petals white. Seed ovate, thick, netted.

Mexican Delima. Shrub cl.

7 D. Guianensis (Rich. in D. C. syst. 1. p. 408.) leaves oblong, acuminated at both ends, smooth, somewhat serrated; flowers dioeceous, axillary, on short pedicels; fruit globose, pu-

bescent. ♄. ◡. S. Native of Guiana. Male flowers unknown. Perhaps a species of *Doliocárpus*.

Guiana Delima. Shrub cl.

8 D. NI'TIDA (Vahl. symb. 3. p. 70.) leaves lanceolate-oblong, scabrous, quite entire; flowers hermaphrodite, panicled, 4-petalled. ♄. ◡. S. Native of the island of Trinidad. Style length of stamens; stigma somewhat peltate.

Shining-leaved Delima. Shrub cl.

9 D.? PIRI'PU (D. C. syst. 1. p. 408.) leaves oval-oblong, soft, with the margins undulately-crenated; flowers panicled, hermaphrodite, pentandrous. ♄. S. Cultivated about Pananie, &c. in Malabar. Piripu, Rheed. mal. 7. p. 101. t. 54. Flowers white, 5-petalled.

Piripu Delima. Fl. December. Shrub cl.

Cult. A genus of fine climbing shrubs. The species will thrive in a mixture of loam peat and sand, and ripened cuttings will strike root if planted in a pot of sand with a hand-glass placed over them, in heat.

VI. CURATE'LLA (from *curatus*, worked; because the leaves, which have a rough surface, are used in Guiana for polishing bows, sabres, and other weapons.) Lin. gen. no. 679. Lam. ill. t. 479. Juss. gen. 282. D. C. syst. 1. p. 409. prod. 1. p. 70.

Lin. syst. *Polyándria, Digýnia.* Calyx of 4-5-spreading unequal sepals. Petals 4-5, roundish, deciduous. Stamens indefinite. Carpels 2, capsular, 1 or 2-seeded. Seeds ovate, shining.—Small shrubs, with ovate rough leaves, winged petioles, and white flowers.

1 C. America'na (Lin. spec. 248.) leaves ovate, repand, and somewhat denticulated, very rough, running along the petiole at the base; racemes issuing from the adult branches. ♄. S. Native of South America, particularly Guiana and Peru. Aubl. guian. 1. p. 579. t. 232. Lam. ill. t. 479. Petals white. The leaves of this species are used in Cayenne for polishing wood. The bark is thick, wrinkled, and cracked, and falls off in large pieces.

American Curatella. Fl. Aug. Clt.? Shrub 10 feet.

2 C. Caba'iba (St. Hil. fl. bras. 1. p. 22. pl. usu. bras. t. 24.) leaves broad, very blunt, more or less repand-toothed, wrinkled above, downy beneath; racemes compound, lateral, and are as well as the pedicels and calyx villous. ♄. S. Native of Brasil, where it is called *Cabaiba*, and where the inhabitants employ the inner bark in the cure of wounds.

Cabaiba Curatella. Shrub 6 feet.

3 C. ala'ta (Vent. choix. p. 49.) leaves oval, quite entire, smooth; blunt at both extremities; petioles winged; panicle terminal. ♄. S. Native of Guiana. Perhaps a species of *Wòrmia*.

Wing-petioled Curatella. Fl.? Clt.? Shrub 10 feet.

Cult. A genus of fine shrubs. The species will grow well in a mixture of loam and peat, and ripened cuttings will root freely if planted in a pot of sand with a hand-glass placed over them, in heat.

VII. TRACHYTE'LLA, (from τραχυτης, *trachytes*, roughness; because the leaves, which have a very rough surface, are used for polishing wood as well as metal). D. C. syst. 1. p. 410. prod. 1. p. 70.

Lin. syst. *Polyándria, Mono-Digýnia.* Calyx of 4-5 permanent sepals. Petals 4-5, deciduous. Stamens indefinite. Carpels 1 or 2, baccate, many-seeded. A perfectly doubtful genus, which was only known to Loureiro.—Climbing shrubs with rough leaves and racemes of white flowers.

1 T. Actæ'a (D. C. syst. 1. p. 410.) leaves lanceolate, somewhat serrated; racemes spiked, linear, interrupted. ♄. ◡. G. Native of uncultivated places near Canton in China. Actæ'a áspera, Lour. cochin. ed Willd. 1. p. 405. The leaves of this species are used in China for polishing works of wood as well as of metal.

Actæa-like Trachytella. Shrub cl.

2 T. calli'gonum (D. C. syst. 1. p. 410.) leaves ovate, quite entire; racemes somewhat divided. ♄. ◡. G. Native of Cochin China in woods. Callígonum ásperum. Lour. cochin. ed Willd. 1. p. 418. The name is derived from καλλος, *kallos*, beauty, and γονυ, *gonu*, a knee or joint; because the leaves are jointed, which gives the plant a very remarkable appearance.

Beautiful-jointed Trachytella. Shrub cl.

Cult. A mixture of loam and peat will probably suit these plants, and ripened cuttings will probably root if planted in a pot of sand, with a hand-glass placed over them.

VIII. RE'CCHIA (in honour of Nardo Antonio Reccho, who arranged Hernandez Mexico). Sesse et Moc. fl. mex. icon. ined. and D. C. syst. 1. p. 411. prod. 1. p. 70.

Lin. syst. *Decándria, Digýnia.* Calyx of 5, equal, spreading sepals. Petals 5, oblong, deciduous. Stamens 10. Ovaries 2. Shrub with twisted angular branches, and yellow flowers.

1 R. Mexica'na (Sess. et Moc. l. c.) ♄. S. Native of Mexico. Leaves oval or oblong. Flowers somewhat racemose along the superior branches.

Mexican Recchia. Shrub cl.

Cult. A mixture of loam and peat will suit this shrub, and ripened cuttings will root if planted in a pot of sand with a hand-glass placed over them, in heat.

Tribe II.

DILLE'NEÆ (plants agreeing with *Dillènia* in some characters). Sal. par. lond. no. 73. D. C. syst. 1. p. 411. prod. 1. p. 70.

Filaments of stamens not dilated at the apex, but somewhat tapering (f. 16. *a.* & f. 17. *a.*), anthers elongated, adnate (f. 17. *c.*); carpels usually from 2 (f. 16. *d.*) to 5, distinct; rarely solitary, or from 5-20, joined (f. 19. *c.*). Trees, shrubs, or subshrubs, very rarely scandent.

IX. PACHYNE'MA (παχυς, *pachys*, thick, νεμα, *nema*, a filament; filaments very thick). R. Br. in D. C. syst. 1. p. 411. prod. 1. p. 70.

Lin. syst. *Heptándria Digýnia* or *Decándria Trigýnia.* Petals 5, ovate (f. 16. *a.*), soon falling off. Stamens 7 (f. 16. *a.*) 10; filaments very thick at the base (f. 16. *b.*), erect, tapering to the top (f. 16. *a.*); anthers ovate, adnate at the top of narrowed filaments (f. 16. *c.*), distinct conniving or parallel. Ovaries 2 (f. 16. *d.*) 3, ovate, each ending in an awl-shaped style (f. 16. *d.*). Fruit unknown.

1 P. complana'tum (R. Br. in D. C. syst. 1. p. 412.) ♄. G. Native of Carpentaria. Deless. icon. sel. 1. t. 73. A little leafless shrub with the habit of *Ephèdra*; branches compressed, toothed on the margins with the flowers rising from the axils of these teeth either singly or in pairs (f. 16.).

Flat-branched Pachynema. Clt.? Shrub 1 foot.

Cult. This shrub will thrive well on a mixture of loam and peat, and cuttings will strike root freely in sand under a hand-glass.

FIG. 16.

X. HEMISTE'MMA (ἡμι, *hemi*, half, στεμμα, *stemma*,

a crown; because the stamens are all inserted in the side of one of the pistils, not around them). Juss. ined. D. C. syst. 1. p. 412. prod. 1. p. 71.

Lin. syst. *Polyándria, Digýnia.* Calyx of 5, permanent sepals. Petals 5, obtuse or emarginate. Stamens indefinite, unilateral (f. 17. *a.*). exterior ones sterile, scale-formed. Ovaries 2; styles filiform. Seed girded by a membranous arillus. Albumen fleshy.—Small elegant shrubs with yellow flowers.

§ 1. *Oppositifòlia. Sterile stamens spatulate at the top; petals emarginate.—Species from Madagascar.*

1 H. Commerso'nii (D. C. syst. 1. p. 413.) leaves opposite, oval-oblong, mucronated; peduncles tomentose. ♄. S. Native of Madagascar. Deless. icon. sel. 1. t. 74. Heliánthemum coriàceum, var. a, Pers. ench. 2. p. 76. Calyxes woolly.

Commerson's Hemistemma. Shrub 1 foot.

2 H. Aube'rtii (D.C. 1. p. 413.) leaves opposite, oblong-lanceolate, tapering to the base, acute at the top; peduncles smoothish. ♄. S. Native of Madagascar. Deless. icon sel. 1. t. 75. Heliánthemum coriàceum, var. β, angustifòlium. Pers. ench. 2. p. 76. Calyxes clothed with silky down. This shrub is called in Madagascar *Angzavidi.*

FIG. 17.

Aubert's Hemistemma. Shrub 1 foot.

§ 2. *Alternifòlia. Sterile stamens linear. Petals blunt.—Species from New Holland.*

3 H. dealba'tum (R. Br. in D. C. syst. 1. p. 413.) leaves alternate, obovate-oblong, tapering to the base, blunt and mucronate at the top, under surface white from pubescence. ♄. G. Native of Arnheim Land in New Holland. Deless. icon. sel. 1. t. 76.

Whitened Hemistemma. Shrub 1 foot.

4 H. Ba'nksii (R. Br. in D. C. syst. 1. p. 414.) leaves alternate, oblong, narrowed at the base, blunt at the top, under surface tomentose. ♄. G. Native of New Holland at Endeavour River. Flowers sessile, secund.

Sir Joseph *Banks's* Hemistemma. Shrub 1 foot.

5 H. angustifo'lium (R. Br. in D. C. syst. 1. p. 414.) leaves alternate, long, linear, acute, under surface whitened. ♄. G. Native of Arnheim Land in New Holland. Deless. icon. sel. 1. t. 77. Peduncles about the length of the leaves. Flowers secund.

Narrow-leaved Hemistemma. Shrub 1 foot.

6 H.? Lechenau'ltii (D. C. syst. 1. p. 414.) leaves alternate oblong, tapering to the base, truncate at the top, somewhat emarginate, under surface whitened. ♄. G. Native of New Holland and the island of St. Francisco. Flowers small, axillary solitary, on very short pedicels.

Leschenault's Hemistemma. Shrub 2 feet.

Cult. This is a genus of elegant little shrubs, with the appearance of *Heliánthemum;* they will thrive best in an equal mixture of sand, loam, and peat, and cuttings will root readily under hand-glasses in the same kind of soil. Those species natives of Madagascar require the heat of a stove.†

XI. PLEURA'NDRA (from πλευρον, *pleuron*, a side, and ανηρ, *aner*, a male; in allusion to the stamens being all inserted in one side of the flower). Lab. nov. holl. 2. p. 5. t. 143 and 144. D. C. syst. 1. p. 415. prod. 1. p. 71.

Lin. syst. *Pent.—Hept.—Oct.—Dec.—Polyándria, Digýnia.* Calyx of 5, oval, permanent sepals. Petals 5, usually obcordate. Stamens 5-20, unilateral (f. 18. *c.*), all fertile. Styles filiform. Carpels 2, membranous, 1-2-seeded. Small shrubs, with solitary yellow flowers seated on the tops of the branches, and entire leaves. Petals emarginate (f. 18. *b.*) This is one of those genera which renders the Linnean system truly ambiguous. It contains Pentandrous, Hexandrous, Heptandrous, Octandrous, Decandrous, and Polyandrous plants.

§ 1. *Daphnoìdeæ (plants with the habit of Dáphne) D. C. syst. 1. p. 415. Stamens free. Leaves oblong or obovate, rather large, flat, smooth.*

1 P. bractea'ta (R. Br. in D. C. syst. 1. p. 415.) leaves oblong, smoothish, mucronulate; bracteas crowded about the sessile flowers, which are villous on the outside; ovaries very hairy. ♄. G. Native of New Holland about Port Jackson. Deless. icon. sel. 1. t. 78. A beautiful shrub, with the habit of *Dáphne collìna.* Leaves sometimes broad, sometimes narrow. Stamens 12.

Bracteated Pleurandra. Fl. May, June. Clt. 1823. Sh. 2 ft.

2 P. ni'tida (R. Br. in D. C. syst. 1. p. 416.) leaves oblong, smooth, mucronate; bracteas few, somewhat scariouse, smooth; ovaries tomentose. ♄. G. Native of New Holland about Port Jackson. Very like *P. bracteàta,* but all its parts are smooth except the ovaries. Stamens 7-8.

Shining Pleurandra. Fl. May, June. Clt. 1823. Sh. 2 ft.

3 P. Cneo'rum (D. C. syst. 1. p. 416.) leaves oblong, obtuse, narrowed at the base, and are, as well as the bracteas and calyxes, smooth; ovaries smoothish. ♄. G. Native of New Holland, in brushy situations on the King's Table Land. Like *P. bracteàta.* Flowers sessile. Stamens 12-15.

Widow-Wale like Pleurandra. Fl. May, June. Clt. 1824. Shrub 2 feet.

§ 2. *Alyssoìdeæ (plants with the habit of Alyssum) D. C. syst. 1. p. 416. Stamens free. Leaves oblong or obovate, velvety with starry pubescence on both surfaces, or only on the under surface.*

4 P. seri'cea (R. Br. in D. C. syst. 1. p. 416.) leaves oblong, with revolute margins, upper surface pilose, under surface velvety; branches hairy; flowers sessile. ♄. G. Native of New Holland on the eastern shore at Port Philip. Deless. icon. sel. 1. t. 79. Flowers solitary, terminal, sessile among the leaves. Stamens 7-8.

Silky Pleurandra. Shrub 2 feet.

5 P. astrotri'cha (Sieb. pl. nov. holl. ex Spreng. syst. app. p. 191.) leaves spatulate-linear, rough, rather hairy; branchlets clothed with starry, powdery pubescence; peduncles bractless, nodding; sepals acute. ♄. G. Native of New Holland.

Starry-haired Pleurandra. Shrub 2 feet.

6 P. cine'rea (R. Br. in D. C. syst. 1. p. 417.) leaves oblong, with revolute margins, velvety on both surfaces; branches somewhat villous; flowers solitary on short pedicels. ♄. G. Native of a place called Memory Cove on the southern coast of New Holland. Stamens 7-8.

Cinereous Pleurandra. Shrub 2 feet.

7 P. furfura'cea (R. Br. in D. C. syst. 1. p. 417.) leaves oblong, flat, blunt; upper surface somewhat scabrous, under surface velvety-tomentose; branches velvety; flowers on pedicels. G. Native of New Holland at King George's Sound. Pedicels an inch long, clothed with starry hairs. Stamens 8-10.

Chaffy Pleurandra. Shrub 2 feet.

8 P. parviflo'ra (R. Br. in D. C. syst. 1. p. 417.) leaves obovate, cuneated at the base; upper surface scabrous, under surface velvety, as well as branches; flowers on pedicels. ♄. G.

Native of New Holland near Port Jackson. Flowers small, 3-lines in diameter. Stamens 3-5.

Small-flowered Pleurandra. Shrub 2 feet.

§ 3. *Hibbertiànæ (plants with the habit of Hibbértia). D. C. syst. 1. p. 418. prod. 1. p. 72. Stamens free at the base. Leaves linear or oblong, small, spreading, smooth or scabrous with simple hairs, but not with starry hairs. as in the preceding section.*

9 P. ovà'ta (Lab. nov. holl. 2. p. 5. t. 143.) leaves ovate, obtuse, upper surface somewhat scabrous, under surface smooth; flowers on pedicels; calyx rather pilose; ovaries pilose. ♄. G. Native of Van Diemen's Land. Pedicels terminal, slender, naked, 1-flowered. Stamens 9-12.

Ovate-leaved Pleurandra. Shrub 2 feet.

10 P. sca'bra (R. Br. in D. C. syst. 1. p. 418.) leaves oblong, blunt; upper surface scabrous, under surface somewhat canescent; flowers on pedicels; calyx smoothish; ovaries tomentose. ♄. G. Native of New Holland near Port Jackson. Stamens 7-8.

Var. α, leaves oblong-linear.

Var. β, leaves oblong-oval: P. ovàta, var. Lab. nov. holl. 2. p. 5. t. 143? Perhaps a proper species between *P. scàbra* and *P. ovàta.*

Scabrous Pleurandra. Shrub 2 feet.

11 P. camforo'sma (Sieb. pl. nov. holl. ex Spreng. syst. app. 191.) leaves in fascicles, filiform, pilose; branches white with hairs; flowers solitary, sessile; sepals smooth, mucronate. ♄. G. Native of New Holland.

Camphor-scented Pleurandra. Shrub 1 foot.

12 P. ripa'ria (R. Br. in D. C. syst. 1. p. 419.) leaves linear, bluntish, almost smooth, with subrevolute margins; flowers sessile; calyx smooth; ovaries hairy. ♄. G. Native of New Holland and on the banks of rivers in Van Diemen's Land. Stamens 5-7.

River-bank Pleurandra. Shrub 2 feet.

13 P. microphy'lla (Sieb. l. c.) leaves crowded, rather terete, obtuse, 4-furrowed, hoary-pubescent; peduncles short, solitary, pubescent; sepals bluntish. ♄. G. Native of New Holland.

Small-leaved Pleurandra. Shrub 1 foot.

14 P. pedunculà'ta (R. Br. in D. C. syst. 1. p. 419.) leaves linear, blunt, smooth, with subrevolute margins; flowers on pedicels; calyx and ovaries smooth. ♄. G. Native of the southern coast of New Holland, near a place called Lucky Bay, and Van Diemen's Land. Stamens 7-8; filaments very long.

Peduncled-flowered Pleurandra. Shrub 2 feet.

15 P. empetrifo'lia (D. C. syst. 1. p. 420.) leaves linear, blunt, upper surface somewhat shining, under surface velvety; flowers on pedicels; calyx smoothish; ovaries hairy; stamens 5. ♄. G. Native of New Holland. Pedicels very slender, a little longer than the leaves.

Empetrum-leaved Pleurandra. Shrub 1 foot.

16 P. interme'dia (D. C. syst. 1. p. 420.) leaves linear, obtuse, with subrevolute margins, upper surface somewhat shining, under surface a little pubescent; flowers on pedicels; calyx smooth; ovaries hairy; stamens 10-15, scattered. ♄. G. Native of New Holland on the mountains. Flowers small; inner sepals with membranous margins.

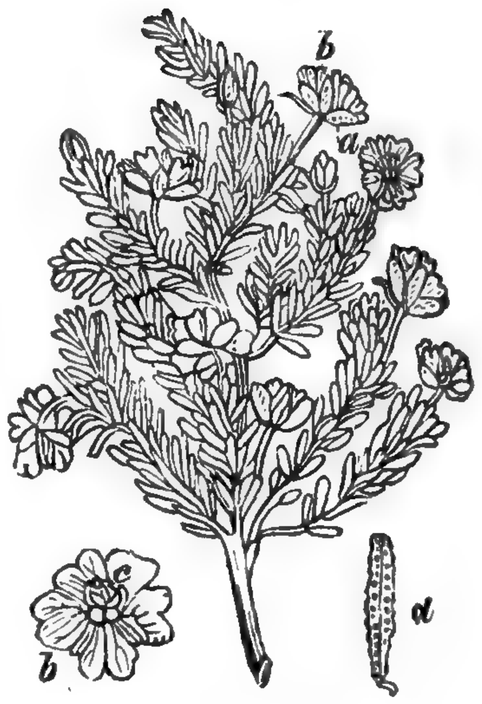
Intermediate Pleurandra. Shrub 2 feet.

17 P. ericæfo'lia (D. C. syst. 1. p. 420.) leaves linear, bluntish, with somewhat revolute margins, upper surface scabrous, under surface pubescent; flowers sessile; calyx somewhat villose; ovaries hairy. ♄. G. Native of New Holland. The plant has the appearance of *Hibbértia pedunculàta.* Stamens 10-12.

Heath-leaved Pleurandra. Fl. May. Clt. 1824. Sh. 2 ft.

18 P. hypericoi'des (D. C. syst. 1. p. 421.) leaves linear, blunt, with revolute margins; upper surface scabrous, under surface hoary; flowers on pedicels; calyx rather pubescent; ovaries velvety. ♄. G. Native of the eastern coast of New Holland. Deless. icon. sel. 1. t. 81. A small, much branched shrub, having the appearance of *Rosemary* or a narrow-leaved species of *Hypéricum.* Stamens 11. (f. 18.)

FIG. 18.



Hypericum-like Pleurandra. Sh. 2 feet.

19 P. stria'ta (Sieb. pl. nov. holl. ex Spreng. syst. app. p. 191.) leaves linear, callose at the apex, striated, scabrous; flowers terminal, sessile; sepals acute, pubescent. ♄. G. Native of New Holland.

Striated Pleurandra. Shrub 1½ foot.

20 P. cistiflo'ra (Sieb. pl. nov. holl. ex Spreng. l. c.) leaves linear-filiform, acute, furrowed, full of rough dots; flowers sessile, terminal; sepals quite smooth, with membranous margins. ♄. G. Native of New Holland. Rchb. hort. bot. t. 79.

Rock-rose-flowered Pleurandra. Shrub 1½ foot.

21 P. ene'rvia (D. C. syst. 1. p. 421.) leaves linear, rather acute, nerveless, smooth; flowers sessile; calyx blunt, mucronulate. and is, as well as ovaries, smooth. ♄. G. Native of New Holland. A much branched humble shrub. Stamens 15-20.

Nerveless-leaved Pleurandra. Shrub 1 foot.

22 P. acicula'ris (Lab. nov. holl. 2. p. 6. t. 144.) leaves linear, awned at the apex, smooth; flowers on pedicels; calyx somewhat hispid, mucronate; ovaries hairy. ♄. G. Native of New Holland, and Cape Van Diemen. Stamens 7-8.

Needle-leaved Pleurandra. Fl. May, Ju. Clt. 1822. Sh. 2 ft.

23 P. acero'sa (R. Br. in D. C. syst. 1. p. 422.) leaves linear-subulate, with revolute margins, upper surface scabrous, under surface smooth; flowers on pedicels; calyx rather scabrous and acute; ovaries villous. ♄. G. Native of the southern coast of New Holland at a place called Lucky Bay. A very dwarf much branched shrub. Stamens 6-7.

Chaffy-leaved Pleurandra. Shrub 1 foot.

§ 4. *Candolleànæ (plants with the habit of Candóllea) D. C. prod. 1. p. 72. Stamens monodelphous at the base. Leaves linear, erect, scarcely spreading.—Perhaps a proper genus.*

24 P. stri'cta (R. Br. in D. C. syst. 1. p. 422.) leaves linear, bluntish, erect, upper surface scabrous, under surface smooth; flowers sessile; calyx somewhat scabrous; ovaries velvety. ♄. G. Native of New Holland near Port Jackson, and in barren brushy situations on the Blue Mountains. An erect, branched shrub. Stamens 5-7.

Erect Pleurandra. Fl. May, Ju. Clt. 1826. Shrub 2 feet.

25 P. calyci'na (D. C. syst. 1. p. 422.) leaves linear, acute, erectish, upper surface scabrous, under surface somewhat pubescent; flowers sessile; calyx sericeously-velvety; ovaries hairy. ♄. G. Native of New Holland on forest land near Bathurst. Stem erect, branched. Stamens 5-8.

Large-calyxed Pleurandra. Fl. May, Ju. Clt. 1826. Sh. 2 ft.

Cult. Pleurándra is a genus of pretty little greenhouse shrubs. They thrive best in an equal mixture of loam, peat, and sand. Ripened cuttings root readily under a hand-glass, in the same sort of soil.

XII. CANDO'LLEA (in honour of Augustus Pyramus De Candolle, F. M. R. S. and L. S. Professor of Botany at Geneva,

and author of many approved and useful botanical works. He is justly considered one of the first botanists of the present age). Labill. nov. holl. 2. p. 33. t. 176. D. C. syst. 1. p. 423. prod. 1. p. 73.

Lin. syst. *Polyadélphia, Polyándria.* Calyx of 5, oval, mucronate, permanent sepals. Petals 5, obovate or obcordate, deciduous. Stamens indefinite, polyadelphous. Styles filiform. Carpels 2-5, ovate, opening on the inside. Shrubs, natives of New Holland, having the appearance of *Pleurándra* and *Hibbértia.* Flowers yellow.

1 C. cuneifo'rmis (Lab. nov. holl. 2. p. 34. t. 176.) leaves smooth, obovately-cuneated, blunt at the top, entire. ♄. G. Native of New Holland on the western coast at Lewin's Land, and at Port Royal George. Hook. bot. mag. 2711. Hibbértia cuneifórmis, Smith. in Rees' cycl. vol. 17. Shrub about 4 feet high; branches cinereous, rough. Ovaries 5-6, smooth.

Wedge-formed-leaved Candollea. Fl. May, Aug. Clt. 1823. Shrub 4 feet.

2 C. peduncula'ta (R. Br. in D. C. syst. 1. p. 424.) leaves smooth, linear-cuneated, truncate at the top, 3-toothed. ♄. G. Native of New Holland at King George's Sound. A small branched shrub, with the younger branches villous, and the adult ones smooth. Ovaries 3?

Pedunculated Candollea. Fl. May, Oct. Shrub 2 feet.

3 C. fascicula'ta (R. Br. in D. C. syst. 1. p. 424.) leaves villous, linear, entire. ♄. G. Native of New Holland at King George's Sound. Branches round, younger ones villous. Ovaries 3-4, smooth.

Fascicular-leaved Candollea. Fl.? Shrub 2 feet?

Cult. *Candóllea* is a genus of beautiful greenhouse shrubs. The species will thrive well in a mixture of loam, peat, and sand, and cuttings will strike root readily in the same kind of soil, under a hand-glass.

XIII. ADRASTÆ'A (Adraste in mythology, daughter of Jupiter and Necessity, who, according to Plutarch, was the only fury that exercised the vengeance of the gods). D. C. syst. 1. p. 424. prod. 1. p. 73.

Lin. syst. *Decándria, Digýnia.* Calyx of 5, acuminated, permanent sepals. Petals 5, oval, deciduous, shorter than the sepals. Stamens 10, free, equal; filaments flat, bearing the oblong cells of the anthers on their margins. Ovaries 2. Styles straight, conico-subulate. A little shrub, having the appearance of a species of *Hibbértia.* Flowers yellow.

1 A. salicifo'lia (D. C. syst. 1. p. 424.) leaves linear, nearly entire, furnished at the top on both sides with 3-5 callose, tooth-like dots. ♄. G. Native of marshes about Botany Bay.

Willow-leaved Adrastæa. Shrub 2 feet.

Cult. This pretty little shrub will thrive well in a mixture of loam and peat, but it will require to be kept rather moist. Cuttings will root readily if planted in a pot filled with the same kind of soil with a hand-glass placed over them.

XIV. HIBBE'RTIA (in honour of George Hibbert, F. R. S. F. L. S. who was once eminently distinguished for his love of plants. He purchased the entire herbarium of Murray of Gottingen, and for some time maintained Mr. Niven, an eminent collector of plants, at the Cape). Andr. bot. rep. t. 126. D. C. syst. 1. p. 425. prod. 1. p. 73.

Lin. syst. *Polyándria, Monogýnia to Polygýnia.* Sepals 5, permanent. Petals 5, deciduous. Stamens indefinite, filiform, equal; anthers oval-oblong. Ovaries 1-15; styles filiform, inflexed. Carpels membranous, dehiscent, usually 1-2-seeded. Seeds without any aril. Erect, procumbent, or twining shrubs, with yellow flowers.

§ 1. *Burtònia* (*see Burtònia*), *Sal. Carpels* 10-15, *with their base smooth, but rather pilose at the apex.—Perhaps a proper genus.*

1 H. grossulariæfo'lia (Sal. par. lond. no. 73. t. 73. under Burtònia.) leaves nearly orbicular, crenate-toothed; flowers on peduncles, opposite the leaves; stems procumbent or climbing. ♄. ◡. G. Native of New Holland at King George's Sound. Sims, bot. mag. t. 1218. H. crenàta, Andr. bot. rep. t. 472.

Gooseberry-leaved Hibbertia. Fl. Mar. Aug. Clt. 1573. Sh. cl.

§ 2. *Carpels* 1-8, *glabrous.*

2 H. volu'bilis (Andr. bot. rep. t. 126.) leaves obovate-lanceolate, nearly quite entire, mucronate, under surface pubescent; flowers sessile, with 4-8-styles; stems twining. ♄. ⌒. G. Native of New Holland near Port Jackson. Dillènia speciòsa, Curt. bot. mag. t. 449. exclusive of the synonyms. Dillènia hùmilis, Donn. hort. cant.? Dillènia turneræflòra, Gawl. recens. pl. bot. rep. 27. Dillènia scándens, Willd. spec. p. 1251. Duham. arb. ed. 2. vol. 4. p. 239. t. 63. Dillènia intègra, Mœnch. suppl. t. 76. Dillènia volùbilis, Vent. choix. p. 11. t. 11. Pers. ench. 2. p. 72. Flowers fetid, about the size of those of *Cistus Ladaníferus.* Seeds black, pea-formed, compressed, hard, exarillate.

Twining Hibbertia. Fl. May, Oct. Clt. 1790. Shrub cl.

3 H. denta'ta (R. Br. in D, C. syst. 1. p. 426.) leaves oblong, acuminated, smooth, serrated, awned; flowers on peduncles with 3 styles; stems twining. ♄. ⌒. G. Native of New Holland on the Blue Mountains. Ker. bot. reg. t. 282. Lodd. bot. cab. t. 347. Sims, bot. mag. t. 2338.

Var. β, pedicels and calyx smooth or scarcely pilose; leaves more serrated.

Toothed-leaved Hibbertia. Fl. Jan. Aug. Clt. 1814. Sh. cl.

4 H. sali'gna (R. Br. in D. C. syst. 1. p. 427.) leaves oblong-linear, mucronately-pointed at the apex, quite entire, under surface villous; flowers sessile, with 2-4 styles; stem erect. ♄. G. Native of New Holland about Port Jackson and among brushwood in several parts of the Blue Mountains, particularly about Spring Wood. Stamens 25-30.

Willow-leaved Hibbertia. Fl. May, Aug. Clt. 1823. Sh. 3 ft.

5 H. procu'mbens (D. C. syst. 1. p. 427.) leaves linear, acuminated, thickish, smooth, veinless; flowers nearly sessile, with 3-5 styles; stems procumbent. ♄. G. Native of New Holland and Van Diemen's Land. Dillènia procúmbens, Lab. nov. holl. 2. p. 16. t. 156. H. angustifòlia, Sal. par. lond. no. 73. Flowers the size of those of *Lysimàchia nummulària.* Stamens 16-24. Seeds immersed in pulp.—Perhaps a proper genus.

Procumbent Hibbertia. Shrub trailing.

6 H. virga'ta (R. Br. in D. C. syst. 1. p. 428.) leaves linear, bluntish, smooth; flowers sessile, with 7-8 anthers and 3-4 styles; stem erect. ♄. G. Native of New Holland about Port Jackson. A small, slender, smooth shrub.

Twiggy Hibbertia. Fl. May, Aug. Clt. 1822. Shrub 2 ft.

7 H. fasciula'ta (R. Br. in D. C. syst. 1. p. 428.) leaves linear, awl-shaped, smooth, in fascicles; branchlets rather pilose; flowers sessile, with 3-4 styles; stem erect. ♄. G. Native of New Holland about Port Jackson. This shrub has the appearance of *Hypéricum fasciculàtum.* Stamens 11-12.

Fascicled-leaved Hibbertia. Shrub 1 foot.

8 H. linea'ris (R. Br. in D. C. syst. 1. p. 428.) leaves linear, acute, quite entire, smooth; flowers sessile, with 2 styles and 20 stamens; stem erect. ♄. G. Native of New Holland about Port Jackson.

Linear-leaved Hibbertia. Fl. Jul. Aug. Clt. 1821. Sh. 2 ft.

9 H. obtusifo'lia (D. C. syst. 1. p. 429.) leaves linear, ob-

tuse, narrowed at the apex, smooth; flowers sessile, with 20 stamens and 2 styles; stem erect. ♄. G. Native of Van Diemen's Land in dry sandy places. This species is very like *H. lineàris*, and is perhaps only a variety of it.

Blunt-leaved Hibbertia. Fl. Jun. Aug. Clt. 1824. Sh. 2 feet.

10 H. DIFFU'SA (R. Br. in D. C. syst. 1. p. 429.) leaves cuneated, toothed at the apex, smooth; flowers sessile, with 2-3 styles and 20 stamens; stem diffuse. ♄. G. Native of the eastern coast of New Holland.

Var. β, leaves oblong-cuneated. Differing from the species in the leaves being nearly oblong, entire, and emarginate, or furnished with 2-3 teeth on the margin.

Diffuse-stemmed Hibbertia. Shrub 1 foot.

11 H. MONO'GYNA (R. Br. in D. C. syst. 1. p. 429.) leaves spatulate, cuneated at the base, 2-3-toothed at the apex, smooth; flowers sessile, with 1 style, and 12 stamens; stem erect. ♄. G. Native of New Holland in the mountains and about Port Jackson. Carpel 1-globose, membranous, indehiscent, 1-seeded. Stamens 12-13.

One-styled Hibbertia. Shrub 1 foot.

§ 3. *Carpels 2-4, velvety from short pubescence, or covered with little scales.*

12 H. PEDUNCULA'TA (R. Br. in D. C. syst. 1. p. 430.) leaves linear, bluntish, with somewhat revolute margins; flowers on pedicels, digynous; ovaries rather hoary. ♄. G. Native of New Holland about Port Jackson. Lindl. bot. reg. t. 1001. H. corifòlia, Sims, bot. mag. t. 2672. Ovaries 2, globose, hoary. Styles filiform, scarcely exceeding the stamens in length. A little shrub, having the appearance of a species of *Heliánthemum*. Stamens 12-13.

Peduncled-flowered Hibbertia. Fl. May, Aug. Clt. 1821. Shrub 1 foot.

13 H. SERPYLLIFO'LIA (R. Br. in D. C. syst. 1. p. 430.) leaves elliptical, obtuse, quite entire, smooth; flowers on pedicels with 2 styles, and 8-10 stamens; ovaries villous. ♄. G. Native of New Holland on the eastern coast. Anthers oblong, longer than the filaments.

Wild-thyme-leaved Hibbertia. Shrub 1 foot.

14 H. CANE'SCENS (Sieb. pl. nov. holl. ex Spreng. syst. app. p. 211.) leaves spatulate-linear, pilose above, smooth beneath; branches villous; ovaries pubescent. ♄. G. Native of New Holland.

Canescent Hibbertia. Shrub 2 feet.

15 H. A'SPERA (D. C. syst. 1. p. 430.) leaves oblong, obtuse, with rather revolute margins, upper surface rather scabrous, under surface greyish-velvety; flowers on short pedicels with 2 styles; ovaries hairy. ♄. G. Native of New Holland. Perhaps a species of *Pleurándra*.

Rough-leaved Hibbertia. Shrub 1 foot.

16 H. HERMANNIÆFO'LIA (D. C. syst. 1. p. 431.) leaves obovate-cuneated, blunt, villous-tomentose on both surfaces, the hairs on the upper surface are simple, those on the under surface are stellately-branched; flowers on pedicels, digynous; ovaries tomentose. ♄. G. Native of New Holland on the mountains. Stamens 15-16.

Hermannia-leaved Hibbertia. Shrub 1 foot.

17 H. OBLONGA'TA (R. Br. in D. C. syst. 1. p. 431.) leaves oblong, quite entire, upper surface smooth, under surface velvety with stellate hairs; nerves confluent at the margins; flowers on pedicels, digynous; ovaries scaly. ♄. G. Native of Carpentaria. Carpels globose, somewhat triquetrous. Stamens 20-25.

Oblong-leaved Hibbertia. Shrub 2 feet.

18 H. CISTIFO'LIA (R. Br. in D. C. syst. 1. p. 431.) leaves oblong, quite entire, 1-nerved, upper surface pubescent with starry hairs, under surface white-velvety; flowers on pedicels digynous; ovaries scaly. ♄. G. Native of New Holland in Arnheim Land. Stamens 20-25.

Cistus-leaved Hibbertia. Fl. May, Aug. Clt. 1826. Sh. 1 ft.

19 H. TOMENTO'SA (R. Br. in D. C. syst. 1. p. 432.) leaves oblong-linear, 1-nerved, quite entire, tomentose on both surfaces; flowers on pedicels digynous; calyxes and ovaries scaly. ♄.G. Native of Carpentaria. Ovaries globose; styles smooth, filiform. Stamens 20-24.

Tomentose Hibbertia. Shrub 1 foot.

20 H. LEPIDO'TA (R. Br. in D. C. syst. 1. p. 432.) leaves linear, acuminated, very entire, scaly on both surfaces; pedicels crowded, 1-flowered; flowers digynous; ovaries scaly. ♄. G. Native of Carpentaria. Styles arched, filiform, smooth. Stamens about 10.

Scaly Hibbertia. Shrub 1 foot.

Cult. All the species of *Hibbértia* are very ornamental. They thrive best in an equal mixture of sandy-loam and peat. Cuttings put in in the spring or summer root freely under a hand-glass in the same kind of soil. The climbing species are very desirable for conservatories.

XV. WO'RMIA

(in honour of Olaus Wormius, M.D. a celebrated Danish philosopher and naturalist, successor of Caspar Bartholin in the professorship of medicine at Copenhagen. He died rector of the university in 1659. His Latin writings on the history and antiquities of Denmark and Norway are valued for their accuracy.) Rottb. nov. act. hafn. 1783. vol. 2. p. 522. t. 3. D. C. syst. 1. p. 433. prod. 1. p. 75.

LIN. SYST. *Polyándria, Pantagýnia.* Sepals 5, very obtuse, permanent. Petals 5, deciduous. Stamens indefinite, free, filiform, equal. Styles 5, filiform; stigmas emarginate. Carpels 5, capsular, opening on the inside, 8-12 seeded, with pulp or aril at the base of the seeds. Elegant trees, with white or yellow flowers.

1 W. MADAGASCARIE'NSIS (D. C. syst. 1. p. 433.) leaves oval, bluntly sinuated; flowers in branched panicles. ♄. S. Native of Madagascar. Deless. icon. sel. 1. t. 82. Clúgnia volùpis, Comm. herb. et icon. ined. Lenìdia Madagascariénsis, Poir. suppl. 3. p. 330. Panicles near to the top of the branches opposite the leaves.

Var. α, *rotundifòlia;* leaves orbicular, somewhat cordate at the base.

Var. β, *oblongifòlia;* leaves oblong, not cordate at the base. A very elegant tree.

Madagascar Wormia. Tree 25 feet.

2 W. DENTA'TA (D. C. syst. 1. p. 434.) leaves ovate, retuse, coarsely and acutely toothed; peduncles triquetrous 3-6-flowered. ♄. S. Native of Ceylon. Dillènia dentàta, Thunb. in Lin. soc. trans. 1. p. 201. t. 20. Petals 5, orbicular. Ovaries 5. This tree is called *Diapara* in Ceylon.

Toothed-leaved Wormia. Fl.? Clt. 1818. Tree 20 feet.

3 W. TRIQUE'TRA (Rottb. nov. act. hafn. 2. p. 532. t. 3.) leaves ovate, rather obtuse, and bluntly sinuated; peduncles triquetrous, racemose. ♄. S. Native of Ceylon. Ovaries 3-sided, approximate. Styles reflexed. Stamens very short.

Triquetrous-peduncled Wormia. Tree 20 feet.

4 W. ALA'TA (R. Br. in D. C. syst. 1. p. 434.) leaves oval, quite entire; petioles winged. ♄. G. Native of New Holland at Endeavour River. Styles awl-shaped, diverging, longer than the stamens.

Wing-petioled Wormia. Tree 20 feet.

Cult. Elegant trees, requiring the heat of a stove, with the exception of *W. alàta.* They will thrive well in a mixture of loam, peat, and sand. Ripened cuttings not deprived of their leaves will root freely, if planted in a pot of sand with a hand-glass placed over them, in heat: those of *W. alàta* do not require heat.

XVI. COLBE'RTIA (in honour of John Baptist Colbert, marquis Seignelai, a famous French statesman, and patron of the Paris garden, who destroyed with his own hands the vines which had been planted therein, in lieu of more curious objects; died 1683.) Sal. par. lond. no. 73. D. C. syst. 1. p. 435. prod. 1. p. 75.

Lin. syst. *Polyándria, Tetra-Polygýnia.* Sepals 5-6, permanent. Petals 5, deciduous. Stamens indefinite, free, 10-50 of which are much longer than the rest, bearing empty anthers. Anthers opening by a double pore. Carpels 4-12, joined into a ribbed baccate fruit. Styles 4-12, diverging. Stigmas capitate? Seeds reniform, many in each cell, all imbedded in a pellucid glutinose pulp. Trees with broad leaves and yellow flowers.

1 C. Coromandelia'na (D. C. syst. 1. p. 435.) leaves oblong, villous on the nerves beneath; pedicels 1-flowered, fascicled; petals oval-oblong, acute; sepals ovate, obtuse. ♄. S. Native of Coromandel in mountain valleys. Dillènia pentágyna, Roxb. corom. 1. p. 21. t. 20. Leaves oblong, like those of *Dillènia speciòsa*, but larger. Pedicels 1-flowered, several of which rise from the same floriferous bud, along the naked branches of the preceding year. An elegant tree with yellow flowers. Fruit pendulous.

Coromandel Colbertia. Fl. March, April. Clt. 1803. Tree 20 feet.

2 C. scabre'lla (D. Don. prod. fl. nep. p. 226.) leaves elliptical, acute, tapering to the base, pilose on both surfaces, with bristly serratures; peduncles in axillary fascicles, each furnished with two opposite bracteas, glabrous; leaflets of calyx oval-roundish; petals orbicular or obovate; anthers obtuse. ♄. S. Native of Bengal. Dillènia scabrélla, Roxb. hort. beng. p. 43. Wall. pl. asiat. rar. p. 20. t. 22. Leaves 1 foot long, deciduous. Ovaries 6-7. Flowers yellow, fragrant. The fleshy leaves of the calyx have a pleasant acid taste, and are used in curries by the inhabitants of Chittagong in the same manner as those of *Dillènia speciòsa*.

Rough-leaved Colbertia. Fl.? Clt. 1820. Tree 3 feet.

3 C. obova'ta (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 492.) leaves obovate, serrated; peduncles 1-flowered; flowers polygynous. ♄. S. Native of Java. Wórmia obovàta, Spreng. syst. app. p. 213. Ovaries 12.

Obovate-leaved Colbertia. Tree 20 feet.

4 C. augu'sta (Wall. in litt.) leaves large, obovate feather-nerved; nerves bifid at the apex, each terminating in a mucrone, all villous; pedicels 1-flowered, aggregate, axillary. ♄. S. Native of the East Indies. Dillènia augústa, Roxb. Leaves 1 foot long and 7 inches broad. The points of the nerves are the teeth of the leaves. Flowers yellow.

August Colbertia. Tree 40 feet.

Cult. Colbértia is a genus of elegant trees resembling *Dillènia*. The species will thrive well in sandy loam, or a mixture of loam and peat. Ripened cuttings root freely in sand under a hand-glass plunged in a moderate heat, but they must not be deprived of any of their leaves.

XVII. CAPE'LLIA (Capell, the name of some botanist?) Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 492.

Lin. syst. *Polyándria Polygýnia.* Stamens indefinite, free, the inner ones much longer than the rest in one row. Carpels 5-8 or more, membranous, joined into a globose fruit. Cells many-seeded, opening on the inside; seeds disposed in a double series at the margins of the carpels. Styles awl-shaped, diverging. Sepals and petals 5, the latter deciduous.—A tall tree, with oblong repand-serrulated, smooth leaves, and terminal many-flowered peduncles. Flowers yellow. This genus differs from *Colbértia* in the fruit not being baccate nor pulpy, and in the carpels opening inwardly. It differs from *Dillenia* in the petals being deciduous, not permanent, as well as in the stamens being unequal.

1 C. multiflo'ra (Blum. l. c.) ♄. S. Native of Java.

Many-flowered Capellia. Tree 40 feet.

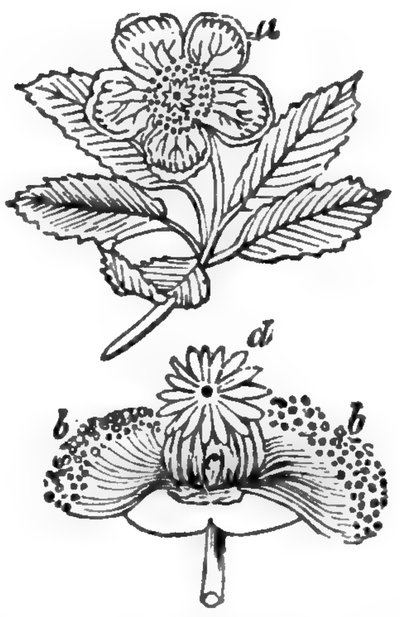
Cult. Capéllia will require the same treatment as that recommended for the species of *Dillènia*.†

XVIII. DILLE'NIA (in honour of John James Dillenius, the famous professor of botany at Oxford, author of Historia Muscorum and Hortus Elthamensis, &c.) Lin. gen. no. 688. D. C. syst. 1. p. 435. prod. 1. p. 75.

Lin. syst. *Polyándria, Polygýnia.* Sepals and petals 5, both permanent. Stamens indefinite, free, equal (f. 19. *b.*) Carpels 10-20, joined into a spurious, many-celled, many-seeded berry (f. 19. *c.*) crowned by the radiant stigmas (f. 19. *d.*) Elegant trees, with large white or yellow flowers. Fruit eatable, of an acid taste.

1 D. specio'sa (Thunb. in Lin. soc. trans. 1. p. 200.) leaves elliptical-oblong, simply serrated; peduncles 1-flowered. ♄. S. Native of Malabar, especially about Cochin and Moutan; also in Java and Ceylon. Smith, exot. bot. 1. t. 2. Syalita, Rheed. mal. 3. p. 39. t. 38 and 39. D. I'ndica, Lin. spec. 745. A tall elegant tree, with leaves like those of the sweet chesnut. Flowers large, with white petals and yellow anthers. (f. 19.)

FIG. 19.



The fruit is eatable, though very acid, which, as Rheede informs us, requires sugar, broth, or some other addition to make it palatable. The acid juice of the fruit, with sugar, is used in India mixed with water as a pleasant cooling beverage in fevers.

Shewy Dillenia. Fl.? Clt. 1800. Tree 40 feet.

2 D. au'rea (Smith, exot. bot. t. 92, 93.) leaves elliptical-oblong, serrated; flowers often solitary on peduncles, rising before the expansion of the leaves. ♄. S. Native of the East Indies, near the river Gogra. A deciduous tree, with the appearance of *D. speciòsa*. Margins of seeds not fringed. Flowers yellow.

Golden-flowered Dillenia. Tree 30 feet.

3 D. orna'ta (Wall. pl. asiat. rar. p. 21. t. 23.) leaves obovate, remotely crenately toothletted, stalked, smooth above, but pubescent beneath; flowers solitary, terminal. ♄. S. Native of the East Indies in the forests of the principal rivers in Malabar. A noble deciduous tree, resembling the *Teak* when in foliage. Flowers large, yellow, fragrant. Stigmas 9, stellately spreading. Perhaps a species of *Colbértia*.

Ornamented Dillenia. Fl. March. Tree 50 feet.

4 D. inte'gra (Thunb. in Lin. trans. 1. p. 199. t. 18.) leaves oblong-obovate, obtuse, nearly entire; peduncles 1-flowered. ♄. S. Native of Ceylon. A tree with broad leaves. Flowers terminal on the extreme branches. This is perhaps a species of *Wórmia* as well as *D. ellíptica* and *D. retùsa*. Called in Ceylon *Gudapara* and *Runumidale*.—A decoction of the leaves is used by the inhabitants for cleansing foul ulcers.

Entire-leaved Dillenia. Fl.? Tree 30 feet.

5 D. elli'ptica (Thunb. in Lin. soc. trans. 1. p. 200.) leaves elliptical-ovate, acute, serrated; peduncles 1-flowered. ♄. S. Native of Amboina, Celebes, near Tambocco. Sòngium, Rumph. amb. 2. p. 140. t. 45. A tree like *Cìtrus Limònia*, with leaves about 2 feet long. Flowers white. Fruit the size of an orange, filled with copper-coloured bitterish-sweet pulp; it is

either eaten in a crude state, or when ripe is used as a sauce with fish.

Elliptic-leaved Dillenia. Tree 30 feet.

6 D. SERRA'TA (Thunb. in Lin. soc. trans. 1. p. 201.) leaves elliptical-ovate, acute, serrated; peduncles 3-flowered. ♄. S. Native of Java and other parts of India. Sángius, Rumph. amb. 2. p. 142. t. 46. Fruit eatable, the size and form of an orange, of a sweetish-acid taste, either yellow, white, or reddish.

Serrated-leaved Dillenia. Tree 30 feet.

7 D. RETU'SA (Thunb. in Lin. soc. trans. 1. p. 200. t. 19.) leaves obovate, truncate at the apex, remotely toothed, peduncles 1-flowered. ♄. S. Native of the woods of Ceylon. Lam. ill. t. 492. f. 2. A tree with leaves two hands long and one broad. Petals obovate, three times longer than the calyx.

Retuse-leaved Dillenia. Tree 30 feet.

Cult. *Dillènia* is a splendid Indian genus of trees. The species thrive well in the collections of this country. A light loamy soil suits them best, or a mixture of loam and peat. Ripened cuttings not deprived of their leaves strike root freely, in a pot of sand, under a hand-glass, plunged in heat. The plants will not bear tobacco smoke, as it turns the leaves brown, and consequently many of them will drop. The house in which they are kept should never be allowed to get below 60 degrees of Fahrenheit's thermometer, as this would also injure their leaves. Sweet, bot. cul. p. 61 and 62.

ORDER III. MAGNOLIA'CEÆ (plants agreeing with Magnòlia in many important characters.) D. C. theor. pl. 213. syst. 1. p. 439. prod. 1. p. 77. Parts of flower imbricate in the bud. Calyx of 3 (f. 22. *a.*) or 6 deciduous sepals. Petals 3-27 (f. 20, 21, 22. *a.*) disposed in a ternary order, in one or many series. Stamens indefinite, free. Anthers adnate, elongated. Ovaries numerous (f. 21. *b.* f. 22. *b.*), inserted in the torus above the stamens, usually disposed in spikes, rarely connected at maturity, 1-celled, 1 or many seeded (f. 20. *g.* f. 21. *c.*), sometimes capsular (f. 22. *b.*), and opening either on the under or upper side, sometimes fleshy (f. 21. *b.*) indehiscent, sometimes samaræformed (f. 20. *f.*). Seeds adnate to the inner angle of the carpel (f. 20. *g.*). Embryo straight, small, inferior (f. 20. *h.*). Albumen fleshy.—Elegant trees and shrubs, natives of Asia and America, with alternate feather-nerved leaves articulately inserted, and involute when in the bud. Stipulas 2, deciduous, when young convolute and terminating the branches in a conical acumen, resembling that of the fig-tree. Flowers beautiful, usually with a delicious fragrance. This order differs from *Dilleniàceæ* in the parts of the flowers being disposed in a ternary order, not quinary, and from *Anonàceæ* in the albumen being continuous, not pierced by the processes of the seed-coat, but it is more easily distinguished from that order in the presence of stipulas. The grandeur of the *Magnòlias* is known to all lovers of plants, as well as the delicious though dangerous fragrance of their flowers, and very few of the other genera are inferior to them, but it is less generally known, that from their affinity to the trees that produce the famous *Winter's-bark* and *Melambo-bark*, they possess qualities of no common power. The bark of all the plants of this order is said to have a bitter flavour without any astringency, combined with a hot aromatic flavour. In the United States the bark of the *Magnòlia glaúca* and *Liriodéndron tulípifera* is employed for the same purposes as *Jesuit's-bark*, and from the fruit of *Magnòlia acuminàta* a tincture is prepared which has some reputation for removing attacks of rheumatism. The fruit of *Illícium anisàtum*, is the material which flavours the liqueur called Anisette de Bourdeaux. The pericarps are usually aromatic. The seeds are generally bitter, and retain their vegetative power a considerable time, therefore, in most instances they may be imported in a living state from any part of the world.

Synopsis of the Genera.

TRIBE I.

ILLICIE'Æ (*D. C. prod.* 1. *p.* 77.) *Carpels disposed in whorles* (f. 20.) *rarely solitary from abortion. Leaves full of pullucid dots.*

1 ILLI'CIUM. Capsules stellately disposed, capsular, opening above; 1-seeded; seeds shining. Calyx of 3-6 petal-like sepals.

2 TE'MUS. Carpels 2, baccate, joined together? Seeds arillate. Style 1. Calyx trifid.

3 DRI'MYS. Carpels crowded, baccate, many-seeded (f. 20. *g.*) Filaments of stamens thickest at the top, and bearing separated cells (f. 20. *d.*) Calyx entire, or 2-3-parted.

4 TASMA'NNIA. Carpel solitary, membranous, indehiscent, many-seeded. Calyx 3-sepalled or 3-parted.

TRIBE II.

MAGNOLIE'Æ (*D. C. prod.* 1. *p.* 79.) *Carpels spicately disposed along the axis* (f. 21. *b.* f. 22. *b.*) *Leaves destitute of pellucid dots.*

5 MANGLIE'TIA. Carpels 2-valved, numerous, permanent, many-seeded, disposed in a dense imbricated cone. Calyx spathaceous, irregularly deciduous.

6 MICHE'LIA. Carpels disposed in loose spikes (f. 21. *b.*) somewhat baccate, opening at the top, many-seeded. (f. 21. *c.*) Calyx of 3-sepals.

7 MAGNO'LIA. Carpels disposed in crowded spikes, opening by the external angle, 1-2-seeded, permanent. Calyx of 3 sepals.

8 TALA'UMA. Carpels disposed in spikes, 1-2-seeded, joined together into a shobile-like fruit (f. 22. *b.*) opening valvately and irregularly on the outside. Calyx of 3 sepals (f. 22. *a.*)

9 AROMADE'NDRON. Carpels 1-2-seeded, joined into a ligneous fruit. Calyx of one spathaceous leaf.

10 LIRIODE'NDRON. Carpels disposed in spikes, 1-2-seeded, indehiscent, deciduous, each drawn out into a wing. Calyx of 3 sepals.

Tribe I.

ILLICIE'Æ (plants agreeing in character with *Illícium*,) D. C. prod. 1. p. 77. Carpels disposed in a whorl, very rarely solitary from abortion. Leaves full of pellucid dots.

I. ILLI'CIUM (from *illicio*, to allure; on account of the agreeable aromatic smell of the species.) Lin. gen. 611. Gært. fruct. 1. p. 339. t. 69. Juss. gen. 281. Lam. illust. t. 493. D. C. syst. 1. p. 440. prod. 1. p. 77.

LIN. SYST. *Polyándria, Polygýnia.* Calyx of 3-6 petal-like sepals. Carpels stellately disposed, capsular, opening on the upper side, 1-seeded. Seeds shining. Evergreen smooth shrubs,

with oblong stalked coriaceous leaves. The species are powerfully carminative and stomachic, especially *Ill. anisàtum*.

1 I. Florida'num (Ellis. in phil. trans. 1770. p. 524. t. 12.) petals 27-30 dark purple, outer ones oblong, inner ones lanceolate. ♄. F. Native of West Florida on the banks of the river Mississippi, and in marshy places near the town of Pensacola. Lam. illustr. t. 493. f. 1. Lois. herb. amat. t. 174. Curt. bot. mag. 439. Lodd. bot. cab. t. 209. Bigel. amer. med. bot. t. 48. The leaves when bruised smell like anise, as well as the rest of the plant. The bark and leaves are strongly impregnated with a spicy aromatic taste and smell, approaching that of *Magnòlia* and *Liriodéndron*, but perhaps more similar to that of *Anise* or *Coriander* seeds. This aroma is preserved in the distilled water, and fills the room with its fragrance while distillation is going on. The medicinal properties of this shrub are not ascertained, but from its bitter taste and aromatic quality it would appear to be analogous with *Sassafras canella* and *Cascarilla* and other aromatic barks, which are regularly consumed in the shops.

Florida Anise-seed-tree. Fl. April, June. Clt. 1766. Shrub 8 feet.

2 I. anisa'tum (Lin. spec. 664.) petals 27-30, yellowish, outer ones oblong, inner ones linear-awl-shaped. ♄. F. Native of Japan and China, where it is also cultivated in gardens as an ornament. Gært. fruct. 1. p. 338. t. 69. Lam. ill. t. 493. f. 2. —Clus. hist. 2. p. 202. f. 3. The capsules of this plant are imported from China under the name of *Chinese anise*, they are used as an aromatic condiment to communicate an agreeable flavour to certain dishes. It is the material which flavours the liqueur called *Anisette de Bourdeaux*. In Japan they place bundles and garlands of this tree in their temples before their idols, and on the tombs of their friends. They also burn the powdered bark as incense to their idols. The plant is stomachic and carminative, and is used in the eastern countries in the colic, rheumatism, &c. The Chinese chew it after dinner as a stomachic and sweetener of the breath. In some parts of the East Indies the natives and the Dutch settlers mix it with their tea and sherbet. A branch put into the decoction of *Tetràodon hispidum* is supposed to increase the virulence of that poison. The bark finely powdered is used by the public watchmen in Japan to make a chronometer or instrument for measuring the hours, by slowly sparkling at certain spaces in a box, in order to direct when the public bells are to sound.

Chinese *Anise*-seed-tree. Fl. April, June. Clt. 1790. Shrub 8 feet.

3 I. parvifio'rum (Mich. fl. bor. amer. 1. p. 326.) petals 9-12, yellowish, ovate-roundish. ♄. F. Native of Western Florida, near Lake George. Vent. cels. t. 22. Lois. herb. amat. t. 330. Ph. fl. amer. sept. 2. p. 380. Sepals 3 ovate, somewhat ciliated. A small shrub. Leaves scented. Flowers scentless. The bark has exactly the flavour of the *Sassafras* root.

Small-flowered Anise-seed-tree. Fl. May, June. Clt. 1790. Shrub 3 feet.

Cult. The species of this genus thrive well in a light loamy soil, or a mixture of loam and peat; and they are readily increased by layers. Ripened cuttings planted in a pot of sand will root freely under a hand-glass.

II. TE'MUS (*Temo* is the name of this tree in Chili.) Mol. chil. 153. Juss. gen. 435. D. C. prod. 1. p. 78.

Lin. syst. *Polyándria*, *Digýnia*. Calyx 3-cleft. Petals 18, linear, very long. Stamens 26 (27 ?) shorter than the petals; anthers globose. Ovaries 2, each terminated by a style. Carpels 2, baccate, (joined ?). Seeds arillate. An evergreen tree. Leaves alternate, stalked, oval, smooth, smelling like the nutmeg when bruised. Flowers terminal, flesh-coloured.

1 T. moscha'ta (Mol. chil. 153.) ♄. G. Native of Chili. Gmel. syst. 1. p. 831. Poir. dict. 7. p. 595. Leaves crowded on the branches, 2 inches long; green shining. Flowers sweet-scented; lobes of calyx blunt; petals flesh-coloured, narrow, 2 or 3 inches long. Filaments of stamens setacious, one-half shorter than the petals. Berries like coffee, but exceedingly bitter. (Mol.)

Musk-scented Temus. Shrub 10 feet?

Cult. This fine shrub will grow freely in a mixture of loam and peat, and ripened cuttings will root freely if planted in a pot of sand with a hand-glass placed over them.†

III. DRI'MYS (from δριμυς, *drimys*, acrid, or δριμυτης, *drimytes*, sharpness; taste of bark.) Forst. gen. t. 42. Lam. ill. t. 494. Lin. fil. sup. 268. Juss. gen. 280. D. C. syst. 1. p. 442. prod. 1. p. 78.

Lin. syst. *Polyándria*, *Tetragýnia*. Carpels crowded, baccate, many-seeded (f. 20. *g*.) Filaments of stamens thickest at the top. Anthers twin (f. 20. *d*.) This genus, from the structure of its stamens and subpersistent calyx, is a little allied to *Delìma*. Evergreen trees, with acrid aromatic bark, and axillary and terminal flowers.

Sect. I. Eudri'mys (from ευ, *eu*, well or good; δριμυς, *drimys*, acrid; taste of bark, or more probably from its containing the original species of Drìmys.) Calyx entire, dehiscent. Flowers small.

1 D. axilla'ris (Fort. gen. t. 42.) leaves oblong, acuminated at both ends; pedicels 2-3 together, 1-flowered; petals 6 ovate. ♄. G. Native of New Zealand in woods. Lam. ill. t. 494. f. 2. Wintèra axillàris, Willd. spec. 2. p. 1240. Ovaries 4-seeded. The flavour of the whole plant, especially of the bark, is extremely acrid and pungent.

Axillary-flowered Drimys. Shrub 10 feet.

Sect. II. Winte'ra (to the honour of William Winter, captain R.N., who went round the world with Sir Francis Drake, see *D. Wintèra*.) Calyx 2-3 parted, or of 2-3 sepals.

2 D. Winte'ri (Forst. gen. p. 84. t. 42.) leaves oblong, obtuse, under surface glaucous; peduncles almost simple, aggregate, divided into elongated pedicels; petals 6, oblong. ♄. F. Native of the Straits of Magellan and of Statenland. Winteràna aromática, Sol. med. obs. 5. p. 46. t. 1. Wintèra aromática, Murr. syst. 507. Winteranus cortex, Clus. exot. 75.

β, *punctàta* (Lam. dict. 2. p. 330. ill. t. 494. f. 1.) leaves less glaucous and more distinctly dotted.

This is a tree from 6 to 40 feet high, with knotty branches and a thick aromatic pungent bark. Flowers milk-white about the size of a *hawthorn* blossom, and smelling like *jasmine*. Berries from 3 to 6 of a light green colour, with a few black spots containing several, usually 4, black aromatic seeds. Captain William Winter, who went out with Sir Francis Drake, when he went round the world, at his return brought the bark of this tree with him from the Straits of Magellan. He had found it to be very useful to his ship's crew, both instead of other spices to their meat, and as a medicine very powerful against the scurvy. And Sebald de Weert says, that both leaves and bark were used with their meat and muscles, to correct them in so cold a climate.

Mr. George Handyside brought home with him a specimen of the leaves, flowers, and seed. He used the leaves, with other herbs, in fomentations with very good success: he also gave the bark inwardly, boiling half a drachm with some carminative seeds, and giving to those of the crew who were very much afflicted with the scurvy. It usually sweated them, and they were very much relieved. He likewise administered the same medicine to many of the crew who were very ill from eating the sea-lion; and were much relieved by it, although they had lost most of their skin, which peeled off in large pieces (Martyn). This bark

is not much used in practice at present, there being many drugs of equal or superior power, as *Canèlla álba*, &c.

Winter's-bark. Fl. Dec. Clt. 1827. Tree 40 feet.

3 D. Granate'nsis (Lin. fil. suppl. 269.) leaves ovate-oblong or oblong, acute, gradually tapering to the base, under surface glaucous; peduncles umbellate, 3-5-cleft, sometimes simple, usually aggregate at the tops of the branches. ♄. S. Native of New Granada, and in the kingdom of Santa-Fe de Bogota in the mountains at the height of 9300 feet, also of Brasil in the province of Minas Geraes. Humb. Bonpl. pl. æquin. 1. p. 205. t. 58. St. Hil. pl. usu. bras. t. 26 and 28. Wintèra Granaténsis, Murr. syst. 507. Drìmys Wintèri, Mart. Reis. 1. p. 280. but not of Lin. The flavour of the bark is the same as the preceding. A tree about 20 feet high, called in New Granada *Agi*, and in the province of Quito and Popaya *Canela de Parama*. Flowers white, rather larger than those of *D. Wintèri*; petals about 12.

FIG. 20.

Var. α, *campéstris* (St. Hil. fl. bras. 1. p. 22. pl. usuell. bras. t. 26.) stem shrubby or arboreous; leaves 2 or 3 inches long, obovate-oblong, very blunt; with the nerves rufescent on the under surface; peduncles 3-5-cleft, but usually 4-cleft; pedicels short, aggregate at the top of the branches rising from the axils of the caducous bracteas; petals usually 10, oblong-linear, blunt. ♄. S. Native of Brazil in fields on the banks of rivers.

Var. β, *sylvática* (St. Hil. l. c. pl. usu. bras. t. 27.) stem arboreous; leaves 4-6 inches long, oblong, rather narrow and rather acute, hoary beneath with rufescent nerves; peduncles umbellate, 3-4, but usually 5-cleft, very numerous, crowded at the tops of the branches, rising from the axils of the caducous bracteas; pedicels slender, longer than the peduncles; petals 5-7 lines long, linear, acute. Native of Brazil in woods, usually on the banks of rivulets. (f. 20.)

Var. γ, *axillàris* (St. Hil. l. c.) stem arboreous; branches glaucous; leaves 2 or 3 inches long, full of pellucid dots; hoary glaucous beneath, with reddish nerves; peduncles umbellate, 3-4 cleft, but often 5-cleft, rising from the axils of the upper leaves; pedicels shorter than the peduncles; petals usually 10, oblong-linear, narrowest at the base, rather acute at the apex. Native of Brazil on mountains near Villa Ricca.

Var. δ, *montàna* (St. Hil. l. c. pl. usu. bras. t. 28.) stem shrubby, a little branched; leaves crowded, 1 or 1½ inches long, obovate oblong, obtuse, usually somewhat emarginate, hoary pubescent beneath; peduncles crowded, not numerous, usually lateral, rising from the axils of the caducous bracteas, simple, 1-flowered or divided, longer than the pedicels; flowers small; petals 12-15, oblong-linear, obtuse. Native of Brasil on the high mountains, commonly called Serra Negra. This variety is called in Brasil *Casca d. Anta*, signifying *ecorse de taper*. The bark of all the varieties is aromatic stimulating, and the inhabitants in the provinces of the mines make much use of it. It is employed as a tonic to cure colics, and as a spice, and is much used by the inhabitants of Brasil to season their food, and therefore the plant is considered of great importance by them.

New *Granada* Winter's-bark. Tree 25 feet.

4 D. Chile'nsis (D. C. syst. 1. p. 444.) leaves oblong-obovate, under surface glaucous; pedicels crowded, 1-flowered, or rising from a common peduncle; petals 6-9, oblong, bluntish. ♄. G. Native of Chili in marshy places. Deless. icon. sel. 1. t. 83. Berries oval, somewhat compressed, blunt. A tall shrub, with very aromatic bark. Flowers white.

Chili Winter's-bark. Shrub 12 feet.

5 D. Mexica'na (Moc. et Sesse, pl. mex. ined. D. C. syst. 1. p. 444.) leaves oblong-lanceolate, acuminated at both ends; peduncles elongated, bearing 4 elongated pedicels at the apex; petals 20-24, acute. ♄. G. Native of Mexico. Berries 4, or from abortion only 2 or 3, obovate, tapering towards the base, of a bluish-violet colour. Flowers white.

Mexican Winter's-bark. Shrub 8 feet.

Cult. A mixture of loam, peat, and sand will suit the species of *Drìmys*, and ripened cuttings will probably root in sand under a hand-glass; however they are extremely difficult to preserve.†

IV. TASMA'NNIA (in honour of Tasman, a Dutch navigator; discoverer of Van Diemen's Land.) R. Br. in D. C. syst. 1. p. 445.

Lin. syst. *Diœ'cia, Polyándria.* Flowers dioecious or polygamous, small, like those of *Drìmys*. Male flowers with an indefinite number of stamens, and with the rudiment of a pistil. Female flowers with 2 sepals and 2-5 deciduous petals. Ovary 1-celled. Stigma adhering longitudinally to the inner side of the ovary. Fruit membranous, indehiscent, 1-celled, many-seeded. Stamens a little curved. This genus comes very near to *Drìmys*, but differs in the flowers being dioecious with the female ones bearing only 1 berry. Very smooth evergreen shrubs, with entire alternate leaves. Flowers crowded in the upper axils of the leaves. Pedicels 1-flowered.

1 T. aroma'tica (R. Br. in D. C. syst. 1. p. 445.) leaves oblong, gradually tapering to the base along the petiole; fruit globose, subdidymous. ♄. G. Native of the colder parts of New Holland, and especially in Van Diemen's Land. Deless. icon. sel. 1. t. 84. Winteràna lanceolàta, Poir. dict. 8. p. 799. Bark aromatic. Flowers small, white.

Aromatic-barked Tasmannia. Fl.? Clt. 1820. Shrub 8 feet.

2 T. insi'pida (R. Br. in D. C. syst. 1. p. 445.) leaves oval-oblong, abruptly eared at the apex of the very short petiole; fruit oval-oblong. ♄. G. Native of New Holland about Port Jackson. T. dipétala, R. Br. in litt. Bark insipid.

Insipid-barked Tasmannia. Shrub 8 feet.

Cult. A mixture of loam and peat will suit the species of this genus, and ripened cuttings will strike root if planted in a pot of sand with a hand-glass placed over them.

Tribe II.

MAGNOLIE'Æ (plants agreeing in character with Magnòlia). D. C. prod. 1. p. 79. Carpels disposed in spikes along the axis. Leaves destitute of pellucid dots. Calyx deciduous.

V. MANGLIE'TIA (*Manglet* is the name of *M. glaúca* in Java). Blum. bijdr. fl. ned. ind. 1. p. 8. fl. jav. fasc. 19. p. 22.

Lin. syst. *Polyándria, Polygýnia.* Calyx spathaceous, irregularly deciduous. Corolla usually 9-petalled. Stamens awl-shaped; anthers bursting inwards. Carpels numerous, somewhat 2-valved, permanent, 2 or many-seeded, disposed in a dense imbricated cone.—Elegant trees with elliptical-oblong leaves, acuminated at both ends, and glaucous beneath. Flowers solitary, terminal.

1 M. glau'ca (Blum. bijdr. 1. p. 8. fl. jav. fasc. 19. p. 22. t. 6.) leaves elliptical-oblong, acute at both ends, pale glaucous beneath; buds smooth; carpels 2-4 or many-seeded. ♄. S. Native of Java. Flowers beautiful pale yellow, fragrant.

Glaucous-leaved Manglietia. Tree 80 feet.

2 M. insi'gnis (Blum. fl. jav. fasc. 19. p. 22. in a note.) leaves oblong, acuminated; glaucous and netted, with veins be-

neath; buds clothed with rusty down; three outer petals calyciform reflexed; carpels 4-seeded; flower-bud smooth. ♄. F. Native of Nipaul on Sheopore. Magnòlia insígnis, Wall. tent. fl. nap. t. 1. This is a fine shewy tree bearing large yellowish flowers tinged with rose. Strobile ovate, densely imbricated. The wood is pale yellow of a fine grain.

Shewy Manglietia. Tree 40-60 feet.

Cult. These elegant trees never having been introduced to this country, the mode of cultivating them is unknown, but we recommend the same mode of treatment as given for *Michèlia*†.

VII. MICHE'LIA (in honour of Pietro Antonio Micheli, a celebrated Florentine botanist, died in 1737, author of Nova Plantarum Genera Flor. 1729. fol. and several other works). Lin. Gen. 691. Gært. fruct. 2. p. 263. t. 137.

LIN. SYST. *Polyándria, Polygýnia.* Carpels somewhat baccate, opening at the top, many-seeded, disposed in loose spikes (f. 21. *b.*). Calyx of 3 sepals, girded on the outside by a deciduous spath-like bractea, which open laterally. Petals 6-15. Flowers sweet-scented. These elegant trees are a great ornament in India, where they are generally known by the name of *Champa*. They are celebrated by Indian poets, and are highly venerated by the Hindus. They are good timber trees.

1 M. CHAMPA'CA (Lin. spec. 756.) leaves ovate-oblong, acuminated, acute at the base, with the ribs beneath as well as the peduncles and spaths silky. ♄. S. Native of India, where it is also very much cultivated. The tree is highly venerated by the Hindus, who have given one of its names *Tulasi* to a sacred grove of their Parnassus on the banks of the Yamuna, and it is also dedicated by them to their God Vishnu. Lam. ill. t. 493. Blum. fl. jav. fasc. 19. t. 1. M. suavèolens, Pers. ench. 2. p. 94. Champàca, Rheed. mal. 1. p. 31. t. 19. Sampàca, &c. Rumph. amb. 2. p. 199. t. 67. Flowers large, yellow, or copper-coloured, sweet scented through the day but at night they become rather fetid. Peduncles short, axillary 1-flowered. Petals oblong, 8-9 lines long and 3 lines broad. This tree is celebrated for the exquisite perfume of its flowers, of which most Europeans who have been in India speak with rapture, though some find it too powerful. The natives adorn their heads with the flowers, both for the sake of perfume and for the elegant contrast of their rich orange colour with their own black hair. The tree is of moderate size; the bark of its root red, bitter, and very acrid according to Rheede. The flowers are not unlike a double *Narcissus*. The fruit is said to be edible. The name *Champàca* is derived from Ciampa an island between Camboge and Cochinchina where the tree grows. The island is also called Tsampa, hence also *M. Tsiampàca*.

FIG. 21.

Champawk. Fl. throughout the year. Clt. 1779. Tree 30-40 feet.

2 M. KI'SOPA (Hamilt. in D. C. syst. 1. p. 448. Wall. tent. fl. nap. t. 4.) leaves ovate-lanceolate, acuminated, smooth; flowers stalked; anthers erect, acute; flower-buds villous. ♄. G. Native of Nipaul at Harain-Hetty, where it is called *Kisopa*. Very like *M. Champàca*, but differing in the leaves being more coriaceous and never drawn out along the petioles. Petals 9, more oblong and more acute. The fleshy part of the seed is aromatic. Flowers stalked, pale yellow, not above one half the size of those of *M. Champàca*, and hardly sweet-scented.

Kisopa. Fl. Oct. Nov. Tree 50 feet.

3 M. DO'LTSOPA (Hamilt. in D. C. syst. 1. p. 448. Wall. tent. fl. nap. t. 3.) leaves oval-oblong, acuminated, smooth, but rather glaucous and rather puberulous on the under surface; flowers on long stalks; stigmas revolute; anthers mucronate; flower-buds clothed with rusty tomentum. ♄. G. Native of Java and of Nipaul about Harain-Hetty, where it is called *Doltsopa*. Flowers yellow, fragrant; petals oval, 6-9, outer ones oblong, inner ones narrower. The wood is sweet-scented and is the best in Nipaul for buildings.

Doltsopa. Fl. Feb. Tree 40-60 feet.

4 M. TSIAMPA'CA (Lin. Mant. 78.) leaves elliptical, oblong, tapering a little to the base, younger ones silky on the under surface, with pubescence as well as the branchlets. ♄. S. Native of Amboyna in woods. Sampàca sylvéstris, Rumph. amb. 2. p. 202. t. 68. M. serícea, Pers. ench. 2. p. 94. This is a taller tree than *M. Champàca* and with larger leaves. Flowers corymbose on the peduncle of a light straw colour, with but little scent. The seeds are from 2 to 7 of a pale reddish colour. Perhaps many species are confounded under *M. Tsiampàca* and *M. Champàca*. The Javanese call this tree *Tsiampacca conneng*.

Tsiampaca. Fl.? Tree 60 feet.

5 M. MACROPHY'LLA (D. Don. prod. fl. nep. p. 226.) leaves lanceolate, short-pointed, waved, glabrous, tapering to the base; flowers terminal, solitary, sessile. ♄. G. Native of Nipaul. An evergreen tree with white flowers about the size of those of *Magnòlia glaúca*. Ovaries 50-60.

Large-leaved Michelia. Tree 30 feet.

6 M. LONGIFO'LIA (Blum. bijdr. fl. ned. ind. 1. p. 7. fl. jav. fasc. 19. t. 2.) leaves elliptical-oblong, tapering to both ends, smooth, stiff; peduncles, buds, and spaths silky. ♄. S. Native of Java. Flowers at first white, then yellowish, sweet-scented.

Var. β, racemòsa (Blum. fl. jav. fasc. 19. t. 3.) peduncles 1-3-flowered.

Long-leaved Michelia. Tree large.

7 M. MONTA'NA (Blum. bijdr. fl. ned. ind. 1. p. 7. fl. jav. fasc. 19. p. 15. t. 5.) leaves oval-oblong, acute at both ends, coriaceous, smooth; buds, peduncles, and spaths almost naked; petals 9, lanceolate, acute. ♄. S. Native of Java. Flowers pale yellow, sweet-scented.

Mountain Michelia. Tree 60 feet.

8 M. VELUTI'NA (D. C. prod. 1. p. 79.) leaves elliptical-oblong, acuminated, acute at the base, upper surface quite smooth, under surface velvety with white tomentum as well as the branchlets. ♄. G. Native of Nipaul and Java. Flower-buds velvety, tomentose. Flowers axillary, solitary, nearly sessile, yellow, Blum. fl. jav. fasc. 19. p. 17. t. 5 & 6. M. Tsiampàca, Blum. bijdr. fl. ind. ned. 1. p. 7.

Velvety-leaved Michelia. Tree 30 feet.

9 M. RUFINE'RVIS (D. C. syst. 1. p. 449.) leaves elliptical, oblong, acuminated at both ends, under surface at the nerves as well as petioles, spaths, and young twigs clothed with yellowish-brown pubescence; outer petals spatulate, blunt. ♄. S. Native of Java, and now cultivated in the Mauritius.

Rufous-nerved-leaved Michelia. Tree 30 feet.

10 M. PUBINE'RVIA (Blum. bijdr. 1. p. 8. fl. jav. fasc. 19. t. 4.) leaves oblong, tapering to both ends, with the veins beneath and the spaths clothed with rufous-villi; outer petals spatulate, obtuse. ♄. S. Native of Java. M. rufinérvia, Spreng. syst. app. p. 217. Flowers pale copper-coloured, sweet-scented.

Blume's Michelia. Tree 50-60 feet.

11 M. LANUGINO'SA (Wall. tent. fl. nap. t. 5.) leaves oblong, acute, clothed with dense wool on the under surface as well as the buds; flowers many-petalled. ♄. S. Native of Nipaul. Flowers large, pale yellow, very fragrant.

Woolly Michelia. Tree 60 feet.

12 M. PARVIFLO'RA (Rumph. amb. 2. p. 199. D. C. syst. 1. p. 449.) leaves elliptical, a little acuminated, smooth; branchlets, buds, and spaths clothed with rufous tomentum. ♄. S. Native of the islands of Java and Ternata. Del. icon. sel. 1. t. 85. Blum. fl. jav. fasc. 19. p. 18. M. fuscàta, Spreng. Magnòlia parviflòra, D. C. syst. 1. p. 459. Flowers small, of a livid flesh colour, or cream-coloured, sweet-scented. Peduncles axillary, solitary, 1-flowered. Petals 6, inner ones broadest.

Small-flowered Michelia. Shrub 7-10 feet.

† *Species scarcely known.*

13 M. CÆRU'LEA (Rumph. amb. 2. p. 199.) ♄. S. Native of Java, where it is called *Tsiampacca-Biru*. Flowers blue.

Blue-flowered Michelia. Tree 30 feet.

14 M. A'LBA (Rumph. amb. 2. p. 199.). ♄. S. Native of Java and Baleya. Flowers white, smaller and more pleasant than those of *M. Champàca*.

White-flowered Michelia. Tree 20 feet.

Cult. *Michelia* is a genus of highly ornamental trees. They succeed well in a mixture of loam and peat. Ripened cuttings do best in sand under a hand-glass, in heat. They take well and grow freely, inarched on the common *Purple Magnòlia*, which is the readiest way of propagating them. (Sweet.)

VIII. MAGNO'LIA (in honour of Pierre Magnol, professor of Medicine, and prefect of the Botanic Garden at Montpelier, died 1715, author of Botanicum Monspeliense, 1676, and other works). Lin. gen. no. 690. Gært. fruct. 1. p. 343. t. 70. Juss. gen. 281. Lam. ill. t. 490. D. C. syst. 1. p. 449. prod. 1. p. 79.

LIN. SYST. *Polyándria, Polygýnia.* Carpels disposed in crowded spikes, opening by the external angle, 1-2-seeded, permanent. Seeds baccate, somewhat cordate, pendulous, hanging out beyond the capsules by a very long umbilical thread. Sepals 3. A genus of highly ornamental trees. The leaves are large and entire. The flowers are solitary, terminal, very large and odoriferous. The bark is bitter and aromatic, tonic and febrifuge. Seeds also bitter and often febrifuge. Capsules aromatic.

SECT. I. MAGNOLIA'STRUM (from *Magnolia* and *astrum*, and affixed signification like; that is to say, the true *Magnolias*). D. C. syst. 1. p. 450. prod. 1. p. 80. American species, with one spath-like bractea, inclosing the flower-bud; ovaries approximate; anthers bursting outwards.

1 M. GRANDIFLO'RA (Lin. spec. 755.) evergreen; leaves oval-oblong, coriaceous, upper surface shining, under surface rusty; flowers erect, 9-12-petalled, expanded. ♄. H. Native of North America in forests, in marshy places from North Carolina to Louisiana. Lam. ill. 490. Savi. bibl. ital. 1819. no. 47. p. 219. Mich. f. arb. amer. 3. p. 71. t. 1. Duham. arb. ed. nov. vol. 2. p. 219. t. 65.

This very stately, elegant, evergreen tree rises in its native country to the height of 70 or 80 feet, dividing into many branches, which form a large pyramidal head. Leaves resembling those of the common *Laurel*, pale green and shining, about 10 inches long. Flowers large, white, sweet-scented. Fruit ovate, 4 inches long, resembling a cone. It should be planted in a sheltered situation, as it is much more tender than the other American species. In America it flowers the greater part of the summer, beginning in May; with us it does not begin till June.

Var. α, *rotundifòlia* (Sweet, hort. brit. p. 11.) leaves roundish.

Var. β, *obovàta;* leaves obovate-oblong; flowers expanded. Hort. kew. ed. 2. vol. 3. p. 329. In Carolina this variety is known by the name of *Big Laurel.*

Var. γ, *elliptica;* leaves oblong-elliptical; flowers somewhat contracted. Ait. hort. kew. ed. 2. vol. 3. p. 329. Lodd. bot. cab. 814. Mill. icon. vol. 2. t. 172. This variety is called the *Exmouth Magnòlia.* It is hardier than the other varieties, and flowers earlier.

Var. δ, *ferrugìnea* (Sims, bot. mag. 1952.) leaves oblong-lanceolate, under surface rusty; flowers somewhat contracted. This variety flowers at a smaller size than the other varieties.

Var. ε, *lanceolàta;* leaves oblong-lanceolate; flowers somewhat contracted. Ait. hort. kew. ed. 2. vol. 3. p. 329. M. grandiflòra, Andr. bot. rep. 518.

Great-flowered or Great Laurel-leaved Magnolia. Clt. 1737. Fl. June, Aug. Tree 70 feet.

2 M. GLAU'CA (Lin. spec. ed. 2. p. 755.) almost deciduous; leaves elliptical, obtuse, under surface glaucous; flowers 9-12-petalled, contracted; petals ovate, concave. ♄. H. Native of North America in low, moist, swampy ground at a little distance from the sea, from Massachusetts to Florida and Louisiana, especially in New Jersey and Carolina. Schkuhr. handb. no. 1441. t. 148. Lodd. bot. cab. t. 215. Sims, bot. mag. 2164. Mich. f. arb. amer. 3. p. 77. t. 2. Duham. abr. ed. nov. vol. 2. p. 223. t. 66. Bonpl. nav. p. 103. t. 42. Bigl. med. bot. t. 27. M. fràgrans, Sal. prod. 379. M. Virginiàna, var. α, glaúca, Lin. spec. ed. 1. p. 538. Fruit red when ripe.

Var. β, *argéntea;* leaves oblong, under surface silvery, whitish-glaucous. Pursh. in herb. Lamb.

Var. γ, *Thomsoniana* (Hort. ulan.) a hybrid between *M. glaúca* and *M. umbrélla*, raised from seed by Mr. Thomson, of Mile End Nursery.

Var. δ, *Gordoniàna* (Hort.) hybrid.

Var. ε, *Burchelliàna* (Hort.) hybrid.

The bark of this tree has a bitter taste, combined with a strong aromatic pungency, which approaches that of *Sassafras.* The aroma resides in a volatile portion, which is probably an essential oil, or a variety of camphor. It is lost from the bark in a dry state. Water distilled from the green bark has its peculiar flavour, with an empyreumatic smell. The dry bark affords a little resin, and more of a bitter extractive substance. As a medicinal article *Magnolia* is to be considered an aromatic tonic, approaching in its character to *Cascarilla Canella*, &c. Chronic rheumatism is one of the diseases in which it exhibits most efficacy, all parts of the plant are employed in tincture with very good success in this disease. In intermittent and remittent fevers the bark is one of the many tonics which have been resorted to for the cure of the inhabitants of the marshy countries of North America. Sufficient testimony has been given in its favour as to warrant a belief that it is fully adequate to the removal of fever and ague, when administered like the *Cinchòna* in liberal quantities between the paroxysms. Several other species of *Magnòlia* resemble the present very closely in their sensible properties, and as far as have been tried they are similar in their medicinal effects. In order to secure the whole efficacy residing in these trees, a tincture should be made from the bark or cones while green, or very recently dried, before their more volatile parts have escaped.

This tree usually grows 15 or 20 feet high. The flowers are white or cream-coloured, and have an agreeable sweet scent.

In America this tree is known by the names of *White Laurel, Swamp Laurel, Swamp Sassafras, Sweet Bay*, and *Beaver Tree.* It has the last name, because the root is eaten as a great dainty by beavers, and this animal is caught by means of it. Kalm says these trees may be discovered at a distance of 3 miles by the scent of their blossoms, if the wind be favorable. It is beyond description pleasant to travel in the woods at the flowering season, especially in the evening. They retain their flowers for 3 weeks, and even longer. The berries also look very handsome, when they are ripe, being of a rich red colour, and hanging in bunches on slender threads. The inhabitants cure coughs and other pectoral diseases by putting these berries into brandy, and giving a

draught of the liquor every morning. The wood is made use of for joiners' planes. Dillenius remarks that the flower never opens in the morning, that the calyx falls off at the second opening of the flower, but that the petals dry on, and that the scent resembles that of the Lily of the Valley, with a mixture of aromatic.

Glaucous-leaved or Deciduous Swamp Magnolia. Fl. May, June. Clt. 1688. Tree 15 or 20 feet.

3 M. LONGIFO'LIA (Sweet, hort. brit. p. 11.) evergreen; leaves elliptical, acute at both ends, under surface glaucous: flowers 9-12-petalled, contracted; petals ovate, concave. M. glaúca *β*, longifòlia, Ait. hort. kew. ed. 1. vol. 2. p. 251, Pursh. fl. amer. sept. 2. p. 381. ♄. H. Native of Florida and Georgia. Flowers white, and sweet-scented. This is a very handsome tree.

Long-leaved or Evergreen Swamp Magnolia. May, June. Tree about 30 feet.

4 M. UMBRE'LLA (Lam. dict. 3. p. 673.) deciduous; leaves lanceolate, spreading, adult ones smooth, younger ones pubescent underneath; petals 9-12, exterior ones pendent. ♄. H. Native of North America on wooded mountains from New York to Carolina and Georgia, as well as Virginia. M. tripétala, Lin. spec. ed. 2. p. 756. Mich. f. arb. amer. 3. p. 90. t. 5. Pursh. fl. amer. sept. 2. p. 381. M. frondòsa, Sal. prod. 379. Leaves from 1 to 2 feet long, placed at the ends of the branches in a circular manner, somewhat like an umbrella, whence its name *Umbrella Tree*. It is called *Elk-wood* in the mountains of Virginia. The wood is soft and spongy. The flowers are 2 or 3 inches in diameter, white and sweet-scented but heavy.

Umbrella Magnolia. Fl. May, June. Clt. 1752. Tr. 35 ft.

5 M. ACUMINA'TA (Lin. spec. ed. 2. p. 756.) deciduous; leaves oval, acuminate, under surface pubescent; flowers 6-9-petalled. ♄. H. Native of North America from Pennsylvania to Carolina in mountain valleys in a fertile soil. Mich. f. arb. amer. 3. p. 82. t. 3. Lodd. bot. cab. 418. Sims, bot. mag. 2427. Pursh. fl. amer. sept. 2. p. 381. The flowers are yellowish, mixed with faint blue, bluish, or pea-green, 3 or 4 inches in diameter, scarcely scented, not remarkable for their beauty. The fruit is about 3 inches long, somewhat resembling a small cucumber, whence the inhabitants of North America call it *Cucumber tree*, and is used by them as a wholesome bitter. The wood is of a fine grain, and orange-coloured. There is a tincture prepared from the fruit of this tree which has some reputation for removing attacks of rheumatism.

Var. β, Candóllii (D. C. prod. 1. p. 80. 85.) leaves ovate, oblong, acute; flowers greenish. M. de Candóllii, Savi, bibl. ital. 1819. no. 47. p. 224. with a figure.

Pointed-leaved Magnolia. Fl. May, July. Clt. 1736. Tree 30 to 60 feet.

6 M. AURICULA'TA (Lam. dict. 3. p. 673.) deciduous; leaves smooth, under surface somewhat glaucous, spatulately-obovate, cordate at the base, with blunt, approximate auricles; sepals 3, spreading; petals 9, oblong. ♄. H. Native of North America in the Alleghany Mountains from the head waters of the Susquehanna to Carolina. M. auriculàris, Sal. par. lond. t. 43. Sims, bot. mag. t. 1206. Mich. f. arb. amer. 3. p. 94. t. 7. Andr. bot. rep. t. 573. Pursh. fl. amer. sept. 2. p. 382. M. Frasèri, Watl. fl. carol. 159. icon. A tree from 40 to 50 feet high, with spongy wood. The bark of this and the greater part of the foregoing species, is esteemed a valuable medicine in North America, particularly in intermittent fevers, from which circumstance it is known in some places by the name of *Indian Physic*. The flowers are erect, of a yellowish white colour, and remarkably sweet-scented, 3 or 4 inches in diameter. The fruit is rose-coloured. This tree will blossom when very young.

Eared-leaved Magnolia. Fl. April, May. Clt. 1786. Tree 40 to 50 feet.

7 M. PYRAMIDA'TA (Bartr. itin. ed. germ. 390.) deciduous; leaves smooth, the same colour on both surfaces, spatulate-obovate, cordate at the base; auricles spreading; sepals 3, spreading; petals 9-lanceolate, pointed. ♄. H. Native of the western parts of Carolina and Georgia. Ker. bot. reg. 407. Very like *M. auriculàta*, but it grows in a more pyramidal form, as well as differing as above, and the leaves are not above half the size.

Pyramidal Magnolia. Fl. April, June. Clt. 1811. Tree 30 ft.

8 M. MACROPHY'LLA (Mich. fl. bor. amer. 1. p. 327. f. arb. amer. 3. p. 79. t. 7.) deciduous; leaves very large, oblong-obovate, somewhat panduriform, cordate at the base, under surface whitish-glaucous; petals 6-9, ovate. ♄. H. Native of North America in moist, swampy, shady places, about Lincolton in upper Carolina, and in the deep forests of Tennassee. Sims, bot. mag. 2189. Bonpl. nav. t. 33. A beautiful tree, with white smooth bark. The leaves are from 1 to 3 feet long, and from 8 to 10 inches broad. The flowers are white and purple at the base, sweet-scented, 8 or 10 inches in diameter.

Long-leaved Magnolia. Fl. Ju. Jul. Clt. 1800. Tree 35 ft.

9 M. CORDA'TA (Mich. fl. bor. amer. 1. p. 328. f. arb. amer. 3. p. 87. t. 7.) deciduous; leaves heart-shaped, somewhat ovate, acute, under surface tomentose, upper surface smooth; petals 6-9, oblong. ♄. H. Native of North America along the sunny banks of the river Savannah in Upper Georgia and Upper Carolina. Ker. bot. reg. t. 325. Lodd. bot. cab. t. 474. A tree with chinky bark. The leaves are from 4 to 6 inches long, and from 3 to 5 broad. The flowers are erect and yellow lined with purple, about 4 inches in diameter.

Heart-leaved Magnolia. Fl. April, Jul. Tree 40 to 50 feet.

SECT. II. GWILLI'MIA (General Gwillim, sometime governor of Madras). Rottler. in D. C. syst. 1. p. 455. prod. 1. p. 81. Asiatic species, generally with two opposite spath-like bracteas inclosing the flower-bud; anthers bursting inwards; ovaries somewhat distant. Perhaps the species of this section with 1 bractea should have been given among the *Michelias?* It is, however, evident that none of them are true *Magnolias*.

10 M. EXCE'LSA (Wall. tent. fl. nap. t. 2.) leaves oblong-elliptical, acuminated, glaucous, and netted with veins beneath; buds bearded with rusty hairs; flowers axillary, solitary, 12-petalled; carpels globose, remote, 1-seeded. ♄. G. Native of Nipaul on Sheopore. A magnificent tree, bearing large, white, sweet-scented flowers. The wood of this tree is greatly prized by the inhabitants of Nipaul at Patma, where it is employed in joinery, and is commonly sold under the name of *Champ*. The colour of this wood is at first greenish but changing to a fine yellow colour, with a very fine grain.

Lofty Magnolia. Tree 50 to 80 feet.

11 M. YU'LAN (Desf. arb. 2. p. 6.) deciduous; leaves obovate, abruptly acuminated, younger ones pubescent, expanding after the flowers; flowers erect, 6-9-petalled; styles erect. ♄. H. Native of China. Bonpl. nav. p. 53. t. 20. M. prècia, Correa in Vent. malm. no. 24. M. conspícua, Sal. par. lond. 38. t. 38. Sims, bot. mag. 1621. A very shewy tree about 30 or 40 feet high, but only grows to the height of 8 or 10 feet in the gardens of Europe, covered with innumerable sweet-scented flowers, which are white, and sometimes suffused with purple, expanded throughout the day-time. This species is hardy in our climate, and is at an early age covered with blossoms from February to April, though the severe east winds often injure its beauty, unless it be protected or planted in a conservatory. *Yu-lan* is the name of the tree in China, where it has been cultivated since the year 627.

Yulan Magnolia. Fl. Feb. April. Clt. 1789. Tree 40 to 50 ft.

12 M. KO'BUS (D.C. syst. 1. p. 456.) deciduous; leaves obovate, acuminated at both ends, produced after the flowers, younger ones pubescent underneath, adult ones smooth; flowers erect of

3 sepals and 6 petals; styles reflexed. ♄. H. Native of the island of Nipon in Japan. M. gràcilis, Sal. par. t. 87. Kòbus, Banks, icon. Kæmpf. t. 42. M. glaúca, var. *a*, Thunb. fl. jap. 236. M. tomentòsa, Thunb. in Lin. soc. trans. 2. p. 336? About the size of a cherry tree, with rough bark which smells like camphor. The flowers are erect and solitary, with the outside purple and the inside white. Ovaries purple. A very ornamental tree, requiring protection against frost when in flower, as the flowers are apt to be hurt by it. *Kobus*, or *Side Kobusi*, is the name of the tree in Japan.

Kobus or Slender Magnolia. Fl. March, April. Clt. 1804. Tree 10 feet.

13 M. OBOVA'TA (Thunb. in Lin. soc. trans. 2. p. 336.) deciduous; leaves obovate, acute, reticulately-veined, almost smooth; flowers erect, of 3 sepals and 6 obovate petals; styles very short. ♄. H. Native of Japan, but cultivated both in the gardens of China and Japan as an ornament.

Var. a, denudàta (Lam. dict. 3. p. 675.) flowering branches without leaves; petals obovate. ♄. H.—Banks, icon. Kæmpf. t. 43. Native of the island of Nipon in Japan. M. glaúca, var. *β*, Thunb. jap. p. 236. Flowers red.

Var. β, díscolor (Vent. malm. 24. t. 24.) flowering branches leafy; petals obovate of two colours. ♄. H. M. purpùrea, Curt. bot. mag. t. 390. Andr. bot. rep. t. 324. Flowers purple outside but whitish inside.

Var. γ, liliiflòra (Lam. dict. 3. p. 657.) flowering branches leafy: petals oblong, white on both sides.—Banks, icon. Kæmpf. t. 44. ♄. H. Native of China. Flowers white.

This shrub has a very elegant and shewy appearance when in flower; at this time it requires to be protected from the frosts during night by a mat, as the flowers are apt to be hurt. The only variety that has as yet been introduced to our gardens is var. *β*. This shrub appears to most advantage in a conservatory.

Obovate-leaved or Purple Magnolia. Fl. Mar, April, May. Clt. 1790. Shrub 5 feet.

14 M. SOULANGEA'NA (Ann. hort. soc. par. pt. 2. ex Soulange Bodin. Sweet, fl. gard. t. 260.) deciduous: leaves obovate, abruptly acuminated, veiny, pubescent on both surfaces; sepals 3; petals 6. ♄. H. or F. Lindl. bot. reg. 1164. This is a hybrid, raised from the seed of *M. Yulan* by M. Soulange Bodin, the other parent is supposed to be *M. obovàta, var. β, discolor*. The flowers are of six obovate, expanded, whitish petals tinged with purple. This species requires protection in severe weather.

Soulange Bodin's Magnolia. Fl. March, May. Clt. 1828. Shrub 5 to 6 feet.

15 M. FUSCA'TA (Andr. bot. rep. t. 229.) evergreen; leaves elliptical-oblong, adult ones smooth, younger ones as well as branches and petioles covered with brown tomentum; flowers erect. ♄. F. Native of China, where it is cultivated for the fragrance of its flowers. Sims, bot. mag. t. 1008. M. fasciàta, Vent. malm. no. 24. adn. 2. Flowers small, very fragrant, of a dull purple colour.

Var. β, annonæfòlia (Sal. par. lond. no. 5. t. 5.) leaves broader; pedicels a little shorter: flowers more red; anthers more numerous. ♄. G. Native of China.

Var. γ, hebecàda (D. C. syst. 1. p. 458.) flowers on shorter peduncles; branches more velvety-tomentose; leaves shorter. ♄. G. Native of India.

Brown-flowered Magnolia. Fl. April, May. Clt. 1789, *β*. 1804. Shrub 2 to 4 feet.

16 M. PTEROCA'RPA (Roxb. corom. 3. p. 62. t. 266.) leaves oblong, with tapering base, entire; flowers terminal, solitary; spaths of flower-buds several deciduous; sepals 3, petals 6. ♄. S. Native in the vicinity of Silhet and Chittagong. Flowers as large as those of *M. grandiflòra*, white, and sweet-scented, and with the sepals green on the outside. Seeds red. Strobile winged. Anthers red and yellowish. The tree is called *Doolee champa* in Silhet. Perhaps a species of *Talàuma*.

Wing-fruited Magnolia. Fl. April, May. Tree 40 feet.

17 M. INODO'RA (D. C. syst. 1. p. 459.) leaves ovate, acuminated, smooth; peduncles terminal, 1-flowered, crowded; petals 6, thick, conniving into a tube, reflexed at the apex. ♄. G. Native of China in fields near Canton. Liriodéndron liliífera, Lour. coch. ed. Willd. 1. p. 424. but not of Lin. Sampàca montàna, Rumph. amb. 2. p. 204. t. 69? A middle-sized tree, with large pale scentless campanulate flowers.

Scentless-flowered Magnolia. Tree 16 feet.

18 M.? co'co (D. C. syst. 1. p. 459.) leaves ovate, quite entire, shining; flowers solitary; sepals 3, oblong, and are as well as the petals incurved; petals 6, fleshy; ovaries 8. ♄. G. Native of Cochin-China, Macao, and Canton, where it is cultivated in the gardens for the beauty and scent of the flowers. Liriodéndron còco, Lour. coch. ed. Willd. 1. p. 424. Flowers very large and pure white, with an exquisite scent. The flower-bud before opening is roundish, and is likened to the *coco-nut*, whence its name about Macao *Fula-coco*.

Coco-nut-like-budded Magnolia. Shrub 5 feet.

19 M. FI'GO (D. C. syst. 1. p. 460.) leaves lanceolate, quite entire, shining, reflexed-incurved; flowers solitary; petals 6, ovate-oblong, erect; ovaries 40 or 50. ♄. G. Native of China, where it is also cultivated, especially about Macao and Canton. Liriodéndron Fìgo, Lour. coch. ed. Willd. 1. p. 424. Michèlia Fìgo, Spreng. syst. 2. p. 643. Flowers solitary, pale, spotted with red on the inside, sweet-scented. There is only one bractea inclosing the flower-bud, therefore this plant may be a species of *Michèlia*. The shrub is called *Fula-Figo* by the inhabitants of Macao.

Fula-Figo. Shrub 4 feet.

Cult. The hardy species are chiefly from North America, but some of the Chinese kinds endure our winter tolerably well; they should be planted in conspicuous situations, as they are handsome shrubs, and flower abundantly when of sufficient size. *M. glaúca* and *M. longifòlia* like a peat soil, and a moist situation. The species are generally increased by layers put down in spring or autumn, or by seeds procured from the places of their natural growth. When the layers are first taken off, they should be potted in a mixture of loam and peat, and placed in a close frame, till they have taken fresh root. None of the leaves should be taken off or shortened, nor any roots be cut off or their tops shortened, as they will not succeed so well; for the more branches and leaves are on them the sooner they will strike fresh root. The Chinese kinds are often inarched or budded on *M. obovàta*, which takes readily. The green-house kinds thrive best in peat mixed with loam; they are also increased by inarching or budding on *M. obovàta*, which is one of the readiest growing sorts. *M. pùmila, fuscata, annonæfolia*, and any of the weak growing kinds, strike readily from cuttings taken off as soon as ripe, and planted in a pot of sand and placed under a hand-glass.

The seeds of the North American species are received annually from that country. They should be sown as soon after their arrival as possible, in pots or boxes of light rich earth, covering them half an inch deep; these may be placed either in a hot-bed or in a warm sheltered situation, or they may be sown in the open ground, and when the plants are of sufficient size they should be planted out singly in pots, and shaded until they take fresh root; and at the approach of frost they should be sheltered by a frame for two or three successive winters, indulging them in the open air in mild weather. When they are replanted none of the roots nor leaves should be shortened. With regard to the disposition of the hardy species, they should have a sheltered sunny situation in conspicuous places. They have a very good

effect disposed singly in different parts, as in open places of pleasure-grounds in warm situations.

IX. TALA'UMA (*Talauma* is the aboriginal name of *T. Plumièri.*) Juss. gen. 281. D. C. syst. 1. p. 460. prod. 1. p. 81.

Lin. syst. *Polyándria, Polygýnia.* Carpels 1 or 2 seeded, disposed in spikes, joined into strobile-like fruit (f. 22. *b.*) opening irregularly on the outside; seeds in each cell 2, or from abortion solitary, hanging by a thread. Spath deciduous, covering the flower-bud before expansion. Sepals 3. Petals 6-12. Anthers bursting inwards. Perhaps several of the East India species of *Magnòlia* is referable to this genus. Large trees, with the habit of *Magnòlia*, with large terminal solitary flowers of 3 sepals and 6-12 petals.

1 T. Plumi'era (Swz. prod. 87. fl. ind. occid. 2. p. 997.) leaves ovate-roundish, somewhat cuneated at the base; petals 12, thick, oblong, obtuse. ♄. S. Native of Màrtinico, Guadeloupe, St. Lucy. Magnòlia Plumìera, Swz. prod. 87. fl. ind. occid. 2. p. 997. Annòna dodecapétala, Lam. dict. 2. p. 127. Magnòlia fatiscens, Rich. icon. et descr. ined. T. cærùlea, Jaum. fam. nat. 2. p. 76. A tree from 50 to 80 feet high. Leaves coriaceous, smooth, reticulately veined, ovate-roundish, somewhat cuneated at the base. Flowers large, white, sweet-scented, solitary on the tops of the branches. Fruit, according to Plumier, blue; according to Swartz sordid-green. The flowers are used by the distillers of Martinico to sweeten liquors.

Var. β, longifòlia (D. C. prod. 1. p. 82.) leaves obovate-oblong. ♄. S. Native of Dominica.

Plumier's Talauma. Tree 50 to 60 feet.

2 T. ova'ta (St. Hil. fl. bras. 1. p. 26. t. 4. f. A.) leaves ovate, bluntish; flowers of 6-petals. ♄. S. Native of Brasil in the western part of the province of Minas Geraes in marshes. Magnòlia ovàta, Spreng. syst. app. 217. Leaves 5-7 inches long and 3-4 broad. Petals 20 lines long, white. Sepals rather glaucous. (f. 22. *a.*)

FIG. 22.

Ovate-leaved Talauma. Tree 20 feet.

3 T. Sellowia'na, (St. Hil. fl. bras. 1. p. 26. t. 4. f. B.) leaves obovate-round, very blunt, but acute at the base; flowers of 6-petals. ♄. S. Native of Brasil in woods not far from the town called Sorocaba. Magnòlia Sellòi, Spreng. syst. app. 216. Leaves 3-5 inches long, and 3-4 broad. Petals 14-16 lines long, white. Sepals rather glaucous (f. 22. *b.*).

Sello's Talauma. Fl. Jan. Tree 50 feet.

4 T. Cando'llii (Blum. bijdr. fl. ned. ind. 1. p. 9. fl. Jav. fasc. 19. p. 32. t. 9.) leaves oblong, acuminated at both ends; flowers 9-12-petalled, outer ones short; peduncles 1-flowered, rather drooping, and are as well as the petioles of the younger leaves clothed with rufous villi; stem shrubby. ♃. S. Native of Java. Magnòlia odoratíssima, Reinw. ined. Magn. pùmila, Spreng. exclusive of the synonyms. Flowers large, cream-coloured.

Var. β, latifòlia (Blum. l. c.) leaves broader, and less attenuated at the base.

De Candolle's Talauma. Fl. Ju. Jul. Clt. 1828. Shrub 6 ft.

5 T. Ru'mphii (Blum. bijdr. fl. ned. ind. 1. p. 10. fl. jav. fasc. 19. p. 39.) leaves oblong-lanceolate, very much acuminated; peduncles 1-flowered erect. Stem arboreous; petals 6. ♄. S. Native of Java and the Moluccas. Magnòlia Rúmphii, Spreng. syst. app. p. 217. Sampàca montàna, Rumph. amb. 2. t. 69. Flowers pale-yellow or cream-coloured, terminal, sweet-scented.

Rumphius's Taláuma. Fl. Ju. July. Clt. 1828. Tree 30 feet.

6 T. muta'bilis (Blum. fl. jav. fasc. 19. p. 35. t. 10.) shrubby; leaves elliptical, acute at both ends, villous on the ribs beneath; flowers of 9 almost equal petals. ♄. S. Native of Java. Flowers solitary, drooping, pale-green, tinged with red or purple, at last brownish.

Var. β, acuminàta (Blum. l. c. p. 36. t. 11.) leaves oval-oblong, acuminated, smooth beneath, but the young ones are pubescent beneath.

Var. γ, longifòlia (Blum. l. c. p. 37.) leaves oblong or lanceolate, acuminated at both ends, younger ones puberulous beneath.

Var. δ, spléndens (Blum. l. c. p. 38. t. 12.) leaves oblong, acuminated, scarcely acute at the base or roundish, smooth, young ones covered with silky brown pubescence on the ribs beneath.

Changeable Talauma. Shrub 6 to 8 feet.

7 T. pu'mila (Blum. fl. jav. fasc. 19. p. 38. t. 12. C.) leaves elliptical, acuminated at both ends, smooth, reticulately veined; flowers drooping, of 6-9 petals. ♄. S. Native of Amboyna and Java on high mountains. Liriodéndron liliífera, Lin. spec. 755. Magnòlia pùmila, Andr. bot. rep. t. 226. Vent. malm. t. 37. Sims, bot. mag. 977. Flowers cream-coloured, very fragrant at night. Anthers club-shaped.

Dwarf Talauma. Fl. year. Clt. 1786. Shrub 2 to 4 feet.

8 T. Mexica'na; leaves oval, tapering a little at the base, blunt; flowers 9-petalled, expanded; petals ovate, flat. ♄. S. Native of Mexico. Yoloxochitl Aristòchyea, Hern. mex. with a figure. Magnòlia grandiflòra, Moc. et Sesse, fl. mex. descr. ined. with a figure. Magnòlia Mexicàna, D. C. syst. 1. p. 451. Magnòlia glaúca, Moc. et Sesse, fl. mex. icon. ined. Flowers large, white, but purplish inside, sweet-scented.

Mexican Talauma. Tree 50 feet.

9 T. Roxbu'rghii; leaves oblong-elliptical, tapering to both ends a little, but obtuse at the point, coriaceous, feather-nerved, prominently reticulated, smooth on both surfaces, shining above. Sepals 3; petals 6; spath 1-leaved, inclosing the flower-bud. ♄. S. Native of the East Indies. Liriodéndron grandiflòrum, Roxb. hort. beng. p. 43. Flowers probably white; sepals and petals coriaceous and obtuse. Perhaps a species of *Magnòlia*.

Roxburgh's Talauma. Tree 50 feet.

Cult. Talauma is a genus of magnificent trees and shrubs, resembling *Magnòlias.* A mixture of loam, peat, and sand, will suit them well. They may be increased by layers or inarching on *Magnòlia obovàta*, and ripened cuttings of most of the species will root if planted in a pot of sand, and placed under a hand-glass, in heat. The leaves should not be shortened †.

X. AROMADE'NDRON (from *αρωμα, aroma*, fragrance; *δενδρον, dendron*, a tree; the flowers are very sweet-scented, and diffuse their fragrance to a considerable distance.) Blum. bijdr. fl. ind. ned. 1. p. 10. fl. jav. fasc. 19. p. 25. t. 7 and 8.

Lin. syst. *Polyándria, Polygýnia.* Calyx of 1 spathaceous leaf. Petals very narrow and very numerous, about 28, disposed in a quaternary order. Stamens numerous, awl-shaped; anthers bursting outwardly. Carpels 2-seeded, joined together into egg-shaped ligneous fruit. A large lofty elegant tree, with oblong-lanceolate distich leaves, and terminal, solitary, large, white, very fragrant flowers, at length changing to a straw-colour. This genus is easily distinguished from *Talàuma* by the number of the petals.

1 A. e'legans (Blum. bijdr. 1. p. 10. fl. jav. l. c.) ♄. S. Native of Java on the mountains. The wood of this tree is excellent, of a fine grain, and is used in Java for many purposes. The bark is a grateful aromatic bitter, and is an excellent stomachic.

Elegant Aroma-tree. Tree 80 to 140 feet.

Cult. As this elegant tree has not yet been introduced into the gardens the mode of treating it is unknown. However, should it be, we would recommend its being grown in a mixture of loam, peat, and sand. For the manner in which we recommend increasing it see *Michèlia* †.

XI. LIRIODE'NDRON (from λειριον, *leirion*, a lily; δενδρον, *dendron*, a tree; because the tree bears flowers resembling the lily, but more like the tulip.) Lin. gen. no. 689. Juss. gen. 281. Gært. fruct. 2. p. 475. t. 178. Lam. ill. t. 491. D. C. syst. 1. p. 461.

Lin. syst. *Polyándria*, *Polygýnia.* Carpels 1-2-seeded, disposed in spikes, indehiscent, deciduous, drawn out into a wing at the apex. Calyx of 3 deciduous sepals. Corolla of 6 petals, conniving into a bell-shaped flower.

1 L. tulipi'fera (Lin. spec. 755.) ♄. H. Native of North America in swampy places. Mich. f. arb. amer. 3. p. 202. t. 5. Duham. arb. ed. nov. vol. 3. p. 61. t. 18. Curt. bot. mag. 275. Schkuhr. handb. 2. p. 93. t. 147. Bigel. amer. med. bot. t. 31. L. pròcerum, Sal. prod. 379. Tulipífera lyriodéndron, Mill. dict. no. 1. A tall elegant deciduous tree, very commonly cultivated, particularly in the South of Europe, in avenues. Leaves smooth, truncate at the top, 4-lobed, resembling a saddle in shape. Flowers large, solitary, terminal, variegated with green yellow and orange-colour, furnished with two deciduous bracteas under the flowers. The bark of the *Tulip-tree* has a very bitter taste, and strong aromatic pungency. The latter property appears to reside in a volatile oil. When the bark is distilled with water it fills the apartment with its fragrant odour. A bitter resin exists in a small quantity in the bark. The bark both of the root and branches act on the system as a stimulating tonic and diaphoretic, having properties resembling the *Cascarilla.* The disease in which it has been most employed is intermittent fever. As a warm sudorific the bark has been employed with success by various practitioners in the United States of America in chronic rheumatism.

The wood of this tree is smooth and fine grained, very easily wrought and not liable to split. It is used for various kinds of carving and ornamental work, and for articles of house-furniture. Michaux says, that the joinery or inside-work of the houses in the western states of North America is most frequently of this material. The common use it is put to is in the manufacture of carriages, to form the pannels of coach and chaise bodies. For this purpose it is particularly fitted by its smoothness, flexibility, and toughness.

Obs. There are two varieties of this tree; the one called *white-wood* or *white poplar*, and the other *yellow-wood* or *yellow poplar*, in America; the first has the lobes of its leaves acute, and is called *var. acutíloba* by Mich. The second has blunt lobes, and is called *var. obtusíloba* by Mich.

Tulip-bearing Lily-tree, Tulip-tree or Saddle-tree. Fl. June, July. Clt. 1663. Tree 60 feet.

Cult. The *Tulip-tree* requires to be a considerable size before it will flower; it is well adapted to grow singly on lawns, &c., and is generally increased by seeds imported from its natural place of growth; these should be sown about the month of March in a light richish soil in a situation exposed to the sun, covering them about half an inch deep; they usually remain two years in the ground before they come up, though some few of them will vegetate the first year.

Order IV. ANONA'CEÆ (shrubs agreeing with Anòna in many important characters.) Rich. anal. 17. D. C. theor. 213. syst. 1. p. 463. prod. 1. p. 83. Dunal, mon. 1817. Anònæ, Juss. gen. 283.

Parts of flowers imbricate in the bud. Calyx trifid (f. 24. *a.* f. 23. *a.*) rarely quadrifid. Petals 3 (f. 23. *b.*) or 6 (f. 25. *b.*) unequal, disposed in a ternary order in a single or double series. Stamens indefinite, adpressed, usually covering the hemispherical disk (f. 24. *b.*). Anthers almost sessile, tetragonal, sometimes nectariferous, bursting outwards or inwards. Ovaries numerous (f. 24. *f.* f. 25. *c.*) crowded, aggregate (f. 25. *c.*) or joined (f. 23. *d.*) very rarely solitary from abortion, baccate (f. 23. *d.*) or capsular (f. 25. *c.*) one or many-seeded, sessile or stipitate, sometimes coadunate. Seeds fixed to the inner angle of the carpels, disposed in 1 or 2 rows, but often solitary. Albumen hard, fleshy, pierced by the substance of the seed-coat in every direction. Embryo minute, located in the umbilical region of the albumen.

Trees or shrubs mostly natives within the tropics, with alternate, simple, feather-nerved, entire, or hardly toothed, sessile, or stalked leaves; young ones pubescent, conduplicate before expansion, without stipulas. Peduncles axillary, lateral or opposite the leaves, usually furnished with bracteas, and shorter than the leaves, one or many-flowered. This order agrees with *Magnoliàceæ*, in the ternary disposition of the parts of the flower, and in the adnate anthers, but differs from it in the absence of stipulas, and in the very different form of the seeds and anthers; and from *Menispermàceæ* in the stamens being indefinite, not definite, as well as in the very different structure of its fruit. The genus *Eupamàtia* of R. Brown differs from all the other genera, particularly in the perigynous insertion of its stamina: it ought, therefore, to be excluded from this order, and placed in the subclass *Calyciflòra.* The fruit of many species of *Anòna* are highly esteemed as an article for the dessert, especially that of the *Cherimoyer*, which has the reputation of being the finest fruit in the world next to that of the *Mangosteen.* The seeds of the dry-fruited species are highly aromatic, acrid, pungent, and stimulating, as well as the roots, bark and leaves, those of one *Uvaria*, furnish the *Pìper Æthiópicum* of the shops. In Brasil the bark of *Xylòpia seríсea* is used for cordage, for which it is admirably adapted. The genus *Asimìna* is the only one which contains any hardy species. The seeds of the fleshy fruited species retain the power of vegetating a considerable time, hence they are easily introduced in a living state from any part of the world, but the seeds of those species having dry fruit are difficult to introduce, as they retain their vegetative power but for a very short time.

§ 1. *Anòneæ. Carpels unilocular, joined together into a many-celled fruit* (f. 23. *d.*)

1 Ano'na. Carpels or cells of the fruit 1-seeded. Calyx of 3-sepals (f. 23. *a.*) which are connected a little at the base. Petals 3 (f. 23. *b.*) or 6.

2 Rolli'nia. Carpels or cells of fruit 1-seeded, scaly (f. 24. *f.*). Calyx 3-parted (f. 24. *a.*). Corolla monopetalous, globose (f. 24. *d.*), 6-lobed, with 3 wings on the back (f. 24. *e.*).

§ 2. *Monodòreæ. Fruit solitary, or many-celled.*

3 Monodo'ra. Fruit solitary, globose, smooth, fleshy, with numerous seeds imbedded in the pulp. Calyx 3-sepalled. Petals 6.

4 EUPOMA'TIA. Fruit solitary, many-celled, many-seeded. Calyx in the form of a calyptra before the flower expands. Stamens numerous, perigynous, inner ones of the form of petals. Petals wanting.

§ 3. *Unòneæ. Carpels numerous, distinct* (f. 25. *c.*).

5 ASIMI'NA. Carpels 3, rarely 4-6, sessile, ovate-oblong, fleshy, many-seeded; seeds in one row. Calyx 3-parted. Petals 6.

6 PORCE'LIA. Carpels 3-6, sessile, cylindrical, somewhat fleshy, many-seeded; seeds in two rows. Sepals 3, connected together a little at the base. Petals 6.

7 UVA'RIA. Carpels 6-15, baccate, stipitate, ovate-globose, many-seeded; seeds in two rows. Sepals 3, connected at the base. Petals 6.

8 UNO'NA. Carpels 8-30, dry, stipitate, oblong-ovate or moniliform, many-seeded. Sepals 3, rarely 4, connected at the base. Petals 6.

9 XYLO'PIA. Carpels 6-20, dry, stipitate, 2-seeded. Calyx 3-5 lobed. Petals 6.

10 ORO'PHEA. Carpels 3, seldom 4, (sometimes single from abortion) at first connected, but at length diverging, 1-2-seeded, sessile, cylindrical, baccate. Seeds hanging from the top of the cell. Calyx 3-parted. Petals 6.

11 DUGUE'TIA. Carpels numerous, ovate, 3-5-angled, woody, 1-seeded, seated on thick pedicels. Receptacle large, cylindrical, globose.

12 GUATTE'RIA. Carpels 8-40, stipitate (f. 25. *c.*), ovate or globose, dry, 1-seeded. Seed almost filling the cell. Sepals 3 (f. 25. *a.*) connected at the base. Petals 6 (f. 25. *b.*).

13 BOCA'GEA. Ovaries 3, sessile, hardly joined together or completely free, 1-celled, 5-6-seeded. Carpels 1-3, distinct, rather dry, tubercled, on short stipes, 1-celled, 3-seeded from abortion. Calyx 3-parted, or almost entire and cup-shaped. Petals 6. Stamens 6, not as in the rest numerous.

14 MOLLINE'DIA. Carpels baccate, numerous, sessile, completely free, on a flat receptacle, 1-celled, 1-seeded. Calyx turbinate, nearly closed, quadrifid, torn in pieces by the fruit as they grow. Petals none.

§ 1. *Anòneæ* (*shrubs agreeing with Anona.*) *D. C. prod.* 1. p. 83. *Carpels* 1-*celled, joined into a many-celled single fruit.*

I. ANO'NA (*Anona* is the name applied to these plants by the natives of St. Domingo; but Rumphius says it comes from its Malay name *Manoa*, or from its Banda name *Menona*, but as the Latin word *annona* signifies victuals, it is probable that Linnæus had taken it from this.) Adans. fam. p. 365. Dun. monog. Anon. p. 58. D. C. syst. 1. p. 466. prod. 1. p. 83. Annòna species, Lin. gen. no. 693. Juss. gen. 283. Lam. ill. t. 494.

LIN. SYST. *Polyándria, Polygýnia.* Sepals 3, connected at the base, concave, somewhat cordate, acutish. Petals 6, thickish, inner ones smallest (f. 23. *b.*) or wanting. Anthers indefinite, almost sessile, angular, and dilated at the apex, covering the torus. Carpels indefinite, sessile, joined into one fleshy, many-celled fruit (f. 23. *d.*) with a muricated, scaly, or reticulated skin, pulpy inside; cells 1-seeded. The fruit of nearly all the species are edible, and are highly esteemed in their native countries. The genus has derived its English name, *custard-apple*, from the consistence of the fruit of several species.

§ 1. *Petals concave, thick, cordate, and ovate.*

* *Outer petals acute, inner ones blunt, a little smaller than the outer ones.*

1 A. MURICA'TA (Lin. spec. 756.) leaves ovate-lanceolate, smooth, somewhat shining; peduncles solitary, 1-flowered; outer petals cordate, acuminated, inner ones blunt; fruit muricated, with fleshy points. ♄. S. Native of the West Indies, and in many other places in South America, and now cultivated almost every where within the tropics. Jacq. obs. 1. p. 10. t. 5. Sloan. jam. hist. 2. p. 166. t. 225. bad. Flowers green on the outside, yellow inside and spotted. Bark, leaves, and flowers sweet-scented. Wood very hard. Fruit fleshy, green, eatable, of an acid taste, and is much used among the negroes in its native country; it is hardly ever eaten by the better sort of people.

Var. β, fruit almost spherical, yellow on the outside. Dun. mon. anon. p. 62. Plum. amer. t. 143. f. 1. gen. 43. t. 10. Mss. 6. t. 114.

Soursoap, or *Muricated*-fruited Custard-apple. Fl. year. Clt. 1656. Shrub 15 feet.

2 A. PURPU'REA (Moc. et Sesse, fl. mex. ined. Dun. mon. anon. p. 64. t. 2.) leaves nearly sessile, lanceolate, under surface somewhat rusty; flowers axillary, almost sessile; outer petals cordate, acute, inner ones roundish. ♄. S. Native of Mexico. Corolla large, with the outer petals yellowish-brown, and the inner ones purple. Fruit unknown.

Purple-petalled Custard-apple. Shrub 10 to 15 feet.

3 A. HUMBO'LDTII (Dun. mon. anon. p. 64. t. 3.) leaves oblong, acuminated, smooth, full of dots; peduncles short, solitary, axillary nearly sessile, 1-flowered; outer petals ovate, somewhat heart-shaped, acute, inner ones bluntish. ♄. S. Native of the province of Cumana, where it is called *Chilimòlia.* A. Humboldtiàna, Kth. nov. gen. 5. p. 56. The three outer petals are yellowish on the outside, and have each a purple spot on the inside at the base; the three inner ones are smaller, keeled and yellowish on the outside, sprinkled with red spots, and on the inside purple, with yellow spots.

Humboldt's Custard-apple. Fl.? Shrub 8 to 15 feet.

4 A. LAURIFO'LIA (Dun. mon. anon. p. 65.) leaves ovate-lanceolate, smooth; peduncles solitary, 1-flowered, pendulous; outer petals heart-shaped, acute, inner ones roundish, fruit mammæform, smooth. ♄. S. Native of the West Indies and in the vicinity of the tropic in North America. Cat. carol. 2. p. 67. t. 67. A. glàbra β, Lam. dict. 2. p. 125. Branches flexuous. Leaves like those of the *Sweet-Bay.* The outer petals are green, the inner ones are smaller and white. Fruit green, of the form of an inverted *Pear.*

Laurel-leaved Custard-apple. Fl.? Clt. 1820. Shrub 10 to 12 feet.

** *Outer petals blunt.*

5 A. OBTUSIFLO'RA (Tuss. antil. t. 28.) leaves oblong-lanceolate, waved, acuminated, full of nerves, younger ones tomentose, adult ones smooth; peduncles axillary, 1-flowered; outer petals blunt. ♄. S. Cultivated in St. Domingo, but perhaps originally from Asia. Dun. mon. anon. p. 65. Leaves distich. Fruit roundish, tubercled, eatable.

Blunt-flowered Custard-apple. Tree 20 feet.

6 A. RHOMBIPE'TALA (Ruiz. et Pav. fl. per. 5. t. 489.) leaves long, obovately-oblong, acuminated, almost sessile: peduncles aggregate, lateral, 1-flowered; flowers large, hairy; sepals ovate; petals 6, inner ones longest, rhomboidal, curved at the base, and with an obtuse mucrone at the apex; ovary surrounded by numerous scales; fruit globose, muricated, or reticulated.

Rhomboidal-petalled Custard-apple. Tree.

* * * *Petals all acute, inner ones a little smaller.* (f. 23. *a. b.*)

7 A. sylva'tica (St. Hil. fl. bras. 1. p. 32. pl. insu. bras. no. 29.) leaves large, elliptical, short-pointed, acutish at the base, puberulous above, pubescent beneath and full of very minute pellucid dots; fruit bearing peduncles extra-axillary, solitary. ♄. S. Native of Brasil in the province of Minas-Geraes. The fruit ripens in March. It is commonly called *Araticu do Mato.* The fruit is good to eat. The wood is white and compact, tender, and light, and, therefore, is very proper for works of sculpture.

Wood Custard-apple. Tree 20 feet.

8 A. palu'stris (Lin. spec. 757.) leaves ovate-oblong, leathery, quite smooth; flowers solitary on peduncles; petals all acute; fruit rather areolate. ♄. S. Native of Jamaica in low moist places, and other parts of South America, near the borders of rivers and in marshes. Dun. mon. anon. p. 65.—Pluk. alm. 32. t. 240. f. 6.—Sloane, jam. 205. hist. 2. p. 169. t. 228. f. 1. Flowers yellow; the three outer petals are veined on the outside, but spotted with red on the inside; the three inner ones are one-half, smaller than the outer ones, white on the outside, and of a dark blood-colour on the inside. Fruit large, smooth, heart-shaped, sweet-scented, of an agreeable taste, but it is said to be a strong narcotic, and is therefore not eaten on that account. It is called in Jamaica *Alligator-Apple.* The wood is so soft even when dry that it is frequently used by the negroes, instead of corks to stop up their jugs and calabashes, whence it has universally obtained the name of *Cork-wood* in Jamaica. In Brasil it is called *Araticu do brejo* and *Cortissa*, where the inhabitants also make corks of the branches. They have also tried to make a kind of wine from the fruit.

Marsh Custard-apple or Cork-wood. Clt. 1788. Tr. 10 to 20 ft.

9 A. co'nica (Ruiz, et Pav. fl. per. 5. t. 490.) leaves oblong, or obovate-oblong, acuminated, on slender petioles; peduncles lateral, 3-4-flowered; outer petals lanceolate, long, acute, inner ones small, ovate, acute; fruit long, conical, reticulated, something like a *Cucumber.*

Conical-fruited Custard-apple. Shrub.

10 A. longifo'lia (Aubl. guian. 1. p. 615. t. 248.) leaves oblong, acuminated, mucronate, smooth; flowers axillary, solitary, stalked; petals all acute; fruit ovate-globose, dotted and reticulated. ♄. S. Native of Guiana on the borders of streams, also in the island of Trinidad. Dun. mon. anon. p. 66. Flowers large, purplish, inner petals smaller than the outer ones. Fruit gelatinous, flesh-coloured, eatable. (f. 23.)

FIG. 23.

Long-leaved Custard-apple. Fl. May. Clt. 1820. Tree 20 feet.

11 A. puncta'ta (Aubl. guian. 1. p. 614. t. 247.) leaves ovate-oblong, acute, smooth; flowers axillary, solitary, nearly sessile; petals all acute; fruit somewhat globose, covered with dots. ♄. S. Native of Cayenne in woods, near the borders of streams. Dun. mon. anon. p. 67. Flowers small, yellowish. Fruit fleshy, of an obscure brown, with red pulp, eatable.

Dotted-fruited Custard-apple. Fl. April. Clt. 1822. Tree 20 ft.

12 A. Peruvia'na (H. et B. ined. Dun. mon. anon. p. 67.) leaves oblong-elliptical, acute, a little coriaceous, somewhat decurrent; peduncles axillary, bracteolate; petals all acute; fruit globose, reticulated. ♄. S. Native of Peru in marshes about Guayaquil. A. uliginòsa, H. B. et Kth. nov. gen. amer. 5. p. 56. Flowers yellow, with the three outer petals furnished with a red spot on the inside at the base of each. Fruit not eatable.

Peruvian Custard-apple. Shrub 16 feet.

13 A. austra'lis (St. Hil. fl. bras. 1. p. 33.) leaves large, ovate, very blunt at the base, but pointed at the apex, quite smooth; fruit even. ♄. S. Native of Brasil in the province of St. Catharine; on the sea-shore very common. A small tree quite smooth, except the buds. Leaves 5-6 inches long, and about 3 broad. The fruit is mature in April, it is ovate and blunt, with a soft compact pulp of the colour of an *Apricot*, but of an ungrateful taste. The tree is very like *A. palústris*, but differs greatly in the size and shape of its leaves.

Southern Custard-apple. Tree 20 feet.

14 A. cornifo'lia (St. Hil. bras. 1. p. 33.) leaves usually ovate or obovate, generally finely mucronated, smoothish above, puberulous and hoary beneath; middle nerves and parallel lateral veins rufescent beneath; peduncles 1-flowered, opposite the leaves; segments of calyx very short and acuminated. ♄. S. Native of Brasil in the provinces of St. Paul and Minas Geraes, where it is called *Araticu do Campo.* Outer petals broad-ovate, inner ones oblong-elliptical, usually acuminated. Receptacle with a circle of villi at the base. Fruit scaly, ovate smooth or villous. Leaves 2-4 inches long, and 1-2 broad. Petals very thick, pubescent, yellow, larger than the calyx. This is certainly a very variable shrub.

Dogwood-leaved Custard-apple. Shrub 15 feet.

15 A. Ambo'tay (Aubl. guian. 1. p. 616. t. 249.) leaves oblong-elliptical, under surface rusty-tomentose; flowers axillary, solitary, on very short peduncles; petals all acute. ♄. S. Native of Cayenne in woods. Dun. mon. anon. p. 67. Flowers very small, greenish. Fruit unknown. *Ambotay* is the name of the tree in Guiana.

Ambotay Custard-apple. Fl. Nov. Shrub 8 feet.

16 A. paludo'sa (Aubl. guian. 1. p. 611. t. 246.) leaves oblong, acute, upper surface somewhat tomentose, under surface silky-tomentose, rufescent, nerved; flowers on short peduncles: petals all acute; fruit ovate, tuberculated. ♄. S. Native of Guiana in marshy places. Dun. mon. anon. p. 68. Flowers greenish; petals silky on the outside. Fruit yellow, eatable.

Marsh Custard-apple. Fl. Feb. Nov. Clt. 1803. Shrub 4 to 5 feet.

§ 2. *Outer petals ovate, concave, acute, coriaceous, inner ones wanting. Fruit not sufficiently known, and therefore this section of Anòna is only added to the genus from the habit of the shrubs.*

17 A. echina'ta (Dun. mon. anon. p. 68. t. 4.) leaves ovate-lanceolate, acutish, upper surface smooth, under surface tomentose; branches rugose; peduncles solitary, 1-flowered; flowers 3-petalled; fruit egg-shaped, echinated. ♄. S. Native of Cayenne. Petals leathery.

Echinated-fruited Custard-apple. Shrub 12 feet.

18 A. seri'cea (Dun. mon. anon. p. 69. t. 5.) leaves ovate-oblong, acuminated, upper surface smooth, under surface as well as branches rusty-tomentose or silky; flowers 3-petalled, solitary, axillary, stalked, rusty on the outside. ♄. S. Native of Cayenne. Flowers nearly like those of *A. echinàta.*

Silky-leaved Custard-apple. Shrub 10 feet.

§ 3. *Outer petals linear-oblong, narrow, triquetrous at the apex, somewhat concave at the base, usually closed, concealing the genitals, inner petals very minute.*

19 A. squamo'sa (Lin. spec. 757.) leaves oblong, bluntish, smooth, full of pellucid dots, rather glaucous beneath; outer petals nearly closed; fruit egg-shaped, scaly. ♄. S. Culti-

vated throughout both Indies, but it is very likely originally from South America, where it is also cultivated. Jacq. obs. 1. p. 13. t. 6. f. 1. Dun. mon. anon. p. 69. Mill. dict. no. 3. St. Hil. pl. usu. bras. t. 30. Atamàram, Rheed. mal. 3. p. 21. t. 29. A. tuberòsa, Rumph. amb. 1. p. 138. t. 46. A. muricàta, Vand. scrip. lus. p. 118. A tree or rather a large shrub. Flowers greenish-yellow. Fruit fleshy, covered with tubercular scales, containing a sweet-tasted pulp, which is eaten by the inhabitants of tropical countries. It is commonly called *Pinha* in Brasil.

Sweetsop or *Scaly*-fruited Custard-apple. Clt. 1739. Shrub 12 to 20 feet.

20 A. FORSKA'HLII (D. C. syst. 1. p. 472.) leaves oblong, somewhat elliptical, smooth, dotted, under surface glaucous; outer petals oblong, nearly closed. ♄. S. Native of Egypt. A. glàbra, Forsk. ægyp. descr. 102. icon. t. 15. A. Asiática, var. β, Dun. mon. anon. p. 71. A. Asiática, Vahl. symb. 3. p. 73. A. squamòsa, Delile. ill. fl. ægypt. p. 17. Very like *A. squamòsa*, but differing in the leaves being more elliptical-oblong than lanceolate, less pointed, more papyraceous, and distinctly dotted, with the under surface glaucous.

Forskal's, or Egyptian Custard-apple. Shrub 12 feet.

21 A. CINE'REA (Dun. mon. anon. p. 71. t. 8.) leaves oblong-elliptical, somewhat lanceolate, full of pullucid dots, under surface pubescent; outer petals nearly closed; fruit ovate-globose, scaly. ♄. S. Cultivated in the West Indian Islands, St. Thomas, and Cumana. Fruit fleshy, eatable, in shape like a young fruit of *A. squamòsa*.

Cinereous Custard-apple. Fl.? Clt. 1823. Shrub 20 feet.

22 A. CHERIMO'LIA (Mill. dict. no. 5.) leaves ovate-lanceolate, not dotted, under surface silky-tomentose; outer petals nearly closed, rusty-tomentose on the outside; fruit somewhat globose and scaly. ♄. S. Native of Peru and New Granada. Dun. mon. anon. p. 72. A. tripétala, Ait. hort. kew. 2. p. 252. Sims, bot. mag. t. 2011. A tree, or rather a large shrub. Leaves strong scented. Peduncles opposite the leaves solitary. Outer petals clothed with rusty-down on the outside, each marked with a dark spot at the base. Fruit, when ripe, of a dark-purple colour; the flesh is soft and sweet. This fruit is esteemed by the Peruvians as one of their most delicate sorts, and is considered by them not inferior to any fruit in the world.

Cherimoyer, *Cherimoliá*, or Soft-fruited Custard-apple. Fl. July, Aug. Clt. 1739. Tree 20 feet.

23 A. RETICULATA (Lin. spec. 757.) leaves oblong-lanceolate, acute, smooth, somewhat dotted; outer petals oblong-lanceolate, acute, nearly closed; fruit ovate-globose, reticulately-areolate. ♄. S. Native of the Caribbee Islands and Brasil, also cultivated in Malabar. Dun. mon. anon. p. 72. Mill. dict. no. 1.—Brown. jam. 3. p. 256. A. squamòsa, Vand. script. lus. p. 118. The fruit of this tree is called *Fruto de Conde*, or *Condissa* in Brasil.

Var. α; areolæ scaly, roundish.—Sloane, hist. 2. p. 167. t. 226.—Catesb. carol. 2. p. 84. t. 86.—Anòna-màram, Rheed. mal. 3. p. 23. t. 30 and 31.

Var. β; areolæ angular, somewhat 5-sided, Dun. mon. l. c. A. reticulàta, Jacq. obs. 1. p. 14. t. 6. f. 2.

A tufted tree like *A. squamòsa*, but much higher with a more nauseous odour. Flowers brownish on the outside, and whitish-yellow on the inside, excavated at the base, and marked with dark purple spots. Fruit, when ripe, yellowish, sometimes reddish. This fruit is as large as a tennis-ball with yellowish soft flesh, of the consistence of a custard, whence the English name of the genus. It is eatable and much esteemed by many people. Perhaps many species are confused under the name of *A. reticulàta*.

Reticulated-fruited or Common Custard-apple. Clt. 1690. Tree 16 to 25 feet.

24 A. MUCO'SA (Jacq. obs. 1. p. 16.) leaves oblong-lanceolate, smooth; outer petals spreading at the top; fruit areolate; areolæ gibbous. ♄. S. Native of Martinico and Guiana in woods, and also cultivated in the Moluccas. Dun. mon. anon. p. 74. Aubl. guian. 1. p. 618. Manòa, Rumph. amb. 1. p. 136. t. 45. This tree is very like *A. reticulàta* in habit and character. The flesh of the fruit is very soft, but possessing an unpleasant taste, whence its name in French Guiana *Cachiman morveux* or *Cachiman sauvage*.

Mucous Custard-apple. Fl.? Clt. 1819. Tree 20 feet.

§ 4. *Outer petals ovate, or oblong-elliptical, obtuse, inner ones smaller, lanceolate, bluntish. Calyx coriaceous, trifid, large, somewhat campanulate. Fruit conical, smooth.*

25 A. GLA'BRA (Lin. spec. 758.) leaves ovate-lanceolate, smooth; peduncles opposite the leaves, 2-flowered; fruit conoid, blunt, smooth. ♄. H. Native of Carolina, and perhaps also cultivated in the West Indies.—Cat. carol. 2. p. 64. t. 64. Dun. mon. anon. 1. p. 74. A tree, or rather a large shrub, with leaves like those of *Citrus médica*. Calyx brown on the outside. Fruit of a greenish-yellow colour, containing a pulp of the consistence of a ripe pear. This is an eatable fruit, very sweet but somewhat insipid: it is the food of the *guanas* and many other wild animals.

Smooth Custard-apple. Fl. Jul. Aug. Clt. 1774. Sh. 16 ft.

26 A. GRANDIFLO'RA (Lam. dict. 2. p. 126.) leaves ovate-lanceolate, smooth, leathery, upper surface shining; peduncles axillary, solitary; fruit egg-shaped, smooth, a little dotted. ♄. S. Native of the Mauritius. Dun. mon. anon. p. 75. t. 6.

Var. β, Madagascariénsis (Pers. ench. 2. p. 95.). ♄. S. Native of Madagascar. Calyx somewhat velvety on the outside.

Great-flowered Custard-apple. Shrub 12 feet.

27 A. AMPLEXICAU'LIS (Lam. dict. 2. p. 127.) leaves heart-shaped, oblong, clasping the stem, acute, smooth; peduncles axillary, solitary, 1-flowered. ♄. S. Native of Madagascar and the Mauritius. Dun. mon. anon. p. 76. t. 7. The flowers are an inch long and more, with the petals thickened towards the base, each marked on the inside with a dark purple hollow, whitish-velvety on the outside.

Stem-clasping-leaved Custard-apple.

§ 5. *Petals all obtuse.*

28 A. DIOI'CA (St. Hil. fl. bras. 1. p. 34.) stem almost simple, downy; leaves broad, obovate, obtuse, rather cuneated at the base, downy beneath; peduncles extra-axillary, 1-flowered, petals all ovate, obtuse. ♄. S. Native of Brazil in the province of St. Paul. Leaves 3-6 inches long, and 2½-4 broad. Peduncles 1-3-together. Flowers yellowish-green; inner petals smallest.

Dioecious Custard-apple. Shrub 2 feet.

29 A. FURFURA'CEA (St. Hil. fl. bras. 1. p. 34. t. 6.) branches scurfy; leaves oblong-elliptical, rather acute at both ends, coriaceous, furfuraceous, and brownish-silvery beneath; peduncles, usually 2-flowered, opposite the leaves; petals ovate, truncate at the base, bluntish, scurfy beneath and downy above. ♄. S. Native of Brazil in the province of Minas Geraes and in the northern part of the province of St. Paul. Leaves 3-5 inches long, and 11-24 lines broad. Peduncles few together. Calyx scurfy, of a yellowish-green colour; sepals ovate, quite entire; petals reddish, inner ones hardly smaller than the outer ones. Fruit rather globose, broadly tubercled, clothed with pale brown scurf.

Scurfy Custard-apple. Shrub 2 to 3 feet.

30 A. PAVO'NII; leaves lanceolate, acuminated, very smooth; peduncles usually aggregate; petals all obtuse. ♄. S. Native of Peru about Guayaquil. An. spe. nov. Ruiz et Pav. herb. in herb. Lamb. (v. s.)

Pavon's Custard-apple. Shrub 6 to 10 feet.

§ 6. *Petals all equal, spreading.*

31 A.? AXILLIFLO'RA (D. C. prod. 1. p. 86.) leaves oval-oblong, bluntish, under surface pubescent; pedicels axillary, 1-flowered, 4-times longer than the petioles. ♄. S. Native of French Guiana. Fruit unknown.

Axillary-flowered Custard-apple. Shrub 8 to 14 feet.

32 A.? UNIFLO'RA (Dun. mon. anon. p. 76.) leaves oblong, acuminated, smooth, under surface glaucous; peduncles opposite the leaves clothed with white tomentum. ♄. S. Native of Para in Brazil. Deless. icon. sel. 1. t. 87. A beautiful species, but doubtful if belonging to this genus. Flowers white on the outside. Calyx 3-parted.

One-flowered Custard-Apple. Shrub 6 feet.

33 A. NI'TIDA (Ruiz. et Pav. fl. per. 5. t. 488.) leaves oblong-lanceolate, acuminated, wavy, smooth; peduncles axillary or lateral, twin or solitary, and furnished with a few scales. ♄. S. Native of Peru. Petals 6, equal, obovate-oblong, obtuse. Ovary globose, crowned by a round point.

Shining-leaved Custard-apple. Shrub.

† *Anònæ not sufficiently known.*

34 A. ASIA'TICA (Lin. spec. 2. p. 758.) leaves oblong, acuminated, not dotted, younger ones pubescent, adult ones smooth. ♄. S. Native of Ceylon. Mill. dict. no. 7. A. Asiática, var. *a*, Dun. mon. anon. p. 71. This tree is said by Martyn to have a smooth oblong-conical fruit, red on the outside, and filled with a whitish eatable pulp, but inferior in flavour to the fruit of *A. squamòsa*. Perhaps this is only a variety of *A. Forskö'hlii*.

Asiatic Custard-apple. Fl.? Clt.? Shrub 12 feet.

35 A. SENEGALE'NSIS (Pers. ench. 2. p. 95.) leaves elliptical, leathery, glaucous, somewhat emarginate at the apex, upper surface smooth, under surface, as well as branches and petioles covered with rusty pubescence; peduncles solitary or twin, axillary, rather pendulous; fruit small, scaly. ♄. S. Native of Guinea in bushy places. Dun. mon. p. 76. Deless. icon. sel. 1. t. 86. Petals leathery, of a greenish-yellow colour. Fruit, when ripe, of a yellowish colour, containing a soft, excellent tasted pulp. This fruit is much esteemed by the natives of Guinea.

Senegal Custard-apple. Fl. Feb. Mar. Clt. 1823. Sh. 6 ft.

36 A. EXSU'CCA (Dun. mon. anon. p. 77.) leaves ovate-oblong, leathery, smooth, upper surface shining, under surface smooth, as well as branches; peduncles nearly opposite the leaves, simple or 2-parted. ♄. S. Native of Guiana in woods. A beautiful tree, bearing small dry fruit. Flower-bud 3-lobed.

Dry-fruited Custard-apple. Tree 20 feet.

37 A. AFRICA'NA (Lin. spec. 758.) leaves lanceolate, pubescent. ♄. S. Native of South America? Mill. dict. no. 6. A very obscure species, of which there is no specimen in the Linnean herbarium.

African Custard-apple. Shrub?

38 A. ATABAPE'NSIS (H. B. et Kth. nov. spec. amer. 5. p. 58.) leaves oblong, obtuse, cuneated at the base, leathery, very smooth, shining, not dotted; peduncles solitary, 1-flowered; petals ovate, heart-shaped, acutish, inner ones scarcely smaller. ♄. S. Native of New Guiana on the banks of the river Atabapo. Perhaps this is not distinct from *A. palústris*.

Atabapo Custard-apple. Shrub 16 feet.

39 A. BONPLANDIA'NA (H. B. ex Kth. nov. spec. amer. 5. p. 58.) leaves oblong, acuminated, somewhat coriaceous, dotted, smooth, shining; peduncles solitary, 1-flowered; outer petals ovate, clothed with fine tomentum. ♄. S. Native near Guayaquil.

Bonpland's Custard-apple. Shrub 12 feet.

40 A. EXCE'LSA (H. B. et Kth. nov. spec. amer. 5. p. 59.) leaves oblong, acuminated, acute at the base, somewhat coriaceous, not dotted, smooth, conduplicate. ♄. S. Native of New Spain near Venta del Exido.

Tall Custard-apple. Tree 60 feet.

41 A. RIPARIA (H. B. et Kth. nov. spec. amer. 5. p. 59.) leaves oblong, acuminated, acute at the base, membranous, dotted, smooth, shining; fruit the form of a pear, obsoletely netted. ♄. S. Native of Peru on the banks of the river Guancabamba.

River-side Custard-apple. Shrub 25 feet.

42 A. MANIRO'TE (H. B. et Kth. nov. spec. amer. 5. p. 59.) leaves obovate-elliptical, short pointed, membranous, rounded at the base, dotted, smooth, with the nerves and veins pubescent; fruit globose, muricated. ♄. S. Native of uncultivated places near Angustura, where it is called *Manirôte*. This species approaches very near *A. muricàta*.

Manirote Custard-apple. Shrub 10 feet.

43 A. LÆ'VIS (H. B. et Kth. nov. spec. amer. 5. p. 60.) leaves lanceolate-oblong, acuminated, acute at the base, membranous, smooth; under surface rather hairy, dotted; peduncles aggregate, 1-flowered; outer petals lanceolate, acutish, fruit smooth. ♄. S. Native of South America near Angustura and in Cumana, where it is cultivated. Perhaps this is either *A. laurifòlia* or *A. glàbra*. Fruit eatable. Flowers greenish-yellow.

Smooth-fruited Custard-apple. Shrub 16 feet.

44 A. QUINDIUE'NSIS (H. B. et Kth. nov. spec. amer. 5. p. 60.) leaves lanceolate-oblong, acuminated at both ends, somewhat coriaceous, upper surface smooth, shining, under surface rather pilose, obsoletely dotted; peduncles 1-5-flowered; outer petals ovate-lanceolate; fruit dotted. ♄. S. Native of New Granada in the Andes about Quindu at the height of 3600 feet.

Quindiu Custard-apple. Shrub 6 feet.

45 A. MICRA'NTHA (Bert. ex Spreng. syst. 2. p. 640.) leaves oblong-lanceolate, tapering to both ends, quite smooth; branches dotted; peduncles lateral, solitary, 1-flowered; calyx exceeding the corolla in length. ♄. S. Native of Hispaniola.

Small-flowered Custard-apple. Shrub 6 feet.

46 A. MICROCA'RPA (Ruiz. et Pav. fl. per. 5. t. 487.) leaves oblong; fruit ovate, small, scaly. ♄. S. Native of Peru.

Small-fruited Custard-apple. Shrub.

Cult. As the species are all natives of tropical countries, they all require the heat of a stove. They thrive best in rich loamy soil mixed with a little peat. Ripened cuttings will root if planted in a pot of sand and placed under a hand-glass, in a moist heat; but the leaves of the cuttings should not be shortened. They are easily raised from fresh seeds, procured from their native countries, sown in pots, and plunged into a good hot-bed, in the same sort of soil recommended for the plants.

II. ROLLI'NIA (to the honour of Charles Rollin, an elegant writer, and professor of rhetoric and eloquence in the college of Plessis, born at Paris, 1661, died 1741). St. Hil. fl. bras. 1. p. 28.

LIN. SYST. *Polyándria, Polygýnia.* Calyx 3-parted (f. 24. *a.*) caducous. Corolla monopetalous, globose, with a narrow, 6-lobed hole at the top (f. 24. *d.*), inserted below the gynophore, and drawn out on the back beneath the outer lobes into 3 very blunt samara-like wings (f. 24. *e.*) which are concave on the inside, deciduous. Ovaries numerous, rather oblong, compressed, connected together, 1-celled, 1-seeded. Fruit scaly, single (f. 24. *f.*) from the coalition of the carpels. Seeds unknown. Peduncles extra-axillary, solitary, rarely twin.

1 R. LONGIFO'LIA (St. Hil. fl. bras. 1. p. 29. t. 5.) leaves oblong, acute, but obtuse at the base, smooth above, but clothed with rufous down beneath as well as the young branches. ♄. S. Na-

tive of Brazil. Corolla clothed with rusty down, 3 lines long. Leaves 4-6 inches long. (f. 24.)

Long-leaved Rollinia. Shrub 20 feet.

FIG. 24.

2 R. FAGIFO'LIA (St. Hil. fl. bras. 1. p. 29.) leaves ovate, pointed, puberulous on both surfaces, and with the nerves clothed with rusty villi. ♄. S. Native of Brazil in the province of Rio-Janeiro on the banks of the river Parabyba. Leaves $1\frac{1}{2}$ to 4 inches long and 1-2 broad. Calyx rusty villous. Corolla pubescent, glaucous. Fruit unknown.

Beach-leaved Rollinia. Fl. Nov. Shrub 6 feet.

3 R. PARVIFLO'RA (St. Hil. fl. bras. 1. p. 30.) leaves oblong, acuminated, and acute at the base, smooth above, puberulous beneath. ♄. S. Native of Brazil in woods on the mountains called Tejuca near Rio-Janeiro. A small tree with rufous-pubescent branches. Leaves $1\frac{1}{2}$ to $2\frac{1}{2}$ inches long. Peduncles solitary. Calyx rusty-villous. Corolla villous of a greenish-brown colour.

Small-flowered Rollinia. Fl. Nov. Tree 20 feet.

4 R. DOLABRIPE'TALA (St. Hil. ex fl. bras. 1. p. 29.) leaves oblong-lanceolate, under surface as well as petioles hairy; corolla tomentose, compressed on one side to the form of a hatchet. ♄. S. Native of Brazil on Mount Cercovado near Rio Janeiro. Annòna dolabripétala, Raddi. in act. soc. ital. 16. p. 15.

Hatchet-petalled Rollinia. Shrub 6 feet.

5 R. BIFLO'RA; leaves oblong, membranous, acuminated, smooth; peduncles 2, 1-flowered, rising below the leaves. ♄. S. Native of Peru. Annòna biflòra, Ruiz, et Pav. MSS. in herb. Lamb. (v. s.)

Two-flowered Rollinia. Shrub 6 feet?

6 R. PTEROCA'RPA; leaves large, oblong, acuminated; wings of petals erect, incurved, hatchet-shaped; fruct large, of numerous carpels. ♄. S. Native of Peru. Annòna pterocárpa, Ruiz, et Pav. fl. per. 5. t. 483.

Wing-fruited Rollinia. Tree.

7 R. MICRA'NTHA; leaves oblong, acuminated; peduncles very thick; fruct of numerous, distinct, close carpels. ♄. S. Native of Peru. Annòna parviflora, Ruiz, et Pav. fl. per. 5. t. 484.

Small-flowered Rollinia. Tree.

Cult. The species of *Rollìnia* will thrive best in good loam mixed with a little peat and sand. Ripened cuttings, with the leaves not shortened, will strike root if planted in a pot of sand, and plunged in a moist heat, with a hand-glass placed over them †.

§ 2. *Monodoreæ, (shrubs agreeing with Monodòra.) Fruit solitary, 1 or many-celled, contained within a single rind.*

III. MONODO'RA (from μονος, *monos*, one, δορα, *dora*, a skin; in allusion to the fruit being 1-celled). Dun. mon. anon. p. 79. D. C. syst. 1. p. 477. prod. 1. p. 87.

LIN. SYST. *Polyándria, Monogýnia.* Calyx 3-sepalled. Petals 6, in 2 series, outer ones lanceolate, inner ones ovate, joined at the base. Anthers indefinite, nearly sessile. Ovary 1, ovate, crowned by the sessile stigma. Berry smooth, somewhat globose, 1-celled, many-seeded. Seeds imbedded in the pulp.

1 M. MYRI'STICA (Dun. mon. anon. p. 80.) fruit very large, somewhat globose; leaves alternate; peduncles lateral, 1-flowered, bearing a bractea at the base or on the middle, or above the middle. ♄. S. Cultivated in Jamaica, but perhaps originally brought from Equinoctial Africa. R. Br. congo, p. 56. Annòna myrística, Gært. fruct. 2. p. 194. t. 125. f. 1. Lunan, hort. jam. 10. American nutmeg, Long, jam. hist. 3. p. 735. Flowers large like those of *Unòna undulàta*, the three inner petals are ciliated on the inside at their margins, the outer ones are much waved, a little longer than the inner ones. Fruit yellow, when ripe.

Jamaica or Calabash *Nutmeg*. Fl.? Clt.? Tree 20 feet.

Cult. The *Jamaica Nutmeg* will thrive well in a mixture of loam and sand, and ripened cuttings will strike root if planted in a pot of sand, plunged in a moist heat, with a bell-glass placed over them †.

IV. EUPOMA'TIA (from ευ, *eu*, well, πωμα, *poma*, a lid; calyptra covering the flower before expansion, in the manner of an extinguisher). R. Br. bot. ter. aust. p. 65.

LIN. SYST. *Icosándria, Polygýnia.* Calyx truncate. Calyptra, covering the flower-bud before expansion. Petals none. Stamens numerous, perigynous, inner ones of the form of petals. Berry many-celled, many-seeded, crowned by numerous connected stigmas. Anthers lateral. A smooth shrub with oblong-coriaceous leaves and 1-flowered axillary peduncles. This genus differs materially from all the rest of the genera of *Anonàceæ* in the perigynous insertion of its stamens; it should therefore be excluded from this order as well as from the sub-class *Thalamiflòræ*.

1 E. LAURI'NA (R. Br. l. c.). ♄. G. Native of New Holland. Flowers greenish-yellow.

Laurel-like Eupomatia. Fl.? Clt. 1824. Shrub 6 feet.

Cult. This fine shrub will thrive well in a mixture of loam and peat, and ripened cuttings will strike root, if planted in a pot of sand, and placed under a hand-glass.

§ 3. *Unòneæ (plants agreeing with Unona.) Carpels many, distinct.*

V. ASIMI'NA (a name of Canadian origin, meaning unknown). Adans. fam. 2. p. 365. Dun. mon. anon. p. 81. D. C. syst. 1. p. 478. prod. 1. p. 87.

LIN. SYST. *Polyándria, Tri-Polygýnia.* Calyx 3-parted. Petals 6, spreading, ovate-oblong, inner ones smallest. Anthers indefinite, nearly sessile. Ovaries many, but for the most part only three, ovate or oblong; carpels the same number as the ovaries, baccate, sessile; seeds many, disposed in a single or double row. Shrubs with oblong, cuneated usually deciduous leaves. Flowers sometimes rising before the leaves, usually solitary and axillary.

1 A. PARVIFLO'RA (Dun. mon. anon. p. 82. t. 9.) leaves cuneate-obovate, mucronate, under surface as well as branches covered with brown pubescence; flowers sessile; outer petals scarcely twice as long as the calyx. ♄. H. Native of Virginia, Georgia and Carolina in shady woods near rivers and lakes. Porcèlia parviflòra, Pers. ench. 2. p. 95. Orchidocárpum parviflòrum, Mich. fl. bor. amer. 2. p. 329. A small shrub, bearing fruit when 2 feet high. Outside of calyx and corolla clothed with brownish tomentum; inside of petals dark purple. Berries 2 or 3, aggregate, sessile, fleshy, the size of a *plum*.

Small-flowered Asimina. Fl. April, May. Clt. 1806. Shrub 2 to 4 feet.

2 A. TRI'LOBA (Dun. mon. anon. p. 83.) leaves oblong-cuneated, acuminated, and are, as well as branches smoothish; flowers on short peduncles; outer petals roundish-ovate, 4-times longer than the calyx. ♄. S. Native of Pennsylvania, Florida, Virginia, and Carolina, on the overflowed banks of rivers. Annòna tríloba, Lin. spec. 758. Mill. dict. no. 8, icon. 1. t. 35. Duham. arb. ed. 2. vol. 2. p. 83. t. 25. Mich. f. arb. amer. 3. p. 161. t. 9. Schkuhr. handb. 2. p. 95. t. 149. Porcèlia tríloba, Pers. ench. 2. p. 95. Orchidocárpum arietìnum, Mich. fl. bor. amer. 1. p. 329.—Catesb. carol. 2. t. 85. A small tree, or rather a large shrub. Flowers campanulate, with the 3 outer petals pale

purplish, and the 3 inner ones smaller, purplish on the outside as well as the inside at the base and apex, with the middle yellow. Berries large, yellow, ovate, oblong, eatable. All parts of the tree have a rank, if not a fetid smell; and therefore the fruit is relished by few, except negroes. Seeds 8-10, disposed in a double row.

Three-lobed-calyxed Asimina. Fl. May, June. Clt. 1736. Shrub 10 feet.

3 A. pygmæ'a (Dun. mon. anon. p. 84. t. 10.) stem suffruticose; leaves oblong-linear, cuneate, blunt, and are as well as branches smooth; flowers on short peduncles; outer petals obovate-oblong, much longer than the calyx. ♄. H. Native of Georgia, Florida, and Carolina in sandy fields. Annòna pygmæ'a, Bartr. trav. ed. germ. p. 21. t. 1. Orchidocárpum pygmæ'um, Mich. fl. bor. amer. 1. p. 330. Porcèlia pygmæ'a, Pers. ench. 2. p. 95. A little shrub hardly a foot high, with twiggy branches, and long cuneated narrow leaves. Outer petals much larger than the inner ones, all white.

Pygmy Asimina. Fl. April, June. Clt. 1812. Shrub 1 ft.

4 A. grandiflo'ra (Dun. mon. p. 84. t. 11.) leaves cuneate-obovate, obtuse, under surface as well as the branches clothed with brown pubescence; flowers sessile; outer petals obovate, much larger than the calyx. ♄. H. Native of Georgia and Florida in sandy woods in shady places. Annòna grandiflòra, Bartr. trav. ed. germ. 20, t. 2. Annòna obovàta, Willd. spec. 2. p. 1269. Orchidocárpum grandiflòrum, Mich. fl. bor. amer. 1. p. 330. Porcèlia grandiflòra, Pers. ench. 2. p. 95. A small, smooth-branched shrub. Flowers white, and very large for the size of the plant, with the outer petals larger than the inner ones. Berries smooth, oblong-obovate.

Great-flowered Asimina. Fl. May. Clt 1820. Shrub 2 feet.

5 A. Campechia'na (H. B. et Kth. nov. spec. amer. 5. p. 61.) leaves elliptical-oblong, acuminated, acute at the base, membranous, dotted; upper surface hairy, under surface as well as the branchlets tomentose; peduncles short, solitary; petals oblong, nearly equal. ♄. S. Native of Mexico about Campeachy.

Campeachy Asimina. Shrub?

Cult. These shrubs will do well in England in the open air, in a warm situation, in a mixture of sand and peat. *A. triloba* will grow in common garden soil. They should be increased by layers put down in the autumn, or by seeds procured from their native country. Seedlings should be trained up in pots, and sheltered in winter until they have acquired a sufficient size. The *A. Campechiàna*, which is a native of a warm climate, will require the heat of a stove. It will do well in the same sort of soil recommended for the hardy species, and ripened cuttings will root in sand under a hand-glass, plunged in a moderate heat.

VI. PORCE'LIA (in honour of Antonio Porcel, a Spanish promoter of botany, who has been highly praised by the authors of the Flora Peruviana). Ruiz. et Pav. syst. fl. per. 1. p. 144. prod. 84. t. 16. D. C. syst. 1. p. 480. prod. 1. p. 88. Dun. mon. anon. p. 85.

Lin. syst. *Polyándria, Tri-Hexagýnia.* Sepals 3, somewhat connected at the base. Petals 6, inner ones a little larger than the outer ones. Anthers indefinite, almost sessile. Carpels 3-6, sessile, coriaceous, hardly fleshy, cylindrical, somewhat torulose, many-seeded; seeds disposed in a twin rank.

1 P. nitidifo'lia (Ruiz. et Pav. syst. 1. p. 144.) leaves ovate-lanceolate, smooth, shining; peduncles axillary, aggregate, 1 or few-flowered; petals ovate. ♄. S. Native of Peru in mountain groves. A beautiful tree with whitish-yellow flowers. Berries marked on the outside by a longitudinal suture, they are pendent as well as the flowers, and are eaten by the inhabitants of Peru. A yellow colouring is obtained from the leaves.

Shining-leaved Porcelia. Tree 60 feet.

2 cinnamo'mea (Ruiz. et Pav. MSS. in herb. Lamb.) leaves distich, long lanceolate, acuminated; branches and petioles clothed with brown villi; peduncles long, rising above the leaves; sepals 3, small; petals 6, inner ones large, concave.

Cinnamon Porcelia. Tree 30 feet.

Cult. A light loamy soil will probably suit these trees well, and ripened cuttings, not deprived of their leaves, will no doubt root in a pot of sand with a hand-glass placed over them, in heat †.

VII. UVA'RIA (from *uva*, a cluster of grapes; resemblance in the clusters of the fruit). Lin. gen. 692. Gært. fruct. 2. p. 155 and 157. Dun. mon. anon. p. 86. D. C. syst. 1. p. 481. prod. 1. p. 88.

Lin. syst. *Polyándria, Polygýnia.* Sepals 3, ovate-cordate, connected at the base. Petals 6, oval, the 3 outer ones smallest? Anthers indefinite, covering the hemispherical receptacle. Ovaries numerous, usually villous. Carpels numerous, baccate, fleshy, ovate-globose, many-celled, many-seeded. Seeds disposed in a double row. Trees or shrubs, with erect or sarmentose branches. Peduncles axillary, opposite the leaves, or lateral 1 or 4-flowered, solitary, twin, or tern, jointed in the middle, usually furnished with bracteas.

1 U. zeyla'nica (Lin. spec. 2. p. 756. exclusive of the synonyms of Rheed. and Rumph.) sarmentose; leaves ovate-lanceolate, smooth; berries many, ovate-cylindrical, tapering into the stipe; inner processes of the integument of the seeds in parallel plates. ♄. ◡. S. Native of Ceylon. Lam. ill. t. 495. f. 2. Dun. mon. anon. p. 88. Gært. fruct. 2. p. 155. t. 114. f. 2. Flowers scarlet, starry. Fruit eatable, of a vinous taste, resembling that of an *Apricot*.

Ceylon Uvaria. Fl.? Clt. 1794. Shrub rambling.

2 U. Gærtne'ri (D. C. syst. 1. p. 482.) berries ovate, tapering into the stipe; inner processes of the integument of the seed awl-shaped, or almost needle-shaped. ♄. S. Perhaps a native of Ceylon. U. trifoliàta, Gært. fruct. 2. p. 167. t. 114. f. 2. Lam. ill. t. 495. f. 3. Dun. mon. anon. p. 89. The berries of this shrub are larger than in *U. Zeylánica*.

Gærtner's Uvaria. Clt. 1794. Shrub rambling.

3 U. cha'mæ (Beauv. fl. d. ow. et ben. 2. p. 43. t. 83. f. 2.) leaves alternate, entire, small, ovate, shining, acute; flowers racemose; sepals coriaceous; petals ligulate. ♄. S. Native of Guinea on the borders of the river St. Jago. Flowers of a rusty-red colour.

Dwarf Uvaria. Shrub 4 feet.

4 U. lu'tea (Roxb. corom. 1. p. 32. t. 36.) tree; leaves oblong, acuminated, smooth, shining; peduncles solitary, 1-6-flowered; berries oblong, 6-seeded. ♄. S. Native of the coast of Coromandel on the mountains. Dun. mon. anon. p. 89. U. coriàcea, Vahl. symb. 3. p. 72.? Flowers small, greenish-yellow. Berries stellately spreading, smooth, yellow, about the size of a partridge's egg, with 4 or 6 seeds imbedded in the pulp. The Telingas call it *Muay*.

Yellow-fruited Uvaria. Fl.? Clt. 1822. Tree 30 feet.

5 U. tomento'sa (Roxb. corom. 1. p. 31. t. 35.) tree; leaves oblong, acute, tomentose; peduncles 1-flowered, mostly solitary; berries globose, 4-seeded. ♄. S. Native of the Circar mountains in Hindoostan. Dun. mon. anon. p. 90. A tall tree with numerous horizontal branches forming a large tuft. Branches and leaves bifarious. Flowers brownish-green. Carpels 10-15, baccate, when ripe, of a violet-purple colour, and about the size of a nutmeg. Seeds about the size of a French-bean imbedded in the pulp.

Tomentose-leaved Uvaria. Fl.? Clt. 1822. Tree 60 feet.

6 U. du'lcis (Dun. mon. anon. p. 90. t. 13.) leaves oblong-elliptical, tapering at the base, cordate, under surface velvety as well as branches; peduncles in pairs, axillary or opposite the

leaves; furnished with bracteas or jointed in the middle. ♄. S. Native of Java. Branches, petioles, and peduncles clothed with rusty villi. Petals rusty on the outside.

Sweet Uvaria. Tree 30 feet.

7 U. JAVA'NA (Dun. mon. anon. p. 91. t. 14.) branches rambling; leaves oval, acute, cordate at the base, clothed with stellate tomentum, as well as the branchlets; peduncles solitary, axillary, or opposite the leaves, 2-5-flowered; pedicels somewhat umbellate, furnished with bracteas in the middle. ♄. S. Native of Java. Inner petals reddish, a little smaller than the outer ones, all greyish on the outside. Pistils villous.

Java Uvaria. Fl.? Shrub rambling.

8 U. VELUTI'NA (Roxb.? Dun. mon. anon. p. 91.) branches rambling; leaves elliptical-oblong, acuminated, cordate at the base, and are as well as the branches, clothed with velvety villi; peduncles lateral, few-flowered; pedicels corymbose, 1-flowered; carpels cylindrical, villous. ♄. S. Native of East Indies. Petals velvety on the outside. Ovaries crowded, somewhat velvety.

Velvety Uvaria. Shrub rambling.

9 U. RUGO'SA (Blum. bijdr. ned. ind. ex Schlecht. Linnæa, p. 494.) leaves oblong, acuminated, smooth; peduncles few-flowered, axillary; fruit globose, wrinkled, 4-seeded. ♄. S. Native of Java.

Wrinkled-fruited Uvaria. Tree 60 feet.

10 U. Burahol (Blum. l. c.) leaves oblong, shining; peduncles crowded, 1-flowered; flowers monoecious. ♄. S. Native of Java. *Burahol* is the name of the tree in Java.

Burahol Uvaria. Tree 60 feet.

11 U. LONGIFO'LIA (Blum. l. c.) leaves oblong, retuse, acutish, clothed with rusty down beneath as well as the branches; racemes elongated, 2-5-flowered; pedicels furnished with bracteas in the middle. ♄. S. Native of Java.

Long-leaved Uvaria. Shrub.

12 U. OBTU'SA (Blum. l. c.) leaves ovate or oval, obtuse, clothed with rusty villi beneath on the ribs as well as the branches; peduncles elongated, lateral, usually 1-flowered; fruit oval, tomentose. ♄. S. Native of Java.

Obtuse-leaved Uvaria. Shrub.

13 U. SPHÆROCA'RPA (Blum. l. c.) branches rambling; leaves ovate-oblong, acute, but obtuse at the base, clothed with rusty villi beneath as well as the branches; fruit on long stipes, globose, smooth, 4-seeded. ♄. S. Native of Java. Flowers purplish.

Round-fruited Uvaria. Shrub rambling.

14 U. PURPU'REA (Blum. fl. jav. fasc. 20. t. 1.) leaves elliptical-oblong, acute, acuminated, somewhat cordate at the base, clothed on both surfaces as well as the branchlets with stellate tomentum; peduncles opposite the leaves, usually 1-flowered, 2-bracteate; bracteas large, roundish, netted with nerves. ♄. S. Native of Java. Flowers beautiful purple.

Purple-flowered Uvaria. Shrub 6 feet.

15 U. AU'RITA (Blum. fl. jav. fasc. 20. t. 2.) leaves oblong, cordate at the base, bluntish; peduncles terminal, panicled or axillary; bracteas small. ♄. S. Native of Java. Flowers purple, about half the size of those of *U. purpùrea*.

Eared Uvaria. Shrub 6 feet.

16 U. FŒ'TIDA (Ruiz, et Pav. MSS. in herb. Lamb.) leaves oblong, villous, acuminated; flowers large, purple; petals long, lanceolate, full of nerves; sepals small. ♄. S. Native of Peru. Perhaps a species of *Unòna*.

Fetid Uvaria. Shrub 6 to 10 feet?

17 U.? SPECTA'BILIS (D. C. syst. 1. p. 484.) leaves oblong, acuminated, smoothish, younger ones rusty and velvety as well as the branches; peduncles 1-flowered, lateral or opposite the leaves; petals obovate, inner ones bifid at the top. ♄. S. Native of Guiana. Flowers large; petals white with silky down. Ovaries crowded, hardly distinct. Fruit unknown. Perhaps a proper genus.

Shewy Uvaria. Shrub.

18 U. OPTHA'LMICA (Roxb. MSS.) leaves oblong-lanceolate, smooth, villous on the nerves beneath, as well as the young branchlets; peduncles lateral, 3-flowered; petals and sepals very villous, inner petals much longer than the outer ones. ♄. S. Native of the Moluccas. Leaves a span long. Fruit not seen.

Eye-plant Uvaria. Fl. Jan. Tree.

19 U. NITIDA (Roxb. MSS.) leaves oval, acuminated, shining, paler beneath; peduncles aggregate, axillary or lateral branched. ♄. S. Native of the East Indies. Fruit not seen.

Shining-leaved Uvaria. Fl.? Tree.

Cult. All the species of this genus require the heat of a stove; they thrive best in sandy loam mixed with a little peat. Ripened cuttings will root in sand under a hand-glass, plunged in heat. Seeds procured from the places of their natural growth, should be sown in spring in pots filled with the same sort of soil recommended for the plants, and placed in a hot-bed.

VIII. UNO'NA (from *uno* to unite, in allusion to the stamens being united with the germens). Lin. suppl. p. 270. Juss. gen. 280. Ann. mus. 16. p. 340. Dun. mon. anon. p. 94. D. C. syst. 1. p. 485. prod. 1. p. 89.

LIN. SYST. *Polyándria, Polygýnia.* Sepals 3, very rarely 4, ovate, acutish, connected at the base. Petals 6, disposed in a ternary order, with the 3 inner ones smallest. Stamens indefinite. Carpels numerous, dry? indehiscent, stipitate, ovate or oblong, 1 or many-celled, smooth, or torulose, many-seeded. Seeds disposed in a single row. Trees or shrubs sometimes with climbing branches. Leaves quite entire. Peduncles usually axillary, 1 or many-flowered, generally furnished with bracteas. The bark and fruit are intensely aromatic, somewhat acrid, and stimulating.

SECT. I. UNONA'RIA (altered from *Unona*). D. C. syst. 1. p. 486. prod. 1. p. 89. Flowers spreading. Carpels smoothish or very torulose.

§ 1. *Marentèria. Petals ovate or oblong, nearly equal.*

1 U. NA'RUM (Dun. mon. anon. p. 99.) stems sarmentose; leaves lanceolate, acuminated; peduncles lateral, solitary, 1-flowered; petals roundish-ovate, nearly equal, inflexed; carpels on long stipes, smoothish. ♄. ◡. S. Native in Malabar and perhaps in the Moluccas. Narum-panel, Rheed. mal. 2. p. 11. t. 9. A shrub climbing up trees. Flowers at first brownish-green, but at length becoming reddish. Anthers yellowish, with an unctuous humour exuding from them. Carpels, when ripe, yellowish-red, nearly an inch long and half an inch broad. There is a sweet-scented greenish oil obtained from the roots by distillation in Malabar, which is used in various diseases, as well as the root itself.

Narum Unona. Clt.? Shrub rambling.

2 U. MUSA'RIA (Dun. mon. anon. p. 100.) stems sarmentose, leaves elliptical-lanceolate, acuminated, cordate at the base; peduncles 1-flowered, solitary, axillary; petals roundish-ovate, nearly equal, reflexed; carpels stipitate, somewhat torulose. ♄. ◡. S. Native of Amboyna, Baleya, and Solor, in steep places at the tops of the highest mountains. Fùnis musàrius, &c. Rumph. amb. 5. p. 78. t. 42. A sarmentose shrub, with brown or blood-coloured flowers. Stamens clammy. Carpels about 10, each marked with a longitudinal prominent line. The roots and bark are used against the colic in the Moluccas. The bark is also used for making musical instruments, as well as that of *A. Nàrum*, whence the specific name.

Musical-rope Unona. Shrub rambling.

3 A. PENDULIFLO'RA (Moc. et Sess. in Dun. mon. anon. p. 100. t. 28.) stem arborescent; leaves nearly sessile, somewhat cordate, oblong-lanceolate, waved; peduncles long, 1-flowered, pendulous; petals inflexed; carpels long, somewhat stipitate. ♄. S. Native of Mexico. A small tree. Petals of a yellowish-green colour, inside of the inner ones reddish-yellow, Carpels about 7, leguminiform.

Pendulous-flowered Unona. Tree 20 feet.

4 U. MARENTE'RIA (D. C. syst. 1. p. 487.) branches climbing; leaves oval, obtuse, quite smooth; peduncles erect, 1-flowered, subterminal; petals oval, velvety on the outside, somewhat unequal; carpels substipitate, ventricose. ♄. ◡. S. Native of Madagascar. Marentèria, Norh. ex Pet. Th. gen. nov. madag. p. 18. no. 60. A small climbing shrub. Carpels 4-5, on short pedicels. Petals brown-velvety on the outside.

D. Armentèries's Unona. Shrub cl.

5 U. CRASSIPE'TALA (Dun. mon. anon. p. 101. t. 24.) leaves oblong-elliptical, acuminated, smooth; peduncles axillary, 1-flowered, pilose, erect, longer than the petioles; petals oblong, thick. ♄. S. Native of Cayenne. U. pachypétala, Spreng. Petals brown, spreading, about an inch long.

Thick-petalled Unona. Shrub.

6 U. FUSCA'TA (D. C. syst. 1. p. 488.) leaves oblong, acuminated, smooth; peduncles erect, axillary, 1-flowered, pilose, somewhat shorter than the petioles; petals oval-oblong, acutish. ♄. S. Native of Guiana. Petals rufescent. Ovaries densely approximate, length of stamens. Fruit unknown.

Brown-flowered Unona. Fl.? Clt. 1820. Shrub.

7 U. OBTUSIFLO'RA (D. C. syst. 1. p. 488.) leaves smooth, oval-oblong, acuminated at both ends; peduncles axillary, 1-flowered, hardly pubescent, much longer than the petioles; petals oblong-obovate, very blunt. ♄. S. Native of Guiana. Petals of a brownish-grey colour on the outside, velvety.

Blunt-flowered Unona. Shrub.

8 U. ACUMINA'TA (D. C. syst. 1. p. 488.) leaves smooth, oblong, taper-pointed at both ends; peduncles axillary, 1-flowered, hardly pubescent, much longer than the petioles; petals oblong, acute. ♄. S. Native of Guiana. Flowers like those of *A. obtusiflòra*, but rather smaller, and of the same colour. Stamens and ovaries like those of *A. fuscàta*.

Acuminated-leaved Unona. Fl.? Clt. 1820. Shrub 6 feet.

9 U. MACROCA'RPA (Vahl. ined. D. C. syst. 1. p. 489.) leaves oval, blunt at both ends, coriaceous, quite smooth; peduncles lateral, short, branched, 2-3-flowered; petals oval-oblong, acutish. ♄. S. Native of Guinea. Petals equal, somewhat coriaceous, velvety with pubescence.

Long-fruited Unona. Shrub.

10 U. OVA'TA (Vahl. ined. D. C. syst. 1. p. 489.) leaves ovate, acute, upper surface smooth, with the middle nerve on the under surface, clothed with rusty tomentum, as well as the branchlets; peduncles 2-flowered, very short, opposite the leaves; petals oval-oblong, acutish. ♄. S. Native of Guinea. Petals nearly equal, coriaceous, purple.

Var. β, *Afzeliàna* (D. C. syst. 1. p. 489.) very like the species, but the adult leaves are smooth, (except the longitudinal nerve) rusty. ♄. S. Native of Sierra Leone.

Ovate-leaved Unona. Shrub.

11 U. GRANDIFLO'RA (Leschen. in litt. D. C. prod. 1. p. 90.) leaves oval-oblong, almost sessile, cordate at the base, upper surface smooth, under surface velvety; peduncles 1-flowered, opposite the leaves; petals oval-oblong. ♄. S. Native of Bengal. Carpels 30-35, terete, velvety.

Great-flowered Unona. Shrub.

§ 2. *Œta'nia. Outer petals ovate-oblong, acutish; inner ones none or very minute.*

12 U. TRIPE'TALA (D. C. syst. 1. p. 490.) leaves lanceolate, upper surface wrinkled, under surface tomentose; carpels stipitate, ovate, somewhat triquetrous, granulated, 3-seeded. ♄. S. Native of Amboyna in plains and on hills. Unona tripetaloìdea, Dun. mon. anon. p. 104.—Rumph. amb. 2. p. 197. t. 66. f. 1. Uvària tripétala, Lam. dict. 1. p. 597. A tree with the habit of *Michèlia Champàca*. Flowers on peduncles solitary, sweet-scented, greenish. Fruit about the size of a *plum*. This tree is called in the Malay language *Cananga-Œtan*, whence the name of the section.

Three-petalled Unona. Tree 40 feet.

§ 3. *Canánga.* (*Cananga-ætan* is the Malay name of the preceding species.) *Petals linear-lanceolate, long, narrow.*

13 U. VIOLA'CEA (Dun. mon. anon. p. 105. t. 25.) leaves elliptical, bluntish, smooth? peduncles opposite the leaves, drooping, 1-flowered, surrounded by one bractea; petals lanceolate-oblong. ♄. S. Native of Mexico. Un. spec. nov. Moc. and Sess. pl. mex. icon. pict. ined. Petals purplish-brown, inner ones white on the inside at the base.

Violaceous-flowered Unona. Shrub.

14 U. UNCINA'TA (Lam. dict. 2. p. 127.) leaves oblong-lanceolate, acuminated, smooth, shining; peduncles opposite the leaves, hooked beneath the middle; carpels ovate-roundish. ♄. G. Native of the Mauritius and the East India islands. Dun. mon. anon. p. 105. t. 12. Artabòtrys adoratíssima, R. Br. in bot. reg. t. 423.—Rheed. mal. 7. p. 86. t. 46? Anona hexapétala, Lin. fil. supl. 270? Petals reddish-brown. Carpels fleshy, roundish, 1 or 2-seeded, about the size of a walnut. Seeds large, oblong. The flowers of this species are extremely fragrant.

β; peduncles simple, arched. Perhaps this plant is referable to t. 16. in Braam. icon. chin. 1821?

Hooked-peduncled Unona. Fl. June, July. Clt. 1758. Shrub 6 feet.

15 U. HAMA'TA (Dun. mon. anon. p. 106. t. 27. Blum. bijdr. fl. ned. ined. ex Schlecht. Linnæa. 1. p. 495.) branches rather climbing; peduncles solitary, hooked, few-flowered; leaves elliptical-oblong, acute at both ends, coriaceous, smooth; petals lanceolate, constricted at the base, clothed with rusty-tomentum; carpels ovate, tapering to both ends, 2-seeded. ♄. ◡. S. Native of Java and China. A large shrub, with an erect stem and climbing branches.

Hooked-peduncled Unona. Shrub cl.

16 U. CANA'NGA (Spreng. syst. app. p. 215.) leaves unequally ovate-oblong, acuminated, smooth; peduncles axillary, 1-many-flowered, leafy; pedicels rather corymbose; petals lanceolate; carpels ovate, stipitate. ♄. S. Native of Java. A. odoràta, Blum. Flowers monoecious. *Cananga* is a name used in Amboyna for *U. tripétala*.

Cananga Unona. Shrub.

17 U. ESCULE'NTA (Dun. mon. anon. p. 107.) stems climbing; leaves ovate-lanceolate, smooth; branches tendrilled at the apex; peduncles 1-flowered; petals lanceolate. ♄. ◡. S. Native of India about Madras. Uvària esculénta, Roxb. Rottl. and Willd. in nov. act. nat. cur. berol. 4. p. 201. A climbing shrub. Fruit eatable.

Esculent Unona. Fl. Nov. Clt. 1818. Shrub cl.

18 U. LESSERTIA'NA (Dun. mon. anon. p. 107. t. 26.) leaves oblong-elliptical, upper surface smooth, shining; peduncles lateral, 1-flowered, bracteate; petals oblong, somewhat curled. ♄. S. Perhaps a native of China or India. Uvària uncàta, Vahl. in herb. Deless. Petals of a pale-brown colour, velvety.

De Lessert's Unona. Shrub cl.?

19 U. VIRGA'TA (Blum. bijdr. fl. ned. ind. ex Schlecht.

Linnæa. 1. p. 495.) leaves ovate-lanceolate, acuminated, smooth; peduncles axillary, 1-flowered; petals lanceolate, inner ones glandular at the base. ♄. S. Native of Java.

Twiggy Unona. Shrub.

20 U. ODORATA (Dun. mon. anon. p. 108.) leaves ovate-oblong, acuminated, smooth, rounded and oblique at the base; peduncles lateral, leafy, 1-flowered; petals linear-lanceolate; carpels stipitate, egg-shaped, umbilicated at the top. ♄. S. Native of Java and China. Uvària undulàta, Lam. dict. 1. p. 595. ill. t. 495. f. 1.—Rumph. amb. 2. p. 195. t. 65. A tall tree, with cinereous smooth branches. Flowers sweet-scented; petals yellowish. Carpels pulpy, about 9. Seeds imbedded in the sweet pulp.

Sweet-scented-flowered Unona. Fl.? Clt. 1804. Tree 40 feet.

21 U. LONGIFO'LIA (Lam. dict. 1. p. 597.) leaves oblong-linear, acuminated, smooth, waved on the margin; peduncles lateral, crowded, somewhat umbellate; petals linear-lanceolate, acute; carpels stipitate, egg-shaped. ♄. S. Native of Bengal, Java, Coromandel, and Pondicherry, where it is cultivated in private avenues.—Sonn. voy. ined. 4. t. 131. A tall erect tree, with yellow flowers.

Long-leaved Unona. Fl.? Clt. 1820. Tree 60 feet.

22 U. NITIDI'SSIMA (Dun. mon. anon. p. 109. t. 23.) leaves oblong-elliptical, acuminated at both ends, smooth, shining; peduncles axillary, very short, 1-flowered; petals linear, bluntish. ♄. S. Native of New Caledonia. Uvària lùcida, Vent. in herb. Deless. U. fúlgens. Labill. nov. caled. t. 56. Fruit unknown.

Very-nitid-leaved Unona. Fl.? Tree.

23 U. LIGULA'RIS (Dun. mon. p. 110.) leaves ovate-lanceolate, acute; peduncles lateral, many-flowered; petals long, linear; carpels stipitate, somewhat globose. ♄. S. Native of Amboyna. Uvària ligulàris, Lam. dict. 1. p. 597.—Rumph. amb. 2. p. 298. t. 66. f. 2. A tree very like *U. odoràta*. Seeds sweet-scented.

Ligular-petalled Unona. Tree 20 feet.

24 U. ELLI'PTICA (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 495.) leaves almost sessile, somewhat cordate at the base, oval-oblong, acute, smooth; peduncles axillary, 1-flowered, furnished with bracteas; petals linear-lanceolate, bluntish. ♄. S. Native of Java.

Elliptical-leaved Unona. Shrub.

25 U. LITTORA'LIS (Blum. l. c.) branches a little climbing; leaves ovate, bluntly acuminated, rounded at the base, coriaceous, smooth; peduncles 1-flowered, longer than the petiole; fruit oval, contracted in the middle, on short stipes, somewhat baccate. ♄. ∪. S. Native of Java.

Sea-side Unona. Shrub cl.

26 U. MACROPHY'LLA (Blum. l. c.) leaves oblong, acuminated, coriaceous, rounded at the base, smooth; peduncles 1-flowered, almost axillary; fruit oval, 2-seeded, somewhat baccate, on short stipes. ♄. S. Native of Java.

Large-leaved Unona. Shrub.

27 U. SUBCORDA'TA (Blum. bijdr. fl. ind. ex Schlecht. Linnæa. 1. p. 495.) leaves almost sessile, somewhat cordate-oblong, acuminated, pubescent beneath at the ribs; peduncles solitary, axillary 1-flowered; carpels globose, stipitate, 2-seeded. ♄. S. Native of Java.

Subcordate-leaved Unona. Shrub.

SECT. II. DE'SMOS (δεσμος, *desmos*, a chain; fruit articulated like the links of a chain.) D. C. syst. 1. p. 493. prod. 1. p. 91. Petals lanceolate, oblong, or linear, sometimes nearly closed. Carpels baccate, torulose, somewhat articulated, many-celled? more or less moniliform.

28 U. DISCRE'TA (Lin. fil. suppl. 270.) leaves oblong-lanceolate, narrow, under surface silky; carpels moniliform, on long stipes. ♄. S. Native of Surinam. Dun. mon. anon. p. 110. Uvària monilífera, Gært. fruct. 2. p. 156. t. 114. Lam. ill. t. 495. f. 4. A tree with twiggy flexile pubescent branches. Leaves narrow, like those of a species of *Sàlix*. Flowers like those of *Anòna*. Berries purple, aromatic, and of a very good taste, 1-3-celled; cells 1-seeded.

Separated Unona. Tree 20 feet.

29 U. UNDULA'TA (Dun. mon. anon. p. 111.) leaves ovate-oblong, smooth; peduncles axillary, 1-flowered; petals oblong-linear, long, outer ones waved; carpels oblong, somewhat moniliform. ♄. S. Native of the kingdom of Waree in Guinea. Xylòpia undulàta, Beauv. fl. owar. et ben. 1. p. 27. t. 16. Flowers scarlet, with the outer petals very long, and elegantly waved. Fruit like that of *Unòna Æthiópica*, aromatic, and is used as a condiment at Waree in Guinea. Joints of fruit 1-2-seeded.

Waved-petalled Unona. Shrub 8 feet.

30 U. DI'SCOLOR (Vahl. symb. 2. p. 63. t. 36.) leaves ovate-oblong, acuminated, smooth, under surface glaucous; peduncles lateral, 1-flowered, elongated; carpels moniliform, on short stipes. ♄. S. Native of the East Indies. Dun. mon. anon. p. 111. A tree with white flowers, with a volatile oil exuding from them.

Two-coloured-leaved Unona. Fl.? June. Tree 20 feet.

31 U. CHINE'NSIS (D. C. syst. 1. p. 495.) leaves ovate-lanceolate, smooth; flowers solitary, spreading, on long peduncles; carpels torulose, moniliform, nearly sessile. ♄. G. Native of China near Canton. A shrub about 5 feet high. Flowers white? Désmos Chinénsis, Lour.

Chinese Unona. Shrub 5 feet.

32 U. COCHINCHINE'NSIS (D. C. syst. 1. p. 495.) leaves lanceolate, tomentose; flowers solitary, closed, on long peduncles; carpels nearly sessile, torulosely-moniliform. ♄. G. Native of Cochin-China in bushy places. Désmos Cochinchinénsis, Lour. coch. ed. Willd. 1. p. 431. Unòna Désmos, Dun. mon. p. 112. A shrub about 5 feet high, with an erect stem and weak reclinate branches. Flowers terminal, yellowish-green, pendulous. Berries reddish-green.

Cochin-China Unona. Shrub 5 feet.

33 U. AROMA'TICA (Dun. mon. anon. p. 112.) leaves oblong, acuminated, smooth; peduncles axillary, 1-2-flowered; carpels oblong, terete, torulose, nearly sessile. ♄. S. Native of Guiana in woods, particularly at a place called Timoutou. Wària Zeylánica, Aubl. guian. 2. p. 605. t. 243. Uvària aromática. Lam. dict. 1. p. 596. Unòna cóncolor, Willd. spec. 2. p. 1271. Every part of the tree is aromatic. The three outer petals are cinereous on the outside, inside smooth, violaceous; inner ones smaller, violaceous. The fruit is acrid and aromatic, and is used as a condiment instead of pepper by the negroes in Guiana.

Aromatic-fruited Unona. Fl.? Clt. 1820. Tree 20 feet.

34 U. ÆTHIO'PICA (Dun. mon. anon. p. 113.) leaves ovate-lanceolate, acute, smooth, under surface glaucous; carpels terete, torulose, nearly sessile. ♄. S. Native of Ethiopia and Sierra Leone. Pìper Æthiòpicum, Math. comm. 1. p. 434. icon. Lob. icon. 2. p. 205. Tabern. 917. icon. The seeds have an aromatic, pungent taste; they were formerly sold in the shops, but now more rarely under the names of *Ethiopian pepper*, *Guinea pepper*, *Negro pepper*, *or Pìper Æthiópicum*, *&c.*

Ethiopian or Negro Pepper. Fl.? Clt. 1822. Shrub.

35 U. OXYPE'TALA (D. C. syst. 1. p. 496.) leaves oval-oblong, acuminated, upper surface smooth, under surface somewhat glaucous; peduncles axillary, very short, 1-flowered; petals linear, pointed. ♄. S. Native of Sierra Leone. Perhaps this species should have been placed in the following section. Petals pubescent on the outside.

Sharp-petalled Unona. Shrub 6 feet.

36 U. BIGLANDULO'SA (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 495.) leaves somewhat cordate, ovate-lanceolate, acuminated, with 2 glands on the margin, glaucous beneath; peduncles lateral, 1-flowered, shorter than the leaves; fruit moniliform, stipitate. ♄. S. Native of Java.

Two-glanded-leaved Unona. Shrub 6 feet.

37 U. SUAVE'OLENS (Blum. l. c.) leaves oblong-lanceolate, smooth, tapering to both ends; peduncles hooked, many-flowered; petals linear, silky, closed at the base; berries oval-oblong, 2-seeded, tapering to both ends, on short stipes. ♄. S. Native of Java.

Sweet-scented Unona. Shrub.

38 U. LEPTOPE'TALA (D. C. syst. 1. p. 496.) leaves oval-oblong, acuminated, and are, as well as branches, smooth; peduncles axillary, branched; petals oblong-linear, pointed. ♄. S. Native of the island of Timor. Deless. icon. sel. 1. t. 88. Petals six times longer than the calyx, rather velvety with fine down.

Slender-petalled Unona. Shrub 10 feet.

SECT. III. MELODO'RUM (*mel*, honey, *odor*, smell, as the leaves of *M. dumetòrum*.) D. C. syst. 1. p. 497. prod. 1. p. 91. Flowers pyramidal, narrow, elongated; petals linear-triangular, acute, generally closed, covering the base of the genitals; carpels baccate, smoothish, or exceedingly torulose.

39 U. LATIFO'LIA (Dun. mon. anon. p. 115.) leaves broad-oblong-lanceolate, under surface woolly; flowers racemose; berries numerous, 2-3-seeded. ♄. S. Native of the Moluccas. A tree with broad leaves, like those of *Michèlia Champàca*. Berries, when ripe, about the size of a nut; at first whitish, then reddish, and at last becoming black. Seeds aromatic.

Broad-leaved Unona. Tree 30 feet.

40 U. SYLVA'TICA (Dun. mon. anon. p. 115.) leaves ovate-oblong, under surface tomentose; flowers solitary, on short pedicels; berries ovate-oblong, fleshy, rough. ♄. S. Native of Cochin-China in woods. Melodòrum arbòreum, Lour. coch. ed. Willd. 1. p. 430. A large tree, used in Cochin-China for building houses. Flowers of a greenish-white colour, fleshy. Berries not eatable.

Wood Unona. Tree 40 feet.

41 U. KENTII (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 495.) leaves oblong-lanceolate, coriaceous, shining; peduncles axillary, 1-flowered, nodding; berries globose, 2-seeded, on short stipes. ♄. S. Native of Java.

Kent's Unona. Shrub 6 feet.

42 U. HU'MILIS (Blum. l. c.) leaves broad-lanceolate, with the veins underneath rufous-silky; peduncles opposite the leaves, 3-flowered; berries 1-2-seeded, globose, stipitate. ♄. S. Native of Java.

Humble Unona. Shrub 6 feet.

43 U. DUMETO'RUM (Dun. mon. anon. p. 116.) leaves lanceolate, smooth; flowers solitary; berries nearly sessile, ovate-oblong, rough. ♄. S. Native of Cochin-China in bushy places. Melodòrum fruticòsum, Lour. cochin. ed. Willd. 1. p. 430. A shrub, with sweet-scented leaves. Flowers yellowish-brown. Pulp of fruit, sparing, but of a grateful taste.

Bush Unona. Shrub 4 feet.

44 U. LU'CIDA (D. C. syst. 1. p. 498.) leaves oval-oblong, acuminated at both ends, quite smooth, upper surface shining; peduncles simple; berries oblong, blunt, somewhat flattened and torulose, on short stipes. ♄. S. Native of Peru. Deless. icon. sel. 1. t. 89.

Shining-leaved Unona. Shrub 6 feet?

45 U. ACUTIFLO'RA (Dun. mon. anon. p. 116. t. 22.) leaves ovate-lanceolate, acute, rather stiff, smooth; peduncles very short, 1-flowered; berries ovate-oblong, on short stipes. ♄. S. Native of the West Indies or Sierra Leone? Petals silky on the outside.

Acute-flowered Unona. Tree 40 feet.

46 U. XYLOPIOI'DES (Dun. mon. anon. p. 117. t. 21.) leaves oblong, acuminated, under surface silky, shining, margins revolute at the base; peduncles 2-4, axillary, short. ♄. S. Native of New Granada. H. B. Kth. nov. spec. amer. 5. p. 62. Uvària febrifûga, H. et B. ined. A tree with pendulous branches. Outer petals brown-silky on the outside, and white on the inside, inner petals white, but red at the base. Berries dry, oblong, somewhat curved, many-celled.

Xylopia-like Unona. Tree 70 feet.

47 U.? POLYCA'RPA (D. C. syst. 1. p. 499.) leaves oblong, acuminated, rather glaucous, smoothish, with the middle nerve at the base rather tomentose; berries on long stipes. ♄. S. Native of Sierra Leone. Perhaps a species of *Guattèria*, or a proper genus.

Many-fruited Unona. Shrub.

48 U.? SELA'NICA (D. C. prod. 1. p. 92.) leaves ovate, acute, upper surface smooth, under surface wrinkled; racemes few-flowered, terminal, pendulous. ♄. S. Native of the Moluccas Dámmara Selánica, Rumph. amb. 2. p. 168. t. 56.? Lam. dict. 2. p. 259. U. orientàlis, Spreng. syst. 2. p. 636.

Selanic Unona. Tree 60 feet.

Cult. The whole of this genus require the heat of a stove. A light loamy soil suits them best; and ripened cuttings will strike root if planted in a pot of sand, and placed under a hand-glass, in heat. If seeds of any of them can be procured from their native places, they should be sown immediately, as they do not retain their vegetative power long, in a mixture of loam, sand, and peat, and placed in a hot-bed.

IX. XYLO'PIA (from ξυλον, *xylon*, wood, and πικρος, *picros*, bitter; the wood of some species are extremely bitter, abridged from Xylopìcron.) Lin. gen. 1027. Lam. ill. t. 495. Aubl. guian. 1. p. 602. Juss. gen. 283. Dun. mon. anon. p. 48. and 118. D. C. syst. 1. p. 499. prod. 1. p. 92.

LIN. SYST. *Polyándria*, *Di-Polygýnia*. Calyx 3-5-lobed; segments ovate, coriaceous, acutish. Petals 6, 3-outer ones largest. Stamens indefinite, inserted in the receptacle, which is usually globose. Carpels 2-15, on short stipes, flattened, 1-celled, 1-2-seeded, sometimes dehiscent, sometimes somewhat baccate. Seeds obovate, shining, sometimes furnished with aril. Trees or shrubs, with oblong or lanceolate leaves and axillary, bracteate, 1 or many-flowered peduncles. Wood bitter, whence the name of P. Browne *Xylopìcron*. Fruit and bark aromatic.

1 X. MURICA'TA (Lin. spec. 1367.) leaves lanceolate, acuminated, strigose on the under surface, bearded at the apex; peduncles many-flowered; carpels muricated. ♄. S. Native of Jamaica on the mountains. Dun. mon. anon. p. 120. X. frutéscens, Gært. fruct. 1. p. 339. t. 69. f. 7.—Brown. jam. 250. t. 5. f. 2. A shrub, with smooth twiggy twisted branches.

Muricated-carpelled Bitter-wood. Fl.? Clt. 1773. Shrub 6 ft.

2 X. FRUTE'SCENS (Aubl. guian. 1. p. 602. t. 292. exclusive of the synonyms.) leaves oblong-lanceolate, acuminated, under surface silky; peduncles 1-3, very short; carpels smooth. ♄. S. Native of Brasil and Guiana. Lam. ill. t. 495. Dun. mon. anon. p. 120. X. setòsa, Poir. dict. 8. p. 812. A shrub with distich branches. The bark affords a cordage. The leaves and wood are very aromatic, and the seeds have an acrid aromatic taste, and are used by the negroes in Guiana instead of pepper. Flowers 4-lines long, silky. Seeds full of a very fragrant acrid oil.

Shrubby Bitter-wood. Fl.? Clt. 1823. Shrub 6 feet?

3 X. SALICIFÒLIA (H. B. et Kth. spe. amer. nov. 5. p. 63.) leaves oblong, acuminated, bluntish, under surface silky; pe-

duncles short, 1-flowered? bracteolate. ♄. S. Native of South America near Espinal. Dun. mon. anon. p. 120. t. 17. A tree with blackish branches. Capsules 5-7, indehiscent.

Willow-leaved Bitter-wood. Tree 40 feet.

4 X. LIGUSTRIFO'LIA (Dun. mon. anon. p. 121. t. 18.) leaves oblong, acutish, smooth; peduncles short, few-flowered, bracteolate. ♄. S. Native of South America near Buga in Popayan. H. B. et Kth. nov. amer. spec. 5. p. 63. Petals and sepals on the outside clothed with brown-velvety hairs. Capsules indehiscent.

Privet-leaved Bitter-wood. Tree.

5 X. GLA'BRA (Lin. spec. 1367.) leaves oblong-ovate, smooth; peduncles 1-flowered, solitary or in pairs; carpels smooth. ♄. S. Native of the islands of Barbadoes and Jamaica. Dun. mon. anon. p. 121. t. 19.—Pluk. alm. 395. t. 238. f. 4. Flower-buds oblong, pubescent on the outside.

The wood, bark, and berries of this tree have an agreeable bitter taste, not unlike that of an orange-seed. The wild pigeons feed much upon the latter, and owe that delicate bitterish flavour so peculiar to them in the season wholly to this part of their food. Fresh gathered from the tree, they are agreeable to the palate and grateful to the stomach. The bitter quality of this tree is communicated with great facility. A handful of the shavings immersed in water and instantly taken out again will render it of a very bitter taste. Sugar sent over in hogsheads made of this wood was so bitter that no person would purchase it. Bedsteads and presses made of it are proof against cock-roaches and other insects. Carpenters who work the wood perceive a bitter taste in their mouths and throats. A decoction of it is said to be of service in colics, and to create appetite. This species is called *bitter-wood* in Jamaica. Perhaps all the species of this genus partake more or less of this bitter quality.

Smooth-leaved Bitter-wood. Fl.? Clt. 1820. Tree 40 feet.

6 X. MARTINICE'NSIS (Spreng. syst. 2. p. 636.) leaves obovate-oblong, tapering into the petiole, smooth on both surfaces, but of a different colour beneath; branchlets angular; peduncles racemose. ♄. S. Native of Martinico.

Martinico Bitter-wood. Tree 20 feet.

7 X. NI'TIDA (Dun. mon. anon. p. 122. t. 20.) leaves oblong-lanceolate, smooth, upper surface shining; peduncles branched, many-flowered; calyx nearly entire. ♄. S. Native of Cayenne in the mountains of Oyac.

Shining-leaved Bitter-wood. Fl.? Tree 28 feet.

8 X. ACUMINA'TA (Dun. mon. anon. p. 122. t. 16.) leaves oblong-elliptical, long-pointed, quite smooth, capsules 1-valved, 2-seeded. ♄. S. Native of Cayenne and Portorico. Seeds black, fetid, convex on the outside, and flat on the inside.

Acuminated-leaved Bitter-wood. Tree

9 X. PRINOI'DES (Dun. mon. anon. p. 122. t. 15.) leaves oblong-lanceolate, acuminated, bluntish at the apex, smooth, membranous; flowers solitary; capsules 2-valved. ♄. S. Native of Cayenne. Seeds as in the preceding species.

Prinos-like Bitter-wood. Tree.

10 X. GRANDIFLO'RA (St. Hil. fl. bras. 1. p. 40.) stem arboreous; branches clothed with rufous down; leaves elliptical-lanceolate, acute, obtuse at the base, puberulous above and downy beneath; peduncles very short, 2-flowered; outer petals linear, acutish, inner ones triquetrous, 2-eared at the base. ♄. S. Native of Brasil in the province of Rio Janeiro. Leaves distich, smooth, 4 inches long and $1\frac{1}{2}$ broad. Petals clothed with rufous silky pubescence.

Great-flowered Bitter-wood. Fl. Feb. Tree 20 feet.

11 X. SERI'CEA (St. Hil. fl. bras. 1. p. 41.) stem arboreous; branches clothed with rufous down; leaves lanceolate-oblong, with long points, smooth above, but silky beneath; peduncles quite short, 3-flowered; petals erect, outer ones oblong-linear, blunt, inner ones triquetrous; berries few, almost dry, smooth, 1-valved. ♄. S. Native of Brazil in the province of Rio Janeiro in woods. St. Hil. pl. usu. bra. t. 33. Embìra Pindaìba, Pis. bras. 71. with a figure. Ibìra Margr. bras. 99. with a figure. Unòna carmatìva, Amd. diss. 48?

The tree is called *Pao d. Embira and Pindaiba* in Brasil. The bark is thready and tough, and is useful for making cables and cordage. The bark of a number of the other species is employed for the same purposes. The fruit is truly aromatic, with the smell of a pear, and its taste is very agreeable. It might be employed as an excellent condiment.

Silky Bitter-wood. Tree 20 feet.

12 X. BRASILIE'NSIS (Spreng. neue. entd. 3. p. 50.) leaves lanceolate, acuminated, coriaceous, under surface pilose; branchlets as well as erect 1-flowered peduncles, hairy; petals thickish, velvety, spreading. ♄. S. Native of Brasil. This plant is said to be very like *X. frutéscens*.

Brasil Bitter-wood. Tree 20 feet.

Cult. All the species of this genus require a stove heat. They grow best in sandy loam, or a mixture of loam and peat; and ripened cuttings will root in sand under a hand-glass, plunged in a moderate heat. The seeds when procured from their native countries should be sown immediately in pots in the same sort of soil recommended for the plants, and placed in a hot-bed. These seeds soon lose their vegetative property.

X. ORO'PHEA (from *ορορη*, *orophe*, the top of any thing; cohesion of inner petals at apex.) Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 496.

LIN. SYST. *Hexo-Enneándria, Tri-Tetragýnia.* Calyx 3-parted. Petals 6, in two series, outer ones smallest, inner ones stalked, cohering at the apex in the form of a calyptra. Stamens 6-9, alternate ones usually sterile. Anthers 2-celled, adnate outwardly. Ovaries 3, rarely 4, villous, at first approximating, but at length diverging, 2-seeded. Stigma blunt. Carpels 3-4, rarely solitary from abortion, sessile, baccate, cylindrical, 1-2-seeded. Seeds adhering to the top of the cell.—Shrubs.

1 O. HEXA'NDRA (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 496.) leaves ovate-lanceolate; peduncles axillary and terminal, solitary, somewhat racemose; pedicels 1-flowered; flowers hexandrous. ♄. S. Native of Java.

Hexandrous Orophea. Shrub.

2 O. ENNEA'NDRA (Blum. l. c.) leaves oblong; peduncles supra-axillary, or opposite the leaves, usually 3-flowered; pedicels in fascicles; flowers enneandrous. ♄. S. Native of Java.

Enneandrous Orophea. Shrub.

Cult. The species of *Oròphea* will thrive well in a mixture of loam, peat and sand, and ripened cuttings will root if planted in a pot of sand, with a hand-glass placed over them, in heat. None of the species have yet been introduced into the gardens of Europe.†

XI. DUQUE'TIA (to the honour of James Joseph Duquet, once professor of theology and philosophy in the college of Troyes. He wrote commentaries on most of the books of the New Testament, and a collection of letters on piety: born at Montbrison 1649, died 1733.) St. Hil. fl. bras. 1. p. 35. t. 7.

LIN. SYST. *Polyándria, Polygýnia.* Receptacle large, transversely 2-parted, cylindrically globose, honey-combed. Carpels numerous, free, 3-5-angled, acuminated with the permanent style, tapering at the base into a thick hardly narrower pedicel, woody, very thick, 1-seeded, indehiscent, deciduous. Seed erect, fixed to the bottom of the carpel.—A small tree, with alternate simple quite entire leaves, furnished with stipulas, short petioles, which are jointed at the base, and extra-axillary, solitary, 1-flowered, peduncles. This genus differs materially from the rest in the presence of stipulas.

1 D. LANCEOLA'TA (St. Hil. fl. bras. 1. p. 35. t. 7.) ♄. S. Native of Brasil. Branches furfuraceous. Leaves about 3-inches long, lanceolate, rather acuminated, shining above, but scurfy beneath. Carpels about 6-lines long, of a chesnut colour, shining, having the appearance of a *plum*.

Lanceolate-leaved Duquetia. Tree 16 feet.

Cult. Duquetia will thrive very well in a mixture of sandy loam and peat, and ripened cuttings will strike root in a pot of sand under a hand-glass, in a moist heat.

XII. GUATTE'RIA (John Bapt. Guatteri, an Italian botanist, once a professor at Parma, mentioned by the authors of Flora Peruviana.) Ruiz, et Pav. prod. p. 85. t. 17. Dun. mon. anon. p. 50 and 123. D. C. syst. 1. p. 502. prod. p. 93.

LIN. SYST. *Polyándria, Polygýnia*. Sepals 3, joined at the base (f. 25. *a*.) ovate, somewhat cordate, acute. Petals 6, (f. 25. *b*.) ovate or obovate. Anthers indefinite, nearly sessile. Carpels indefinite (f. 25. *c*.) somewhat baccate, dry, coriaceous, ovate, or somewhat globose, stipitate, 1-seeded. Trees or shrubs with entire leaves, and axillary solitary, binate or tern, one or rarely few-flowered peduncles.

1 G. ABEREMO'A (Dun. mon. anon. p. 126.) leaves ovate-oblong, acute, tomentose; peduncles axillary, 1-flowered; berries somewhat stipitate, ovate, mucronate. ♄. S. Native of Guiana in woods. Aberemòa Guianénsis, Aubl. gui. 1. p. 610. t. 245. A small tree with large leaves. Berries about 20, yellowish.

Var. β, microcárpa (D. C. l. c.) differing from the species in the fruit being a little smaller.

Aberemoa is the name of the species in Guiana. Tree 60 ft.

2 G. BRE'VIPES (D. C. syst. 1. p. 505.) leaves oval, somewhat pointed, smooth, shining; peduncles axillary, 1-flowered; berries ovate, on short stipes. ♄. S. Native of Guiana, and in the island of Trinidad, in woods. Leaves 8 or 12 inches long, and 3 or 4 broad. Flowers unknown.

Short-footed-fruited Guatteria. Tree 60 feet.

FIG. 25.

3 G. OUREGO'U (Dun. mon. anon. p. 126.) leaves oblong-elliptic, acuminated, smooth; peduncles 1-3, axillary; berries ovate, acute, on long stipes. ♄. S. Native of Guiana and the island of Trinidad in woods. Canánga Ouregòu. Aubl. guian. 1. p. 608. t. 244. Flowers brown, sweet-scented. Berries ovate, dry, coriaceous, yellowish. The leaves when bruised are very aromatic, as well as all parts of the tree. We have seen a tree in the island of Trinidad resembling this, whose flowers were lateral on the branches. *Ouregou* is the Caribbean name of this tree.

Ouregou Guatteria. Fl. Sep. Tree 70 feet.

4 G. PODOCA'RPA (D. C. syst. 1. p. 503.) leaves oval-oblong, abruptly-acuminated, smooth; peduncles axillary, solitary; berries ovate, submucronate; stipe much longer than the berry. ♄. S. Native of Cayenne. Very like *G. Ouregòu*, but the berries are one-half larger; stipes 3 or 4 times longer than the berry. Flowers brown, sweet-scented.

Var. α, oligocárpa (D. C. prod. 1. p. 93.) berries 14-20, a little ribbed.

Var. β, polycárpa (D. C. prod. 1. p. 93.) berries about 40, not ribbed.

Stalked-fruited Guatteria. Tree 50 feet.

5 G. CERASOI'DES (Dun. mon. anon. p. 127.) leaves lanceolate, acute, pubescent beneath; peduncles axillary, solitary; petals nearly equal; berries ovate-globose; stipe longer than the berry. ♄. S. Native of Coromandel in the mountains. Uvària cerasoìdes, Roxb. cor. 1. p. 30. t. 33. A large tree with bifarious branches. Fruit dark-red about the size and shape of a small cherry, 1-seeded, they are eaten by the natives, but are rather too astringent. Stigma broad purple. The wood is employed for many purposes by the natives of Coromandel.

Cherry-like Guatteria. Clt. 1820. Tree 60 feet.

6 G. SUBERO'SA (Dun. mon. anon. p. 128.) leaves oblong, acute, smooth; peduncles nearly opposite the leaves, 1-flowered; outer petals smallest; berries globose; stipe one-half longer than the berry. ♄. S. Native of Coromandel. Uvària suberòsa, Roxb. corom. 1. p. 31. t. 34. This plant is more common than *G. cerasoìdes* and smaller. The three outer petals are greenish, the three inner ones whitish. Fruit dark-red, or almost black, about the size of a small-pea. The wood is durable, of a chocolate colour, and very elastic.

Var. β; leaves narrowest at the base, and a little curled on the margins.

Var. γ; leaves exactly oblong, pale glaucous; branchlets villous.

Corky-barked Guatteria. Fl. ? Clt. 1820. Tree 30 feet.

7 G. MACROPHY'LLA (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 496.) leaves oval, tapering to both ends, coriaceous, pubescent beneath; peduncles very short, lateral, few-flowered; outer petals shortest; berries egg-shaped, on short stipes. ♄. S. Native of Java.

Long-leaved Guatteria. Tree.

8 G. BRA'GMA (Blum. l. c.) leaves oblong, acuminated, shining above, with the veins underneath as well as the branchlets, tomentose; peduncles lateral, very short, 1-flowered; outer petals shortest. ♄. S. Native of Java and the neighbouring islands, where it is called *Bragma*.

Bragma Guatteria. Tree.

9 G. PISOCA'RPA (Blum. l. c.) leaves unequal at the base, ovate-oblong, bluntish, with the veins beneath as well as the branches tomentose; peduncles 1-flowered, usually opposite the leaves, fruit 1-4, globose, almost sessile, smooth. ♄. S. Native of Java.

Pea-fruited Guatteria. Tree 20 feet.

10 G. RU'FA (Dun. mon. anon. p. 129. t. 29.) leaves oval, acuminated, cordate at the base, under surface clothed with brown tomentum as well as the branchlets; peduncles very short, lateral, or opposite the leaves; petals equal; berries stipitate, velvety. ♄. S. Native of the East Indies in the islands of Timor and Java, Lindl. bot. reg. 836. Uvària tomentòsa, Vahl. ined. but not of Roxb. A small shrub with brownish-purple, sweet-scented flowers. Berry 1-seeded, nearly the length of the stipe.

Rufous Guatteria. April, Aug. Clt. 1820. Shrub 4 feet.

11 G. CORDA'TA (Dun. mon. anon. p. 129. t. 30.) leaves cordate at the base, oblong, acutish, under surface rather tomentose as well as the branchlets; recemes opposite the leaves, short, few-flowered. ♄. S. Native of Java. Corolla and calyx clothed with rusty tomentum.

Cordate-leaved Guatteria. Tree.

12 G. ERIÓPODA (D. C. syst. 1. p. 505.) leaves oblong-lanceolate, tapering a little to the base, acuminated, younger ones villous; peduncles lateral, solitary, 1-flowered, tomentosely hispid. ♄. S. Native of Peru about Cuchero. Deless. icon. sel. 1. t. 90. Flowers velvety and peduncles hairy.

Hairy-peduncled Guatteria. Tree 20 feet.

13 G. HIRSU'TA (Ruiz. et Pav. fl. per. syst. 1. p. 146.) leaves lanceolate, acuminated; peduncles axillary, smooth; flowers hairy. ♄. S. Native of Peru in groves towards a village called Chinchao. Dun. mon. anon. p. 131. Ruiz, et Pav. fl. per 5. t. 478.

Hairy-flowered Guatteria. Fl. Jun. Sept. Shrub 12 feet.

14 G. PE'NDULA (Ruiz. et Pav. fl. per. syst. 1. p. 146.) leaves lanceolate; peduncles axillary, very long, pendulous. ♄. S. Native of Peru in the mountains about Chinchao and Pozuzo. Dun. mon. anon. p. 131. Ruiz, et Pav. fl. per 5. t. 476.

Pendulous-flowered Guatteria. Fl. May, July. Shrub 10 ft.

15 G. OVA'LIS (Ruiz. et Pav. fl. per. syst. 1. p. 146. fl. per 5. t. 476.) leaves oblong, oval; peduncles axillary. ♄. S. Native of Peru in the mountains about Pozuzo. Dun. mon. anon. p. 131.

Oval-leaved Guatteria. Fl. June, Aug. Tree 23 feet.

16 G. GLAU'CA (Ruiz. et Pav. fl. per. syst. 1. p. 145.) leaves oblong or ovate, pointed; peduncles axillary. ♄. S. Native of Peru in groves towards the villages of Cuchero and Chinchao. Dun. mon. anon. p. 131. Ruiz. et Pav. fl. per 5. t. 475.

Glaucous Guatteria. Fl. Jun. Aug. Tree 20 feet.

17 G. VIRGA'TA (Dun. mon. anon. p. 131. t. 31.) leaves ovate, acuminated, quite smooth, nearly sessile; peduncles axillary, 1-flowered; berries somewhat stipitate, coriaceous, bluntish, egg-shaped. ♄. S. Native of Jamaica in wooded mountains. Uvària lanceolàta, Swz. prod. 87. U. virgàta, Swz. fl. ind. occid. 2. p. 999. A middle-sized tree with smooth bark and flexile branches. The three outer petals are largest, white.

Twiggy Guatteria. Fl.? Clt. 1793. Tree 16 feet.

18 G. LAURIFO'LIA (Dun. mon. anon. p. 132. t. 32.) leaves oblong, acuminated at both ends, smooth, on short petioles; peduncles axillary, rather crowded; berries somewhat stipitate, egg-shaped, mucronate. ♄. S. Native of Jamaica on wooded mountains, and also in St. Domingo and Portorico. Uvària excélsa, Vest. ex Vahl. in herb. Juss. A middle-sized tree with rigid branches and flexile twiggy branchlets. Petals white, nearly equal, not expanding.

Laurel-leaved Guatteria. Fl.? Clt. 1820. Tree 30 feet.

19 G. GOMEZIA'NA (St. Hil. fl. bras. 1. p. 36.) stem arboreous, with hairy branches; leaves oblong or elliptical-oblong, acuminated at the apex and acute at the base, adult ones smooth above but pilose beneath; outer petals ovate, acutish or bluntish, inner ones longer and narrower, ovate or oblong-lanceolate. ♄. S. Native of Brazil in the province of Minas Geraes. Leaves 2-4 inches long, 9-12 lines broad. Peduncles axillary, solitary, 1-flowered. Petals spreading, pubescent, green, or yellowish-red.

Gomez de Abreu's Guatteria. Fl. Jan. Tree 30 feet.

20 G. LU'TEA (St. Hil. fl. bras. 1. p. 37.) stem shrubby; branches hardly puberulous at the top; leaves oblong, downy; peduncles axillary, solitary, 1-flowered; outer petals ovate, acute, inner ones a little longer and narrower, oblong, acute. ♄. S. Native of Brazil in the province of Minas Geraes on high mountains near Villa Rica. Sepals ovate, acuminated, pubescent. Petals yellowish, pubescent.

Yellow-flowered Guatteria. Fl. Jan. Shrub 8 feet.

21 G. AUSTRA'LIS (St. Hil. fl. bras. 1. p. 37.) stem frutescent; branches pubescent or smoothish; adult leaves oblong-elliptical, acuminated, smooth; petals almost equal, ovate, obtuse; berries obovate, obtuse. ♄. S. Native of Brazil in the province of St. Paul on the banks of the river Tarere. Leaves 4 inches long, 9-12 lines broad. Calyx 4 times shorter than the receptacle, pubescent. Berries blunt, black, with a thin pericarp, seated on a short receptacle.

Southern Guatteria. Fl. Jan. Shrub 12 feet.

22 G. FERRUGI'NEA (St. Hil. fl. bras. 1. p. 38.) stem arboreous; branches clothed with rusty pubescence at the top; leaves elliptical, acute, rather cuneated at the base, puberulous, with the middle nerve and lateral veins clothed with rusty pubescence, outer petals oblong-linear, acutish, inner ones broader, a little shorter than the rest, ovately-trapeziform, obtuse, with a short point. ♄. S. Native of Brazil in cut down woods, near the village called Arguassu, about 9 leagues from Rio Janeiro. Leaves 4-6 inches long and $1\frac{1}{2}$ to $2\frac{1}{2}$ broad. Peduncles axillary, 1-flowered, solitary or twin. Calyx 3-times shorter than the corolla, clothed with rusty hairs, with broad ovate segments. Like *G. Ouregòu*.

Rusty Guatteria. Fl. Dec. Tree 20 feet.

23 G. VILLOSI'SSIMA (St. Hil. fl. bras. 1. p. 38.) stem arborescent; branches very villous; leaves oblong-lanceolate, acuminated, convex, with revolute edges, smooth above, with the middle nerve villous beneath; peduncles axillary, usually profoundly 2-parted, 2-flowered; outer petals lanceolate, acute, inner ones a little shorter and narrower, ovate, acute. ♄. S. Native of Brazil on the iron mountains called *Serra dos Piloes*. Leaves 5-6 inches long and 12-18 lines broad. Sepals ovate, acute, clothed with villi below but with rusty down above. Petals clothed with rusty-green hairs. Berries about 4 lines long, obovate-elliptical, crowned by the permanent styles, of a blackish-red colour with a thin pericarp. The wood of this tree is very light, it is therefore made into fishing-rods, and on that account it is called in Brazil *Pindaiba* from *pindai* a rod, and *iba* a tree.

Very villous Guatteria. Tree 25 feet.

24 G. SEMPERVI'RENS (Dun. mon. anon. p. 133.) leaves ovate-oblong, smooth, shining; peduncles 1-flowered; petals oblong. acute; berries stipitate, globose. ♄. S. Native of Malabar in many places, especially about Angiccaimaal.—Rheed. mal. 5. p. 31. t. 16. A dwarf little tree, always green, flowering, and fruiting. Petals cuspidate, reddish. Berries black, fleshy, smooth, of an acid-sweet taste.

Evergreen Guatteria. Tree 10 feet.

25 G. KORI'NTI (Dun. mon. anon. p. 133.) leaves ovate-oblong, smooth, shining; peduncles axillary, 1-flowered; petals oblong, bluntish; berries stipitate, globose. ♄. S. Native every where in Malabar, especially in sandy and rocky places. Corínti-pànel, Rheed. mal. 5. p. 27. t. 14. A shrub from 5 to 10 feet high, covered with cinereous or lanuginose bark. Petals green, reflexed at the top. Berries at first green, afterwards reddish, 1-seeded; flesh sweetish.

Corinti-panel Guatteria. Fl. Jul. Aug. Shrub 5 to 10 feet.

26 G. MONTA'NA (D. C. syst. 1. p. 508.) leaves lanceolate-oblong, narrow, smooth, shining; peduncles in twos or threes, 1 or 3-flowered; petals inflexed. ♄. S. Native of Malabar in mountainous and rocky places about Paracaro. G. Malabarica, Dun. mon. p. 134.—Rheed. mal. 5. p. 33. t. 17. Very like *G. Korinti*, but the leaves are narrower and aromatic, and the flowers are smaller.

Mountain Guatteria. Fl. and fruiting all the year. Tr. 16 ft.

27 G. ACUTIFLO'RA (Dun. mon. anon. p. 134.) leaves ovate-oblong, acute, thick, smooth; peduncles axillary, short; lobes of calyx blunt; petals very acute; berries stipitate, globose. ♄. S. Native of Malabar in mountainous places.—Rheed. mal. 5. p. 35. t. 18. An evergreen shrub.

Acute-flowered Guatteria. Fl. all the year. Shrub 4 ft.

28 G. UMBILICA'TA (Dun. mon. anon. p. 135. t. 33.) leaves oblong-elliptical, acuminated, smooth; peduncles 1-flowered, bracteolate; berries stipitate, umbilicate at the base, depressed at the apex. ♄. S. Native perhaps of South America or the West Indies. Fruit about the size of a small cherry. Seeds globose, depressed on both sides.

Umbilicated-berried Guatteria. Shrub 10 feet.

29 G. CUNEIFO'RMIS (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 496.) leaves obovate, somewhat cordate at the base, smooth, glaucous beneath; peduncles lateral, 1-flowered, elongated; outer petals leafy, elongated; fruit smooth, egg-shaped, tapering to both ends. ♄. S. Native of Java.

Wedge-shaped-leaved Guatteria. Tree.

30 G. LATERIFLO'RA (Blum. l. c.) leaves oblong, acuminated, smooth; peduncles lateral, solitary, 1-flowered; fruit oval, tapering to the base, shorter than the stipe. ♄. S. Native of Java.

Side-flowered Guatteria. Tree.

31 G. PA'LLIDA (Blum. l. c.) leaves oblong, tapering to both ends, smooth, pale beneath; peduncles lateral, solitary, 1-flowered, longer than the petiole; fruit stipitate, oblong, tapering a little to both ends, pubescent. ♄. S. Native of Java.

Pale Guatteria. Tree.

32 G. BERTERIA'NA (Spreng. syst. 2. p. 635.) leaves oblong, obtuse, quite smooth on both surfaces, serrated, and quite entire; carpels very numerous, rather tomentose, oblique, mucronated, about equal in length to the stipes. ♄. S. Native of Portorico.

Bertero's Guatteria. Tree.

33 G. PRINOI'DES (Spreng. syst. 2. p. 635.) leaves oblong-lanceolate, oblique, tapering to both ends, obsoletely serrated, shining above; branches twiggy; fruit oblique, mucronated, on very short stipes. ♄. S. Native of Hispaniola.

Prinos-like Guatteria. Shrub.

34 G. VIRIDIFLO'RA; leaves oblong-lanceolate, coriaceous, smooth; flowers solitary, terminal. ♄. S. Native of Peru. Uvària viridiflòra, Ruiz. et Pav. MSS. in herb. Lamb. (v. s.)

Green-flowered Guatteria. Tree.

35 G. DECA'NDRA; leaves oblong, acuminated, smooth, except the nerves; peduncles lateral; flowers decandrous. ♄. S. Native of Peru. Uvària decándra, Ruiz. et Pav. MSS. in herb. Lamb. (v. s.)

Decandrous Guatteria. Shrub.

36 G. PAVO'NII; leaves oblong-lanceolate, smooth, long, acuminated; branches clothed with brown villi as well as the petioles and the 1-flowered solitary axillary peduncles. ♄. S. Native of Peru. Uvària longifòlia, Ruiz. et Pav. MSS. in herb. Lamb. (v. s.)

Pavon's Guatteria. Shrub.

37 G. VILLO'SA (Roxb. hort. beng. under Uvària) all parts of the tree very villous; leaves oblong or roundish, cordate at the base, on very short petioles; peduncles solitary, 1-flowered, very long, rising below the leaves; flowers very villous; calyx of 6 small ovate, acute, equal sepals; corolla of 3, obtuse petals, which are purple inside and clothed with white villi on the outside. ♄. S. Native of the East Indies above the Ghat Coadwara. Carpels winged, 1-seeded.

Villous Guatteria. Tree 40 feet.

38 G. PILO'SA (Roxb. MSS. under Uvària) leaves oblong or oval, somewhat cordate at the base, beset with tufts of brown villi, particularly remarkable on the margins; pedicels lateral, 1-flowered, clothed with long fuscous hairs as well as the 3 sepals of the calyx; petals 6, equal, lanceolate, obtuse, wavy, apparently purple. ♄. ب. S. Native of the East Indies. Fruit unknown.

Pilose Guatteria. Tree 40 feet.

39 G. MICROCA'RPA (Ruiz. et Pav. fl. per. 5. t. 479.) leaves obovate-oblong, villous on the nerves, abruptly acuminated, peduncles 1-flowered, solitary, axillary; petals fiddle-shaped, mucronate, nearly equal, clothed with brown villi as well as sepals and branches; carpels small, oval. ♄. S. Native of Peru.

Small-fruited Guatteria. Tree 30 feet.

40 G. MAGNI'FICA (Ruiz. et Pav. fl. per. 5. t. 480.) leaves large, obovate-oblong, cordate at the base, on very short thick petioles; peduncles trichotomous, 3-flowered, beset with a few scaly bracteas; petals 6, conniving, or corolla 6-lobed, globose; carpels few, obovately-globose. ♄. S. Native of Peru.

Magnificent Guatteria. Tree.

† *Species not sufficiently known.*

41 G. WILLEMETIA'NA (D. C. prod. 1. p. 94.) leaves lanceolate, smooth; peduncles lateral, compressed, bifid. ♄. S. Native? Anòna distincta, Will. herb. maur. p. 42.

Willemet's Guatteria. Tree 20 feet.

42 G. MAYPURE'NSIS (H. B. et Kth. nov. spec. amer. 5. p. 64.) leaves oblong, acuminated, running along the petiole, somewhat coriaceous, smooth, shining; peduncles axillary, solitary, 1-flowered, petals oblong, blunt, outer ones a little smaller. ♄. S. Native near Maypures in the mission of Orinoco. Flowers yellow.

Maypure Guatteria. Tree 20 feet.

Cult. The species of this genus are all stove plants. They require a loamy soil or a mixture of loam and peat. Ripe cuttings strike well in sand, under a hand-glass, placed in a moderate heat. The seeds, when procured from their native places of growth, should be sown immediately in pots, filled with a mixture of loam, peat, and sand, and then plunged into a hot-bed, but as they soon become rancid, it is doubtful whether they will remain good during a voyage.

XIII. BOCA'GEA (to the honour of Joseph Maria de Souza du Bocage, who elegantly translated the poem of Casteli on flowers into the Portuguese language, and illustrated it with notes.) St. Hil. fl. bras. 1. p. 41.

LIN. SYST. *Hexándria, Trigýnia.* Calyx 3-parted, or almost entire and cup-shaped. Petals 6, disposed in a double series, deciduous. Stamens 6, flattened, deciduous, opposite the petals; anthers 2-celled, bursting lengthwise outwardly. Ovaries 3, seated on a short receptacle, hardly connected together or completely free, 1-celled, 5-6-seeded. Berries 1-3, quite distinct, rather dry and tapering into a short pedicel, 1-celled, 3-seeded from abortion. Seeds horizontal, arillate. Albumen large, fleshy. Trees or shrubs. Leaves simple, quite entire, on short petioles, which are jointed at the base, without stipulas. Peduncles few, extra-axillary, solitary, 1-flowered, jointed above the middle.

1 B. A'LBA (St. Hil. fl. bras. 1. p. 42.) branches hardly puberulous at the top; leaves ovate-lanceolate, somewhat acuminated, smooth, shining; outer petals linear, acutish inner, ones shorter, narrower, and triquetrous above; ovaries 5-seeded. ♄. S. Native of Brazil in the province of Rio Janeiro. A small tree with leaves about 2 inches long. Flowers white.

White-flowered Bocagea. Fl. Sept. Tree 15 feet.

2 B. VI'RIDIS (St. Hil. fl. bras. 1. p. 42. t. 9.) branchlets pubescent; leaves lanceolate or ovate-lanceolate, acute at the base and acuminated at the apex, smooth above, pilose beneath; outer petals ovate, acute, concave, inner ones broader, roundish-ovate, acute; ovaries 8-seeded. ♄. S. Native of Brazil in the provinces of Rio Janeiro and Minas Geraes. Leaves about 2 inches long. Petals green, converging into a globe.

Green-flowered Bocagea. Shrub 6 feet.

XIV. MOLLINE'DIA (Francis Mollinedo, a Spanish chemist and naturalist, mentioned by the authors of Flora Peruviana, p. 72.) Ruiz. et Pav. fl. per. syst. 1. p. 142. fl. per. 5. t. 472.

LIN. SYST. *Polyándria, Polygýnia.* Calyx turbinate, nearly closed, quadrifid, torn in pieces by the fruit as it grows. Corolla none. Anthers wedge-shaped, sessile. Carpels numerous. Stigmas awl-shaped, sessile. Drupes baccate, numerous, sessile, oblong, 1-seeded, seated on a flat receptacle. Trees or shrubs with axillary or lateral flowers. This genus differs from the rest in having opposite or tern leaves.

1 M. REPA'NDA (Ruiz. et Pav. fl. per. syst. 1. p. 142. fl. per. 5. t. 472.) leaves opposite, oval, and elliptical, wrinkled, repand. ♄. S. Native of Peru in groves at Chinchao. The drupes, when ripe are of a beautiful purple colour, and tinge the hands and linen with the same colour.

Repand-leaved Mollinedia. Fl. May, June. Tree 25 feet.

2 M. OVA'TA (Ruiz. et Pav. fl. per. syst. 1. p. 143. fl. per. 5. t. 473.) leaves opposite, ovate, shining, serrated from the middle

to the apex. ♄. S. Native of Peru in groves at Chinchao. Drupes, when ripe, are eaten with avidity by birds, and they supply a fine violet colouring.

Ovate-leaved Mollinedia. Fl. May, June. Shrub 12 feet.

3 M. lanceola'ta (Ruiz. et Pav. fl. per. syst. 1. p. 143. fl. per. 5. t. 474.) leaves opposite or tern, lanceolate, toothed from the middle to the apex. ♄. S. Native of groves at Chinchao.

Lanceolate-leaved Mollinedia. Fl. May, June. Shrub 12 ft.

Cult. This species of *Mollinèdia* will thrive in a mixture of loam and sand with the addition of a little peat, and ripe cuttings will strike root if planted in a pot of sand, and placed in heat under a hand-glass.†

Order V. SCHIZANDRIA'CEÆ (plant agreeing with Schizandra in many important characters). Blum. bijdr. fl. ind. ex Schlecht. Linnæa 1. p. 497. obs.

Flowers monoecious or dioecious. Sepals 3, sometimes wanting. Petals 9 to 12 (f. 26. *a.*) disposed in a ternary order. Male flowers with 5 or numerous stamens (f. 27. *a.*) connate or free, seated on a hemispherical disk. Anthers adnate, bursting outwards by distinct chinks. Ovaries in the female flowers crowded on a long conical torus, at length elongated (f. 26. *b.*) 2-seeded, baccate. Albumen fleshy. Embryo straight. Cotyledons oval. Usually climbing shrubs with ovate-lanceolate or oblong leaves and axillary or lateral, 1-flowered peduncles. This order differs from *Menispermàceæ* in the presence of albumen, as well as in the ovaries being numerous, seated on a long slender receptacle, and in the different habit of the plants, and from *Anonàceæ* in the albumen not being ruminated or pierced by the seed-coat as well as in the very distinct habit of the plants. The medical qualities of this order are not known. Seeds do not retain their vegetative power any length of time, therefore they will be difficult to introduce in a living state.

Synopsis of the Genera.

1 Schiza'ndra. Flowers with 9 petals (f. 26. *a.*) without any sepals. Male flowers with 5 anthers, connected at the apex. Berries seated on a long receptacle (f. 26. *b.*)

2 Sarcoca'rpum. Flowers with 3 bracteas, 3 sepals, and 9-12 petals. Filaments very short, free. Ovaries numerous, crowded on a conical receptacle.

3 Sphæroste'mma. Flowers with 3 sepals and 9 petals. Filaments somewhat connate. Ovaries seated upon a conical torus, at length elongated.

4 Kadsu'ra. Calyx 3-parted. Petals 6-12. Anthers sessile, seated upon a honey-combed receptacle, free. Ovaries 30-40, seated upon a long receptacle.

5 Ma'yna. Calyx 3-parted or 3-sepalled. Petals 6-9 (f. 27. *c.*), smaller than the calyx. Filaments short. Anthers 4-sided (f. 27. *a.*), thickest at the apex. Female flowers unknown.

I. SCHIZA'NDRA (from σχιζω, *schizo*, to cut, and ανηρ, ανδρος, *aner, andros*, a male organ; stamens cleft). Mich. fl. bor. amer. 2. p. 18. D. C. syst. 1. p. 543.

Lin. syst. *Monœcia, Pentándria.* Flowers monoecious. Sepals 9, in a ternary order (f. 26. *a.*) Petals wanting. Male flowers with 5 anthers, which are joined at the apex, female ones with an indefinite number of ovaries. Berries disposed in spikes along an elongated receptacle (f. 26. *b.*). A smooth, climbing shrub, with ovate-lanceolate leaves, and small scarlet flowers.

1 S. cocci'nea (Mich. fl. bor. amer. 2. p. 219. t. 47.) ♄. ◡. G. Native of Carolina and Georgia in woods. Sims, bot. mag. t. 1413. Pursh. fl. amer. sept. 1. p. 212.

Scarlet Schizandra. Fl. June, July. Clt. 1806. Shrub cl.

Cult. A desirable plant, being a greenhouse climber with scarlet flowers. A mixture of sand, peat, and loam suits it well, and ripened cuttings will strike root if planted in a pot of sand, placed under a hand-glass.

FIG. 26.

II. SARCOCA'RPUM (from σαρξ, *sarx*, flesh, καρπος, *karpos*, a fruit; fleshy fruit). Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 497.

Lin. syst. *Monœ'cia, Polyándria.* Flowers monoecious, male ones with 3 bracteas, 3 sepals, and 9-12 petals disposed in a ternary order. Filaments very short, covering the hemispherical disk, nevertheless they are free; anthers adnate, outwardly. Female flowers with a calyx and corolla like that of the male ones. Ovaries numerous, crowded upon a conical torus. Berries 2-seeded, collected into one fruit. Albumen fleshy. A climbing shrub, with ovate-oblong leaves and crowded axillary or lateral 1-flowered peduncles.

1 S. sca'ndens (Blum. l. c.) ♄. ◡. S. Native of Java.

Climbing Sarcocarpum. Shrub cl.

Cult. This plant will thrive in a mixture of loam and peat, and ripened cuttings will strike root if planted in a pot of sand, placed under a hand-glass, in heat. †

III. SPHÆROSTE'MMA (σφαιρα, *sphaira*, a globe, στεμμα, *stemma*, a crown; stamens seated on globose disk). Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 497.

Lin. syst. *Monœ'cia, Polyándria.* Flowers monoecious or dioecious. Calyx bracteate, 3-sepalled, and with about 9 petals disposed in a ternary order. Stamens numerous, seated on the globose disk; filaments almost connate. Female flowers with numerous ovaries seated upon a conical torus, which is at length elongated. Berries 2-seeded. Albumen fleshy. Climbing shrubs.

This genus differs from the last in the stamens being connate, and in the carpels being disposed in spikes, distant, not crowded.

1 S. axilla'ris (Blum. l. c.) leaves quite entire, ovate-lanceolate, acuminated; peduncles axillary, usually solitary, 1-flowered, scarcely equal in length to the petiole; flowers dioecious; outer filaments free. ♄. ◡. S. Native of Java.

Axillary-flowered Sphærostemma. Shrub cl.

2 S. elonga'ta (Blum. l. c.) leaves ovate, acuminated, finely denticulated, smooth; peduncles axillary, 1-flowered, much longer than the petiole; flowers dioecious; filaments all connate. ♄. ◡. S. Native of Java.

Elongated-peduncled Sphærostemma. Shrub cl.

Cult. See *Sarcocárpum.*

IV. KADSU'RA (*Tuto-Kadsura* or *Sane-Kadsura* is the Japanese name of K. Japónica). Juss. ann. mus. 16. p. 340. Dunal. mon. anon. p. 57. D. C. syst. 1. p. 465.

Lin. syst. *Diœ'cia, Polyándria.* Flowers dioecious. Calyx 3-parted. Petals 6, disposed in a ternary order. Anthers

sessile or on very short filaments, seated on a honey-combed receptacle. Ovaries numerous, crowded upon a long receptacle. Berries just so many, sessile, 1-celled, 2-seeded. Climbing or twining shrubs with ovate-lanceolate or oblong leaves, and 1-flowered peduncles.

1 K. JAPO'NICA (Dunal, monogr. p. 57.) twining; leaves oval, or oblong-oval, acute at both ends, serrated, smooth, thick; peduncles opposite the leaves, 1-flowered, usually solitary, longer than the petioles; anthers sessile, immersed. ♄. ⌒. G. Native of Japan about Nagasaki. Uvària Japónica, Lin. spec. 756. Uvaria heteroclìta, Roxb.—Kœmf. amœn. 476 and 185. t. 477. hist. jap. 458. with a figure. Bark warted, fleshy, and clammy. Petioles purplish. Flowers white. Berries 2-seeded, red, but white within.

Japan Kadsura. Fl. June, Sept. Shrub twining.

2 K. GRANDIFLO'RA (Wall. tent. fl. nap. 1. p. 10. t. 14.) twining; leaves oblong, acuminated, serrated, netted beneath; peduncles 1-flowered, solitary, nodding, twice as long as petioles, bractless; stamens complete; filaments awl-shaped. ♄. ⌒. G. Native of Nipaul on Sheopore. The whole shrub smooth. Flowers whitish-yellow, purplish towards the base. Berries 2-seeded, in spikes on a thick clavated receptacle.

Great-flowered Kadsura. Shrub twining.

3 K. PROPI'NQUA (Wall. l. c. p. 11. t. 15.) twining; leaves ovate-lanceolate, almost quite entire; flowers in fascicles, erectish; peduncles furnished with bracteas, hardly equalling the petioles in length; anthers sessile, immersed. ♄. ⌒. S. Native of Nipaul on Sheopore. Flowers solitary or twin, inodorous, pale-yellow, at length orange, drooping a little. Berries 2-seeded, spiked on a tuberculated receptacle.

Allied Kadsura. Shrub twining.

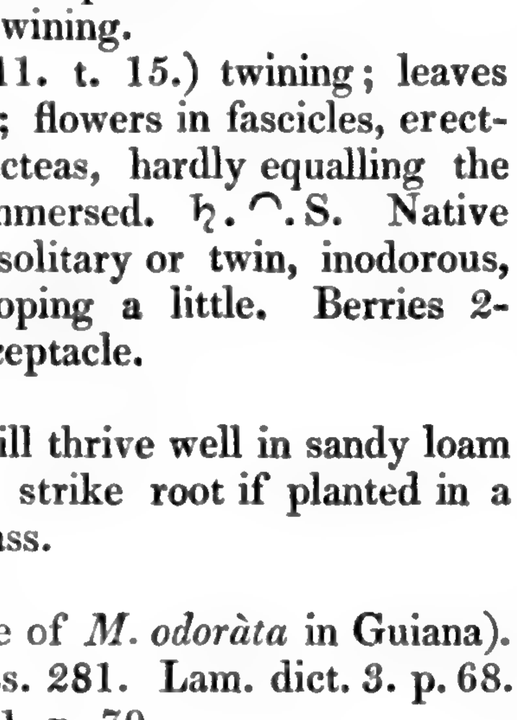
Cult. The species of *Kadsùra* will thrive well in sandy loam and peat, and ripened cuttings will strike root if planted in a pot of sand, placed under a hand-glass.

V. MAY'NA (probably the name of *M. odoràta* in Guiana). Aubl. guian. 2. p. 922. t. 352. Juss. 281. Lam. dict. 3. p. 68. t. 491. D. C. syst. 1. p. 446. prod. 1. p. 79.

LIN. SYST. *Diœ'cia, Polyándria.* Flowers dioecious, male ones of 3 sepals and 6-9 petals (f. 27. *c.*) and numerous 4-sided anthers (f. 27. *a.*). The carpels are perhaps disposed in spikes, on an elongated receptacle? Shrubs with large stalked smooth leaves and small axillary flowers.

1 M. ODORA'TA (Aubl. guian. 2. p. 922. t. 352.) leaves oblong, quite entire. ♄. S. Native of Cayenne. Pedicels numerous, axillary, 1-flowered. Flowers small, white, sweet-scented.

FIG. 27.



Sweet-scented Mayna. Fl. Dec. Shrub 8 feet.

2 M. SERI'CEA (Spreng. neu. entd. 2. p. 158.) leaves lanceolate, quite entire, silky on the under surface. ♄. S. Native of Brazil. Flowers stalked, axillary, aggregate, sweet-scented, usually 6-petalled. Ovaries usually 6.

Silky-leaved Mayna. Shrub 6 feet.

3 M. BRASILIE'NSIS (Raddi in act. soc. ital. 18. p. 23.) leaves oblong, toothletted, tapering much at the base; peduncles 3-flowered. ♄. S. Native near Rio Janeiro in the dense woods in the mountain of Cercovado.

Brazilian Mayna. Tree 40 feet.

Cult. As no species of this genus has as yet been introduced into Europe, the mode of cultivating and propagating them is therefore unknown, but notwithstanding we would advise their being grown in a mixture of loam, peat, and sand, and ripened cuttings will no doubt root if planted in a pot of sand, with a hand-glass placed over them, in heat. †

ORDER VI. MENISPERMA'CEÆ (plant agreeing with Menispermum in many important characters). D. C. prod. 1. p. 95. Menispérmeæ, Jaum. fam. 2. p. 82. t. 86. D. C. syst. 1. p. 509.

Flowers unisexual. Sepals and petals of a definite number, deciduous, disposed in a ternary or quaternary, rarely quinary order, but the petals are sometimes absent. Stamens in the male flowers monodelphous (f. 28. *c.*) rarely free, equal in number with the petals, and opposite them, rarely double that number or fewer. Anthers adnate, usually adhering the whole length of the filaments, bursting outwards. In the female flowers the ovaries are numerous (f. 28. *i.* f. 30. *a.*) somewhat connected at the base, sometimes solitary, each bearing a style, or many-celled. Drupes nearly all baccate, 1 or many-seeded, oblique or lunulate, compressed, with the seeds of the same form. Embryo curved or peripheric. Albumen wanting, or when present it is very sparing and fleshy. Cotyledons flat, sometimes distant, and placed in the two cells of the seed. Climbing or twining shrubs, mostly natives within the tropics, with alternate, stalked, usually cordate or peltate, simple, rarely compound leaves, always with the middle nerve terminating in an awn or point, destitute of stipulas. Flowers small, usually racemose and axillary. This order differs from *Anonàceæ* in the plants being climbing, which is very rarely the case in that order, as well as in the stamens being definite, in the structure of the fruit, and distinct habit of the plants, and from *Berberídeæ* in the stamens being opposite the petals. The bitter diuretic sorts of *Pareira brava* are the produce of *Cissampèlos Pareira*. The famous *Colomba-root*, so much esteemed for its intense bitterness, and for its use in diarrhœa and dysentery, is the produce of *Cocculus palmàtus*. The poisonous drug called *Cócculus Indicus* is the produce of *Cócculus suberòsus*, and several Brazilian species of *Cocculus* are said to possess powerful febrifugal qualities, which may be said of the whole of the plants of this order in a greater or less degree. The berries of *Lardizabàla biternàta* are sold in the markets of Chili, according to different travellers. The seeds do not retain their vegetating power any length of time, therefore they are truly difficult to import in a living state from any great distance, but as none of the species are ornamental, this is the less to be regretted.

Synopsis of the Genera.

TRIBE I.

LARDIZABA'LEÆ. *D. C. prod. 1. p. 95. Flowers usually dioecious. Male flowers with symmetrical number of parts* (f. 28. *a. d.*). *Carpels numerous, distinct* (f. 28. *i.*) *many-seeded, 1 or many-celled. Leaves compound.*

1 LARDIZABA'LA. Flowers dioecious. Sepals and petals disposed in a ternary order (f. 28. *a. d. h.*) in 2 or 3 series. Male flowers with 6 monodelphous stamens (f. 28. *c. b.*) female ones with 3-6 6-celled berries (f. 28. *i.*) cells many-seeded.

2 STAUNTO'NIA. Sepals disposed in a ternary order in 2

series. Petals wanting. Male flowers with 6 monodelphous stamens. Female flowers unknown.

3 BURASA'IA. Sepals and petals disposed in a ternary order in 2 series. Male flowers with 6 stamens, which are connected at the base. Ovary triple. Drupes 3.

4 HOLBŎ'LLIA. Flowers monoecious. Sepals 6, in two series. Male flowers with 6 stamens, furnished with a gland at the base of each stamen. Berries 3, distinct, oblong, follicular, 1-celled, many-seeded.

5 GYNOSTE'MMA. Sepals 10, in 2 series, connected at the base. Petals wanting. Male flowers with 5 monodelphous stamens; female ones with 3-4-celled ovary; cells 1-seeded.

TRIBE II.

MENISPE'RMEÆ. *D. C. prod.* 1. *p.*96. *Flowers usually dioecious. Male ones with a symmetrical number of parts* (f. 29. *a. b.*). *Carpels numerous, distinct* (f. 30. *a.*), 1-*celled*, 1-*seeded* (f. 30. *b.*). *Leaves simple. Flowers small, usually greenish yellow.*

6 SPIROSPE'RMUM, Sepals and petals disposed in a ternary order in 2 series. Male flowers with 6 stamens, the 3 inner ones connected at the base; female ones with 8 or 9 carpels.

7 CO'CCULUS. Sepals and petals disposed in a ternary order, in 2, rarely 3, series (f. 29. *a. b.*). Male flowers with 6 free stamens, which are opposite the petals, female ones with 3-6 carpels.

8 COSCI'NIUM. Sepals and petals disposed in a ternary order, in 2 series. Male flowers with 6 free stamens, female ones with 3 ovaries. Berries 1-3. Seed pierced by a large hole.

9 TILIACO'RA. Sepals and petals disposed in a ternary order; sepals 6; petals 3. Male flowers with 6 stamens, alternate ones shortest; female flowers with about 12 ovaries. Berries on pedicels.

10 ANAMI'RTA. Calyx of 2 sepals. Petals 6 in 2 series. Stamens 6, monodelphous; anthers collected into a globe. Female flowers unknown.

11 PSE'LIUM. Sepals and petals disposed in a ternary order, in 2 series. Male flowers with 6 free stamens; female ones with 4 sepals without petals, with a single ovary and a trifid stigma.

12 CISSA'MPELOS. Male flowers with 4 sepals, without petals, and 4 or 2 monodelphous stamens. Female flowers with 1 lateral sepal and 1 petal in front of the sepal. Ovary 1. Stigmas 3. Drupe obliquely kidney-shaped.

13 MENISPE'RMUM. Sepals and petals disposed in a quaternary order, in 2 or 3 series. Male flowers with 16-20 stamens, female ones with 2 or 4 ovaries. Drupe baccate, roundish-kidney-shaped.

14 ABU'TA. Flowers unknown. Berries 2 or 3, rising from the same receptacle (f. 30. *a.*), large, ovate, dry, somewhat compressed, with a fragile covering, (f. 30. *b.*).

15 TRICHO'A. Sepals and petals 3, reflexed at the top. Male flowers with 6 stamens inserted in the disk, the 3 outer ones are sterile alternating with the petals, the 3 central ones monodelphous and fertile. Female flowers with 6 sterile stamens and 3 drupaceous, coriaceous, oblong, villous, carpels.

16 AGDE'STIS. Flowers hermaphrodite. Sepals 4. Petals wanting. Stamens 24. Anthers bifid at both ends. Carpels 4, connected together into one 4-furrowed ovary, bearing only one style, which is terminated by 4 spreading stigmas.

17 CLY'PEA. Male flowers with 6 sepals, the 3 alternate ones smaller. Petals 3. Filament 1, truncate, crowned by an annular anther. Female flowers with 6 sepals without petals. Stigma filiform. Berry superior.

Allied Genera.

18 MENISCO'STA. Flowers polygamous, male ones with a small 4-5-cleft calyx and 4-5 petals disposed in two series. Stamens 5, broad, opposite the petals, and glued to them at the base. Ovary didymous, sterile. Female flowers with the calyx, corolla, and stamens as in the male. Ovary didymous. Stigmas 2, bluntish. Drupes 2, baccate, kidney-shaped, compressed, 1-seeded.

19 JO'DES. Flowers dioecious, male ones with a 5-parted calyx, a 5-parted corolla, and 5 stamens which are connected at the base; female ones with the calyx and corolla as in the male, but are usually 6-cleft. Ovary simple, ovate-globose, 1-seeded. Stigma sessile, orbicular, radiately emarginate. Fruit unknown.

Tribe I.

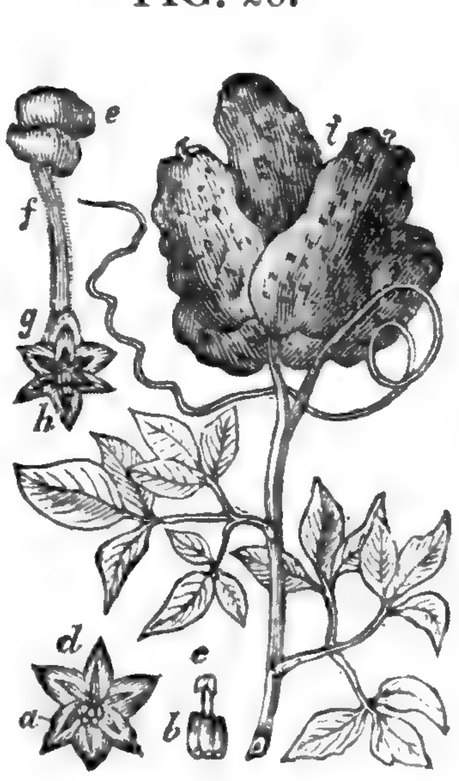
LARDIZABA'LEÆ (plants agreeing in character with *Lardizabàla*). D. C. prod. 1. p. 95. Flowers usually dioecious. Male flowers equal in number of parts. Carpels many, distinct, many-seeded, 1 or many-celled. Leaves compound.

I. LARDIZABA'LA, (in honour of Michael Lardizala y Uribe, a Spanish naturalist, mentioned by the authors of Flora Peruviana, p. 133.) Ruiz, et Pav. prod. p. 143. t. 37. D. C. sys. 1. p. 511. prod. 1. p. 95.

LIN. SYST. *Diœ'cia* or *Polygàmia, Monodélphia.* Flowers dioecious or polygamous. Sepals and petals disposed in a ternary order in 2 or 3 series (f. 28. *a. d. h.*). Male flowers with 6 monodelphous stamens (f. 28. *c. b.*). Female with 3 or 6 6-celled berries (f. 28. *i. e.*); cells many-seeded. Pulp of fruit sweet and eatable.

1. L. BITERNA'TA (Ruiz. et Pav. fl. per. syst. 286. prod. t. 37.) leaves 2-3-ternate; leaflets oblong, acute, unequal at the base, hence a little toothed; bracteas 2, large, unequally cordate, situated at the base of peduncle. ♄. ◠. S. Native of Chili in woods at Conception; also in Peru about Arauco. The fruit eatable, and is gathered and sold at markets by the natives of Peru and Chili. The pulp is sweet and grateful to the taste. It is known in Peru by the name of *Aguilboguil* and *Guilbogui*, and in Chili by that of *Coguill-Vochi*.

FIG. 28.



Biternate-leaved Lardizabala. Shrub twining.

2 L. TRITERNA'TA (Ruiz. et Pav. fl. per. syst. 287.) leaves 2-3-ternate; leaflets oval or obovate, obtuse, quite entire; bracteas 2, large, ovate, situated at the base of the peduncle. ♄. ◠. S. Native of Chili in the woods at Conception. Deless. icon. sel. 1. t. 91. Flowers unknown. Fruit 3, oblong cylindrical; younger ones crowned by the thick stigma.

Triternate-leaved Lardizabala. Shrub twining.

3 L. TRIFOLIA'TA (D. C. syst. 1. p. 513.) leaves ternate, tri-

foliate; leaflets ovate; bracteas small, along the pedicels. ♄. ◡. S. Native of Peru. Deless. icon. sel. 1. t. 92. A somewhat climbing shrub, with the habit of a species of *Glycìne*. Flowers whitish-yellow. Petals 6, ovate-roundish, situated at the base of the column of stamens.

Trifoliate Lardizabala. Shrub cl.

Cult. See *Cócculus* and *Stauntònia*.

II. STAUNTO'NIA (in honour of Sir George Staunton, who has introduced numerous plants from China, on his return from a mission there with Lord Macartney). D. C. syst. 1. p. 513. prod. 1. p. 96.

Lin. syst. *Diœ'cia Monodélphia*. Sepals disposed in a ternary order in 2 series. Petals none. Male flowers with 6 monodelphous stamens. Female flowers unknown.

1 S. Chine'nsis (D. C. syst. 1. p. 514.) ♄. ◡. G. Native of China. Sepals of flower 6 lines long. Anthers whitish. Leaves on petioles, peltate, 5-foliate. A smooth sarmentose shrub.

Chinese Stauntonia. Shrub rambling.

Cult. This plant, as well as all belonging to *Menispermàceæ*, require plenty of room to grow and climb or they will not flower. A mixture of loam and peat suit it well, and cuttings put in in the spring will root freely, under a hand-glass. †

III. BURASA'IA (from *Bourasaha*, the name of the plant in Madagascar.) Pet. Th. dict. scient. nat. ex gen. madag. p. 18. D. C. syst. 1. p. 514. prod. 1. p. 96.

Lin. syst. *Diœ'cia Monodélphia*. Sepals and petals disposed in a ternary order in 2 series. Male flowers with 6 stamens, which are joined at the base. Female flowers with 6 sterile stamens, triple ovary, and 3 drupes.

1 B. Madagascarie'nsis (Pet. Th. l. c.) ♄. S. Native of Madagascar. Leaves alternate, trifoliate, on long petioles; leaflets 3, ovate, entire. A weak shrub with racemose flowers.

Madagascar Bourasaha. Shrub rambling.

Cult. This plant will thrive well in a mixture of loam and peat, and cuttings put in in the spring will root freely under a hand-glass, placed in a good heat. †

IV. HOLBŎLLIA (in honour of Fred. Louis Holboel, superintendent of the botanic garden at Copenhagen.) Wall. tent. fl. nap. 1. p. 25. t. 16 and 17.

Lin. syst. *Monœ'cia, Hexándria*. Flowers monoecious. Perianth 6-leaved, disposed in a double series. Stamens 6, distinct. Glands 6, opposite the base of the stamens. Female flowers, with 6 sterile stamens. Stigma simple. Berries 3, distinct, oblong, follicular, 1-celled, many-seeded.—Climbing shrubs, with compound leaves. The natives of Nipaul eat the fruit of both species, the pulp of which is sweetish, but otherwise of an insipid taste. It is very probable that *Rajània quinàta* and *hexaphýlla*, Thunb. fl. jap. 148, 149. belong to this genus.

1 H. latifo'lia (Wall. tent. fl. nap. 1. p. 24. t. 16.) leaflets 3-5, ovate-oblong, 3-nerved; flowers racemose. ♄. ◡. G. Native of Nipaul on Chundaghira and Sheopore. Flowers white, campanulate. Fruit baccate, oval, turning, purple, eatable.

Broad-leaved Holbollia. Shrub cl.

2 H. angustifo'lia (Wall. tent. fl. nap. 1. p. 25. t. 17.) leaflets 7-9, linear-lanceolate, acuminated; peduncles 2-3-flowered, in fascicles. ♄. ◡. G. Native of Nipaul, with the last. Flowers white, purplish on the outside. Fruit baccate, turning purple, eatable.

Narrow-leaved Holbollia. Shrub cl.

Cult. See *Cocculus* and *Stauntonia*.

V. GYNOSTE'MMA (from *γυνη, gyne*, a female or stigma; *στεμμα, stemma*, a crown; ovaries crowned by the permanent stigmas.) Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 497.

Lin. syst. *Diœ'cia, Monodélphia*. Flowers dioecious. Sepals 10, disposed in a quinary order, connected at the base. Petals wanting. Stamens 5, monodelphous, bearing the anthers on the outside; anthers 2-celled, connected into a ring. Female flowers with the calyx as in the male. Ovary simple, half inferior, 3-5-celled; cells 1-seeded. Stigmas 3-4, permanent. Drupes globose, 3-4-celled; cells or nuts 1-seeded. Embryo inverted, without albumen.—Climbing shrubs, with simple or pedate leaves.

1 G. peda'ta (Blum. l. c.) leaves 3-7-foliate; leaflets ovate-oblong, coarsely toothed; panicle axillary. ♄. ◡. S. Native of Java.

Pedate-leaved Gynostemma. Shrub cl.

2 G. simplicifo'lia (Blum. l. c.) leaves ovate-oblong, acuminated, smooth, terminated by a repand-serrulated mucrone; racemes panicled, axillary, and terminal. ♄. ◡. S. Native of Java.

Simple-leaved Gynostemma. Shrub cl.

Cult. See *Cocculus* and *Stauntònia*.

Tribe II.

MENISPE'RMEÆ (plants agreeing in character with Menispérmum.) D. C. prod. 1. p. 96. Flowers usually dioecious; male flowers equal in number of parts. Carpels many, distinct, 1-celled, 1-seeded. Leaves simple. Twining or climbing shrubs, with small inconspicuous flowers, which are usually greenish-yellow.

VI. SPIROSPE'RMUM (from *σπιερα, spiera*, a screw; *σπερμα, sperma*, a seed; embryo long and spirally twisted.) Pet. Th. dict. scienc. nat. ex gen. mad. p. 19. no. 63. D. C. syst. 1. p. 514. prod. 1. p. 96.

Lin. syst. *Diœ'cia, Monodélphia*. Sepals and petals disposed in a ternary order in two series. Male flowers with 6 stamens, the 3 inner ones are joined at the base; female ones with 8 or 9 carpels, forming a round head. Embryo cylindrical, very long and spirally twisted, whence the generic name.

1 S. penduliflo'rum (Pet. Th. l. c.) ♄. ◡. S. Native of Madagascar. A weak sarmentose shrub, with alternate many-nerved leaves, and pendulous racemes of flowers.

Pendulous-flowered Spirospermum.

Cult. This genus requires the same treatment as *Cócculus*, which see.

VII. CO'CCULUS (from *coccus*, the systematic name of cochineal, applied to this genus on account of the greater part of the species bearing scarlet berries.) Bauh. pin. 511. D. C. syst. 1. p. 515. prod. 1. p. 96.

Lin. syst. *Diœ'cia, Hexándria*. Sepals and petals disposed in a ternary order, in 2, very rarely in 3 series (f. 29. *a*.). Male flowers with 6 free stamens (f. 29. *b*.) opposite the petals; female ones with 3 or 6 carpels. Drupes baccate, 1 to 6, usually obliquely-reniform, somewhat flattened, 1-seeded. Cotelydons distant. A large genus of climbing or twining shrubs, with peltate, cordate, ovate or oblong, entire, rarely lobed leaves. Peduncles axillary, rarely lateral, those bearing the male flowers usually many-flowered, those bearing the female ones few-flowered, either free from bracteas or furnished with very small ones (not as in *Cissámpelos* furnished with large bracteas.) The berries of many of this genus are used in their native countries to intoxicate fish and birds, &c. in order to take them, being made up into a paste, and it is said they are often used by brewers to give their ale and porter an intoxicating quality.

§ 1. *Leaves peltate.*

1 C. Japo'nicus (D. C. syst. 1. p. 516.) leaves peltate, roundish-ovate, acuminated, quite entire, smooth; petioles twining, length of leaves; female peduncles 3 times shorter than the petioles, umbelliferous; carpels twin. ♄. ◡. G. Native of Japan near Nagasaki and elsewhere. Menispérmum Japóni-

cum, Thunb. jap. 195. Stems smooth, slightly polygonal. Seeds white.

Var. β, Timoriénsis (D. C. prod. 1. p. 96.) peduncles equal in length to the petioles. Perhaps a different species. ♄. ◠. S. Native of the island of Timor.

Japan Cocculus.. Shrub tw.

2 C. Roxburghia'nus (D. C. syst. 1. p. 516.) leaves peltate, ovate, roundish at the base, and acutish at the apex, quite entire, smooth; petioles much shorter than the leaves; female peduncles much shorter than the petioles, umbelliferous; berries generally 6 or 7. ♄. ◠. S. Native of the East Indies. Cissámpelos glàbra, Roxb. according to Wallich. Very like *Cócculus Japónicus*. Branches smooth, climbing and twining, cylindrical.

Roxburgh's Cocculus. Shrub tw.

3 C. pelta'tus (D. C. syst. 1. p. 516.) leaves peltate, somewhat triangular, acuminated, bluntly truncate at the base, quite entire, rather scabrous; petioles pilose; female peduncles racemose, scarcely double the length of the petioles. ♄. ◠. S. Native of Coromandel and Malabar.—Pluk. phyt. t. 24. f. 6.—Rheed. mal. 7. p. 93. t. 49. Menispérmum peltàtum, Lam. dict. 4. p. 96. Root the form and size of that of *Daùcus satìvus*, or *carrot*, and it is used for the cure of dysentery and hemorrhoids in Malabar. Female flowers small, whitish. Fruit, when ripe, white and shining.

Peltate-leaved Cocculus. Shrub tw.

4 C. Burma'nni (D. C. syst. 1. p. 517.) leaves peltate, triangularly oblong, acuminated, quite entire, shining, bluntly truncate at the base; male peduncles very long, racemose. ♄. ◠. S. Native of Ceylon.—Burm. zeyl. 218. t. 101. Male flowers 6-cleft, and the female ones with 1 pistil.

Burmann's Cocculus. Shrub tw.

5 C. Forste'ri (D. C. syst. 1. p. 517.) leaves peltate, ovate, roundish at the base and acutish at the apex, quite entire, smooth; petioles longer than the leaves. ♄. ◠. S. Native? Menispérmum peltàtum, Forst. ined. in herb. Lamb. This shrub is very like *C. Roxburghiànus*, but the leaves are a little larger.

Forster's Cocculus. Shrub tw.

6 C. rimo'sus (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 498.) leaves somewhat peltate; oval-oblong, acute, coriaceous, smooth; racemes panicled, axillary, shorter than the leaves; stems chinky, or rather the bark. ♄. ◠. S. Native of Java. Menispérmum rimòsum, Spreng. syst. app. p. 143.

Chinky-barked Cocculus. Shrub tw.

§ 2. *Leaves cordate at the base.*

7 C. rotundifo'lius (D. C. syst. 1. p. 517.) leaves somewhat peltate, rather cordate at the base, orbicular, hardly acuminated, mucronate, smooth; peduncles axillary, racemosely-panicled, shorter than the leaves. ♄. ◡. S. Native? Cultivated in the gardens at Paris in 1812. This shrub is very like *Aristolòchia sìpho* in habit. Berries blackish, somewhat globose, the size of a pea.

Round-leaved Cocculus. Fl.? Clt. 1820. Shrub cl.

8 C. corymbo'sus (Blum. l. c.) leaves somewhat peltate, cordate-roundish, mucronulate, 5-nerved; corymbs axillary, solitary, shorter than the leaves; pedicels somewhat umbellate. ♄. ◡. S. Native of Java. Menispérmum corymbòsum, Spreng. syst. app. p. 143. Plant villous.

Corymbose-flowered Cocculus. Shrub cl.

9 C. glauce'scens (Blum. l. c.) leaves somewhat peltate, cordate-orbicular, mucronate, smooth, under surface glaucous; racemes panicled, lateral, longer than the leaves. ♄. ◠. S. Native of Java. Menispérmum glaucéscens, Spreng. syst. app. p. 143.

Glaucescent-leaved Cocculus. Shrub tw.

10 C. cordifo'lius (D. C. syst. 1. p. 518.) leaves orbicular, cordate, acuminately-cuspidate, 7-nerved, smooth; female racemes lateral, simple, longer than the leaves. ♄. ◡. S. Native of Malabar and the East Indies. Citamérdu, Rheed. mal. 7. p. 39. t. 21. Menispérmum cordifòlium, Willd. spec. 4. p. 826. M. Malabàricum var. β, Lam. dict. 4. p. 96. M. glàbrum Klein, mss. Fruit ovate, tern; a decoction of them is refreshing, and the juice of the plant cures ulcers, according to Rheede. It is also employed in the cure of jaundice in India.. It is tonic and febrifuge.

Heart-leaved Cocculus. Clt. 1822. Shrub cl.

11 C. convolvula'ceus (D. C. syst. 1. p. 518.) leaves orbicular, cordate, acuminately-cuspidate, 7-nerved, smooth; male peduncles simple, axillary, shorter than the leaves. ♄. ◠. S. Native of the East Indies. This plant is very like *C. cordifòlius*, and is perhaps the male plant of that species.

Convolvulus-like Cocculus. Shrub tw.

12 C. Malaba'ricus (D. C. syst. 1. p. 518.) leaves cordate, ovate, acuminated, under surface villous; female racemes simple, lateral, length of the leaves. ♄. ◠. S. Native of Malabar, where it is always in flower and fruit. Menispérmum Malabàricum, Willd. spec. 4. p. 826. Pee-amérdu, Rheed. mal. 7. p. 37. t. 19 and 20. The flowers, according to Rheede, are hermaphrodite, and of a pale green-colour. Fruit first green, then yellowish, but at last reddish and shining.

Malabar Cocculus. Fl. year. Shrub twining.

13 C. coria'ceus (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 498.) leaves cordate, ovate, bluntly acuminated, mucronate, coriaceous, smooth; racemes elongated, axillary, solitary, pendulous. ♄. ◡. S. Native of Java. Menispérmum coriàceum, Spreng. syst. app. p. 148.

Coriaceous-leaved Cocculus. Shrub cl.

14 C. populifo'lius (D. C. syst. 1. p. 519.) leaves heart-shaped, acuminated, quite entire, smooth; female panicles large, many-flowered. ♄. ◠. S. Native of the island of Timor. This plant is very like *C. cordifòlius* and *C. Malabàricus*, with large leaves, similar to those of *Pòpulus angulàtus*. Carpels 1 or 2, baccate, on pedicels, somewhat globose, about the size of a pea.

Poplar-leaved Cocculus. Shrub tw.

15 C. lacuno'sus (D. C. syst. 1. p. 519.) leaves heart-shaped, acuminated, upper surface green and smooth, under surface clothed with yellowish wool; peduncles lateral, compound, racemose, twice as long as petioles. ♄. ◠. S. Native of the Celebes and Moluccas on rocks by the sea-shore.—Rumph. amb. 5. p. 35. t. 22. Menispérmum lacunòsum, Lam. dict. 4. p. 98. Flowers small, white, 6-parted, with an ungrateful odour. Berries at first white, then black, and at last purplish-black; they are used by the natives in various ways for taking birds and fish by intoxicating them; the most common mode of giving them, is in a paste.

Plated-barked Cocculus. Shrub tw.

16 C. subero'sus (D. C. syst. 1. p. 519.) leaves cordate, subtruncate at the base, compact, shining; panicles many-flowered; stem perennial, twining; bark corky and chinky. ♄. ◠. S. Native of Malabar. Cócci orientàlis, Tab. icon. t. 924. f. 1. Menispérmum Cócculus, Lin. spe. 1468? Gært. fruct. 1. p. 219. t. 70. f. 1. exclusive of the synonyms. This is considered the true *Cocculus Indicus* of the shops. The berries are used in various ways as a medicine, and for killing vermin. They are also used in the East Indies to intoxicate fish, &c. in order to take them, being made up into a paste and thrown into the water. Their use for this purpose is, we believe, prohibited in England, nor is it easy to account for the copious importation of these berries as an article of trade, unless they serve to adul-

terate fermented liquors, as is often reported. The seeds are intensely bitter and very acrid. M. Boullay analyzed them, and found them to contain about half their weight of a concrete waxy oil, albumen, a particular colouring matter, a new bitter poisonous principle, Picrotoxia Lignin, and various new saline matters. In later experiments M. Boullay detected a peculiar acid, to which he has given the name of Menispermic. Picrotoxia is obtained by digesting for a day a decoction of the berry upon caustic magnesia. It is then to be treated with alcohol, which dissolves out the picrotoxia, and this may be purified by evaporation and repeating the solution, and if much coloured, by the addition of animal charcoal. It has the form of quadrangular prisms, white, brilliant, semi-transparent, and extremely bitter; it is soluble in three parts of alcohol, in 25 of boiling, and 50 of cold water. It melts by heat, and contains no azote. Vauquelin got a substance very similar from the *Dàphne alpìna*. Picrotoxia resembles camphor in its action, but is much more powerful and deleterious. The extract has been lately recommended by M. Fouquier of Paris in paralysis, but Dr. Duncan of Edinburgh tried it, and found it less energetic than considering its nature and the small proportion of extract obtained he expected. It seemed to act as a tonic, and to keep the bowels in a good state, but he observed it had no narcotic or stimulant effects. An ointment made with it has long been a domestic remedy in some places to kill vermin on the head, and is successfully applied in cases of tinea of the head. Perhaps the berries of several Indian species of this genus possess the same quality.

Cork-barked Cocculus. Fl.? Clt. 1790. Shrub tw.

17 C. Plukene'tii (D. C. syst. 1. p. 520.) leaves ovate, somewhat cordate at the base, bluntly truncate and mucronate at the apex; female racemes axillary, simple, rather longer than the leaves. ♄. ⌒. S. Native of Malabar and Java. C. officinàrum, Pluk. mant. 52. t. 345. f. 7. Menispérmum Cócculus, Willd. 4. p. 826. The berries are in bunches like grapes, but smaller; first white, then red, and finally blackish purple. In the East Indies they are made into a paste which is used to intoxicate fish and birds, &c.

Plukenet's Cocculus. Fl.? Clt. 1790. Shrub cl.

18 C. Aristolo'chiæ (D. C. syst. 1. p. 520.) leaves cordate, blunt, mucronate, entire; female peduncles 1-flowered, shorter than the petioles. ♄. ◡. S. Native of Madras.—Pluk. alm. t. 13. f. 2.

Aristolochia-leaved Cocculus. Shrub cl.

19 C. flave'scens (D. C. syst. 1. p. 520.) leaves somewhat cordate, ovate, bluntly-acuminated, younger ones orbicular, pubescent; female racemes panicled, lateral, longer than the leaves. ♄. ◡. S. Native of the Moluccas on rocks by the sea-shore.—Rumph. amb. 5. p. 38. t. 24. Menispérmum flavéscens, Lam. dict. 4. p. 100. Flowers small, white, sweet-scented. Fruit of a dirty yellow colour; they are used to poison fish. A decoction of the wood is used against the jaundice, white phlegm, and indigestion, in the Moluccas. (Rumph.)

Yellowish-fruited Cocculus. Fl. Sept. Shrub cl.

20 C. glau'cus (D. C. syst. 1. p. 521.) leaves heart-shaped, acuminated, entire, under surface pubescent; peduncles racemosely-corymbose, shorter than the petioles. ♄. ◡. S. Native of Amboyna in sunny valleys and deserted gardens.—Rumph. amb. 5. p. 40. t. 25. f. 1. Menispérmum glaúcum, Lam. dict. 4. p. 100. Flowers small, yellowish-green. Berries small, blackish-purple.

Glaucous-leaved Cocculus. Fl. Jul. Shrub cl.

21 C. cri'spus (D. C. syst. 1. p. 521.) leaves cordate, acuminated, smooth; stem somewhat angular, and rough with roundish tubercles; racemes simple, slender, lateral. ♄. ◡. S. Native of Java, Sumatra, Moluccas, and Bengal, and from thence transported to Amboyna and Bali.—Colebr. in Lin. soc. trans. 13. p. 6. t. 17. f. 3.—Rumph. amb. 5. p. 83. t. 44. f. 1. Menispérmum críspum, Lin. spec. 1468. The whole plant is bitter, and is used in the Moluccas against gripings of the abdomen, and to kill vermin. It is considered by the natives of Bengal a powerful tonic, and is very highly valued by them.

Curled Cocculus. Fl.? Clt. 1822. Shrub cl.

22 C. tamoi'des (D. C. syst. 1. p. 521.) leaves very entire, truncate or cordate at the base, ovate, pointed, 5-nerved, smooth; male racemes slender, a little longer than the leaves. ♄. ⌒. S. Native of Cayenne. Similar to *C. Carolìnus*, but differing in the leaves being smooth and the racemes much longer.

Tamus-like Cocculus. Shrub tw.

23 C. Chondode'ndron (D. C. syst. 1. p. 522.) leaves cordate, much crenated, acuminated, under surface tomentose. ♄. ◡. S. Native of South America in Pilaya. Chondodéndron tomentòsum, Ruiz. et Pav. prod. fl. per. 132. syst. 261. Epibatèrium? tomentòsum, Pers. ench. 2. p. 561. The bark of this species is exceedingly bitter.

Lump-tree Cocculus. Fl. Oct. Nov. Shrub cl.

24 C. inca'nus (Coleb. in Lin. trans. 13. p. 57. t. 17. f. 1.) leaves cordate, entire, villous, mucronate; panicles axillary, shorter than the leaves. ♄. ◡. S. Native of Chitagong and Silhet in Bengal. Menispérmum villòsum, Roxb. mss. Flowers yellowish-green, inodorous.

Hoary-leaved Cocculus. Fl. year. Clt. 1820. Shrub cl.

25 C. se'pium (Coleb. in Lin. soc. trans. 13. p. 58. t. 17. f. 2.) leaves from broad cordate to linear cordate, downy; male flowers in racemes; female ones axillary, solitary. ♄. ◡. S. Menispérmum hirsùtum, Roxb. citing Willd. spec. 4. p. 829. Native of the East Indies. Very common in hedges.

Hedge Cocculus. Clt. 1820. Shrub cl.

26 C. tomento'sus (Coleb. in Lin. soc. trans. 13. p. 59.) leaves roundish-cordate, 3-lobed, tomentose; racemes axillary, generally simple, one, two, or more together; corollas expanding; nectarial scales entire. ♄. ◡. S. Native of Bengal in thickets and hedges. Menispérmum tomentòsum, Roxb. mss.

Tomentose Cocculus. Fl. Feb. March. Clt. 1820. Shrub cl.

27 C. hexa'gynus (Coleb. in Lin. soc. trans. 13. p. 63.) old leaves cordate, younger ones parabolic, entire, upper surface smooth, under surface rather hairy; racemes axillary and terminal, panicled, villous; pedicels 3-flowered. ♄. ⌒. G. Native of China near Canton. Menispérmum hexágynum, Roxb. mss. Flowers small, white.

Six-styled Cocculus. Shrub tw.

28 C. Bantame'nsis (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 498.) leaves somewhat cordate-oval, acute, generally 5-nerved, smooth, quite entire; panicles elongated, axillary, solitary. ♄. ◡. S. Native of Java. Menispérmum Bantamense, Spreng. syst. app. p. 148.

Bantam Cocculus. Shrub cl.

29 C. hasta'tus (D. C. syst. 1. p. 522.) leaves cordate at the base, hastate, villous beneath; auricles blunt, drawn out a little beyond the auricles at the apex; petioles villous, six times shorter than the leaves. ♄. ⌒. S. Native of the East Indies. Menispérmum hastàtum, Lam. dict. 4. p. 98.

Halbert-leaved Cocculus. Shrub tw.

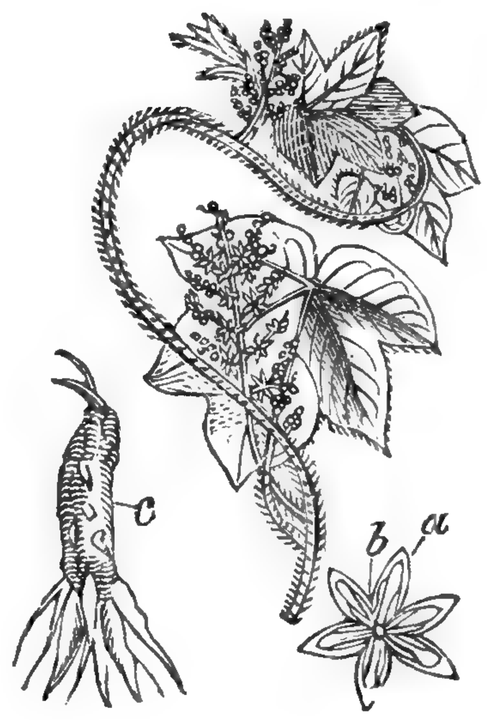
30 C. tri'lobus (D. C. syst. 1. p. 522.) leaves 3-lobed, nerved, villous; lobes acute, mucronate, entire; petioles reflexed at the base; peduncles racemose, shorter than the petioles. ♄. ⌒. G. Native of Japan near Nagasaki. Menispérmum trílobum, Thunb. fl. jap. 194. The whole plant is villous. Flowers whitish. Berries globose, 1-seeded, about the size of a small pea.

Three-lobed-leaved Cocculus. Fl. Sep. Oct. Shrub tw.

31 C. palma'tus (D. C. syst. 1. p. 522.) leaves cordate at the base, palmately-5-cleft, covered with hispid hairs, lobes

acuminated, quite entire. ♃. ◠. S. Native of the south-eastern coast of Africa, especially in shady woods of Oibo and Mozambique. Menispérmum palmàtum, Lam. dict. 4. p. 95. D. C. ess. prop. pl. ed. 2. p. 79. Colomba, Columbo or Kalumbo, Berry, in asiat. reser. 10. p. 385. t. 5. Male plant. Roots perennial, thick, with fusiform branches (f. 29. *c*.). Stems twining, annual, about the thickness of a goose-quill. The roots of this plant are sold in the shops under the name of *Calumba* or *Colomba Root;* it is a bitter stomachic, useful in dysentery, diarrhœa, and dyspepsia. This root is produced in Africa in the country of the Caffres, and forms an important article of commerce with the Portuguese at Mozambique. It is remarkable that the place of the growth of this important plant should have been so long unknown to Europe. It is never cultivated, but grows naturally, and in great abundance in the thick forests that are said to cover the coasts of Oibo and Mozambique, and inland about 15 or 20 miles. The roots are dug up in March, the dry season, or when the natives are not employed in agriculture, not the original root, which is perennial, but off-setts from its base, that are of sufficient size, yet not so old as to be full of fibres, which render it unfit for commerce. Soon after it is dug up, the root is cut into slices, strung on cords and hung up to dry in the shade. It is deemed merchantable when on exposure to the sun it breaks short, and of a bad quality when it is soft or black. This root is in high estimation among the Africans, even far removed from Mozambique, for the cure of dysentery, which is frequent among them, also for the cure of syphilis and all complaints of long standing, and as a remedy for almost every disorder. In powder, it is used for the cure of ulcers. It is generally brought in transverse sections, from half an inch to three inches in diameter, rarely divided across. This is evidently done to facilitate its drying; for the large pieces are all perforated with holes. The root is yellow within. Its smell is faintly aromatic, and readily lost when not preserved in close vessels; the taste is unpleasant, bitter, and somewhat acrid; the bark has the strongest taste; the pith is almost mucilaginous. Its active constituent is a bitter principle called *Cinchonine*. It also contains a great deal of mucilage. Planche says it contains one-fourth of its weight of starch. It is accordingly more soluble in water than in alcohol. The tincture is not precipitated by water, and does not affect the colour of infusion of turnsole, or solution of red sulphate of iron. In India it is much used in diseases attended with bilious symptoms, particularly in cholera; and it is said to be sometimes very effectual in other cases of vomiting. It produces excellent effects in dyspepsia. Half a drachm of the powder is given repeatedly in the day. The false *Colombo-root*, the produce of *Frasèra Waltèri*, has been imported from the United States. (f. 29.)

FIG. 29.



Palmate-leaved Cocculus or Colombo-root. Fl.? Clt.? Pl. tw.

32 C. CINERA'SCENS (St. Hil. fl. bras. 1. p. 59.) leaves ovate, acutish, mucronulate, somewhat cordate at the base, crenated, clothed with greyish tomentum beneath. ♄. ◡. S. Native of Brasil in woods. This plant is employed by the Brasilians in the treatment of fever, it being considered a powerful febrifuge, and is also regarded as a powerful specific in diseases of the liver.

Greyish Cocculus. Shrub cl.

33 C. ORBICULA'TUS (D. C. syst. 1. p. 523.) leaves orbicular, somewhat cordate, blunt, 5-7-nerved, mucronulate, under surface cinereously-pubescent; male pedicels large, 1-3, racemose at the apex, shorter than the petioles. ♄. ◠. S. Native of Malabar and Tranquebar. Menispérmum orbiculàtum, Lin. spec. 1468. —Rheed. mal. 11. p. 127. t. 62.—Pluk. amalth. 61. t. 384. f. 6. Flowers small, villous on the outside. Perhaps a species of *Cissámpelos*.

Orbicular-leaved Cocculus. Fl.? Clt. 1790. Shrub tw.

34 C. DIVERSIFO'LIUS (D. C. syst. 1. p. 523.) lower leaves cordate, middle ones ovate, upper ones oblong, all of which are truncate obtuse and mucronate; peduncles 1-3-flowered, shorter than the leaves. ♄. ◠. S. Native of Mexico. Menispérmum, spec. nov. Moc. et Sesse, fl. mex. icon. ined. Flowers small, white. Berries fleshy, reddish, almost kidney-shaped. Very like *C. Carolìnus*, but is easily distinguished from it by the tops of the leaves being truncate.

Variable-leaved Cocculus. Shrub tw.

35 C. CAROLI'NUS (D. C. syst. 1. p. 524.) leaves cordate or ovate, entire, obtuse or somewhat 3-lobed, under surface velvety-pubescent; male racemes floriferous from the base, female ones 3-flowered. ♄. ◠. H. but often herbaceous in gardens in cold countries. Native of Carolina, Georgia, and Florida, in woods and hedges. Menispérmum Carolìnum, Lin. spec. 1468. Wendlándia populifòlia, Willd. spec. 2. p. 275.—Pursh. fl. amer. sept. 1. p. 252.—Dill. elth. 223. t. 178. f. 219. Androphìlax scándens, Wendl. obs. p. 38. hort. herrenh. 3. t. 16. Baumgàrtia scándens, Mœnch, meth. 650. Flowers dioecious, but according to Wendland often hermaphrodite. Berries, when ripe, red.

Carolina Cocculus. Fl. Jun. Jul. Clt. 1759. Shrub tw.

36 C. LANUGINO'SUS (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 498.) woolly; leaves broad-ovate, retuse, scarcely cordate at the base; corymbs axillary, crowded, much shorter than the leaves; pedicels somewhat umbellate. ♄. ◡. S. Native of Java.

Woolly Cocculus. Shrub cl.

37 C. PLATIPHY'LLA (St. Hil. fl. bras. 1. p. 59. pl. us. bras. t. 42.) leaves broad, heart-shaped, obsoletely-crenate, tomentose beneath. ♄. ◡. S. Native of Brasil in the northern parts of the province of Minas Geraes, where it is called *Batua*. This plant is employed by the Brasilians in the treatment of intermittent fevers, and it is also regarded by them as a powerful remedy in diseases of the liver.

Broad-leaved Cocculus. Shrub cl.

§ 3. *Leaves ovate, oval, or oblong.*

38 C. THUNBE'RGII (D. C. syst. 1. p. 524.) leaves ovate, obtuse, with a point, under surface villous; lower leaves somewhat triangular, upper ones orbicular; flowers axillary, panicled. ♄. ◠. S. Native of Japan near Nagasaki. Menispérmum orbiculàtum, Thunb. jap. 194. Compare it with Braam. icon. china. t. 2. f. 1.; perhaps the same, or a new species.

Thunberg's Cocculus. Shrub tw.

39 C. VILLO'SUS (D. C. syst. 1. p. 525.) leaves ovate or lanceolate, 3-5-nerved, younger ones villously-tomentose, adult ones pubescent, branchlets pubescent; pedicels few-flowered, length of petioles. ♄. or ♃. ◠. S. Native of Malabar and the East Indies. Plant very villous, having the appearance of a species of *Evólvulus*.

Var. α; leaves oblong-lanceolate.—Pluk. amalth. 62. t. 384. f. 3. Menispérmum myosotoìdes, Lin. spec. 1469.

Var. β; leaves all ovate.—Pluk. amalth. 61. t. 384. f. 7. Menispérmum hirsùtum, Lin. spec. 1469.

Var. γ; upper leaves ovate, lower ones cordate.—Pluk. amalth. 61. t. 384. f. 5.

Villous Cocculus. Pl. tw.

40 C. COTONEA'STER (D. C. syst. 1. p. 525.) leaves oval, quite entire, mucronate, under surface tomentose as well as the branches;

peduncles racemose, longer than the petioles. ♄. ◡. S. Native perhaps of South America. Deless. icon. sel. 1. t. 93. Leaves resembling those of *Cotoneáster vulgàris*, but a little longer. Flowers small.

Cotoneaster-like Cocculus. Shrub cl.

41 C. Tria'ndrus (Coleb. in Lin. soc. trans. 13. p. 64.) leaves ovate-oblong, acuminated, smooth; racemes axillary, one or more together, rather longer than the petioles. ♄. ◠. S. Native of the Malay Islands. Menispérmum triándrum, Roxb. MSS. Flowers numerous, minute, yellow.

Triandrous Cocculus. Shrub tw.

42 C. ovalifo'lius (D. C. syst. 1. p. 426.) leaves oval, entire, mucronate, 3-nerved, smooth; branchlets villous; lower peduncles axillary, scarcely longer than the petioles, upper ones disposed in terminal panicles; pedicels sub-umbellate. ♄. ◠. S. Native of Java and China. Deless. icon. sel. 1. t. 94. Menispérmum ovalifòlium, Pers. ench. 2. p. 628. Berries 2-3, smooth, compressed, orbicular.

Oval-leaved Cocculus. Shrub. tw.

43 C. Fibra'urea (D. C. syst. 1. p. 525.) leaves ovate, acute, quite entire, smooth, on long petioles; racemes oblong, lateral. ♄. ◡. S. Native of Cochin-china and China in woods. Fibràurea tinctòria, Lour. coch. ed Willd. 2. p. 769. Berries small, yellow, not eatable. Taste of whole plant bitter. Roots diuretic. The root and lower part of the stem are esteemed resolvent, deobstruent, and diuretic. The bruised stems afford by boiling a yellow dye, which is not very vivid but lasting, and serves as a basis for Turmerick and Safflower which, though more vivid, are not so durable.

Golden-fibred Cocculus. Shrub cl.

44 C. elli'pticus (D. C. syst. 1. p. 426.) leaves elliptical, obtuse, quite entire, smooth; racemes axillary, in pairs, unequal, much shorter than the leaves. ♄. ◡. S. Native of Senegal. Menispérmum ellípticum, Poir. suppl. 3. p. 657. Flowers small, greenish, disposed in unequal, small racemes.

Elliptical-leaved Cocculus. Shrub cl.

45 C. Lima'cia (D. C. syst. 1. p. 526.) leaves ovate-oblong, acuminated, quite entire, smooth; male flowers almost terminal, crowded, female ones in pairs, axillary. ♄. ◡. G. Native of Cochin-china in woods. Limàcia scándens, Lour. coch. ed Willd. 2. p. 761. Flowers yellowish-green; berries small, smooth, fleshy, acrid, but eatable. The specific name *Lamacia* was applied to this plant by Loureiro, because the fruit resembles the shell of a limacon or snail.

Snail-fruited Cocculus. Fl. cl.

46 C. Ceba'tha (D. C. syst. 1. p. 526.) leaves oval-oblong, mucronate, smooth, shining; peduncles axillary, length of petioles; male ones capitate, female ones 1-flowered. ♄. G. Native of Arabia. Cebàtha, Forsk. ægyp. arab. 171. Menispérmum édule, Vahl. symb. 1. p. 80. Flowers greenish. Berries red, when ripe eatable, but they have an acrid taste, and from them a wine is prepared which is called *Chamr. el Madjnume* in Arabia. *Cebatha* is a name of Arabian origin.

Cebatha Cocculus. Shrub cl.?

47 C. acumina'tus (D. C. syst. 1. p. 527.) leaves ovate, acuminated, quite entire, smooth, somewhat 5-nerved at the base, the rest feather-nerved; racemes axillary, sub-villous, a little longer than the petioles. ♄. ◡. S. Native of the East Indies. Deless. icon. sel. 1. t. 95. Menispérmum acuminàtum, Lam. dict. 4. p. 101. Very like *C. radiàtus* in habit, but the petioles are one half longer. Flowers brownish. Berries obovate, numerous, stipitate, smooth.

Pointed-leaved Cocculus. Shrub. cl.

48 C. radia'tus (D. C. syst. 1. p. 527.) leaves ovate-oblong, acuminated, scarcely cordate, quite entire, feather-nerved, smooth; peduncles racemosely-panicled, 3-times longer than the petioles. ♄. ◡. S. Native of the East Indies. Valli-caniram, Rheed. mal. 7. p. 5. t. 3. Menispérmum radiàtum, Lam. dict. 4. p. 100. Bràunea menispermoìdes, Willd. spec. 4. p. 797. Berries 3-seeded. Sepals and petals 3, with 6 nectariferous scales, in the petals of the male flowers; female ones with 3 styles.

Rayed Cocculus. Shrub tw.

49 C. leptosta'chius (D. C. syst. 1. p. 528.) leaves oval, acuminated, 3-nerved, smooth; racemes axillary, simple, slender, length of leaves. ♄. ◡. S. Native of Timor.

Slender-spiked Cocculus. Shrub cl.

50 C. brachysta'chyus (D. C. syst. 1. p. 528.) leaves ovate, acute, 3-5-nerved, smooth; female racemes axillary, shorter than the petioles. ♄. ◡. S. Native of the island of Timor. Seeds within the berry, arched. Stem hardly scandent.

Short-racemed Cocculus. Shrub cl.

51 C. Dominge'nsis (D. C. syst. 1. p. 528.) leaves oval, acuminated, quite entire, scarcely 3-nerved at the base, smooth; peduncles racemosely-panicled, axillary, slender, somewhat shorter than the leaves, rising from a tubercled villous base. ♄. ◡. S. Native of St. Domingo. Deless. icon. sel. 1. t. 96. Very like *C. brachystàchyus*. Flowers very small.

St. Domingo Cocculus. Shrub cl.

52 C. leæ'ba (D. C. syst. 1. p. 529.) leaves ovate-oblong, blunt, glaucous, somewhat pubescent, on short petioles; branches rather twining. ♄. ◠. G. Native of Upper Egypt. Male plant found about Liblad in the desert near Cairo, female ones rarely, usually far from the males. Leæ'ba, Forsk. fl. ægyp. p. 172. Juss. gen. 285. Menispérmum Leæ'ba, Delile, fl. ægyp. ill. 30. descr.-t. 51. f. 2 and 3. *Leæba* is the name of the plant in Upper Egypt. Calyx yellowish; petals greenish; anther yellow.

Leæba Cocculus. Shrub tw.

53 C. oblongifo'lius (D. C. syst. 1. p. 529.) leaves oblong, 3-nerved, blunt at both ends, mucronate, smooth; peduncles shorter than the leaves, upper ones somewhat racemose, female ones 1-flowered. ♄. ◠. S. Native of Mexico. Menispérmum, nov. spec. Moc. et Sesse, fl. mex. icon. ined. Flowers small, white.

Oblong-leaved Cocculus. Shrub tw.

54 C. triflo'rus (D. C. syst. 1. p. 529.) leaves ovate-lanceolate, acuminated, 3-nerved at the base, quite entire, smoothish; female peduncles axillary, trifid, 3-flowered, length of petioles. ♄. ◡. S. Native of Java. Stems almost erect.

Three-flowered Cocculus. Shrub cl.

55 C. milleflo'rus (D. C. syst. 1. p. 530.) leaves ovate, obtuse, feather-nerved, smooth, shining; panicle terminal, many-flowered, branches spreading, in pairs. ♄. ◡. S. Native of Madagascar. Very like *C. gomphioìdes* but differing in the leaves being larger, more ovate at the base, and less attenuated at the apex.

Thousand-flowered Cocculus. Shrub cl.

56 C. gomphioi'des (D. C. syst. 1. p. 530.) leaves oblong, acuminated, 3-nerved at the base, quite entire, smooth, shining; peduncles axillary, much longer than the leaves. ♄. ◡. S. Native of Madagascar. Berries about the size of a small grape.

Gomphia-like Cocculus. Fl.? Clt. 1820. Shrub cl.

57 C. laurifo'lius (D. C. syst. 1. p. 520.) leaves oblong, acuminated, smooth, shining; peduncles lateral and axillary, branched at the top, rather shorter than the petioles. ♄. ◡. S. Native of Nipaul and Sirinagur. Deless. icon. sel. 1. t. 97. Flowers very small, 8-10, smooth.

Laurel-leaved Cocculus. Fl. Jan. Feb. Clt. 1820. Shrub cl.

§ 4. *Flowers monoecious. (Perhaps a genus.)*

58 C. Epibate'rium (D. C. syst. 1. p. 530.) flowers monoecious; drupes 1-3; leaves oblong, quite entire, smooth. ♄. ◡. S. Native of the island of St. James in the South Sea. Epibatèrium

péndulum, Forst. gen. t. 54. The name is derived from *επι, epi*, upon, and *βαινω, baino*, to walk, in allusion to the plant climbing upon others.

Epibaterium Cocculus. Shrub cl.

59 C. Nephro'ia (D. C. syst. 1. p. 531.) flowers monoecious; drupes 6; leaves ovate, emarginate, smooth. ♄. ◡. G. Native of Cochin-china in woods. Nephròia sarmentòsa, Lour. coch. ed Willd. 2. p. 692. Drupe small, fleshy, somewhat kidney-shaped, 1-seeded. The name is derived from *νεφρος, nephros*, a kidney; because of the form of the fruit.

Kidney-fruited Cocculus. Shrub cl.

Cult. The stove and greenhouse species of this genus will thrive well in a mixture of loam and peat; and cuttings root easily if planted in a pot of light earth, with a hand-glass placed over them, in a moderate heat. The only hardy species, *Cocculus Carolìnus*, may be propagated by parting the roots, which spread out on the side, so that part of them may be cut off every other year; this should be done in the spring, and these should be planted in a light soil in a sheltered situation against a wall, which the branches can be trained to. All the species are climbers or twiners.

VIII. COSCI'NIUM (from *κοσκινον, koskinon*, a little sieve; in allusion to the seeds being pierced). Coleb. in Lin. soc. trans. 13. p. 65.

Lin. syst. *Diœ'cia, Hexándria.* Sepals and petals in threes; male flowers with 6 stamens embracing the base of the pistil, female ones with 3 ovaries. Styles slender. Berries 1-3. Seeds pierced by a large hole. A climbing shrub.

1 C. fenestra'tum (Coleb. Lin. soc. trans. 13. p. 66.) ♄. ◡. S. Native of Ceylon. Menispérmum fenestràtum, Gært. fruct. 1. p. 219. t. 46. f. 5. Wood yellow, bitter. Leaves alternate, cordate, entire, 5-7-nerved, smooth and shining above, very hoary underneath. In the young plants they are frequently peltate; peduncles umbellulate, several from the same bud. Flowers greenish. Berries villous. This plant is in repute among the inhabitants of Colomba, who slice it in thin pieces and swallow it, with the liquid, after steeping it in water several hours. They commend it as an excellent stomachic. It is called in Singalese *Veni-vell-gettah* or *Bang-well-gettah*, in English the *Knotted plant.*

Windowed Coscinium. Fl. Nov. Dec. Clt. 1820. Shrub cl.

Cult. This plant will require plenty of room in the stove where grown, or it will not flower as well as all the stove plants belonging to this natural order. A mixture of peat and loam suits it well, and cuttings will root freely under a hand-glass, in heat.

IX. TILIACO'RA (*Tilia-kora*, the Bengalese name of the plant). Coleb. in Lin. soc. trans. 13. p. 67.

Lin. syst. *Diœ'cia, Hexándria.* Sepals 6. Petals 3. Nectary 6-leaved; male flowers with 6 stamens, alternately shorter, length of corol. Anthers ovate. Female flowers with about 12 ovaries in a circle, each ending in a short subulate style. Berries many, short-pedicelled, clubbed, smooth. Nut 1 or 2-celled. A climbing shrub with ash-coloured bark and alternate, cordate, smooth, shining, pointed, and frequently scolloped leaves. Male racemes frequently compound, female ones simple, few-flowered.

1 T. racemo'sa (Coleb. in Lin. soc. trans. 13. p. 67.) ♄. ◡. S. Native of the coast of Coromandel in hedges and places overrun with bushes. Menispérmum polycárpon, Roxb. mss. Called Bagha *Hind.* Tilia-kora *Beng.* Tiga-mashadi *Teling.* Flowers small, yellow. Berries about the size of a French bean.

Racemose Tilia-kora. Fl. all the year. Clt. 1820. Shrub cl.

Cult. This plant should be propagated and cultivated in the same manner as *Coscínium*, or the stove species of *Cócculus*, which see.

X. ANAMI'RTA (meaning unknown.) Coleb. in Lin. trans. 13. p. 66.

Lin. syst. *Diœ'cia, Monodélphia.* Calyx 2-sepalled. Petals 6, in 2 series, equal. Nectary none. Stamens collected into a column or monodelphous. Anthers numerous, crowded in the form of a globe; female flowers have not been seen, but the berries are as in *Menispérmum;* about the size of a ripe black-heart cherry, and as they are collected in very large pendulous bunches, their appearance is most inviting, but their taste is most abominable.

1 A. paniculata (Coleb. in Lin. soc. trans. 13. p. 66.) ♄. ◡. S. Native of the East Indies. Menispérmum heteroclìtum, Roxb. MSS. Bark cracked, ash-coloured. Leaves alternate, cordate, stalked, entire, smooth, upper surface deep, shining, green, under surface whitish, 3-5-nerved. Panicles rising from the naked woody parts of the stem, drooping. Bracteas 3-fold, 1-flowered, small, caducous.

Panicled-flowered Anamirta. Shrub cl.

Cult. This genus should also be propagated and treated in the same manner as *Coscínium*, which see.

XI. PSE'LIUM (from *ψελιον, pselion*, a bracelet; form of nuts). Lour. fl. cochin. ed Willd. 2. p. 762. D. C. syst. 1. p. 531. prod. 1. p. 100.

Lin. syst. *Diœ'cia, Hexándria.* Sepals and petals disposed in a ternary order in two series. Stamens 6, free. Female flowers with 4 sepals, without petals; ovary 1; stigma 4-cleft. A climbing shrub with axillary flowers.

1 P. heterophy'llum (Lour. fl. coch. ed Willd. 2. p. 762.) ♄. ◡. G. Native of Cochin-china in woods. Leaves alternate, quite entire, smooth, stalked; in the male plant they are somewhat cordate, roundish, with short somewhat divided racemes; in the female plants the leaves are ovate, peltate, acuminated, with racemes somewhat umbellate; pedicels very short.

Various-leaved Pselium. Shrub cl.

Cult. This plant will grow freely in a mixture of loam and peat; and cuttings will root freely in the same kind of soil, under a hand-glass.

XII. CISSA'MPELOS (*κισσος, kissos*, the Greek name of ivy, *αμπελος, ampelos*, a vine; plants like the ivy in the rambling branches, and like the vine in having the fruit in racemes). Lin. gen. no. 1138. Lam. ill. t. 830. Juss. gen. 285. D. C. syst. 1. p. 532. prod. 1. p. 100.

Lin. syst. *Diœ'cia, Monodélphia.* Male flowers with 4 sepals and 4-2, monodelphous stamens, without petals. Female flowers with 1 sepal, and 1 petal in front of the sepal. Ovary 1. Stigmas 3. Drupe oblique, reniform. Abumen none. Embryo long, terete, perapheric. Radicle superior, rising from the base of the stigma. Climbing shrubs with simple, stalked, orbicular, ovate, heart-shaped or peltate leaves, which are mucronulate at the apex. Racemes axillary; male ones often trichotomously-branched, somewhat corymbose, solitary, twin, or tern; bearing many flowers at the top of the pedicels, which are destitute of bracteas, or furnished with very small ones; female racemes simple, elongated, bearing broad alternate bracteas, with the pedicels rising in fascicles from the axillæ of these bracteas.

§ 1. *Female flowers furnished with bracteas. Leaves in both sexes peltate.*

1 C. tropæolifo'lia (D. C. syst. 1. p. 532.) leaves peltate, ovate-orbicular, acutish, pubescent with scattered hairs; racemes axillary, in pairs. ♄. ◠. S. Native of South America, near Cuchero. Deless. icon. sel. 1. t. 98. Flowers dark-purple.

Fruit compressed, orbicular, with their margins marked with rayed stripes.

Tropæolum-leaved Cissampelos. Shrub tw.

2 C. HERNANDIFO'LIA (Willd. spec. 4. p. 861.) leaves peltate, ovate, acuminated, obtuse, mucronate, smooth, with the veins on the under surface pilose. ♄ . ◠. S. Native of the East Indies. Leaves like those of *Hernàndia sonòra*. Flowers unknown. Berries 1-seeded, in corymbs.

Hernandia-leaved Cissampelos. Shrub tw.

3 C. OWARIE'NSIS (Beauv. ined. D. C. prod. 1. p. 100.) leaves peltate, ovate, roundish, awned, somewhat lobed, upper surface smooth, veins on the under surface finely-pubescent; floral leaves kidney-shaped, ciliated. ♄ . ◡. S. Native of the western coast of Africa in the kingdom of Waree.

Waree Cissampelos. Shrub tw.

4 C. PAREI'RA (Lam. ill. t. 830.) leaves peltate, somewhat cordate, ovate-orbicular, under surface silky-pubescent; female racemes longer than the leaves; berries hispid. ♄ . ◡. S. Native of Martinico, Jamaica, St. Domingo, St. Thomas, New Spain, and Brazil in mountain coppices. Ciss. Parèira, var. *a*, Lin. spec. 1473. Swz. obs. 380. t. 10. f. 5. Caapèba Marcgr. bras. 24. icon. Piso bras. 94. icon. The juice of this tree, according to Piso, is a famous remedy against the bite of serpents. The leaves applied whole or bruised to a wound cures it very effectually. The root is the true *Parèira bràva* of the shops, it is a bitter-sweet diuretic, and is much used in infusion or powder, especially in ischuria, urinary calculi, jaundice, gout, and phlegmatic diseases. See Geoffroy, act. ac. par. 1710. p. 57. Lochner, diss. par. br. norimb. 1719. Murray. app. med. 1. p. 498. Woodv. med. bot. 2. p. 227. t. 82. It is to be suspected that the roots of many plants belonging to this natural order are used in the same manner as this plant in various regions, and have the same qualities, and are confused under the same name in commerce. The name *Pareira-brava* signifies a wild vine in Portuguese.

Pareira-brava Cissampelos. Fl. Ju. Jul. Clt. 1733. Shrub cl.

5 C. GUAYAQUILE'NSIS (H. B. et Kth. nov. spec. amer. 5. p. 67.) leaves peltate, somewhat kidney-shaped, hairy-pubescent, hoary on the under surface; male cymes axillary, in pairs, shorter than the petioles. ♄ . ◡. S. Native of Guayaquil. Female plant unknown. Perhaps it is only a variety of *Ciss. Parèira*.

Guayaquil Cissampelos. Shrub cl.

6 C. ARGE'NTEA (H. B. et Kth. nov. spec. amer. 5. p. 67.) leaves peltate, roundish, kidney-shaped, emarginate at the apex, upper surface pubescent, under surface silky-tomentose, and silvery; male cymes axillary, in pairs, shorter than the petioles. ♄ . ◡. S. Native of South America on the banks of the river Magdelena near Mompox. Female plant unknown. Perhaps also a variety of *Ciss. Parèira*.

Silvery-leaved Cissampelos. Shrub cl.

7 C. MICROCA'RPA (D. C. syst. 1. p. 534.) leaves somewhat peltate and kidney-shaped, orbicular, under surface tomentose; berries at first pubescent, afterwards smooth. ♄ . ◡. S. Native of the West Indies in Jamaica, Martinico, St. Domingo. Ciss. Parèira, var. *β*, Lin. spec. 1473. Very like *Ciss. Pareira*, but differing as above.

Small-fruited Cissampelos. Clt. 1823. Shrub cl.

8 C. HETEROPHY'LLA (D. C. syst. 1. p. 534.) stem leaves peltate, orbicular, cordate at the base, under surface pubescent; floral leaves cordate-reniform, velvety on both surfaces. ♄ . ◡. S. Native of New Spain about San Blas. Male flowers small, hispid, 4-sepalled, female ones unknown.

Variable-leaved Cissampelos. Shrub cl.

9 C. DI'SCOLOR (D. C. syst. 1. p. 534.) leaves peltate, broad-ovate, truncate at the base, acuminated at the apex, 7-9-nerved, under surface pubescent, whitish, upper surface smooth; male peduncles 2-3 together, 3-times shorter than the petioles. ♄ .? ◡. S. Native of the Molucca islands. Male flowers small, on corymbose branched peduncles; female ones unknown.

Two-coloured-leaved Cissampelos. Shrub cl.

10 C. HIRSU'TA (Buch. D. C. syst. 1. p. 535.) leaves peltate, ovate-orbicular, almost veinless. ♄ . ◡. G. Native of Nipaul. Male flowers very minute, villous; female ones unknown.

Hairy Cissampelos. Fl.? Clt. 1820. Shrub cl.

11 C. MAURITIA'NA (Petit-Th. in journ. bot. 1809. 2. p. 65. t. 3 and 4.) leaves cordate-orbicular, pubescent-villous; those of the male plants peltate; male racemes axillary, in pairs or numerous. ♄ . ◡. S. Native of the Mauritius, frequent in woods. Ciss. Pareìra var. *γ*, Willd. spec. 4. p. 861. Ciss. pareiroìdes, D. C. ess. prop. pl. ed. 2. p. 78. This plant is called *Pareìra-bràva* in the Mauritius; it possesses the same medical qualities as the true *Pareira-brava* of Brasil, although in a lesser degree. See *Ciss. Pareira*. This plant differs from *Ciss. Pareìra* in the branches being hispid, not smooth.

Mauritian Cissampelos. Fl.? Clt. 1820. Shrub cl.

12 C. GLABE'RRIMA (St. Hil. fl. bras. 1. p. 57.) stem herbaceous, twining; leaves peltate, ovate, acute, rounded at the base; male flowers corymbose and racemose; divisions of the calyx oblong-linear; corolla campanulate, 4-lobed. ♄ . ◠. S. Native of Brasil in the provinces of Rio Janeiro and Minas Geraes, Cipo de Cobras Marcgr. bras. 25-26, with a figure. Piso, bras. 94, with a figure. The stems and the leaves of this plant have a bitter taste and stimulating odour, like that of *Tropæolum*. The whole plant is employed to cure the bite of snakes.

Very-smooth Cissampelos. Pl. tw.

13 C. ORINOCE'NSIS (H. B. et Kth. spe. amer. 5. p. 68.) leaves scarcely peltate, deltoid, cordate, obtuse, upper surface puberulous, under surface silky-pubescent; fructiferous racemes hardly exceeding the petioles in length; fruit tubercled, pilose. ♄ . ◡. S. Native in shady woods near the river Orinoco. Very like *Ciss. tamoìdes*.

Orinoco Cissampelos. Shrub cl.

§ 2. *Female flowers furnished with bracteas. Leaves not peltate.*

14 C. TOMENTO'SA (D. C. syst. 1. p. 535.) leaves orbicular, cordate, tomentose on both surfaces, as well as petioles and calyx; male peduncles axillary, many together, shorter than the leaves. ♄ . ◠. S. Native near Campechy, in fields. Male flowers villous, small; female ones unknown.

Tomentose Cissampelos. Shrub cl.

15 C. TAMOÌDES (Willd ined. D. C. sept. 1. p. 536. St. Hil. fl. bras. 1. p. 55.) leaves heart-shaped, pubescent; obtuse, but acute in the recesses; 5-nerved at the base; male racemes longer than the leaves. ♄ . ◠. S. Native of Brasil, in the province of Minas Geraes. Very like *Ciss. Pareira*. Male flowers small; petal of the female flower rather orbicular, villous beneath.

Tamus-like Cissampelos. Shrub tw.

16 C. CONVOLVULA'CEA (Willd. spec. 4. p. 863.) leaves heart-shaped, acuminated, under surface pubescent, upper surface smooth; female racemes a little longer than the petioles. ♄ . ◠. S. Native of the East Indies. Female flowers small, male ones and fruit unknown.

Convolvulus-like Cissampelos. Shrub tw.

17 C. TRI'LOBA (Spreng. neue. entd. 2. p. 152.) leaves cordate, somewhat 3-lobed, pubescent, denticulately-ciliated, 5-nerved; female peduncles axillary, aggregate. ♄ . ◡. S. Native of Brasil. Bracteas ovate, very villous on the outside, 10-nerved, denticulately-bearded. Perhaps this plant is the female of *Ciss. tamoìdes*.

Three-lobed-leaved Cissampelos. Shrub cl.

18 C. littora'lis (St. Hil. fl. bras. 1. p. 54.) Stem pubescent; leaves cordate, retuse at the apex, quite entire, tomentose beneath; male racemes solitary or twin, hairy-tomentose, lower ones much longer than the leaves; corolla cup-shaped, divisions lanceolate acute. ♄. S. Native of Brasil, in the province of Minas Geraes, on the banks of rivers. The taste of the root of this plant is very stimulant.

Sea-shore Cissampelos. Shrub cl.

19 C. Caape'ba (Lin. spe. 1473.) leaves somewhat orbicular, cordate at the base, 7-nerved, rather pubescent; female racemes length of the petioles. ♃. ◡. S. Native of St. Domingo.—Plum. ed. Burm. t. 67. f. 2. Berries small, kidney-shaped, hardly compressed, rather hispid. Male flowers unknown. *Caapeba* is the name of the plant in Brasil.

Caapeba Cissampelos. Fl. Jun. Jul. Clt. 1773. Pl. cl.

20 C. orbicula'ta (D. C. syst. 1. p. 537.) leaves orbicular, cordate at the base, under surface villous, upper surface pubescent; male peduncles generally in threes, shorter than the petioles. ♄. ◡. S. Native of the East Indies. Ciss. tetrándra, Roxb. ined. in herb. Lamb. Leaves similar to those of *Menispérmum orbiculàtum*. Berries small, somewhat compressed, hairy. Flowers in crowded corymbs, small, villous.

Orbicular-leaved Cissampelos. Shrub cl.

21 C. crena'ta (D. C. syst. 1. p. 537.) leaves ovate-orbicular, nearly sessile, 7-nerved, obtuse, mucronulate, crenately-sinuated, rather tomentose; female racemes in pairs, longer than the leaves. ♄. ◡? S. Native of Brasil. Fruit ovate-orbicular, pubescent, reticulately-nerved, somewhat compressed.

Crenate-leaved Cissampelos. Shrub cl.

22 C. austra'lis (St. Hil. fl. bras. 1. p. 54.) leaves cordate, emarginate, mucronate, pubescent; racemes of the female flowers solitary or twin; stem suffruticose, twining. ♄. ◠. S. Native of Brasil. Stem smoothish; peduncles and axis pubescent. Drupe ovate-orbicular, compressed.

Southern Cissampelos. Pl. tw.

23 C. monoi'ca (St. Hil. fl. bras. 1. p. 55.) leaves cordate, obtuse, rather pilose, puberulous beneath; flowers racemose, monoecious. ♄. ◡. S. Native of Brasil, in the province of St. Paul. Stem rather pubescent. Drupes globose, scarlet, rather compressed.

Monoecious Cissampelos. Fl. Feb. Shrub cl.

24 C. gra'cilis (St. Hil. fl. bras. 1. p. 55.) leaves cordate, acutish, pubescent; flowers small, corymbose, and racemose; peduncles pubescent. ♄. ◠. S. Native of Brasil, on the banks of the Uruquay. Stem slender, twining. Corolla cup-shaped.

Slender Cissampelos. Shrub tw.

25 C. ovalifòlia (D. C. syst. 1. p. 537.) leaves oval, acutish, coriaceous, under surface hoary, upper surface smooth; male racemes usually twin, hispid, 3-times longer than the petioles. ♄. ◡? S. Native of Brasil. Flowers small, dark purple; villous on the outside; female flowers unknown. Probably the same as No. 34.

Oval-leaved Cissampelos. Shrub cl.

26 C. ova'ta (Poir. dict. 5. p. 11.) leaves ovate, obtuse, mucronate, upper surfaee smooth, under surface pubescent on the nerves; female racemes longer than the petioles; bracteas subulate. ♄. ◡. S. Native of the East Indies. Berries kidney-shaped, orbicular, somewhat compressed, smooth, about the size of a pea.

Ovate-leaved Cissampelos. Shrub cl.

27 C? acumina'ta (D. C. syst. 1. p. 538.) leaves oval-oblong, acuminated, smooth, 3-nerved at the base; male peduncles axillary, racemosely panicled, one half shorter than the leaves. ♄. ◡. S. Native of the East Indies. Female flowers unknown, male ones very small.

Acuminated-leaved Cissampelos. Shrub cl.

28 C? Cape'nsis (Thunb. prod. 110.) leaves ovate, bluntish, smooth, on very short petioles; racemes much branched, hardly longer than the petioles. ♄. ◠. G. Native of the Cape of Good Hope. Stems frutescent, twining, branched, somewhat velvety. Petioles short, pubescent. Flowers small, tomentose.

Cape Cissampelos. Fl.? Clt. 1775. Shrub tw.

29 C.? hu'milis (Poir. dict. 5. p. 11.) leaves ovate, obtuse, truncate at the base, smooth, stalked with the axillæ woolly. ♄. 7. Native of Cape of Good Hope. Flowers small, tomentose. M. Decandolle has two specimens, the one a garden, and the other a native specimen; the first is nearly erect, the second is twining; and he thinks they may be different species, and that *Ciss. Capénsis hùmilis* and *Calcarífera* may form another genus.

Dwarf-Cape Cissampelos. Fl.? Clt. 1817. Shrub tw.

30 C.? calcari'fera (Burch. cat. no. 1795.) leaves elliptical-oblong, blunt at both ends, on very short petioles, cinereously-pubescent, and furnished with a spur at the external base of petiole; male flowers glomerate, and nearly sessile in the axillæ of the leaves. ♄. G. Native of Cape of Good Hope. Ciss. fruticòsa Thunb. prod. 110? Lin. fil. suppl. 432? Stem erect, branched, never twining nor climbing.

Spur-bearing Cissampelos. Shrub 2 feet.

31 C.? laurifo'lia (Poir. dict. 5. p. 11.) leaves ovate-oblong, obtuse, quite smooth; petioles short, thick; female racemes short; fruit large. ♄. ◡. S. Native of the Island of St. Thomas, in the West Indies. Fruit ovate, narrowed at the base, pulpy, wrinkled, about the size of a nut, when dry of a blackish brown colour.

Laurel-leaved Cissampelos. Shrub tw.

32 C. angustifo'lia (Burch. cat. no. 1717. ex trav. 1. p. 389.) leaves broad-linear, roundish at the apex, often emarginate; stem twining. ♄. ◠. G. Native of the Cape of Good Hope.

Narrow-leaved Cissampelos. Shrub tw.

§ 3. *Stems simple, twiggy, erect, suffruticose.*

33 C. subtriangula'ris (St. Hil. fl. bras. 1. p. 51.) stems suffruticose, erect, simple, downy; leaves orbiculately-triangular, somewhat truncate at the base, sides rounded, obtuse at the apex, pubescent above, and downy beneath; petal of the female flower rather orbicular. ♄. S. Native of Brasil. Stems solitary or numerous. Racemes shorter than the leaves, bracteate, many-flowered. Style trifid. Drupe elliptically globose.

Subtriangular-leaved Cissampelos. Pl. I½ to 2 feet.

34 C. ovalifo'lia (St. Hil. pl. usu. bras. t. 34. fl. bras. 1. t. 51.) stems suffruticose, erect, simple, downy; leaves on short stalks, ovate, bluntish at the apex, somewhat repand, tomentose on both surfaces, or only beneath, as well as the petioles and female racemes; petals of female flower rather villous beneath; male corymbs usually tern. ♄. S. Native of Brasil, where it is called *Orelha de Onca*. The root of this plant is acrid, bitter, and is a powerful febrifuge, and the inhabitants of Brasil make a decoction of it, which they drink with success in intermittent fevers.

Var. α, cinèreo-víridis (St. Hil. l. c.) leaves cordate at the base, tomentose on both surfaces, greenish grey, paler beneath. Native in the province of Minas Geraes.

Var. β, ruféscens (St. Hil. l. c. 52.) Stems rufescent, and are as well as the leaves much less tomentose above than *var. α*, less orbicular, and scarcely cordate at the base. Native in the province of Minas Geraes.

Var. γ, cineráscens (St. Hil. l. c. p. 52.) leaves a little larger, scarcely cordate at the base. Native of Para.

Oval-leaved Cissampelos. Shrub 2 feet.

35 C. commu'nis (St. Hil. fl. bras. 1. p. 52. t. 11.) stem suffruticose, erect, simple, tomentose; leaves cordate, acute, quite entire,

pubescent above and tomentose beneath, of a hoary-grey colour, on short stalks; male flowers racemose, male corolla cup-shaped. ♄. S. Native of Brasil, in the province of St. Paul. Racemes solitary in the axillæ of the leaves, rarely twin or tern. Petal about one half shorter than the calyx.

Common Cissampelos. Fl. Oct. Shrub 1½ foot.

36 C. veluti'na (St. Hil. fl. bras. 1. p. 52.) stem suffruticose, erect, simple, woolly; leaves ovate, obtuse, velvety; male corymbs axillary, hairy, in fours; male corolla cup-shaped, obsoletely 4-lobed, pilose on the outside. ♄. S. Native of Brasil, in the province of St. Paul. Stem solitary or numerous. Flowers greenish.

Velvety Cissampelos. Fl. Oct. Shrub 2 feet.

37 C. suborbicula'ris (St. Hil. fl. bras. 1. p. 53.) stem suffruticose, erect, simple, tomentose; leaves somewhat orbicular, hardly repand, pubescent above and tomentose beneath on longish petioles; male corymbs in twos or fours, without bracteas; corolla cup-shaped, 4-lobed, rather pilose. ♄. S. Native of Brasil, in the province of Minas Geraes.

Var. β, sublanàta (St. Hil. l. c. p. 53.) stems rather woolly; leaves somewhat cuspidate.

Suborbicular-leaved Cissampelos. Shrub 2 feet.

§ 4. *Female racemes bractless.*

38 C. andromo'rpha (D. C. syst. 1. p. 539.) leaves somewhat heart-shaped, quite smooth, membranous, entire, mucronate; female peduncles aggregate, branched, bractless. ♄. ◡. S. Native of Cayenne. Deless. icon. sel. 1. t. 99. A very distinct species, which should perhaps be made a distinct genus.

Andromorphous Cissampelos. Fl.? Shrub cl.

39 C. ebractea'ta (St. Hil. pl. usu. bras. t. 35. fl. bras. 1. p. 53.) stem suffruticose, erect, simple, downy; leaves orbicularly-rhomboid, scarcely repand, pubescent above, downy beneath; female flowers axillary in fascicles, bractless. ♄. S. Native of Brasil, in the province of Minas Geraes, where it is called by the inhabitants *Orelha de Onca*. The roots of this plant are considered a specific against the bite of serpents.

Bractless Cissampelos. Shrub 2-3 feet.

Cult. All the species of this genus will grow freely in a mixture of loam and peat; and cuttings root freely, if planted in a pot of the same kind of earth, with a hand-glass placed over them, in heat. The species are either stove or green-house, and the greater part of them require a great deal of room to spread, before they can be got to flower.

XIII. MENISPE'RMUM (from μηνη, *mene*, the moon, and σπερμα, *sperma*, a seed; in allusion to the half-moon, or kidney-shape of the fruit.) Tourn. mem. acad. par. 1705. p. 237. Lam. ill. t. 824. D. C. syst. 1. p. 539. prod. 1. p. 102.

Lin. syst. *Diœ'cia, Polyándria.* Sepals and petals disposed in a quaternary order, in two or three series; male flowers with 16-20 stamens; female flowers with 2-4 ovaries. Drupe baccate, roundish, kidney-shaped, 1-seeded. Climbing shrubs with alternate peltate or cordate smoothish leaves; peduncles axillary or supraxillary. Male and female peduncles rather dissimilar. Flowers small, greenish-white.

1 M. Canade'nse (Lin. spec. 1468.) leaves peltate, smoothish, somewhat cordate, roundish, angular; angles bluntish, terminal one abruptly awned, mucronate, racemes solitary, compound; petals 8. ♄. ◡. H. Native of North America among bushes on the banks of rivers, and on fertile declivities, from Canada to Carolina. Sims, bot. mag. t. 1910. Schkuhr. handb. 3 t. 337. M. Canadénse *var. a*, Lam. dict. 4. p. 95. ill. t. 824. M. angulàtum, Mœnch. meth. 277. Flowers small, yellowish-green. Berries black.

Var. β, lobàtum (D. C. syst. 1. p. 540.) angles of leaves acutish. M. Virgínicum, Lin. spec. 1468. Flowers small, greenish-white. Berries black.—Dill. elth. 223. t. 178. f. 219.

Canadian Moon-seed. Fl. June, Aug. Clt. 1691. Shrub cl.

2 M. Da'uricum (D. C. syst. 1. p. 540.) leaves peltate, smooth, cordate, angular; angles acute, terminal one acuminated, hardly mucronate; racemes in pairs, capitellate. ♄. ◡. H. Native of Dauria, on rocky hills, at the river Chilca, not far from the town of Nertchinsk, and also about Ouroulga. Deless. icon. sel. 1. t. 100. Trílophus ampelisàgria, Fisch in. hort. gorenk.—Gmel. Sib. 3. p. 108. M. Canadénse, *var. β*, Lam. dict. 4. p. 95. Very like *M. Canadénse*, but of smaller stature. Flowers yellowish.

Daurian Moon-seed. Fl. Jun. Jul. Clt. 1818. Shrub cl.?

3 M. smilaci'na (D. C. syst. 1. p. 541.) leaves peltate, smoothish, cordate-roundish, bluntly angular, under surface glaucous; racemes simple; petals 4. ♄. ◡. H. Native of Carolina. Cissámpelos smilacìna, Lin. spec. 1473. Jacq. coll. 4. p. 128. icon. rar. 3. t. 629.—Cat. carol. 1. p. 51. t. 51. Female flowers unknown.

Smilax-like Moon-seed. Fl. Jul. Aug. Clt. 1776. Shrub cl.

4 M. Lyo'ni (Pursh. fl. amer. sept. 2. p. 371.) leaves cordate, palmately-lobed, on long petioles; racemes simple; flowers with 6 petals and 12 stamens. ♃. ◡. H. Native of Kentucky and Tennessee. Stems 8 or 10 feet long. Leaves broad. Berries large, black, 1-seeded. Flowers purple.

Lyon's Moon-seed. Fl. July, August. Clt. 1822. Shrub cl.

†*A species not sufficiently known.*

5 M.? acu'tum (Thunb. jap. 193.) leaves cordate, angular, behind, acuminated at the apex, smooth. ♄. ◡? H. Native of Japan, about Nagasaki. Lam. dict. 4. p. 96. Flowers unknown.

Acute-leaved Moon-seed. Shrub cl.?

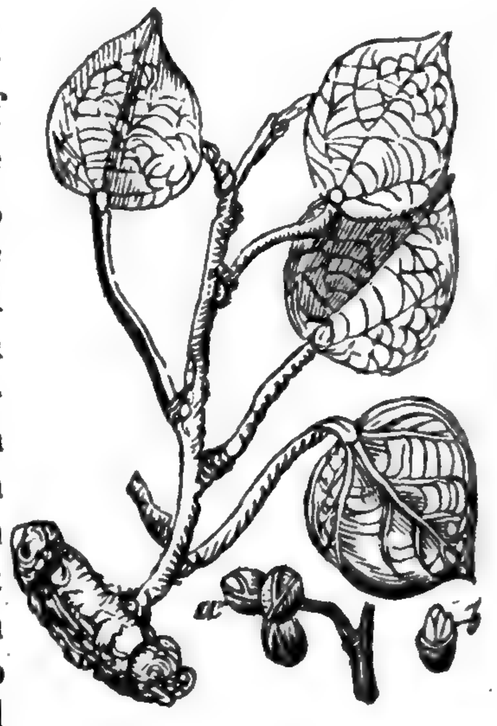
Cult. As the species are all hardy climbing plants, they may be used for covering bowers or trellis-work; they are readily increased by dividing the plants at the roots, or by cuttings planted in a sheltered situation, early in the spring. Seeds vegetate freely.

XIV. ABU'TA. (*Abouta*, or *Abuta*, is the Caribbean name of this tree in Guiana.) Barrer. fr. æq. 1. Aubl. guian. 1. p. 618. Juss. gen. 286. D. C. syst. 1. p. 542. prod. 1. p. 103.

Lin. syst. *Diœcia, Monodélphia.* Flowers unknown. Berries 2 or 3, rising from the same receptacle, (f. 30. *a.*) large, ovate, dry, somewhat compressed, 1-seeded, (f. 30. *b.*) with a brittle covering. Large climbing shrubs, with ovate feather-nerved leaves, the two lower nerves approximate.

1 A. rufe'scens (Aubl. guian. 1. p. 618. t. 250.) leaves ovate, acute, entire, under surface greyish-velvety or brownish. ♄. ◡. S. Native of Cayenne and Guiana, in woods. Male flowers grey-velvety on the outside, dark-purple on the inside; female ones unknown. Bark brown; wood reddish. A ptisan is prepared from the branches, which is used by the natives of Cayenne against obstruction of the liver, to which they are often subject: the ordinary dose is a drachm boiled or infused in a pint of water: The same plant is called by them *White Parèira-brava.* There are also varieties with yellow branches and red branches, called *Yellow Parèira-brava* and *Red Pareira-brava*, and perhaps the roots of this are confused with those of the true *Parèira-bràva* of Brasil (*Cissámpelos Parèira*), and sold in shops for them (f. 30.)

FIG. 30.



Rufescent Abuta. Fl. March, April. Clt. 1822. Shrub cl.

2 A. CA'NDICANS (Rich. ined. in herb. Juss. D. C. syst. 1. p. 543.) leaves ovate, acuminated, somewhat crenated or lobulate, under surface smooth, white. ♄. ◡. S. Native of Cayenne, where it is called *Liane amere*, from its bitter taste. The plant probably possesses the same medical qualities as the *A. ruféscens* and *Cissámpelos Parèira*. The flowers are unknown.

Whitened-leaved Abuta. Shrub cl.

Cult. The species of this genus will grow freely in a mixture of loam and peat; and cuttings will strike root readily, if planted in a pot of sand, with a hand-glass placed over them, in heat.

XV. TRICHO'A (from θριξ, τριχος, *thrix*, *trichos*, hair; in allusion to hair-like barren filament both in male and female flowers). Pers. ench. 2. p. 634. D. C. prod. 1. p. 103. Bátschia, Thunb. nov. act. ups. 5. p. 120. t. 2.

LIN. SYST. *Diœ'cia*, *Hexándria*. Flowers dioecious. Calyx 3-sepalled. Petals 3, coriaceous, villous, approximate at the middle, but reflexed at the top. Male flowers with 6 stamens inserted in the disk, the 3 outer ones sterile, alternating with the petals; the 3 central ones monadelphous, fertile. Female flowers with 6 sterile stamens, their filaments bimaculate at the apex. Carpels 3, drupaceous, coriaceous, oblong, villous. Seed biplicate. Climbing shrubs with alternate simple leaves.

1 T. RACEMO'SA (Pers. ench. 2. p. 634.) racemes axillary, solitary, few-flowered. ♄. ◡. S. Native about Mariquita, in South America. Bátschia racemòsa, Thunb. l. c. p. 123. t. 2. f. 1.

Racemose-flowered Trichoa. Shrub cl.

2 T. CONFE'RTA (Pers. ench. 2. p. 634.) spikes axillary, solitary; flowers crowded. ♄. ◡. S. Native of South America, with the first. Bátschia conférta, Thunb. l. c. t. 2. f. 2.

Crowded-flowered Trichoa. Shrub cl.

Cult. The species of Trichoa will thrive in a mixture of loam and peat; and cuttings will root freely planted in the same kind of mould, with a hand-glass placed over them, in heat.

XVI. AGDE'STIS. (Agdestis, in mythology, a hermaphrodite, descended from Jove and the Agde rock. The name is applied to this genus because it is the only one in the order *Menispermàceæ* with hermaphrodite flowers, therefore it is a monster in the order.) Moc. et Sesse, fl. mex. icon. ined. D. C. syst. 1. p. 543. prod. 1. p. 103.

LIN. SYST. *Polyándria*, *Tetragýnia*. Flowers hermaphrodite. Sepals 4. Petals wanting. Stamens 24; anthers bifid at both ends, adhering by their middle. Carpels 4, joined into one 4-furrowed ovary. Stigmas 4, spreading, somewhat reflexed at the apex. A climbing smooth shrub, with alternate heart-shaped stalked leaves, and trifid corymbose peduncles, the lower ones axillary, and the upper ones approximating into a thyrse.

1 A. CLEMATI'DEA (Moc. et Sesse, fl. mex. icon. ined.) ♄. ◡. S. Native of New Spain. Flowers rufescent, about the size of those of *Clématis Flámmula*. Fruit unknown.

Clematis-like Agdestis. Shrub cl.

Cult. This plant will thrive well in a mixture of loam and peat; and cuttings will root under a hand-glass, in a moderate heat.

XVII. CLY'PEA (from *clypeus*, a buckler; in allusion to the buckler-formed filament.) Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 499. Stephània Lour. Spreng. but not of D. C.

LIN. SYST. *Diœ'cia*, *Monándria*. Flowers dioecious. Male flowers with 6-9 unequal sepals and 3 petals. Stamen 1; filament peltate, crowned by an annular anther. Female flowers with 3-4-6 sepals, with the same number of petals. Ovary 1, crowned by 3-5 acute stigmas. Berry superior, obovate or kidney-shaped, 1-seeded. Plants climbing or twining, shrubby or herbaceous, with tuberous or creeping roots. Leaves of all peltate. This genus approaches near to *Cissámpelos*, but the structure of the flowers and stamens are very different.

1 C. DI'SCOLOR (Blum. l. c) leaves peltate, ovate, bluntish, mucronate, hoary-tomentose beneath; heads of flowers disposed in axillary umbels. ♄ ◠. S. Native of Java.

Two-coloured-leaved Clypea. Shrub tw.

2 C. VENO'SA (Blum. l. c.) leaves peltate, ovate, bluntish, mucronate, smooth, somewhat truncate at the base, whitish beneath, but with the veins purplish; umbels elongated, compound, axillary, solitary. ♄. ◠. S. Native of Java.

Veined Clypea. Shrub tw.

3 C. CAPITA'TA (Blum. l. c.) leaves peltate, ovate, acute, membranous, smooth; racemes axillary, solitary; flowers crowded on a fleshy receptacle. ♄. ◠. S. Native of Java.

Headed-flowered Clypea. Shrub tw.

4 C. ACUMINATI'SSIMA (Blum. l. c.) leaves peltate, ovate-oblong, acuminated, somewhat coriaceous, smooth; racemes axillary or lateral, solitary; flowers crowded on the receptacle. ♄. ◠. S. Native of Java.

Very-acuminated-leaved Clypea. Shrub tw.

5 C. TOMENTO'SA (Blum. l. c.) the whole plant tomentose; leaves roundish obtuse, mucronate; corymbs dichotomous, axillary, solitary, shorter than the leaves. ♄. ◠. S. Native of Java.

Tomentose Clypea. Shrub tw.

6 C. CORYMBO'SA (Blum. l. c.) leaves peltate, roundish, acute, repand, smooth; flowers umbellate, axillary. 4. ◠. G. Native of Cochin-china and Java. Stephània rotúnda, Lour. Root tuberous. Stem simple.

Corymbose-flowered Clypea. Pl. tw.

7 C. LO'NGA; leaves peltate oblong, smooth; flowers capitate, axillary. 4. ◠. G. Stephània lónga, Lour. Root filiform, creeping.

Long-rooted Clypea. Pl. tw.

Cult. The species of *Clypea* will thrive in a mixture of loam and sand; and cuttings will root, if planted in a pot of sand, with a hand-glass placed over them, in a moderate heat.

Allied Genera.

XVIII. MENISCO'STA (μηνισκος, *meniskos*, a little moon; in allusion to the shape of the seed.) Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa, 1. p. 499.

LIN. SYST. *Polygàmia*, *Monœ'cia*. Flowers polygamous, male ones with a small 4-5-cleft calyx, and 4-5 petals, disposed in two series. Stamens 5, broad, opposite the petals, and glued to them at the base. Urceolus membranous, short, 5-toothed, girding the base of the pistillum. Ovary didymous, sterile. Female flowers with the corolla, calyx, and stamens, as in the male ones: ovary didymous, crowned by two bluntish stigmas. Drupes baccate, 2, (or, from abortion, solitary), kidney-shaped, compressed, 1-seeded. A climbing smooth shrub, with oval-oblong mucronated leaves, and axillary panicles of flowers.

1 M. JAVA'NICA (Blum. l. c.) ♄. ◡. S. Native of Java.

Java Meniscosta. Shrub cl.

Cult. A mixture of loam, peat, and sand will suit this plant well; and cuttings planted in the same kind of soil, will root, if placed under a hand-glass, in heat. †

XIX. JO'DES (ωδης, *jodes*, violaceous, colour of fruit). Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 499.

LIN. SYST. *Diœ'cia*, *Monadélphia*. Flowers dioecious; male ones with a 6-parted calyx and corolla, and 5 stamens, which are monadelphous at their base, and alternating with the petals.

Anthers 2-celled, opening on the side; they are inserted on the top of the filaments. Female flowers with a corolla and calyx as in the male ones, but they are usually 6-cleft. Ovary simple, ovate-globose, 1-seeded. Stigma sessile, orbicular, radiately emarginate. Fruit unknown. A climbing shrub, with almost opposite oval mucronate leaves, which are tomentose on the ribs beneath; and axillary, rather dichotomous corymbs of flowers.

1 J. ova'lis (Blum. l. c.) ♄. ⌣. S. Native of Java.
Oval-leaved Jodes. Shrub cl.
Cult. See *Meniscósta*.

Order. VII. BERBERI'DEÆ, (plants agreeing with Bérberis in many important characters.) Vent. tabl. 3. p. 83. D. C. fl. fr. ed. 3. vol. 4. p. 627. syst. 2. p. 1. prod. 1. p. 105.

Sepals 3-4, but usually 6, (f. 31. *c.*) in two series, deciduous, furnished with petal-like scales on the outside (f. 31. *c.*) Petals equal in number with the sepals, rarely double that number, (f. 31. *a.* f. 32. *b.*), and opposite them, usually furnished with a gland or a scale at the base on the inside of each. Stamens equal in number with the petals and opposite them; anthers adnate, 2-celled, opening from the base to the apex by a small somewhat elastic valve. Ovary solitary, crowned by the rather orbicular stigma. Fruit 1-celled, baccate, or capsular, (f. 31. *c.*). Seeds erect, usually fixed to the bottom of the lateral placenta, rarely solitary, usually 2-3, ovate or globose. Albumen fleshy, usually rather corneous. Embryo straight, slender, with the radicle more or less thickened at the point, and flat cotyledons. Smooth shrubs or perennial herbs, with simple or compound feather-nerved leaves. Flowers yellow or white, usually disposed in racemes or panicles. This order differs from all those belonging to *Thalamiflòræ* in the singular dehiscence of the anthers. The species are all inhabitants of Europe, Asia, North and South America, usually of the temperate zones; but when found within the tropics, they are always at a considerable height on the mountains.

The seeds retain their vegetative power a considerable time, therefore they are easily imported in a living state from any part of the world. The medicinal qualities of this order are scarcely known. The roots are usually bitter and astringent. Bark purgative, taken in the form of a decoction in ale or other liquors. The berries and leaves in all the species of *Bérberis* and *Mahònia* are acid and astringent; the latter quality is particularly strong in the wood and bark: these last parts afford a yellow colour, which will dye linen and cotton, with the assistance of alum.

Synopsis of the Genera.

§ I. *Shrubs.*

1 Be'rberis. Sepals 6, furnished on the outside with 3 scales. Petals 6, with 2 glands on the inside of each at the base. Stamens toothless. Berries 2-3-seeded.

2 Maho'nia. Sepals 6, furnished on the outside with 3 scales, (f. 31 *c.*). Petals 6, (f. 31. *a.*) without glands on the inside. Stamens furnished with a tooth on each side at the top of the filament, (f. 31. *b.*) Berries 3-9-seeded.

3 Nandi'na. Sepals 6, furnished on the outside, with numerous scales, which are disposed in many series. Petals 6, without glands on the inside. Berries 2-seeded.

§ II. *Perennial herbaceous herbs.*

4 Leo'ntice. Sepals 6, (f. 32. *a.*) naked on the outside. Petals 6, (f. 32. *b.*) bearing a scale at the base of each on the inside. Capsules bladdery, (f. 32. *c.*) 2-4-seeded.

5 Epime'dium. Sepals 4-8, furnished with 2 bracteas on the outside. Petals 4-6, furnished with a two-coloured appendage on the inside of each. Capsule in the form of a silicle, many-seeded.

6 A'chlys. Sepals and petals wanting. Flowers naked, disposed in a dense spike. Stamens numerous. Stigma dilated, hence concave.

7 Diphylle'ia. Sepals 3, naked outside. Petals 6, naked inside. Berry 2-3-seeded.

I. BE'RBERIS. (*Berberys* is the Arabic name of the fruit, and *βερβερι* in Greek signifies a shell: many authors believe that it is originally derived from this word, because the leaves are hollow, like a shell; and Bochart says, the word *βερβερι* is derived from the Phœnician word *barar*, which expresses the brilliancy of a shell; alluding to their shining leaves.) Lin. gen. no. 442. Juss. gen. 286. Lam. ill. t. 253. Schreb. gen. no. 595. Gært. fruct. 1. p. 200. t. 42. f. 6. D. C. syst. 2. p. 4. prod. 1. p. 105.

Lin. syst. *Hexándria, Monogýnia.* Sepals 6, guarded on the outside by 3 scales. Petals 6, with 2 glands on the inside of each. Stamens toothless. Berries 2-3-seeded. Seeds 2, rarely 3, laterally inserted at the base of the berries, erect, oblong, with a crustaceous coat, and fleshy albumen; cotyledons leafy, elliptical; radicle long, capitellate at the top. Shrubs from 2 to 18 feet high, with the primary leaves abortive, generally changed into spines, the secondary ones growing in fascicles in the axillæ of the primary ones. Flower in all yellow. The stamens of *Bérberis vulgàris, Canadénsis, Sinénsis*, and perhaps all the species of such flowers as are open, bend back to each petal, and shelter themselves under their concave tips. No shaking of the branch has any effect upon them, but if the inside of the filaments are touched with a small bit of stick, a needle, or pin, they instantly spring from the petals, and shake the anthers against the stigma. The outside of the filament has no irritability, nor has the anther itself any; as may be proved by touching either of them with a blunt needle, or any thing which cannot injure the structure of the part. If the stamen be bent to the stigma by means of a pair of scissars applied to the anther, no contraction of the filament is produced. From all this it is evident that the spring of the stamens is owing to a high degree of irritability in the side of the filament next the germ, by which, when touched, it contracts, that side becomes shorter than the other, and consequently the filament is bent towards the germ. This irritability is perceptible in the stamens of flowers of all ages. If the germ is cut off the filaments will still contract; and, nothing being in their way, will bend over quite to the opposite side of the flower. After irritation the stamens will return to their original place; and, on being touched again, they will contract with the same facility as at first, and this may be repeated three or four times. The purpose which this curious contrivance of nature answers is evident. In the original position of the stamens, the anthers are sheltered from rain by the concavity of the petals. Thus probably they remain till some insect comes to extract honey from the base of the flowers, thrusts itself between the filaments, and almost unavoidably touches them in the most irritable part: thus the impregnation of the germ is performed. This irritability in the stamina has been more particularly observed in the *B. vulgàris*.

§ 1. *Leaves simple. Peduncles many-flowered, racemose.*

1 B. VULGA'RIS (Lin. spec. 472.) spines 3-parted; leaves somewhat obovate, ciliately-serrated; racemes many-flowered, pendulous; petals entire. ♄. H. Native throughout the whole of Europe and Western Asia, in hedges and coppices, especially in a chalky soil; it is even found on Mount Etna, at 5000 or 7500 feet above the level of the sea: in England, particularly about Saffron-Walden in Essex, &c. Mill. dict. no. 1. Oed. fl. dan. t. 904. Smith eng. bot. 49. B. irritábilis, Sal. prod. 213. Fruit red.

Var. β, lùtea; fruit yellow. Lher. ined.

Var. γ, violàcea, fruit violaceous. Poit. et Turp. arb. fr. 59.

Var. δ, purpùrea; fruit purple; leaves narrow, hardly-ciliated. B. innominàta, Kielm. dec. rar. pl. tub. p. 18.

Var. ε, nìgra; fruit black; leaves oblong, ciliately serrated; serratures few.

Var. ζ, àlba; fruit white. Mill. dict. no. 1.

Var. θ, aspérma; fruit destitute of seeds. Mill. dict. no. 1. Shrubs from 4 to 8, but sometimes 25 feet high. Roots bitter, astringent, boiled in lye will dye wool yellow. Bark purgative, taken in the form of a decoction, in ale or other liquors, is efficacious in the jaundice. The bark of the root and inner bark of the stem affords a colour which will dye linen or cotton of a fine yellow, with the assistance of alum. In Poland they dye leather of a most beautiful yellow with the bark of the root. The leaves are gratefully acid. The flowers are offensive to the smell when close, but at a proper distance their odour is extremely agreeable. The berries are so acid that birds will not eat them. The *Barberry*, however, is cultivated for the sake of these, which are pickled and used for garnishing dishes; and being boiled with sugar they form an agreeable rob or jelly, they were formerly used as a dry sweet-meat as well as in sugar-plumbs and comfits. They are moderately restringent, and are said to be of great use in bilious fluxes, and in all cases where heat, acrimony, and putridity of the humours prevail. On the authority of Prosper Alpinus we are informed that the Egyptians employ them in pestilential fevers and fluxes with great success, and Simon Paulli relates that he was cured of a malignant fever, accompanied with a bilious diarrhœa, by using these berries according to the Egyptian practice, that is, macerating them for a day and a night in twelve times their quantity of water with the addition of a little fennel-seed, and then stirring and sweetening the liquor and using it as a common drink. Dr. Woodville observes in his Medical Botany, vol. 4. p. 62, that these berries are well calculated to allay heat and thirst, and to correct a putrid tendency in the fluids; but that, in this respect, they seem to possess no peculiar advantages over most of the other acid fruits; hence the colleges of Edinburgh and London have expunged this fruit from the Materia Medica, and retained only that of the currant. In many parts of Europe a certain peculiarity is ascribed to this shrub, that ears of corn growing near it constantly prove abortive, and that it extends this sterile influence over them to the distance of 3 or 400 yards across a field; but this opinion is altogether groundless. Insects of various kinds are remarkably fond of the flowers of the *Barberry*, and the *Æcídium Berbéridis*, its particular inhabitant, is supposed to generate the dust which, carried from the bush by winds and lighting on wheat and other corns, is said to give rise to the *Puccínia*, a minute fungus which closes up the pores of the leaves and appears like rust or mildew. All the peculiarities the *B. vulgàris* is said to possess runs through the whole genus as well as the genus *Mahònia*.

Common Barberry. Fl. April, May. Brit. Sh. 8 to 20 ft.

2 B. IBE'RICA (Stev. et Fish. in litt.) spines simple and 3-parted; leaves obovate-oblong, quite entire; racemes many-flowered, pendulous; petals entire. ♄. H. Native of Iberia. B. vulgàris? *ν, ibérica.* D. C. syst. 2. p. 6.

Iberian Barberry. Fl. April, May. Clt. 1790. Sh. 8 to 10 ft.

3 B. EMARGINA'TA (Willd. enum. 1. p. 395.) spines 3-parted; leaves lanceolate-obovate, ciliately serrated; racemes scarcely pendulous, shorter than the leaves; petals emarginate. ♄. H. Native of Siberia. Very like *B. vulgàris*, but is one half smaller in all its parts and with emarginate petals.

Emarginate-petalled Barberry. Fl. April, May. Clt. 1820. Shrub 6 feet.

4 B. CANADE'NSIS (Mill. dict. no. 2.) spines 3-parted; leaves obovate-oblong, remotely serrated, upper ones nearly entire; racemes many-flowered, nodding. ♄. H. Native of North America in fertile hills and among rocks, especially in the Alleghany mountains, from Canada to Carolina, also in Tennessee. Pursh, fl. amer. sept. 1. p. 219. Nutt. gen. amer. 1. p. 210. B. vulgàris, Mich. fl. bor. amer. 1. p. 205. Hook fl. bor. amer. 1. p. 28. Shrub 3 or 4 feet high, apparently between *B. vulgàris* and *B. Chinénsis*. The berries are said by Pursh to be more acid and less fleshy than those of *B. vulgàris*. Nuttall says that the petals are emarginate. The same incorrect idea too prevails in the United States respecting the injurious effects of the *Barberry* upon the wheat which grows in its neighbourhood.

Canadian Barberry. Fl. April, June. Clt. 1759. Sh. 4 ft.

5 B. SINE'NSIS (Desf. cat. ed. 1804. p. 150.) spines 3-parted; leaves oblong, obtuse, entire, or the lower ones are a little toothed; racemes many-flowered, nodding. ♄. H. Native of China. Wats. dend. brit. t. 26. A shrub, 3 or 5 feet high. Berries oval, of a deep-red colour, 1-2-seeded. This plant is perhaps the *B. vulgàris* of Thunb. jap. 1. p. 146.

China Barberry. Fl. May. Clt. 1800. Shrub 3 to 6 feet.

6. B. FLORIBU'NDA (Wall. MSS.) spines 3-parted, unequal; leaves obovate-lanceolate, or obovate-oblong, tapering much to the base, ending in a mucrone at the apex, paler beneath, spiny-ciliated; racemes many-flowered, loose, solitary, pendulous; fruit oblong. ♄. H. Native of Nipaul.

Bundle-flowered Barberry. Shrub 10 feet.

7 B. ARISTA'TA (D. C. syst. 2. p. 8.) lower spines 3-parted, upper ones simple and hardly bidentate at the base; leaves obovate-oblong, or lanceolate, mucronate, membranous, smooth, serrated with 4 or 5 spinulose teeth; racemes nodding, many-flowered, longer than the leaves; pedicels trifid, 3-flowered; berries oblong. ♄. H. Native of Nipaul. Hook exot. fl. t. 98. Ker. bot. reg. 729. B. angustifòlia, Roxb. hort. beng. 87. B. Chítria, Buch. in D. Don. prod. fl. nep. p. 1. A species very like *B. Sinénsis*. Ovaries oblong-cylindrical, crowned by the very short thick style, and orbicular stigma. Leaves sometimes quite entire.

Awned-leaved Barberry. Fl. April, May. Clt. 1820.

8 B. AFFI'NIS; spines 3-parted, unequal; leaves membranous, oblong-obovate, tapering to both ends, spiny-ciliated in the middle, but with the base and apex entire, paler beneath; racemes many-flowered, erect, long, loose. ♄. H. Native of Kamoon in the East Indies. B. floribùnda? Wall. MSS.

Allied Barberry. Shrub 6 feet.

9 B. CERATOPHY'LLA; spines strong, 3-parted, unequal; leaves lanceolate, or obovately lanceolate, mucronate, tapering to the base, spiny-toothed; teeth large, 2 or 3 on each side, paler beneath; racemes many-flowered, loose, erect; pedicels long, sometimes somewhat verticillate. ♄. H. Native of Nipaul? B. floribúnda? Wall. MSS.

Buckhorn-leaved Barberry. Shrub 6 to 10 feet.

10 B. CRE'TICA (Lin. spec. 472.) spines 3-5-parted; leaves oval-oblong, entire, or somewhat serrated; racemes 3-8-flowered, rather shorter than the leaves. ♄. H. Native of Crete and Cyprus. Fl. græc. t. 342.—Clus. hist. p. 301.—Alpin. exot. 21. t. 20. Berries ovate, black, 2-seeded, more sour than acid; stigma on a very short style.

Var. β, *serratifòlia* (Poir. dict. 8. p. 618.) leaves ciliately-serrated.

Cretan Barberry. Fl. April, May. Clt. 1759. Sh. 4 to 5 ft.

11 B. CRATÆGI'NA (D. C. syst. 2. p. 9.) spines simple; leaves oblong, reticulated, hardly serrated; racemes many-flowered, crowded, spreading, scarcely longer than the leaves. ♄. H. Native of Asia Minor. Allied to *B. Crética* and *B. Sinénsis*. Flowers 12-18, crowded. Like *B. vulgàris*.

Cratægus-like Barberry. Fl. April, May? Shrub 4 to 8 ft.

12 B. TINCTO'RIA (Lesch. in mem. mus. 9. p. 306.) spines 3-parted? leaves rather spatulate, spiny-toothed, glaucous beneath; racemes simple, pendulous; bark rather corky: wood bitter and yellow. ♄. H. Native of Nellygerry mountains in the Peninsula of India, where the inhabitants call it *tjaklon*, and they employ a decoction of the wood and bark to dye linen and cotton of a bright yellow colour with the assistance of alum.

Dyers' Barberry. Fl. April, May. Shrub 6 to 7 feet.

13 B. THUNBE'RGII (D. C. syst. 2. p. 9.) lower spines 3-parted, upper ones simple; leaves oval, tapering at the base, quite entire; racemes few-flowered, corymbose, shorter than the leaves. ♄. H. Native of Japan. B. Crética, Thunb. jap. 1. p. 146. but not of Lin. Young berries oblong, terminated by the broad, orbicular, sessile stigma, and as if it were truncate.

Thunberg's Barberry. Fl. April, May? Shrub 4 to 6 feet.

14 B. UMBELLA'TA (Wall. mss.) spines 3-parted, long, equal; leaves obovate-oblong, mucronate, entire, glaucous beneath; peduncles solitary, erect, bearing at the top several umbellate pedicels which rise from the same centre. ♄. H. Native of Nipaul?

Umbellated-flowered Barberry. Shrub 6 feet.

15 B. GLAU'CA (D. C. syst. 2. p. 10. H. B. et Kth. nov. spec. amer. 5. p. 71. t. 433.) spines 3-parted; leaves obovate, under surface glaucous, nearly entire; racemes many-flowered, erect; paniculately-branched; petals obovate. ♄. S. Native of South America about Santa Fe de Bogota. Allied to *B. vulgàris* but very distinct. Flowers a little larger. Sepals 6, with an addition of 3 largish scales.

Glaucous-leaved Barberry. Fl. April, May? Sh. 4 to 6 ft.

16 B. MONOSPE'RMA (Ruiz, et Pav. fl. per. 3. p. 52.) spines 3-parted; leaves oval or obovate, mucronate, lower ones spiny-toothed; racemes many-flowered, nodding. ♄. G. Native of Peru on mountains. Berries black, 1-seeded.

One-seeded Barberry. Fl. Aug. Sept. Shrub 4 feet.

17 B. GLAUCE'SCENS (St. Hil. fl. bras. 1. p. 46.) spines 3-parted; leaves obovate-oblong, obtuse, mucronulate, cuneated at the base and tapering into the petiole, quite entire, glaucescent; racemes many-flowered, pendulous; calyx 8-sepalled; style narrower than the ovary. ♄. S. Native of Brazil in the province of Cis Platine in woods. Stipulas awl-shaped, very acute. Flowers globose, about the size of those of *B. vulgàris*.

Glaucescent-leaved Barberry. Fl. Sept. Shrub 4 to 8 feet.

18 B. LATIFO'LIA (Ruiz. et Pav. fl. per. 3. p. 52. t. 282, *a*.) spines short, 3-parted, or simple; leaves obovate, quite entire, mucronate, under surface pale; peduncles 3-6-flowered, shorter than the leaves. ♄. H. Native of Peru in the Andes towards the village of Pillao in cold groves. Berries oval, dark, 3-4-seeded, terminated by the pedicellate stigma. Flowers unknown.

Broad-leaved Barberry. Fl. March, April. Shrub 9 feet.

19 B. FLEXUO'SA (Ruiz, et Pav. fl. per. 3. p. 52. t. 281. f. 2.) spines 3-parted; leaves obovate, glaucous, quite entire, mucronate at the apex; racemes aggregate, unequal, few-flowered. ♄. G. Native of Peru on rocks in the Andes; about Tarma and Cheuchin. Young berries ovate-oblong, drawn out into a neck at the apex and crowned by the orbicular stigma, adult ones oblong, black, 4-5-seeded.

Flexuous-branched Barberry. Fl. from Dec. to Ju. Sh. 4 to 8 ft.

20 B. CORIA'CEA (St. Hil. fl. bras. 1. p. 46.) spines small, 3-parted, sometimes wanting; leaves on short petioles, oblong, narrow, obtuse, mucronulate, gradually tapering to the base; racemes curved, pendulous. ♄. S. Native of Brazil in the southern parts of the province of St. Paul. Berries small, acid, eatable. Stipulas somewhat triangular.

Coriaceous-leaved Barberry. Shrub 4 to 8 feet.

21 B. RUSCIFO'LIA (Lam. ill. t. 253. p. 2.) spines 3-parted; leaves oblong, tapering at the base, mucronate, entire, or grossly and spiny-toothed; peduncles short, bearing 4-5 flowers at the apex. ♄. G. Native of South America about Buenos Ayres. Flowers a little larger than those of *B. vulgàris*.

Ruscus-leaved Barberry. Fl.? Clt. 1825. Shrub 4 to 8 ft.

22 B. PANICULA'TA (Juss. in D. C. syst. 2. p. 12.) spines short, trifid; leaves lanceolate, mucronate, entire, or spinulosely-toothed; peduncles angular, erect, racemosely-panicled. ♄. S. Native of Peru. Bracteas linear-subulate, one half shorter than the pedicels. Calyx with 3 bracteas at the base.

Panicled-flowered Barberry. Shrub 4 to 8 feet.

23 B. ILICIFO'LIA (Forst. in comm. goett. 9. p. 28.) spines 3-parted; leaves ovate, tapering at the base, coarsely and spinulosely-toothed; peduncles short, 4-flowered; pedicels elongated, somewhat corymbose; berries ovate, bottle-shaped. ♄. H. Native of Terra del Fuego in the fissures of rocks, at a place called Baye de Bougainville in the Straits of Magellan. In Terra Fuego the inhabitants make use of the wood for bows, for which purpose it is well adapted, on account of its great elasticity.

Holly-leaved Barberry. Fl. Jul. Aug. Clt. 1791. Sh. 2 to 3 ft.

24 B. ASIA'TICA (Roxb. in D. C. syst. 2. p. 13.) spines trifid, or simple; leaves oval, cuneated, or elliptical, mucronate, smooth, under surface glaucous, entire, or spinulosely-toothed; racemes short, many-flowered, corymbose, shorter than the leaves; pedicels elongated, 1-flowered; berries oval. ♄. G. Native of the East Indies and Nipaul. Deless. icon. sel. 2. t. 1. In the form of the leaves this species comes very near to *B. ilicifòlia*. Berries terminated by the thick short style; pollen grey.

Asiatic Barberry. Fl.? Clt. 1820. Shrub 4 to 8 feet.

25 B. PETIOLA'RIS (Wall. mss.) spines simple; leaves obovate roundish, or obovate-oblong, spiny-ciliated, on long petioles, membranous; racemes solitary, short, loose, erect, or rather pendulous; flowers large. ♄. H. Native of Nipaul?

Stalked-leaved Barberry. Shrub 6 to 10 feet.

26 B. RIGIDIFO'LIA (H. B. et Kth. nov. spec. amer. 5. p. 70. t. 431.) spines 3-parted; leaves oblong, terminated by a spiny mucrone, hardly furnished with one or two teeth, smooth; racemes few-flowered, scarcely longer than the leaves. ♄. G. Native of South America. Allied to *B. lùtea*. Flowers the size of those of *B. vulgàris*. Bracteas subulate, 3-times shorter than the pedicels.

Kigid-leaved Barberry. Shrub 4 to 8 feet.

27 B. QUINDIUE'NSIS (H. B. et Kth. nov. spec. amer. 5. p. 70. t. 432.) spines none; leaves oblong, spiny-toothed, mucronate, smooth; racemes erect, pubescent, many-flowered, longer than the leaves. ♄. S. Native of South America in the mountains about Quindiu. Flowers one half larger than those of *B. vulgàris*. Bracteas linear-subulate, smooth.

Quindiu Barberry. Shrub 4 to 8 feet.

28 B. SPINULO'SA (St. Hil. fl. bras. 1. p. 45.) branches rather flattened, smooth, or even; spines 3-parted; leaves few in a fascicle, on short stalks, oblong, tapering and cuneated at the base, remotely spiny-toothed, quite entire at the base. ♄. S. Native of Brazil in the province of St. Paul, near the town of Curitiba. Branches flexuous. Stipulas membranous, somewhat triangular.

Spinulose-leaved Barberry. Shrub 3 to 5 feet.

29 B. LAURI'NA (Billb. in flor. 1821. p. 330.) spines? leaves

ovate, mucronate, entire; racemes simple, pendulous. ♄. S. Native of Brazil.

Laurel-like Barberry. Shrub 4 to 8 feet.

§ 2. *Leaves simple. Pedicels* 1-*flowered.*

30 B. Wallichia'na (D. C. prod. 1. p. 107.) spines 3-parted; leaves elliptical-oblong, acuminated at both ends, very smooth, rigid, coriaceous, spinosely-serrated, green and shining on both surfaces; pedicels club-shaped, 10-15, aggregate, 1-flowered; berries oval. ♄. G. Native of Nipaul.

Wallich's Barberry. Fl. ? Clt. 1820. Shrub 4 to 8 feet.

31 B. tomento'sa (Ruiz, et Pav. fl. per. 3. p. 52. t. 282. *b*.) spines none; leaves oval, under surface densely tomentose, entire or with a few spiny-teeth; pedicels 1-3, 1-flowered, slender. ♄. G. Native of Chili about Conception. Flowers 6-petalled, about the size of those of *B. vulgàris*. Berries oval, 2-3-seeded, beaked with the pedicellate stigma.

Woolly-leaved Barberry. Fl. May, July. Shrub 8 feet.

32 B. lu'tea (Ruiz, et Pav. fl. per. 3. p. 51. t. 280.) spines none; leaves obovate, mucronate, and tricuspidate; branchlets rather pubescent; pedicels many, 1-flowered, somewhat shorter than the leaves. ♄. H. Native of Peru on wooded rocks in the Andes in cold situations. The wood is hard and made into utensils, it also yields a yellow colour which is used for dying cloth.

Yellow-dye Barberry. Fl. Nov. to June. Shrub 4 feet.

33 B. confe'rta (H. B. et Kth. nov. spec. amer. 5. p. 69. t. 430.) leaves smaller than in any of the other species, entire, terminated by a spine, and furnished with a small spine on each side, but many of them bear 2 or 3 small spines on each side. ♄. S. Native of South America between Caxamarca and the river Magdalena. B. lùtea, var. β, D. C. syst. 2. p. 14.

Crowded-leaved Barberry. Fl. Nov. to June. Shrub 4 feet.

34 B. ine'rmis (Pers. ench. 1. p. 387.) spines none; leaves elliptic, quite entire, smooth, scarcely mucronulate; pedicels solitary, 1-flowered, longer than the leaves. ♄. H. Native of the Straits of Magellan at Bougainville Bay. Ovaries ovate, crowned by the stigma.

Unarmed Barberry. Fl. Dec. Shrub 4 feet.

35 B. buxifo'lia (Lam. ill. t. 253. f. 3.) spines 3-parted; leaves ovate or ovate-lanceolate, smooth, quite entire; pedicels longer than the leaves, either solitary, 1-flowered, or in threes, rising from a short peduncle. ♄. H. Native of the Straits of Magellan at the bottom of the Boucaut Bay. A small twisted shrub. Berries blueish-purple, 4-seeded.

Var. β, *microphýlla* (Forst. in comm. goett. 9. p. 29.) peduncles 3, 1-flowered. Native of Terra del Fuego in the fissures of rocks.

Box-leaved Barberry. Shrub 2 to 3 feet.

36 B. empetrifo'lia (Lam. ill. t. 253. f. 4.) spines 3-parted; leaves linear, quite entire, with revolute margins; pedicels 1-2, 1-flowered. ♄. H. Native of the Straits of Magellan in subalpine woods, frequent. A small shrub. Pedicels rising from the branchlets between the leaves.

Empetrum-leaved Barberry. Fl. Dec. Shrub 1 to 2 feet.

37 B. cunea'ta (D. C. syst. 2. p. 16.) spines 3-parted, hardly longer than the leaves; leaves obovate-cuneate, spinosely-trifid, smooth; pedicels solitary, 1-flowered, nearly equal in length with the leaves. ♄. G. Native of South America about Port Desideratum. Allied to *B. heterophýlla*. Flowers about the size of those of *B. vulgàris*. Berries obovate, somewhat globose, of an intense bluish-purple colour, crowned by the sessile stigma.

Wedge-leaved Barberry. Shrub 4-6 feet.

38 B. heterophy'lla (Juss. in Poir. dict. 8. p. 622.) spines 3-parted; leaves ovate-lanceolate, glabrous, some of them entire, others furnished with 3 pungent teeth; pedicels solitary, 1-flowered, hardly longer than the leaves; filaments toothed. ♄. H. Native of the Straits of Magellan. Hook. exot. fl. t. 14. Allied to *B. ruscifòlia*, but abundantly distinct in the pedicels being 1-flowered. Berries roundish, 4-seeded, purplish-blue, about the size of a pea, and crowned by the sessile stigma.

Variable-leaved Barberry. Fl. May, June. Clt. 1820. Shrub 4 to 6 feet.

39 B. virga'ta (Ruiz. et Pav. fl. per. 51. t. 281. f. B.) spines small or none; leaves obovate, entire, or spinosely-toothed at the apex, smooth; pedicels solitary, 1-flowered, length of leaves. ♄. S. Native of Peru in woods. An erect, much branched, smooth shrub. Berries small, oblong-ovate. Seed brown. Allied to *B. lùtea*.

Twiggy Barberry. Fl. Dec. to Feb. Shrub 4 to 6 feet.

40 B. Sibi'rica (Pall. fl. ross. 2. p. 42. t. 67. itin. app. no. 108. t. P. f. 2. ed. gall. 3. p. 211. t. 13. f. 2.) spines 3-7-parted; leaves lanceolate-obovate, ciliately-serrated; peduncles 1-flowered, shorter than the leaves. ♄. H. Native of Siberia, Altaia, and Dauria, among rocks. Flowers very like those of *B. vulgàris*. The berries, according to Pallas, are obovate and red.

Siberian Barberry. Fl. June, July. Clt. 1790. Shrub 1 to 2 ft.

41 B. atrovi'rens (Wall. mss.) spines 3-parted, long, equal; leaves lanceolate, tapering to both ends, spiny-ciliated, acute, rusty on the under surface; pedicels aggregate, 1-flowered, rising from the heart of the fascicle of leaves. ♄. H. Native of Nipaul.

Dark-green-leaved Barberry. Shrub 10 feet.

Species not sufficiently known, but distinct, from the leaves being abruptly pinnate, and with their petioles ending in a spine at the apex.

42 B. tragacanthoi'des (D. C. syst. 2. p. 18.) spines 3-parted, small; leaves with 1-2 pair of leaflets, crowded in the axillæ; petioles spiny at the apex. ♄. H. Native of Russia along the banks of the river Cur near Tiflis. A species allied to *B. Crética* and *B. Sibírica*.

Tragacantha-like Barberry. Shrub 1 foot.

43 B. caraganæfo'lia (D. C. syst. 2. p. 18.) the primordial leaves bearing at the base two stipulary spines, with the top of their petioles ending in a spine; leaflets 2-pairs. ♄. G. Native of China in the province of Shantong. Leaflets 2-pairs, inserted at the top of petiole beneath the spinescent part.

Caragana-leaved Barberry. Shrub 1 to 2 feet.

Cult. The commoner sorts of this genus will do well in any kind of garden soil, but the rarer species will require to be grown in a mixture of loam and peat, mixed with a little sand; they may be either propagated by suckers or layers which should be put down in the autumn, when the leaves have fallen, and ripened cuttings planted at the same time will strike root, or they may be increased by seeds, which is the most general method, sown either in the autumn or spring. The stove species, or those sorts natives of warm climates, do not require so much heat as other stove plants, and the green-house kinds may be easily preserved in a frame.

II. MAHO'NIA (in honour of Bernard Mc Mahon of Philadelphia, a lover of botanical science.) Nutt. gen. amer. 1. no. 307. D. C. syst. 2. p. 18. prod. 1. p. 108. Adostèmon, Raf. amer. monthl. mag. 1819. p. 192.

Lin. syst. *Hexándria, Monogýnia.* Sepals 6, guarded on the outside by 3 scales. Petals 6, without glands on the inside. Stamens furnished with a tooth on each side at the top of the filament. Berries 3-9-seeded. Elegant shrubs, with impari-pinnate leaves, and sinuately-toothed leaflets. Flowers yellow. Species either inhabiting the north-western coast of America or the north of Asia, especially in Nipaul, and perhaps Japan. Some botanists think that the character that distinguishes this genus from *Bérberis* is not sufficiently constant to separate it, as *Bérberis heterophýlla* has toothed stamens, and those of *M. Napaulensis* are without teeth.

1 M. fascicula'ris (D. C. syst. 2. p. 19.) leaflets 3-6-pairs, with an odd one, the lower pair distant from the base of the petiole; leaflets ovate-lanceolate, rather distant, 1-nerved, spiny-toothed, with 4-5-teeth on each side; racemes erect, much crowded; filaments bidentate. ♄. F. Native of New Spain, and about Nootka Sound. Deless. icon. sel. 2. t. 3. Bérberis pinnàta, Lag. elenc. hort. mad. 1803. p. 6. Ker. bot. reg. t. 702. Hook. fl. bor. amer. 1. p. 28. H. B. et Kth. nov. spec. amer. 5. p. 71. t. 434. B. fasciculàta, Sims bot. mag. t. 2396. Berries oval, deep-blue.

Fascicular Mahonia. Fl. March, May. Clt. 1820. Shrub 6 to 8 feet.

2 M. aquifo'lium (Nutt. gen. amer. 1. p. 212.) leaflets 2-3-pairs, with an odd one, the lower pair distant from the petiole; leaflets ovate, approximate, cordate at the base, 1-nerved, spiny-toothed, with 9 or 6 on each side; racemes erectish, much crowded; filaments bidentate. ♄. H. Native of North America on the western coast, and along the river Columbia, among rocks in rich vegetable soil. Berberis aquifòlium, Pursh. fl. amer. sept. 1. p. 219. t. 4. Hook. fl. bor. amer. p. 29. Berries dark-purple, crowned by the 3-lobed stigma.

Var. α; leaflets sinuately-toothed, wavy, with few teeth. Native of Nootka Sound.

Var. β; leaflets obscurely-toothed, flat, glaucous beneath, with numerous teeth. Native at the junction of the Portage river with the Columbia.

Holly-leaved Mahonia. Fl. Ap. May. Clt. 1823. Shrub 3 to 6 feet.

3 M. re'pens; leaflets 2-3 pairs, with an odd one, roundish-ovate, opaque, spiny-toothed; racemes diffuse; root creeping, filaments bidentate. ♄. H. Native of North America on the Rocky Mountains. Bérberis aquifòlium, Lindl. bot. reg. 1176. A small branched shrub, with the leaves rather glaucous on both surfaces. Racemes terminal, numerous, fascicled, diffuse, rising from the scaly buds. The description of Pursh's *B. aquifolium* was taken partly from this, and partly from the true *M. aquifolium*.

Creeping-rooted Mahonia. Fl. Ap. May. Clt. 1822. Shrub 1 to 2 feet.

4 M. nervo'sa (Nutt. gen. amer. 1. p. 212.) leaflets 5-6 pairs, with an odd one, the lower pair distant from the petiole; leaflets ovate, acuminated, remotely spiny-toothed, somewhat 3-5-nerved, with 12 or 14 teeth on each side; racemes elongated; filaments bidentate. ♄. H. Native of North America on the western coast, along the river Columbia. Common in shady pine forests, on the coast of the Pacific. Bérberis nervòsa, Pursh. fl. amer. sept. 1. p. 219. t. 5. Hook. fl. bor. amer. 29. M. glumàcea, D. C. syst. 2. p. 21. A small shrub. Berries deep-blue.

Nerved-leaved Mahonia. Fl. Oct. Clt. 1826. Shrub 1 to 3 feet.

5 M. Napaulensis (D.C. syst. 2. p. 21.) leaflets 5-9 pairs, with an odd one, the lower pair smallest, approximating the base of the petiole; leaflets ovate-oblong, cuspidate, 5-nerved and rounded, or subcordate at the base; repand toothed, with 5 to 10 spiny-teeth on each side, tricuspidate at the apex; racemes few, elongated, slender; bracteoles oval-oblong, obtuse. ♄. F. Native of Nipaul about Narain-Hetty. Deless. icon. sel. 2. t. 4. Bérberis Mìccia, Hamilt. mss. D. Don, prod. fl. nep. p. 205. Filaments simple. (f. 31.)

FIG. 31.

Var. β, *Roxbúrghii* (D. C. l. c.) B. pinnàta, Roxb. ined. The leaflets have fewer and larger teeth. Pedicels a little longer than the bracteas. ♄. F. Growing along with the species. Racemes 12 or 14, from the same bud.

Nipaul Mahonia. Fl. Nov. Dec. Shrub 4 to 6 feet.

6 M. acanthifòlia; leaves with 6-10 pairs of sessile leaflets and an odd one, lower pair small, approximating the stem, the rest obliquely oblong-lanceolate, acuminated, spiny-toothed, gradually enlarging from the base to the top; racemes numerous, rising from the top of the branches in fascicles, long, erect, crowded with flowers. ♄. F. Native of Nipaul. Bérberis acanthifòlia, Wall. mss. Perhaps the same as the preceding.

Acanthus-leaved Mahonia. Shrub 6 feet.

Species not sufficiently known.

7 M. Japo'nica (Thunb. fl. jap. 77 ? icon. jap. t. 22.) ♄. G. Cultivated in the island of Nipon in Japan. Ilex Japónica, Thunb. fl. jap. 77. icon. jap. t. 22.

Japan Mahonia. Shrub.

Cult. This is a genus of beautiful and rare shrubs. They will grow well in a mixture of loam and peat, mixed with a little sand; they may be either propagated from suckers or layers put down in the autumn; and ripe cuttings planted at the same time will strike root the following year, under a hand-glass.

III. NANDI'NA (*Nandin* or *Nand-scokf* is the vernacular name of the shrub in Japan.) Thunb. nov. gen. 1. p. 14. Gært. fruct. 2. p. 69. t. 92. f. 3. Juss. gen. 429. D. C. syst. 2. p. 22. prod. 1. p. 109.

Lin. syst. *Hexándria, Monogýnia.* Sepals 6, guarded by numerous series of scales. Petals 6, glandless inside. Berries dry, globose, crowned by the style. Seeds 2, round, convex on one side and concave on the other. An elegant evergreen shrub, with decompound leaves, and with the petioles sheathing at the base; leaflets entire. Flowers terminal, panicled, white, with yellow anthers. Berries red, about the size of a pea.

1 N. dome'stica (Thunb. diss. nov. gen. 1. p. 14.) ♄. G. Native of Japan and China, where it is cultivated in the gardens. Lam. ill. t. 261. Herb. amat. 281. Banks, icon. Kœmpf. t. 13 and 14. Sims bot. mag. 1109. Called in its native country *Nandscokf*, *Nattan*, or *Nandin* Kœmpf.

Domestic Nandina. Fl. in China and Japan in May and July; in England in Jan.; at Paris in July and Aug. Clt. 1804. Shrub 5 feet.

Cult. This shrub will thrive well in a mixture of loam and peat; and ripened cuttings, with their leaves not shortened, will strike root freely if planted in a pot of sand, and placed under a hand-glass. (Sweet.)

IV. LEO'NTICE (an ancient name abridged from *Leontope-*

talon, which is derived from λεων, *leon*, a lion; πεταλον, *petalon*, a leaf; because the leaf of L. Leontopetalum is said to bear some resemblance to the impression of a lion's foot.) Lin. gen. no. 423. Lam. ill. t. 254. Schreb. gen. no. 571. Juss. gen. p. 287. Brown in Lin. trans. 12. p. 145. t. 7.

LIN. SYST. *Hexándria*, *Monogýnia*. Sepals 6 (f. 32. *a*.) without scales. Petals 6 (f. 32. *b*.) each bearing a scale on the inside at the base. Capsules bladdery, 2-4-seeded (f. 32. *c*.) Seeds globose, inserted in the bottom of the capsule. Herbs with tuberous roots and annual stems about a foot high, and variously cut leaves, somewhat resembling those of *Columbine*. Flowers in loose racemes, or panicles, furnished with ovate, leafy, entire bracteas, at the base of the pedicels. Calyx usually coloured.

SECT. I. LEONTOPE'TALUM (from λεων, *leon*, a lion, and πεταλον, *petalon*, a leaf; lion's leaf. See *L. Leontopétalum*.) D. C. syst. 2. p. 24. prod. 1. p. 109. Capsules greatly inflated when mature (f. 32. *c*.) never ruptured, inclosing the seeds. Upper leaves pinnate or ternate. Petioles simple, or divided at the top, not at the base.

1 L. CHRYSO'GONUM (Lin. spec. 447.) leaves pinnate; leaflets sessile, oval-oblong, 3-5-cleft at the apex; bracteas small, scarious. ♃. H. Native of Greece in corn-fields, also near Abydos and Aleppo.—Mor. hist. 2. p. 285. sect. 3. t. 15. f. 7.—Barrl. icon. 1113. &c. Chrysógonum Dioscórides, Rauw. itin. 1582. p. 119. icon. Flowers yellow; stamens and petals nearly equal in length. The specific name is derived from χρυσος, gold, and γονυ, a knee, on account of the bright yellow blossoms which usually rise from the forks or knees of the stem.

Golden-kneed Lion's Leaf. Fl. in its native country in March; in England in June. Clt. 1740. Pl. 1 foot.

2 L. LEONTOPE'TALUM (Lin. spec. 448.) leaves biternate; leaflets obovate, on very short petioles; bracteas leafy, much shorter than the pedicels. ♃. H. Native of Puglia, Etruria, and Crete, in ploughed land and corn fields; frequent in Greece and all the islands of the Archipelago, &c. Lam. ill. t. 254. f. 1.—Barrl. icon. t. 1030. Leontopétalon, Lob. icon. t. 685. f. 2. —Mor. hist. 2. p. 285. sect. 3. t. 15. f. 6. &c. Flowers yellow, striated with veins. Stamens shorter than the petals. Seeds 3-4, globose, brown. For the meaning of the specific name see section. It is given to this plant because the leaves are said to bear some resemblance to the impression made by a lion's foot, and from this cause it is called in French *Pied-de-Lion*.

True *Lion's Leaf*. Fl. in its native country in the winter or the beginning of spring; in England in April and May. Clt. 1597. Pl. 1 foot.

3 L. VESICA'RIA (Pall. act. petrop. 1779. p. 2. t. 9. f. 4.) leaves biternate; leaflets oblong, somewhat cuneate, blunt, submucronate; bracteas leafy, scarcely one-half shorter than the pedicels. ♃. H. Native of Siberia in muddy places at the salt lake in the Kirghisian steppe. L. incérta, Pall. itin. 3. app. no. 84. t. 5. f. 2. ed. gall. app. no. 321. t. 77. f. 3. Flowers yellow? Plant soft, succulent (f. 32. *c*.)

Bladdery-podded Lion's Leaf. Fl. in its native country in the beginning of spring; in England in April and May. Pl. $\frac{3}{4}$ foot.

SECT. II. CAULOPHY'LLUM (from καυλος, *kaulos*, a stem; φυλλον, *phyllon*, a leaf; because the plants contained in this section bear only one leaf on each stem, directly under the racemes of flowers, and appears to terminate the stem, as if it were only a petiole.) Mich. fl. bor. amer. 1. p. 204. t. 21. D. C. syst. 2. p. 26. prod. 1. p. 109. Capsules hardly inflated, sometimes baccate, ruptured when mature; the seeds are therefore exserted. Bearing only one leaf on each stem, which is situated under the raceme; petiole 3-parted from the base, bearing 3 or 5 leaflets on each part.

4 L. ALTA'ICA (Pall. act. petrop. 1779. p. 257. t. 8. f. 1, 2, and 3.) stem leaf solitary; petioles 3-parted, divided to the base, each part bearing 5-oblong, entire leaflets, which are palmately disposed. ♃. H. Native on the Altaian mountains, in sunny places, and about Zmeof. Lam. ill. 254. f. 2. Root the size of a nut. Flowers yellow. Stamens equal in length with the petals.

Altaian Lion's Leaf. Fl. April, May. Clt. 1822. Pl. 1 foot.

5 L. ODESSA'NA (Fisch. in litt.) stem leaf solitary, petioles divided into 3 parts to the base, each part bearing 5 oblong, entire, stalked leaflets, which are palmately disposed; stamens double the length of the petals. ♃. H. Native on chalky hills about Odessa. L. Altàica β, Odessàna, D. C. syst. 2. p. 26. prod. 1. p. 110. This plant differs from *L. Altàica* in the pedicels being a little longer, and the stamens being double the height of the petals, and with the segments of the leaves on rather longer stalks. Flowers yellow.

Odessa Lion's Leaf. Fl. April, May. Clt. 1828. Pl. 1 foot.

6 L. THALICTROI'DES (Lin. spec. 448.) stem leaf solitary; petiole divided to the base into 3 parts, each part bearing 3 ovate or obovate deeply-cut acuminated leaflets. ♃. H. Native of North America, in shady woods on mountains, from Virginia to New England; also near Philadelphia; but rare. Brown in Lin. trans. 12. p. 145. t. 7. Caulophýllum thalictroìdes, Mich. fl. bor. amer. 1. p. 205. t. 21. Pursh, fl. bor. amer. sept. 1. p. 218. Stems a foot high. Flowers yellow-green. Berries deep blue, globose, contracted below into a long stipitate base; these are called *Cohosh* by the Indians, and the plant is esteemed medicinal. (f. 32.)

FIG. 32.

Thalictrum-like Lion's Leaf. Fl. April, May. Clt. 1784. Pl. 1 foot.

Cult. A genus of pretty little plants, usually with beautiful yellow flowers. The species require to be kept in pots, in order that they may be sheltered by a frame during winter; they will thrive well in a mixture of sand, loam, and peat, and may be increased by separating the tubers of the root. *Leóntice Vesicària* will require to be watered now and then with salted water, or it will not live.

V. EPIME'DIUM (from επι, *epi*, upon, and Media; said to grow in Media, a name from Dioscorides, retained by Linnæus.) Lin. Gen. no. 148. Juss. gen. 287. D. C. syst. 2. p. 28. prod. 1. p. 110.

LIN. SYST. *Tetra-Hexándria Monogýnia*. Sepals 4-8, furnished with 2 bracteas on the outside, at the base. Petals 4-6, each furnished on the inside with a 2-coloured appendage. Capsules siliculæform, 2-valved, many-seeded. Stamens 4-6. Style 1. Seeds obliquely and transversely situated, unilateral. Herbs with creeping perennial trunks, and annual stems. Leaves stalked, compound; leaflets awnedly-serrated. Racemes terminal, simple, or compound.

1 E. ALPI'NUM (Lin. spec. 171.) radical leaves none; stem one biternate; leaflets cordate-lanceolate, acuminated, serrated, with the serratures awned; sepals 4-6; petals 4; stamens 4. ♃. H. Native of England in Cumberland and Yorkshire, in coppices and woods; France and other parts of the South of Europe, in the same kind of situation. Lam. ill. t. 83. Schkuhr handb. 1. p. 81. t. 24. Smith fl. græc. 2. t. 150. eng. bot. 438. Stem about 4 inches high. Flowers purplish.

Var. β, pubígerum (D. C. syst. 2. p. 28. prod. 1. p. 110.) petioles pilose; nodes very hairy. ♃. H. Native about Constantinople. Perhaps a proper species.

Alpine Barren-wort. Fl. March, May. England. Pl. ¼ foot.

2 E. pinna'tum (Fisch. in litt. D. C. syst. 2. p. 29.) radical leaves pinnate; scape leafless. ♃. H. Native of Persia, in the province of Gilan. Flowers erect. Fruit pendulous at top of pedicels.

Pinnate-leaved Barren-wort. Pl. ½ foot.

3 E. hexa'ndrum (Hook. fl. bor. amer. p. 30. t. 13.) radical leaves twice or thrice ternate; leaflets cordate, bluntly 5-lobed, somewhat pilose; flowers hexandrous; sepals 8; scape leafless. ♃. H. Native of North-west America; common in shady pine forests at Fort Vancouver on the Columbia, Puget Sound, and North California. Caulophýllum gràcile, Dougl. mss. Petals 6, oblong-obovate, cucullate at the apex, each furnished at the base on the inside with a spatulate concave yellow appendage.

Hexandrous Barren-wort. Pl. ½ to 1 foot.

Cult. The *E. alpìnum* succeeds well in any common garden soil, and is readily increased by dividing at the root. The *E. pinnàtum* and *E. hexándrum* have not yet been introduced; but if they should, it would be advisable to keep them in pots, in a mixture of peat, sand, and loam, until their hardiness is ascertained.

VI. A'CHLYS. (*achlys*, dimness; obscure plant.) D. C. syst. 2. p. 35. prod. 1. p. 112. Hook. fl. bor. amer. p. 30. t. 12.

Lin. syst. *Polyándria, Polygýnia.* Calyx wanting. Corolla wanting. Flowers naked, disposed in a dense spike. Stamens numerous. Anthers didymous, globose, almost unilocular, bilabiate. Stigma dilated, hence concave. Ovary ovate, smooth, 1-celled; containing only 1 erect ovula, fixed to the bottom of the cell. Herb with a creeping perennial woody trunk, with 2 or 3 leaves rising from the same root, which are ternate. Leaflets large, fan-shaped, sessile. Flowers in spikes; those at the base of the spikes are rather remote.

1 A triphy'lla (D. C. l. c. Hook. l. c.) ♃. H. Native of the North-west coast of America, in shady pine woods among moss; common near the shores of the Pacific, about the mouth of the Columbia river and at Fort Vancouver, Leóntice triphýlla, Smith, in Rees' Cycl. Leaflets with very unequal sides; upper side, or front, coarsely sinuate-toothed or lobed; lobes blunt, finely rayed with nerves. Scapes longer than the leaves, erect, slender.

Three-leaved Achlys. Pl. 1 to 2 feet.

Cult. This plant will succeed well in any common garden soil; and it may be increased by dividing at the root.

VII. DIPHYLLE'IA (from δις, *dis*, double; and φυλλον, *phyllon*, a leaf; in allusion to each stem of the plant only bearing two alternate leaves.) Mich. fl. bor. amer. 1. p. 203. t. 19. and 20. Pursh, fl. amer. sept. 1. p. 218. Nutt. gen. amer. p. 304. D. C. syst. 2. p. 29. prod. 1. p. 110.

Lin. syst. *Hexándria, Monogýnia.* Sepals 6, naked on the outside. Petals 6, naked on the inside. Stamens 6. Style scarcely any. Stigma capitate. Berries nearly globose, sessile, 1-celled, 2-3-seeded. Seeds ovate-oblong. A smooth perennial herb. with the habit of *Leóntice* or *Podophýllum*, with 2 large alternate lobed leaves on each stem.

1 D. cymòsa (Mich. l. c.) ♃. H. Native of North Carolina, Virginia, Georgia, on the borders of rivulets, on the tops of the highest mountains, and on the banks of Columbia river. Leaves 2, alternate, large, kidney-shaped, usually profoundly 2-lobed at the apex. Flowers white, cymose. Berries roundish, of a bluish-black colour.

Cymose-flowered Diphylleia. Fl. May, June. Clt. 1812. Pl. 1 foot.

Cult. This plant will grow freely in any light rich soil, in a shady, moist situation, and is easily increased by dividing at the root, in the spring.

Order VIII. PODOPHYLLA'CEÆ. (plant agreeing with *Podophýllum* in many important points.) D. C. syst. 2. p. 31. prod. 1. p. 111.

Calyx of 3 (f. 33. *a.*) or 4 sepals. Petals 6-9. (f. 33. *b. c.*) disposed in 2 or 3 series, each series containing the same number as there are sepals, the outer series alternating with them. Stamens equal in number with the petals, or double that number; filaments filiform; anthers terminal, opening lengthwise on the inside by a double chink. Ovary solitary, crowned by a thick peltate stigma, which is nearly sessile, (f. 33. *e.*) Carpels 1-celled baccate (f. 33. *e.*) indehiscent, or capsular opening round the circumference at the apex. Seeds numerous, ovate-globose, inverted, fixed to the lateral placenta. Albumen fleshy. Embryo straight, basilar. Herbs with rhyzomatose roots, stalked, peltate-nerved lobed leaves, and 1-flowered bractless peduncles. Flowers white. This order is closely allied, on the one hand, to the herbaceous species of *Berberídeæ*, but differs from them in the anthers not opening by an elastic valve, and they are terminal, not adnate. It differs from *Nymphiàceæ* in the parts of the flower being ternary, or quaternary, as well as in the torus being narrow, and in the albumen being fleshy, not mealy, and from *Papaveràceæ*, in the plants yielding a watery juice, not milky, and in the unilateral disposition of the seeds, as well as in the albumen being fleshy, not oily. It differs from *Ranunculàceæ Vèræ* in the anthers bursting inwardly; but perhaps the *Ranunculàceæ Spùriæ* ought to be associated with this order on account of the dehiscence of its anthers.—Plants inhabiting humid and shady places of North America, from whence the roots are easily imported in a living state, as well as the seeds. The roots are purgative. The herb is narcotic and poisonous. The berries are eatable, but sour.

Synopsis of the Genera.

I. Podophy'llum. Calyx 3-sepalled. Petals 6-9. Stamens 12-18. Berry rather fleshy, 1-celled, indehiscent.

II. Jeffersònia. Calyx 4-sepalled. Petals 8. Stamens 8. Capsules opening round the circumference at the apex.

I. PODOPHY'LLUM. (This name is abridged from *Anapodophyllum*, the name originally given to it by Catesby, derived from *anas*, a duck; πους ποδος, *pous podos*, a foot; and φυλλον, *phyllon*, a leaf; in allusion to the leaves bearing some resemblance to the form of a duck's foot.) Lin. gen. 646. Lam. ill. t. 449. Juss. gen. 235. Nutt. gen. 2. p. 365. D. C. syst. 2. p. 33. prod. 1. p. 111.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 3 sepals, (f. 33. *a.*). Petals 6-9, (f. 33. *b. c.*). Stamens 12-18. Berries somewhat fleshy, (f. 33. *e.*) 1-celled, indehiscent. Perennial herbs, with 2 opposite peltate deeply bipartite lobed leaves, bearing one white drooping flower on the top of each stem, between the two leaves.

1 P. PELTA'TUM (Lin. spec. 722.) stem erect, 2-leaved, 1-flowered; fruit ovate. 4. H. Native of North America, in shady, humid woods, from New England to Carolina, near Boston, and along the Delaware, near Philadelphia; near Montreal; Lake Huron, &c. Sims, bot. mag. 1819. Bigel. mat. med. 2. p. 34. t. 23.—Mentz. pug. t. 11.—Catesb. carol. p. 24. t. 24. Root horizontal, creeping. Leaves irregularly lobed. Flowers white, solitary, situated between the 2 leaves. Pedicel, after flowering, inflexed. Berry ovate, about the size of a sloe, yellowish, at first nauseous, but when ripe rather acid, but eatable: hence its vernacular name, *Wild Lemon*.—The root is a safe and active cathartic, combined with calomel: it contains a resinous matter, a bitter extract, and a little gummy substance. The whole herb is narcotic and poisonous, particularly the leaves. The fruit ripens in May, whence its name *May-Apple*, given to it by the settlers in North America. (f. 33.)

FIG. 33.

The dried root of the *May-Apple* is brittle, and easily reduced to powder. It has a peculiar and rather unpleasant taste, but without much acrimony. When chewed for some time it manifests a strong bitter taste. Both the tincture and decoction are intensely bitter. When water is added to the alcoholic solution, the mixture becomes very gradually turbid, and at length opaque. The powdered root answers all the purposes of jalap, rhubarb, and aloes, and is more safe and mild in its operation. In irritable stomachs it sometimes occasions nausea and vomiting, but this effect is often occasioned by other cathartic medicines. A dose of about 20 grains operates with efficacy. The root is said by some physicians to be a medicine particularly suited for dropsy. It has also had the character, in the southern states of North America, of curing intermittent fevers. It is said that the Shakers at Lebanon, New York, prepare an extract of the *Podophýllum*, which is much esteemed by medical practitioners as a mild cathartic.

Peltate-leaved Duck's-foot, or May-Apple. Fl. May. Clt. 1664. Pl. $\frac{3}{4}$ foot.

2 P. CALLICA'RPUM (Rafin. fl. lud. p. 14. no. 20.) stem forked; fruit oblong. 4. H. Native of Louisiana. Stem 2-leaved, 1-flowered, about 5 inches high. Leaves 6-lobed. Flowers nodding, sweet-scented; petals 6, white. Fruit about the size of a filbert, white or reddish.

Beautiful-fruited Duck's-foot, or May-Apple. Pl. $\frac{1}{2}$ foot.

Cult. These plants should be planted in a moist, shady situation, in a peat or vegetable soil; they are easily increased by dividing at the root.

II. JEFFERSO'NIA. (This genus is dedicated to Mr. Jefferson, the celebrated President of the United States.) Bart. act. soc. amer. 3. p. 334. Nutt. gen. amer. 368. D. C. syst. 2. p. 34. prod. 1. p. 111.

LYN. SYST. *Octándria*, *Monogýnia*. Calyx of 4 sepals. Petals 8. Stamens 8, with short filaments. Capsules opening by the whole circumference at the apex. Seeds numerous, furnished at the base with a lacerated arillus. A stemless herb, about 4 inches high, allied on the one hand to *Podophýllum*, and on the other to *Sanguinària*.

1 J. DIPHY'LLA (Pers. ench. p. 418.) 4. H. Native of Tennessee, in shady, somewhat humid places in valleys, and on the sides of hills and mountains; also in Virginia, abundantly about Harper's ferry, and Sweet-springs. Sims, bot. mag. 1513. Podophýllum diphýllum, Lin. spec. 723. Jeff. binàta, Bart. act. soc. amer. 3. p. 344. icon. Jeff. Bartònis, Mich. fl. bor. amer. 1. p. 237. Leaves profoundly cleft into 2 lobes. Peduncle 1-flowered. Flower white; anthers yellow. Calyx deciduous, coloured. Seeds shining.

Two-leaved Jeffersonia. Fl. April, May. Clt. 1792. Pl. $\frac{1}{4}$ foot.

Cult. This pretty little plant thrives best in peat soil, mixed with a little loam and sand, in a shady situation, and may either be increased by seeds or dividing at the root. It will require a little protection in severe weather.

ORDER IX. HYDROPELTI'DEÆ (plants agreeing in many important characters with *Hydropéltis*,) D. C. syst. 2. p. 36. Cabómbeæ, Rich. anal. fru.

Calyx of 3-4-coloured sepals, (f. 34. *a*.) Petals equal in number to the sepals, and alternating with them. Stamens 6-36, (f. 34. *b*.) disposed in a double or multiple series; filaments capillary; anthers ovate-triangular, or linear, terminal, (f. 34. *b*.) opening by a double chink on the inside. Ovaries 2-18, terminated by the style. Stigma obtuse. Carpels 2-18, baccate or capsular, indehiscent, each containing only 1-2 seeds from abortion; seeds globose, inverted or pendulous. Albumen rather farinaceous, not truly fleshy. Embryo small, basilar. Small aquatic herbs, floating on the surface of water. Leaves entire, peltate, or multifid. Peduncles axillary, 1-flowered. Flowers purple or yellow. This order differs from *Podophyllàceæ* in the ovaries being numerous, not solitary, as well as in the stigma being seated on a longer style, and in the seeds being definite: it also differs from *Nymphiàceæ* in the last respect. Nothing is known of their medicinal qualities. The seeds are difficult to preserve in a living state for any length of time.

Synopsis of the Genera.

1 CABÓMBA. Sepals and petals 3. Stamens 6. Ovaries 2. Seeds 1-2, globose, inverted.

2 HYDROPE'LTIS. Sepals and petals 3 or 4. Stamens 18-36. Ovaries 6-18. Seed ovate-globose, pendulous within the pericarp.

I. CABO'MBA (a name given by Aublet to this plant, but from what derived he does not mention) Aubl. guian. 1. p. 321. t. 124. Rich. ann. mus. 17. p. 230. t. 5. f. 23. D. C. syst. 2. p. 36. prod. 1. p. 112. Juss. gen. 46. Néctris, Schreb. gen. no. 610. Willd. spec. 2. p. 248. Nutt, gen. amer. no. 338.

LIN. SYST. *Hexándria*, *Digýnia*. Calyx of 3 sepals coloured on the inside. Petals 3. Stamens 6; anthers tetragonal. Ovaries 2, terminated by the style. Carpels baccate, 1-2-seeded; seeds globose, inverted. Herb emulating *Ranúnculus aquátilis*.

1 C. AQUA'TICA (Aubl. l. c.) 4. S. W. Native of Cayenne and Guiana, in ditches and slow running rivulets. Also in Georgia and Carolina, according to Mich. Néctris aquática, Willd. spec. 2. p. 248. N. peltàta, Pursh. fl. amer. sept. 1. p. 239. Herb floating in water, immersed leaves opposite, stalked, cut into 5 divisions even to the petiole, segments multifid; emersed leaves floating, alternate, on long petioles, peltate-nerved, orbicular, entire. Peduncles long, axillary, solitary, 1-flowered. Flowers small yellow. Néctris pinnàta, Pursh. fl. amer. sept. 1. p. 239. is perhaps only a variety of this plant.

Aquatic Cabomba. Fl. Jul. Aug. Clt. 1823. Pl. fl.

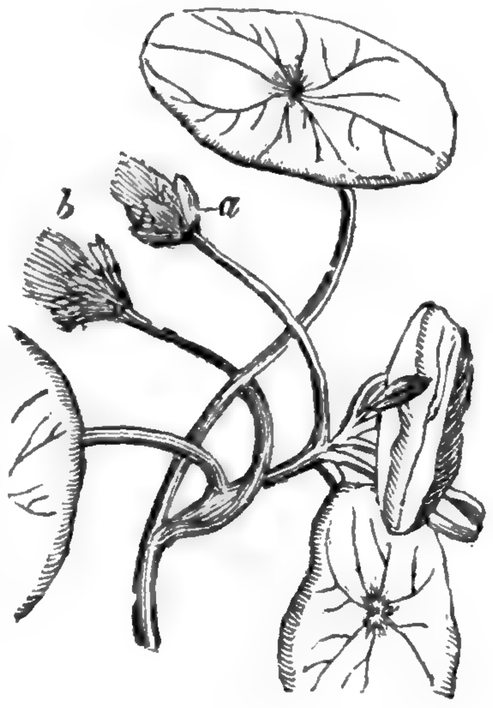
Cult. This plant will do well in a cistern about a foot deep, with 2 inches of loam in the bottom for the plant to root in, then filled up with water, and placed in the warm part of a stove. †

II. HYDROPEL'TIS (from ὑδωρ ὑδρος, *hydor hydros*, water, πελτη, *pelte*, a buckler; because the plant grows in water and has leaves in the form of a buckler) Mich. fl. bor. amer. 1. p. 324. t. 29. Sims, bot. mag. t. 1147. Rich. ann. mus. 17. p. 230. t. 5. f. 22. Brasènia, Pursh. fl. amer. sept. 2. p. 389. Nutt. gen. amer. no. 392.

Lin. Syst. *Polyándria Polygýnia.* Calyx of 3-4-sepals, coloured on the inside (f. 34. *a.*) Petals 3-4. Stamens 18-36. Ovaries 6-18, ending in filiform styles. Carpels capsular, 1-seeded. Seed ovate-globose, pendulous within the pericarp.—An aquatic herb with the aspect of *Hydrochàris*, covered with a clammy gelatinous substance. Roots fibrous, fixed in the mud.

1 H. purpu'rea (Mich. fl. bor. amer. 1. p. 324. t. 29.) ♃. H. W. Native in tranquil lakes and pools of water in Lower Carolina, also in Tennessee, New Jersey, and Upper Canada. Brasènia peltàta, Pursh. fl. amer. sept. 2. p. 389. Herb floating. Leaves alternate, on long petioles, oval, peltate in the centre, very smooth, and quite entire, floating on the surface of the water. Peduncles axillary, 1-flowered. Flowers dull purple, closing and lying down on the surface of the water at night, and expanding again in the morning. There is another species found in New Holland. (f. 34.).

FIG. 34.



Purple Hydropeltis. Fl. Jul. Aug. Clt. 1798. Pl. flt.

Cult. This pretty little plant must be grown in a pond or a cistern of water, and it may be increased by offsets. The plant being extremely difficult to preserve is seldom to be seen in the gardens of Britain.

Order X. NYMPHIA'CEÆ (plants agreeing with *Nymphæ'a* in many important characters.) D. C. prop. med. ed. 2. p. 119. syst. 2. p. 39. prod. 1. p. 113.

Calyx of 4-5-sepals (f. 36. *a. b.*), inserted in the receptacle (f. 36. *b.*), but not articulated with it. Petals and stamens disposed in one or numerous series, the latter inserted a little higher up than the former, alternate with the sepals. Filaments flattish, sometimes drawn out beyond the cells of the anthers; anthers adnate linear, opening inwardly by two chinks (f. 36. *e.*). Ovaries or carpels numerous, 8-24, sometimes half immersed in the large honeycombed torus (f. 35. *a.*), each bearing a style (f. 35. *e.*), sometimes inclosed within a large and pitcher-shaped torus (f. 36. *c.*), membranous 1-2 or many-seeded. The styles in those with the free carpels are distinct and crowned by simple stigmas (f. 35. *e.*), in those with the inclosed carpels they are peltately-rayed above the urceolus (f. 36. *d.*) as in *Papàver*, they are connate at the base, but free at the apex (f. 36. *d.*). Seeds in the free carpels 2 or solitary (f. 35. *b.*), in the inclosed carpels innumerable, these last are fixed laterally to the parietes of the carpels, inverted, ovate-globose, dotted, girded by a somewhat gelatinous follicle-formed aril, and with the cells filled with gelatinous pulp when mature. Albumen sometimes wanting in the seeds of the free carpels, but farinaceous in the seeds of the inclosed carpels. Embryo small, turbinately globose, situated on the outside of the albumen at the base of the seed, therefore inverted in the fruit; it appears undivided at first sight, because it is inclosed in a membranous covering (this is not the case in any other order) when this covering is torn asunder it exhibits two thick leafy cotyledons. The covering falls off of itself before germination. All aquatic floating plants yielding somewhat milky juice, and to gardeners possessed of great interest on account of the elegant form and various hues of their flowers. The trunk of the root lies in a horizontal position in the mud, emitting numerous fibres, these are eatable when dried and pounded, and are made into cakes by the inhabitants of vàrious countries. The leaves are peltate or cordate, usually floating on the surface of the water, involute before expansion. Peduncles rising from the trunk of the root, axillary, or supra-axillary, constantly naked and 1-flowered. Flowers imbricate in the bud, large, white, yellow, blue and red, usually sweet-scented, resembling those of *Magnòlia*, *double Pæonys* or *Poppies*, lying on the surface of the water or raised a little above it, when they begin to decay the peduncle becomes inflexed and sinks in the water, where the capsules soon decay and relieve the carpels, which soon after vegetate. The seeds of the *Lotos* are pounded by the Egyptians and mixed among flour. The *Cýamus* or *Pythagorean-bean* of antiquity is the produce of the *Nolúmbium*, a stately aquatic, which abounds in all the hotter countries of the East, where its roots are frequently used as an article of food. This very natural order, from the structure of its flower, is intermediate between *Ranunculàceæ*, and *Papaveràceæ*, therefore joins the first and second cohort of *Thalamiflòræ*. The tribe *Nelumbòneæ* agrees in a certain degree with *Pæònia Moután* in the torus being elevated into urceolus around the ovaries. The tribe *Nymphæ'ea* agrees with *Papàver* in the structure of its fruit. The order differs from *Ranunculàceæ* in the anthers being adnate inwardly, as well as in the seeds being always inverted. It is distinguished from *Papaveràceæ* in the fruit opening irregularly, as well as in the anthers being adnate, and the sepals permanent not deciduous. It also differs from *Hydropeltideæ* in the torus being elevated and surrounding the ovaries. The seeds retain their vegetative power a considerable time, those of the *Nelúmbium* will vegetate after having been kept 30 years. This order was formerly the cause of much difference among botanists as to its station in the natural classification, its structure being of so doubtful a character as to leave room for disputing whether it belonged to *Dicotyledòneæ* or *Monocotyledòneæ*, but this has been clearly settled by M. De Candolle. See the structure of the embryo.

Synopsis of the Genera.

Tribe I.

Nelumbo'neæ. (D. C. syst. 2. p. 43. prod. 1. p. 113.). Carpels many, distinct, 1-2-seeded, each bearing a style (f. 35. *e.*)

half immersed in deep pits, in an elevated obconical torus (f. 35. *a*.).

1 NELU'MBIUM. Character the same as the tribe.

TRIBE II.

NYMPHÆE'Æ (D. C. syst. 2. p. 43. prod. 1. p. 114.). Carpels many-seeded, inclosed within the torus, with the stigmas radiating upon the top of the berry-formed fruit (f. 36. *d*.).

2 EURY'ALE. Sepals petals and stamens adhering to the torus, a great way up, and therefore the fruit appears half inferior.

3 BARCLA'YA. Sepals 5 distinct, absolutely hypogynous. Corolla seated upon the top of the fruit, tubular above, corollaceous, bearing the stamens on the inside of the tube, with the throat 8-10-lobed.

4 NYMPHÆ'A. Sepals inserted at the base of the torus. Petals and stamens covering the torus, and adhering to it a great way up, and therefore the fruit appears as if it were half-inferior.

5 NU'PHAR. Sepals petals and stamens inserted at the base of the torus (f. 36. *b*.), and therefore the berry appears as if it were superior.

Tribe I.

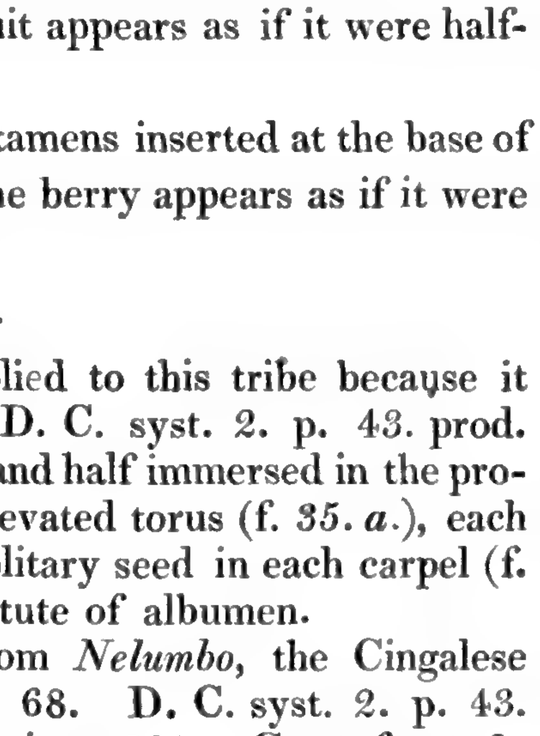
NELUMBO'NEÆ (a name applied to this tribe because it contains *Nelùmbium*, which see.) D. C. syst. 2. p. 43. prod. 1. p. 113. Carpels many, distinct, and half immersed in the profoundly honey-combed obconical, elevated torus (f. 35. *a*.), each bearing a style (f. 35. *e*.), with a solitary seed in each carpel (f. 35. *b*.), which is exarillate and destitute of albumen.

I. NELU'MBIUM (latinized from *Nelumbo*, the Cingalese name of *N. speciòsum*.) Juss. gen. 68. D. C. syst. 2. p. 43. prod. 1. p. 113.—Nelúmbo, Tour. inst. 261. Gært. fruct. 1. p. 73. t. 19.

LIN. SYST. *Polyándria, Polygýnia.* Character of the genus the same as that of the tribe. Herbs emulating the habit of *Nymphæ'a*. Flowers large, shewy, white, red or yellow. Both leaves and flowers rising above the surface of the water.

1 N. SPECIO'SUM (Willd. spec. 2. p. 1258. *Var.* α et β.) corolla polypetalous; anthers drawn out beyond the cells into a club-shaped appendage. 4. S. W. Native in slow running streams and tranquil waters in the warmer parts of Asia, but formerly common in Egypt (Herod. and Theop.), but now rare (Delile), in Persia (Pers.), in Malabar (Rheed.), in India (Burm.), in Ceylon (Herm.), in Java (herb Deless.), introduced into the Philippine and Molucca islands (Rumph.), Nipaul (herb. Lamb.), Cochinchina and China (Lour.), about Siam (Kæmpf.), Japan (Thunb.). Sims, bot. mag. t. 903. Lam. ill. t. 453. Nymphæ'a Nelúmbo. Var. α. Lin spec. 730. Delil. fl. ægyp. descrip. p. 164. t. 61. Nelúmbo nucífera, Gært. fruct. 1. p. 73. t. 19. f. 2. Mirb. ann. mus. 13. p. 465. t. 34. Nelúmbium Asiáticum, Rich. ann. mus. 17. p. 249. t. 9. f. 49 to 57. Cýamus mýsticus, Sal. ann. bot. 2. p. 75. Cýamus Nelúmbo, Smith, exot. bot. 1. p. 59. t. 31, 32.

FIG. 35.



Nelúmbo Indica, Pers. Flowers very beautiful, smelling of anise, commonly rose-coloured, seldom white (f. 35.).

Var. β, *Tamàra* (Rheed. mal. 11. p. 59. t. 30.) outer stamens sterile, dilated at the top, winged, obcordate; appendage rising from a notch at the apex. 4. S. W. Native of Malabar. *Tamàra* is the name of this plant in Malabar.

Trunk of the root horizontal, fleshy, white, sending out many fibres from the under surface. Petioles long, rising beyond the surface of the water, scabrous with acute tubercles. Leaves large, 1 or 2 feet in diameter, exactly peltate in the centre, orbicular entire, glabrous, under surface palest, margins somewhat waved. Peduncles longer than the petioles, erect, scabrous. Flowers large, emulating *Pæònia* and *Papàver*, white or red. Fruit resembling an instrument once used in play by the French, by the very antique name *Lotos*. (D. C.). It was known to the Greeks, and is said by Herodotus, Theophrastus, and others, to be a native of Egypt, but no modern traveller has observed it in that country. There can, however, be no doubt of its having actually existed there, either naturally or cultivated, since the terms in which it is described by those authors are too clear and decisive to be mistaken, and their accounts are confirmed by ancient Egyptian sculptures and mosaics, which are still preserved, and testify that from the earliest times it, as well as the proper *Lotos*, has obtained a religious reverence. It is remarkable that neither Herodotus nor Theophrastus, the most ancient writers by which it is described, have attributed any sacred character to it, but speak of it as only used as food by the Egyptians. Both root and seeds are esculent, sapid and wholesome. They are accounted cooling and strengthening, and to be of service in extreme thirst, diarrhœa, tenesmus, vomiting, and too great internal heat. In China it is called *Lien-wha*, and the seeds, and slices of the hairy root, with the kernels of apricots and walnuts, and alternate layers of ice were frequently presented to the British Ambassador and his suite at breakfasts given by some of the principal Mandarins. The roots are laid up by the Chinese in salt and vinegar for the winter. Sir George Staunton remarks that the leaf besides its common uses, has, from its structure, growing entirely round the stalk, the advantage of defending the flower and fruit arising from its centre from contact with the water, which might injure them. He also remarks that the stem never fails to ascend in the water from whatever depth, unless in a case of sudden inundation, until it attains the surface, when its leaf expands, rests upon it, and often rises above it. Many varieties of the plant are distinguished by the Chinese; one of them with pure-white flowers, and another having about an hundred petals white or rose-coloured. From the root of the *Nelumbo* Sir George Staunton says the Egyptians are supposed to have prepared their *Colocasia*, but as the plant is no longer to be found wild in that country, from which circumstance some naturalists infer that it never was indigenous there, but cultivated by the inhabitants with extreme care. The ancient Romans made repeated efforts to raise it among them from seeds brought out of Egypt. Dr. Patrick Browne is of opinion that the ancients confounded two plants under the name of *Lotos* or *Egyptian-bean*, and that under these titles they described the upper parts of the *Nelúmbium* and the roots of *Calàdium Colocàsia*, now commonly called *Coccos* in Jamaica. Thunberg says that it is considered as a sacred plant in Japan, and pleasing to their deities, and that the images of their idols were often drawn sitting on its large leaves. Loureiro relates that it abounds in muddy marshes in India and China, and is cultivated in large handsome pots in the gardens and houses of the Mandarins. The Chinese have always held this plant in such high value, that at length they regarded it as sacred. The seeds are somewhat of the size and form of an acorn, and of a taste more delicate than that of almonds. The ponds in India and

China are literally covered with the plant, and exhibit a very shewy appearance when it is in flower, and the flowess are no less fragrant than handsome. It is the *Pythagorean bean* of the ancients, and has been regarded from the most remote periods as an emblem of fertility. Perhaps many species are confused under *N. speciòsum*.

Shewy Nelumbium or Pythagorean Bean. Fl. in the summer. Clt. 1787. Pl. flt.

2 N. Ca'spicum (Fisch. in litt. D. C. l. c.) corolla polypetalous; anthers drawn out beyond the cells into a club-shaped appendage; inner petals blunt, scarcely smaller than the outer ones. ♃. S. W. Native at the mouth of the river Volga near Astracan at that part of the river called Tschulpan, growing among reeds, Nymphæas and Trapas. This plant hardly differs from the preceding, unless that the petals are all obtuse, with the inner scarcely smaller than the outer ones.

Caspian Nelumbium. Fl. summer. Clt. 1817. Pl. flt.

3 N. lu'teum (Willd. spec. 2. p. 1259.) corolla polypetalous; anthers drawn out beyond the cells into a linear appendage. ♃. F. W. Native of North America in lakes and ponds in Virginia, Carolina, Florida and Louisiana, also near Philadelphia in the ditches and ponds of Brobston's meadows. Turp. ann. mus. 7. p. 210. t. 11. f. 27. Nymphæ'a nelúmbo β, Lin. spec. 730. Cýamus flavicómus, Sal. ann. bot. 2. p. 75. Cýamus lùteus, Nutt. gen. amer. 2. p. 25.—Swert. floril. 2. t. 22. f. 4. Very like *N. speciòsum* in habit as well as character, but the flowers are smaller. Flowers yellow, resembling a double tulip. The seeds are very agreeable to eat, and eagerly sought after by children and Indians. By the latter it is supposed they were introduced to those ponds near Philadelphia, as there is no other instance known of their being found so far north. Walter mentions his *Nelumbo* to have white flowers, but this variety has not been seen by any other person.

Yellow Nelumbium. Fl. July. Clt. 1810. Pl. flt.

† *Species not sufficiently known.*

4 N. codophy'llum (Raf. fl. lud. p. 22. no. 64.) leaves tomentose underneath. ♃. F. W. Native of lakes in Louisiana. Napoleone, Rob. trav. louis. 1. p. 355. 2. p. 322. and 441. ex Rafinisque. Flowers yellow, larger than those of *N. lùteum*. Petals numerous, unequal. Seeds eatable. Leaves 2 feet in diameter, campanulate, entire, but look as if they were fringed on the margins. Scapes scabrous with acute tubercles.

Bell-leaved Nelumbium. Pl. flt.

5 N. pentape'talum (Willd. spec. 2. p. 1259.) flowers pentapetalous. ♃. F. W. Native of North and South Carolina. Cýamus pentapétalus, Pursh. fl. amer. sept. 2. p. 398. Nymphæ'a pentapétala, Walt. fl. carol. 155. Flowers large, white. Mr. Pursh saw a specimen of this doubtful plant in the possession of a gentleman in Carolina, which ascertains its existence, but he unfortunately took no notes at the time, being in expectation of seeing the living plant.

Five-petalled Nelumbium. Pl. flt.

6 N. Jamaice'nse (D. C. syst. 2. p. 47.) ♃. S. W. Native of Jamaica in ponds. Nymphæa with orbicular, rayed leaves, and obversely conical fruit, and large imbedded seeds. P. Browne, jam. 343. no. 2. N. speciòsum γ, Willd. spec. 2. p. 1259. Nymphæ'a Nelúmbo, Lunan. hort. jam. 2. p. 272. Flowers rose-coloured.

Jamaica Nelumbium. Fl.? Clt. 1823. Pl. flt.

Cult. The species of this beautiful aquatic genus should be grown in cisterns, tubs, or large pots in a rich loamy soil; they require a strong heat to flower in perfection. The cistern, pot, or tub should be kept full of water all the time the plants are growing, but may be allowed to get dry when the flowering season is over. The plants may be increased by dividing the roots, but are obtained more readily from seeds, which vegetate freely (Swt. cult.). None of the species have flowered in this country except the *N. speciòsum;* they all require to be kept in a very warm situation in a stove.

Tribe II.

NYMPHÆ'EA. (D. C. syst. 2. p. 48. D. C. prod. p. 114.) Carpels numerous, many-seeded, inclosed within the enlarged torus (f. 36. *c.*). Stigmas radiated on the top of the berry-formed fruit (f. 36. *d.*). Seeds arillate, fixed to the sides of the carpels. Albumen mealy.

II. EURY'ALE (*Euryale*, one of the Gorgons, alluding to the thorny menacing habit of the plant). Sal. ann. bot. 2. p. 73. D. C. syst. 2. p. 48. prod. 1. p. 114.

Lin. syst. *Polyándria, Polygýnia.* Calyx of 4 sepals, inserted in the torus and adhering to it. Petals 16-28, in 4-7 series. Stamens numerous. Carpels 16-20. Fruit appearing half inferior from the sepals petals and stamens adhering half way up. An elegant aquatic, covered all over with prickles. Leaves peltate, large, orbicular. Flowers blueish-purple or violet, not so large as those of the commoner species of *Nymphæ'a.*

1 E. fe'rox (Sal. ann. bot. 2. p. 73.) ♃. S. W. Native of the East Indies in the lakes called Gumtoe and Gogra; also in China in the province of Kianang and Nipaul. Annesléa spinòsa, Andr. bot. rep. t. 618. Petioles and calyxes hispid, with stiff prickles. Leaves large, scutate, about a foot in diameter. Carpels the size of a pea, inclosed within the torus. Trunk of root esculent.

Fierce Euryale. Fl. Sept. Clt. 1809. Pl. flt.

Cult. This singular aquatic plant requires to be always kept in water in a hot-bed or stove; it will seed freely if some pollen be shaken on the stigmas when it is in bloom, which is the only method of increasing it.

III. BARCLA'YA (in honour of Robert Barclay, F. L. S. of Bury Hill, Surrey, eminently distinguished for his love of plants, and who has introduced numerous new plants to England, more particularly from Mexico and the Mauritius). Wall. in Linn. trans. vol. 15. p. 442. t. 18.

Lin. syst. *Polyándria, Polygýnia.* Calyx of 5 distinct sepals inserted beneath the ovary. Receptacle widened into a globose ovary at the base, tubular and corollaceous at the apex, with the throat 8-10-lobed; lobes unequal, connivent, disposed in 2-3 series. Stamens numerous, nodding, fixed to the inside of the tube of the torus, and inclosed within the same; superior ones sterile and branched. Anthers naked. Styles numerous radiating and inserted in the bottom of the tube, connate at the base. Berry fleshy, globose, many-celled, many-seeded, surrounded at the base by the permanent calyx and crowned by the permanent corolla. Seeds globose, beset with fleshy bristles, albuminose, inverted. A floating aquatic with appearance of *Potamogèton.* Leaves thin, elongated, oblong, rather narrowest at the base, rather cordately-hastate and a little peltate at the base, feather-nerved, shining, rusty beneath and tomentose. Scape 1-flowered, about equal in length to the slender petioles. Flowers erect, smooth, of a greenish-colour, scentless. This genus differs from *Eurỳale* in the calyx being absolutely hypogynous.

1 B. longifo'lia (Wall. l. c.) ♃. W. S. Native of the East Indies in Pegu near Rangoon in stagnant water.

Long-leaved Barclaya. Fl. Aug. Pl. floating.

Cult. For the cultivation see *Euryale.*

IV. NYMPHÆ'A (*νυμφη, nymphe*, a water nymph, in refer-

ence to the habitation of the plants). Neck. elem. no. 1828. Tourn. Lin. & Juss. D. C. syst. 2. p. 49. prod. 1. p. 114.

Lin. syst. *Polyándria, Polygýnia.* Calyx of 4 sepals, girding the base of the torus. Petals 16-28, adnate to the torus, elevated about the ovary and covering the same, and therefore at first sight appearing inserted in it. Stamens numerous, disposed in many series, inserted in a similar way above the petals. Shewy aquatic herbs. Trunk of root fleshy, horizontal, emitting fibres below. Leaves large, cordate or peltate, floating. Flowers large, white, rose-red, and blue, never yellow. The genus is called water-lily in English, from the plants growing in water, and the flowers having the appearance of a lily.

Sect. I. Cya'næa (from *κυανος, kyanos,* blue; because the flowers are blue or blueish). D. C. syst. 2. p. 49. prod. 1. p. 114. Anthers drawn out at top. Flowers blue or blueish. Leaves peltate, entire or bluntly sinuated.

1 N. scutifo'lia (D. C. syst. 2. p. 50.) leaves peltate, bluntly and sinuately toothed, not dotted, smooth on both surfaces, 2-lobed at the base; lobes incumbent; anthers appendiculated at the top; stigmas 20-rayed. ♃. S. W. Native of Cape of Good Hope in rivers. N. cærùlea, Andr. bot. rep. t. 197. Sims, bot. mag. t. 552. Castàlia scutifòlia, Sal. ann. bot. 2. p. 72. This plant differs from the following in the flowers being of a more intense blue, as well as in the sepals and petals being blunter. Leaves constantly sinuated.

Saucer-leaved Water Lily. Fl. June, Sept. Clt. 1792. Pl. flt.

2 N. cæru'lea (Savig. decad. ægypt. 3. p. 74.) leaves peltate, nearly entire, without dots, glabrous on both surfaces, 2-lobed at the base; lobes free; anther appendiculated at the apex; stigmas 16-rayed. ♃. S. W. Native of Lower Egypt in rice grounds and canals about Rosetta, Damietta, Kahira, &c. Savig. ann. mus. paris 1. p. 366. t. 25. Vent. malm. t. 6. Herb amat. t. 338. N. stellàta, var. Sims, bot. mag. 2058. Flowers very fragrant. Root pear-shaped, blackish. That this species was sacred amongst the ancient Egyptians is obvious from the representations of it on their old monuments and in hieroglyphics.

Blue Water Lily. Fl. June, Sept. Clt. 1812. Pl. flt.

3 N. Madagascarie'nsis (D. C. syst. 2. p. 50. prod. 1. p. 114.) leaves peltate, bluntly-sinuated, not dotted, glabrous on both surfaces, 2-lobed at base; lobes divaricate; anthers appendiculate at the apex; stigmas 8-10-rayed. ♃. S. W. Native of the island of Madagascar. Perhaps this is a variety of *N. stellàta.* Flowers blue.

Madagascar Water Lily. Pl. flt.

4 N. stella'ta (Willd. spec. 2. p. 1153.) leaves peltate, entire, not dotted, glabrous on both surfaces, 2-lobed at the base; lobes divaricate; anthers appendiculate at the apex; stigmas 8-12-rayed. ♃. S. W. Native of Malabar in tranquil rivulets and lakes, also in Coromandel, Tranquebar, and Java. Andr. bot. rep. t. 330. Citambel, Rheed. mal. 11. p. 53. t. 27. Castàlia stellàta, Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa 1. p. 643. Castàlia stellàris, Sal. ann. bot. 2. p. 72. N. Malabàrica var. cærùlea, Lam. dict. 2. p. 457. Flowers blue or blueish.

Starry Water Lily. Fl. June, Sept. Clt. 1803. Pl. flt.

5 N. pulche'lla (D. C. syst. 2. p. 51.) leaves peltate, nearly entire, not dotted, glabrous on both surfaces, 2-lobed at the base; lobes blunt, somewhat diverging; anthers appendiculated at the apex; stigmas 12-rayed. ♃. S. W. Native of Guayaquil. Flowers white, one half smaller than those of *N. álba.* Petals 8, oblong, acuminated, shorter than the calyx.

Neat Water Lily. Fl. June, Sept. Pl. flt.

6 N. cya'nea (Roxb. hort. beng. p. 41.) ♃. S. W. Native of the East Indies. N. Cahlàra, Donn, cant. ed. 7. Leaves peltate. Flowers blue. A species scarcely known.

Blue Indian Water Lily. Fl. June, Sept. Clt. 1809. Pl. flt.

Sect. II. Lòtos (the name *Lotos* is applied to this section because the plants it contains agree in character with the Egyptian *Lotos. N. Lotus.*) D. C. syst. 2. p. 52. prod. 1. p. 115. Anthers not drawn out at the top into an appendage. Flowers white, rose-coloured, or red. Leaves peltate, rarely entire, usually deeply toothed, and usually pubescent on the under surface, not glabrous as the last section.

7 N. edu'lis (D. C. syst. 2. p. 52.) leaves peltate, broad-oval, quite entire, under surface pubescent. ♃. S. W. Native of the East Indies in fens. Castàlia edùlis, Sal. ann. bot. 2. p. 73. N. Cotèka, Roxb. mss. with a figure in Banks' Libr. N. esculénta, Roxb. hort. beng. p. 41. Roots esculent. Flowers small, white, or red?

Eatable-rooted Water Lily. Fl. in Botanic Garden Calcutta throughout the year, in England from June to Sept. Clt.? Pl. flt.

8 N. ru'bra (Roxb. ined. Sims bot. mag. t. 1280.) leaves peltate, sharply toothed, under surface pubescent, and not spotted. ♃. S. W. Native of the East Indies. Andr. bot. rep. 503. Castàlia magnífica, Sal. parad. t. 14. Flowers deep red. Petiole inserted very near the margin of the leaf. The seeds and roots are said to be eatable, and the flowers are said to be held in superstitious veneration in Hindostan, which may arise from its affinity with the *Nelumbo,* or sacred bean.

Red-flowered Water Lily. Fl. Ju. Aug. Clt. 1803. Pl. flt.

9 N. ròsea (Sweet, hort. brit. p. 15.) leaves peltate, sharply toothed, under surface pubescent, upper surface dark-green. ♃. S. W. Native of the East Indies. N. rubra var. β, ròsea, Sims, bot. mag. t. 1364. D. C. syst. 2. p. 52. prod. 1. p. 115. Flowers rose-coloured, not deep-red, as in the preceding species. Petiole inserted very near the margin of the leaf.

Rose-coloured-flowered Water Lily. Fl. July, Aug. Clt. 1803. Pl. flt.

10 N. pube'scens (Willd. spec. 2. p. 1154.) leaves peltate, sharply toothed, orbicularly-reniform, under surface velvety-pubescent and spotted; lobes roundish. ♃. S. W. Native of the East Indies, Malabar, Moluccas, Tranquebar, Ceylon, Java, and about Bombay, and also on the western coast of Africa at Waree and Acra, &c. in tranquil water. N. Lòtus, Burm. ined. Beauv. fl. d'ow. et de ben. 2. p. 50. t. 88. Jones asiat. reser. 3. p. 285. Castàlia sàcra, Sal. parad. no. 14. Castàlia pubéscens, Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 643. This plant is called the *Lotos* throughout India, and is one of the sacred plants of the Hindus. Flowers white; petals rather unequal, expanded throughout the day and closing at night, breathing a vinous pungent odour.

Pubescent-leaved Water Lily. Fl. in its native country in the dry season; in England from June to Sep. Clt. 1803. Pl. flt.

11 N. lòtus (Lin. spec. 729. exclusive of the synonyms of Browne and Sloane,) leaves peltate, sharply serrated, under surface pilose at the nerves, and pubescent between them. ♃. S. W. Native of Egypt, in slow running streams, especially in the Nile near Rosetta and Damietta, and in rice fields during the time they are under water, &c. Del. fl. ægyp. descr. p. 159. t. 60. f. 1. Hill. veg. syst. 16. p. 39. t. 39. Castàlia mýstica, Sal. ann. bot. 2. p. 73. Root tuberous, eatable. Flowers large, white; sepals red at the margins. This is the *Lotos,* which was celebrated by the ancient Egyptians, sacred to Isis, and was sometimes engraven on their very ancient coins. This is not to be confounded with the *Lotos* of the Lotophagi, which is *Zizyphus Lòtus* (see Desf. in mem. acad. par. 1788. p. 443.) nor with the *Lòtos* of Homer and Dioscoridis, which is evidently a species of *Lòtus* or *Trifòlium,* nor with the *Lòtos* of Hippocrates, which is *Céltis austràlis,* nor with the *Italian Lotos,* which is *Diospỳrus Lòtus.* The seeds dried and ground were made into a kind of bread by the ancient Egyptians,

as well as the roots. The ancients record the sinking of the flower under water at night. It is conceived that this flower became sacred to superstitious veneration in Egypt in consequence of its resemblance to the true East Indian *Lotos* or *Nelumbo;* the latter, from its mode of vegetation, was adopted in the most remote ages to serve as an emblem of fertility. It seems therefore a sort of substitute or type, and strengthens the theory of the mythology of Egypt having migrated thither from India. The *Nelumbo* was brought to Egypt, but has never perpetuated itself there to any great extent.

Egyptian *Lotos*. Fl. June, Sep. Clt. 1802. Pl. flt.

12 N. THERMA'LIS (D. C. syst. 2. p. 54.) leaves peltate, sharply-toothed, glabrous on both surfaces; auricles approximate. ♃. S. W. Native of Croatia in the hot river called Pecze, in water 19-28 degrees of Reaum. Therm. not far from Varasdin. N. Lòtus, Wald. et Kit. hung. 1. p. 13. t. 15.? Sims, bot. mag. t. 792. Castàlia mýstica, Sal. parad. no. 14. Flowers white, having a somewhat vinous odour.

Hot-water Water Lily. Fl. in its native country from the end of April; in England from June to Sept. Clt. 1802. Pl. flt.

13 N. A'MPLA (D. C. syst. 2. p. 54.) leaves peltate, sharply-toothed, quite glabrous on both surfaces, with the nerves on the under surface very prominent. ♃. S. W. Native of Jamaica, St. Domingo, Gulph of Mexico about Vera Cruz, Guiana, &c. in tranquil water. Castàlia ámpla, Sal. ann. bot. 2. p. 73. par. no. 14. N. Lòtus, Aubl. guian. 1. p. 533. Flowers white.

Var. β, *Rudgeàna* (Meyer. prim. esseq. p. 198.) This plant is distinguished from *N. Lòtus* by the leaves being minutely tubercled on the upper surface.

Ample-leaved Water Lily. Fl. June, Sept. Clt.? Pl. flt.

14 N. VERSI'COLOR (Roxb. hort. beng. p. 41.) leaves peltate, with the margin and between the recesses sinuately-toothed, full of pustules, glabrous on both surfaces. ♃. S. W. Native of Bengal in tranquil water. Sims, bot. mag. 1189. Flowers white, changing to red, and several of the outer petals are green, and furrowed on the back with green lines. This plant is multiplied by the tubers, which hang by a thread from the main root, which are about the size of a nut, and fall off from the mother plant with the fading of the leaves.

Party-coloured Water Lily. Fl. in England from July to Sept. in Bengal throughout the year. Clt. 1807. Pl. flt.

Sect. III. Casta'lia (*Castalia*, a fountain in Asia in the suburbs of Daphne.) D. C. syst. 2. p. 55. prod. 1. p. 115. Anthers not drawn out at the apex. Flowers white. Leaves cordate, not peltate, glabrous, quite entire.

15 N. RENIFO'RMIS (Walt. fl. carol. 155.) leaves kidney-shaped, stigmas 16-rayed. ♃. G. W. Native of Carolina. Nelúmbium renifórme, Willd. spec. 2. p. 1260. Cýamus renifórmis, Pursh. fl. amer. sept. 2. p. 398.—Deless. icon. sel. 2. t. 5. Flowers white, a little larger than those of *N. álba;* anthers yellow, as in the rest of this section.

Kidney-shaped-leaved Water Lily. Fl. July. Clt. 1823. Pl. flt.

16 N. A'LBA (Lin. spec. 729.) leaves cordate, quite entire; stigmas 16-rayed; rays ascending. ♃. H. W. Native throughout Europe in ditches, lakes, and rivers; plentiful in Britain. Smith engl. bot. 160. Fl. dan. 602. Schkuhr. handb. 2. t. 142, &c. Castàlia speciòsa, Sal. ann. bot. 2. p. 72. Seeds horizontal or deflexed; obovate, red. According to Linnæus, the flowers of this plant raise themselves out of the water, and expand about 7 o'clock in the morning, and close again, reposing upon the surface of the water, about 4 o'clock in the evening. The roots have a bitter astringent taste; they are used in Ireland, in the highlands of Scotland, and in the island of Jura, &c. to dye a dark brown or chesnut colour. Swine are said to eat it; kine and horses to refuse it. The flower, herb, and roots were formerly used in medicine, but are now become obsolete. It was reputed by the ancients as an antiphrodisiac, and as a remedy in dysentery, and some other morbid discharges; to the latter purpose its astringency might in some instances make it well suited.

Var. β, *mìnor* (Besl. hort. eyst. vern. ord. VII. t. 3. f. 1. Weim. phyt. 3. p. 456. t. 761. f. c.) ♃. H. W. Native of Alsace near Argentina; in Baden near Linkenheim, and Moscow near Gorenki. Every part of this plant is smaller than in the species.

Common *White* Water Lily. Fl. June, July. Britain. Pl. flt.

17 N. ODORA'TA (Ait. hort. kew. ed. 1. vol. 2. p. 227. ed. 2. vol. 3. p. 292.) leaves cordate, quite entire, with the nerves and veins on the under surface very prominent; stigmas 16-20-rayed; rays erect, inflexed at the top. ♃. H. W. Native of North America from Canada to Carolina; about Philadelphia at Glocester Point and in New Jersey; abundant about Quebec; in deep ditches and slow running rivers. Sims, bot. mag. t. 819. Andr. bot. rep. t. 297. Bigel. amer. med. bot. t. 55. N. álba, Walt. fl. carol. 155. This plant is very like *N. álba*, and has by many authors been confounded with it, but it is truly distinct. Flowers white, tinged with red, sweet-scented, expanding in the morning, but closing after meridian. The roots of this plant are amongst the strongest astringents of North America. When fresh, if chewed in the mouth, they are extremely stiptic and bitter. Their decoction instantly strikes a jet black colour with sulphate of iron, and yields a dense white precipitate to a solution of gelatin. Tannin and gallic acid are to be considered its most characteristic ingredients. The roots of this plant are kept by most of the apothecaries in North America, and are much used by the common people in the composition of poultices. They are no doubt often injudiciously applied to suppurate tumors, since their astringency must be rather a discutient than a promotive of suppuration. They are occasionally used by physicians in cases where astringent applications are requisite, and answer a purpose somewhat analogous to that of lead poultices and alum curds. The whole of the genus possess the same qualities.

Sweet-scented Water Lily. Fl. June, July. Clt. 1786. Pl. flt.

18 N. MI'NOR (D. C. syst. 2. p. 58.) leaves cordate, quite entire, with the nerves and veins very prominent on the under surface; peduncles and petioles rather purplish and rather pilose; stigmas 16-20-rayed. ♃. H. W. Native of North America about New York and in Canada. N. odorata β minor, Sims, bot. mag. t. 1652. β, ròsea, Pursh, fl. bor. amer. 2. p. 368. Flowers white, smaller than those of *N. odoràta*, rose-coloured on the outside.

Smaller-flowered Water Lily. Fl. July. Clt. 1812. Pl. flt.

19 N. NI'TIDA (Sims, bot. mag. t. 1359.) leaves cordate, quite entire; nerves not prominent on the under surface; petioles smooth; petals blunt; stigmas 12-20-rayed. ♃. H. W. Native of Siberia in lakes and in the river Lena, and in Dauria in still water. N. odoràta, Willd. hort. berl. t. 39. Like *N. odoràta* and *N. álba*. Root perpendicular. Flowers white, scentless, a little smaller than those of the above named species. Stamens yellow.

Shining-leaved Water Lily. Fl. June, July. Clt. 1809. Pl. flt.

20 N. PYGMÆ'A (Ait. hort. kew. ed. 2. vol. 3. p. 293.) leaves cordate, quite entire; nerves not prominent; petioles smooth; petals acute; stigmas 8-rayed. ♃. H. W. Native of China and eastern Siberia. Sims, bot. mag. 1525. Castàlia pygmæ'a, Sal. parad. t. 68. Flowers white, smelling like those of *Polánthus tuberòsus*. A small plant. Torus greenish-yellow.

Pygmy Water Lily. Fl. June, Sep. Clt. 1805. Pl. flt.

21 N. BLA'NDA (Meyer prim. fl. esseq. p. 201.) leaves cordate, quite entire, with the nerves on the under surface channelled; petals 16, acuminated. ♃. S. W. Native of Essequibo, in stagnant and slow running water. N. glandulífera, Rodsch. obs.

p. 76. Like *N. odoràta*, but is easily distinguished from it by the nerves of the leaves being channelled. Flowers white.

Bland Water Lily. Fl. July, Sep. Clt. 1820. Pl. flt.

22 N. ACUTI'LOBA (D. C. prod. 1. p. 116.) leaves ovate, somewhat toothed; lobes very acute; petals 16, acute; stigmas 16-rayed. ♃. S. W. Native of China.—Braam. icon. chin. t. 18.

Acute-lobed-leaved Water Lily. Pl. flt.

Cult. The stove species, or those from warm climates, may be grown in large pots, or pans of water placed in a warm part of the stove, with several inches of rich loamy soil in the bottom. They thrive well in a water-tight frame, placed on a hot-bed in the summer season, where we have seen them flower freely. The hardy species should be planted in ponds, cisterns, or canals, where they will make a fine appearance. They are all either increased by seeds, dividing the roots, or separating the tubes. Mr. Kent, formerly of Clapton, who cultivated exotic aquatics to great perfection, found that the bulbous-rooted *Nymphæ'as*, if checked in their growth for want of water, from cold or excessive heat, were apt to form bulbs at their roots, and cease growing for that season. Hence the necessity of a regular and powerful moist heat to make them flower freely.

V. NU'PHAR (from *naufar*, or *nyloufar*, the Arabic name of *Nymphæ'a*.) Sibth. and Smith, prod. fl. græc. 1. p. 361. D. C. syst. 2. p. 59. prod. 1. p. 116.

LIN. SYST. *Polyándria, Polygýnia.* Calyx of 5-6 petal-like sepals (f. 36. *a. b.*). Petals 10-18, much smaller than the sepals with their backs, melliferous. Stamens indefinite, which are, as well as the sepals and petals, inserted at the base of the torus (f. 36. *b.*), and therefore the berry appears as if it were superior. Stigmas 10-18, radiated (f. 36. *d.*). Carpels 10-18, inclosed within the torus. Elegant aquatic herbs. Rhizoma or trunk of root thick, horizontal. Petioles and peduncles smooth, rising a little above the water. Flowers yellow.

1 N. LU'TEA (Smith, prod. fl. græc. 1. p. 361.) calyx of 5-sepals; stigmas entire, 16-20-rayed, profoundly umbilicated; leaves oval-cordate; lobes approximate; petioles triquetrous, with acute angles. ♃. H. W. Native throughout the whole of Europe and Siberia, in ditches, lakes, and slow running rivers; also of North America between lat. 54° and 64°. Nymphæ'a lùtea, Lin. spec. 729. Fl. dan. t. 603. Smith, engl. bot. t. 159. Schrank. fl. mon. 1. t. 20 Schkuhr. handb. 2. t. 142. Nymphosánthus vulgàris, Rich. ann. mus. 17. p. 230. t. 9. f. 51 and 52. Sepals 5, very blunt. Petals much smaller, truncate, with their backs melliferous. Flowers smelling like brandy. Linnæus says that swine are fond of both the leaves and roots; that goats are not fond of them; and that kine, sheep, and horses refuse them, and also that crickets are driven out of houses by the smoke in burning the roots; they and cock-roaches are destroyed by the roots rubbed or bruised with milk.

Common *yellow* Water Lily. Fl. June, July. Britain. Pl. flt.

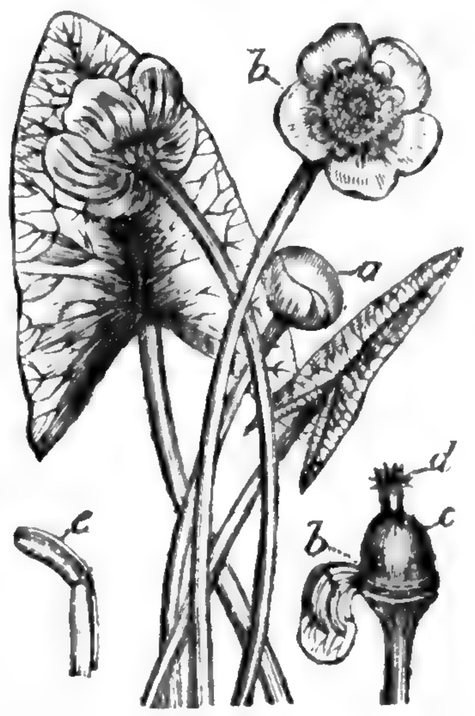
2 N. PU'MILA (Smith, engl. bot. t. 2292.) calyx of 5-sepals; stigmas lobed 10-rayed; leaves oblong-cordate, dotted, somewhat pubescent; lobes approximate; petioles semi-cylindrical at the base, but triquetrous at the top. ♃. H. W. Native of Germany, Lapland, and Norway, in slow running rivers, and mountain lakes; also in the mountain lakes of Scotland, especially in a lake at the foot of Ben Cruachan, Loch Lomond, and several other lakes. Nymphæ'a pùmila, Hoffm. fl. germ. 1800. p. 241. N. lùtea *β* mínima, Willd. spec. pl. 2. p. 1151. Nùphar mínima, Smith engl. bot. t. 2292. Plant one-half smaller than *Nup. lùtea.*

Dwarf yellow Water Lily. Fl. June, July. Scotland. Pl. flt.

3 N. KALMIA'NA (Ait. hort. kew. ed. 2. vol. 3. p. 295.) calyx 5-sepalled; stigmas toothed, 8-10-rayed; leaves cordate, somewhat emersed; lobes somewhat approximate; petioles nearly cylindrical. ♃. H. W. Native of North America throughout Canada and Carolina, and in Newfoundland, in ponds and ditches, but rare; about Philadelphia, near the Schuylkill. Nymphæ'a Kalmiàna, Sims, bot. mag. t. 1243. Nymphæ'a lùtea, Walt. carol. 154? Nymphæ'a lùtea *β*, Kalmiàna, Mich. fl. bor. amer. 1. p. 311. Nymphæ'a microphýlla, Pers. ench. 2. p. 63.

Kalm's yellow Water Lily. Fl. July, Aug. Clt. 1807. Pl. flt.

FIG. 36.



4 N. SERI'CEA (Langd. ex Spreng. syst. 2. p. 606.) calyx 5-sepalled? stigmas toothed; leaves cordate-oblong; lobes distant at the base; peduncles and petioles have a scaly-silky appearance. ♃. H. W. Native of the Danube.

Silky yellow Water Lily. Fl. June, July. Pl. flt.

5 N. JAPO'NICA (D. C. syst. 2. p. 69.) calyx of 5-sepals; stigma 15-16-rayed; leaves oblong-sagittate, cordate; auricles acute, rather distant; petioles nearly cylindrical ♃. G. W. Native of Japan in ponds. Nymphæ'a lùtea, Thunb. fl. jap. 223. exclusive of the synonyms, Deless. icon. sel. 2. t. 6. A plant between *N. lùtea* and *N. sagittæfòlia.* (f. 36.)

Japan yellow Water Lily. Fl. June, July. Pl. flt.

6 N. SAGITTÆFÒLIA (Pursh. fl. amer. sept. 2. p. 370.) calyx of 6 sepals; petals none; anthers nearly sessile; leaves sagittately-cordate, oblong, obtuse. ♃. H. W. Native of Carolina, Georgia, and Savannah, in slow running water. Nymphæ'a sagittæfòlia, Walt. fl. car. 154. Nymphæ'a longifòlia, Mich. fl. bor. amer. 1. p. 312. Nùphar longifòlia, Smith, in Rees's cycl. no. 5. Flowers small.

Arrow-leaved yellow Water Lily. Fl. July, Aug. Clt. 1820. Pl. flt.

7 N. A'DVENA (Ait. hort. kew. ed. 2. vol. 3. p. 295.) calyx of 6 sepals; petals many, small, shorter, never exceeding the stamens; pericarp furrowed; leaves erect, cordate; lobes divaricate. ♃. H. W. Native of North America from Canada to Carolina, in lakes, ponds, and ditches, even in salt-water; very plentiful about Philadelphia, and throughout Canada. Nymphæ'a ádvena, Ait. hort. kew. ed. 1. vol. 2. p. 226. Nymphæ'a arifòlia, Sal. ann. bot. 2. p. 71. Leaves and flowers rising considerably above the surface of the water.

Stranger yellow Water Lily. Fl. Jul. Aug. Clt. 1772. Pl. flt.

Cult. As the species of this genus are all hardy except one, the *N. Japónica*, which has not as yet been introduced into Europe, they may be planted in ponds, cisterns, canals, or lakes, where they will make a beautiful appearance, a rich loamy soil suits them best, and they are propagated either by dividing the roots or by seeds, which may be thrown into the water, wherever they are intended to remain.

COHORT II. Fruit solitary or connate. Placentas parietal, intervalvular. Calyx of 2-5 sepals. Petals 4-5, rarely more. Stamens numerous, but usually 5 or 6.

ORDER XI. SARRACE'NIEÆ (containing only the genus Sarracènia). De La Pylaie, in ann. de la soc. Lin. par. 6. p. 388. Hook, fl. bor. amer. p. 33.

Calyx of 5 permanent sepals (f. 37. *a.*) which are concave at the base and furnished with a 3-leaved involucrum just under it. Corolla of 5 petals which are contracted at the base, and unquiculate (f. 37. *b.*). Stamens numerous, hypogynous (f. 37. *c.*) closely packed together; filaments shortish; anthers fixed by

their back, oblong, 2-celled (f. 37. *c.*) opening upwards from the base, hardly to the apex. Ovary 1, large, globose, with 5 longitudinal furrows (f. 37. *f.*). Style columnar, crowned by a broad, convex, leafy, 5-angled stigma (f. 37. *d.*). Capsule globose, crowned by the permanent style and stigma, 5-lobed, 5-celled, 5-valved, many-seeded (f. 37. *f.*), valves separating from the apex. Placentas 5, one in each cell closely covered with seeds, progressing from the central axis. Seeds small, minutely tubercled (f. 37. *g.*). Embryo cylindrical, cleft at one extremity into 2 cotyledons, placed at the base of a copious waxy-granular albumen, with the radicle pointing towards the hilum. The seeds are keeled on their under side, inserted by their narrowest point upon a large club-shaped, stipitate receptacle, which stands out from the central column or axis into the middle of each cell. The valves of the capsule open from above between the cells, whose dissepiments are attached to the centre of each valve, and separate from the central axis of the column. Well known singular plants, inhabitants of the swamps of North America, remarkable for the singular form of their leaves, which are tubular and hold water, and some species have lids or covers, which it is alleged shrink and close over the mouth, so as to prevent the exhalation of the water. In dry weather birds resort to them for drink. Scapes always 1-flowered. Flowers large, nodding, greenish-yellow or dark purple. This order differs chiefly from *Papaveràceæ* and *Nymphiàceæ* in having a broad, peltate, leafy stigma, but it is still nearer to the former than the latter in the capsules being furnished with intervalvular placentas.

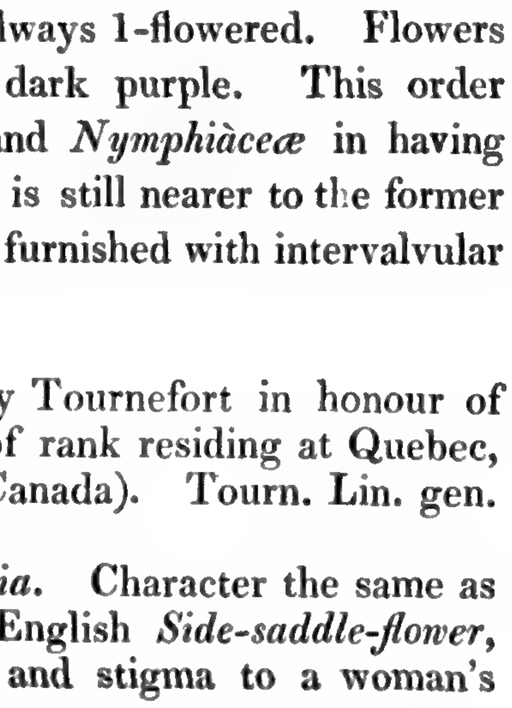
I. SARRACENIA (so named by Tournefort in honour of Dr. Sarrazin, a French physician of rank residing at Quebec, who sent this genus to him from Canada). Tourn. Lin. gen. no. 885.

Lin. syst. *Polyándria, Monogýnia.* Character the same as the order. The genus is called in English *Side-saddle-flower*, from the resemblance of the style and stigma to a woman's pillion.

1 S. purpu'rea (Lin. spec. 728.) leaves short, constricted at top, with the tube inflated and gibbous, and the lid or wing or helmet-like appendage, erect, broad-cordate, and sometimes emarginate. ♃. F. M. Native of North America in swampy places about Quebec, Lake Huron, and probably common throughout Canada, and as far north as Bear Lake and as far south as Carolina. Sims, bot. mag. 849. Mill. fig. 2. 241.—Cat. car. 2. t. 70. Flowers dark purple. Seeds reddish.

Purple-flowered Side-saddle-flower. Fl. Ju. Jul. Clt. 1646. Pl. 1 foot.

FIG. 37.



2 S. ru'bra (Walt. fl. car. 152.) leaves short, coloured upwards with netted veins; tube ending gradually in a somewhat arched, long, pointed appendage (f. 37. *i.*) ♃. F. M. Native of North America in the swamps of Georgia and Florida. Hook. exot. fl. 13. S. psittacìna, Mich. fl. bor. amer. 1. p. 311. Pursh, fl. amer. sept. 2. p. 368.—Pluk amalth. t. 152. f. 3.? Flowers on very long peduncles, purple. Leaves small, very handsomely marked with purple veins (f. 37.).

Red-flowered Side-saddle-flower. Fl. Ju. Jul. Clt. 1786. Pl. 1 ft.

3 S. fla'va (Mich. fl. bor. amer. 1. p. 310.) leaves straight, very long, funnel-shaped, with a spreading throat; appendage erect, constricted at the base, with the sides in the lower part bent backwards, and ending in an awl-shaped mucrone. ♃. F. M. Native of North America in open swamps from Virginia to Florida. Sims, bot. mag. 780. Andr. bot. rep. 381.—Catesb. car. 2. t. 69.—Pluk. amalth. t. 376. f. 5. Flowers yellow. This is the tallest growing species; the leaves are often 2 feet long.

Yellow-flowered Side-saddle-flower. Fl. June, July. Clt. 1752. Pl. 2 feet.

4 S. variola'ris (Mich. fl. bor. amer. 1. p. 310.) leaves elongated, their tube spotted on the back, ending in a short arched appendage. ♃. F. M. Native of North America in open swamps on a sandy soil from North Carolina to Florida. Sims, bot. mag. 1710. S. adúnca, Smith exot. bot. 1. t. 53. S. mìnor, Walt. car. 153. Flowers yellow. The transparent spots on the back of the leaf distinguish this species readily from the preceding, with which it has often been confounded.

Chequered Side-saddle-flower. Fl. Ju. Jul. Clt. 1803. Pl. 1 ft.

Cult. These singular and handsome plants are very desirable objects in the collections of the admirers of nature. They are all inhabitants of the swamps of North America, but will not stand in the open air in Britain. They should be kept in pots filled with turfy peat at the bottom, and the upper part with *Spágnum* or *water-moss* in which the plants must be set and then placed in pans of water; they succeed best in frames in a shady situation or in a stove. They also succeed very well if set in *Spágnum* in a frame without pots, but they always will require to be kept rather moist and well shaded. In this last way the sashes require to be almost always kept shut. There is no way known by which they can be increased in this country but by dividing the plants at the root. Most of the plants in the gardens have been imported from North America.

Order XII. PAPAVERA'CEÆ (plants agreeing with *Papàver* in many important characters.) Juss. gen. 236. excluding Fumariàceæ. D. C. syst. 2. p. 67. prod. 1. p. 117. Rhæàdeæ, Lin. ord. nat. ed. Gisel. 383.

Calyx of 2 deciduous sepals, inclosing the young flower (f. 38. *a.*), or calyptrate (f. 41. *f.*). Petals usually 4 (f. 38. *b.* f. 39. *a.* f. 41. *a.*), free, rarely wanting, usually regular; irregularly plaited before evolution. Stamens indefinite (f. 39. *b.* f. 40. *c.*), seldom definite, disposed in one or many series; filaments filiform; anthers 2-celled, inserted by their base, opening by 2-furrows. Ovary 1 (f. 38. *d.*) free, oblong, constantly of 2 or many carpels, clasped by a membranous production of the *Thalamus* (f. 38. *e.*). Style short or wanting. Stigmas-2-4 (f. 41. *c.*) 6, or numerous (f. 38. *c.*), usually stellately disposed on the top of the ovary (f. 38. *c.*). Capsules the same as the ovaries (f. 38. *d.* f. 39. *c.* f. 41. *d.*), with 2 (f. 39. *c.* f. 41. *e.*) or numerous, intervalvular, placentas, bearing seeds on both sides (f. 38. *e.*), adhering to the sides of the valves; but in the 2-valved silique-formed capsules, the seeds are born on the margins (f. 39. *c.* f. 41. *e.*), sometimes opening at the base, sometimes at the top, each cell or carpel usually ending in a permanent style or stigma. Seeds numerous (f. 38. *e.* f. 39. *c.*), rarely solitary from abortion, inserted in the intervalvular placentas, unless in silique-formed capsules; nearly globose, destitute of aril except *Boccònia.* Embryo small, placed in the base of a fleshy oily albumen; cotyledous ovate-

oblong, flat on one side, and convex on the other.—Annual, perennial, or suffruticose herbs, yielding white, yellow, copper-coloured or blood-like juice. Roots fibrous. Leaves alternate, simple, sessile or stalked, usually dilated at the base, and half-stem-clasping, feather-nerved, generally pinnate-lobed, never truly entire, often glaucous. Peduncles axillary and terminal, 1-flowered, naked, inflexed before the expansion of the flower, usually solitary, distant, sometimes approximating in a panicle. Flowers very fugacious, usually large, white, yellow, red, or purple, but never truly blue. This order is intermediate between *Nymphiàceæ* and *Ranunculàceæ*, but differs from both in having intervalvular placentas. *Sanguinària* comes near to *Podophyllàceæ*. *Chelidònium* and *Hypécoum* to *Fumariàceæ* and *Crucíferæ*, but from all these orders they are easily distinguished by the above characters.

The plants of this order are better known for their medicinal qualities than for their beauty. *Sanguinària* is a neat little plant, well known for its crimson juice, and the emetic, purgative and anthelmintic powers of its roots. The peculiar narcotic power of the poppy is well known, a property which pervades the whole order, although in a less intense degree in all than in *Papàver somníferum*, from which, exclusively, the drug opium is obtained. The Mexicans use the expressed seed of *Argemòne Mexicàna* for polishing furniture. The seeds of the plants of this order are easily introduced in a living state from any part of the world, as they retain their vegetative power a considerable time.

Synopsis of the Genera.

1 PAPA'VER. Petals 4 (f. 38. *b.*). Stamens indefinite. Style wanting. Stigmas 4-20, radiating, sessile, connected, crowning the top of the ovarium (f. 38. *c.*). Capsules obovate (f. 38. *d.*).

2 ARGEMO'NE. Petals 4-6. Stamens indefinite. Style almost wanting. Stigmas 4-5, radiating, concave, free. Capsule obovate, prickly, 4-5-valved.

3 MECONO'PSIS. Petals 4. Stamens indefinite. Style short. Stigmas 5-6, radiating, convex, free. Capsule obovate, smooth, 5-6-valved.

4 STYLO'PHORUM. Petals 4. Stamens indefinite. Style long. Stigma 4-lobed. Capsules obovate, echinated, 4-valved.

5 HUNNEMA'NIA. Petals 4 (f. 39. *a.*). Stamens indefinite. Stigma peltate, 4-furrowed, slightly 4-lobed. Capsules silique-formed, rather compressed, 10-ribbed, 1-celled, 2-valved (f. 39. *c.*).

6 SANGUINA'RIA. Petals 8-12. Stamens 24. Stigmas 2. Capsule oblong, 2-valved.

7 BOCCO'NIA. Petals wanting. Stamens 8-24. Stigmas 2. Capsules elliptical, 1-seeded. Seed inwrapped in soft pulp.

8 MACLE'AYA. Petals wanting. Stamens 8-24 (f. 40. *c. b.*). Capsules many-seeded. Seeds inwrapped in soft pulp.

9 ESCHSCHO'LZIA. Petals 4 (f. 41. *a.*). Stamens indefinite. Stigmas 4, 2 short and 2 long (f. 41. *c.*). Capsules elongated, silique-formed (f. 41. *d.*), 2-valved (f. 41. *e.*), 1-celled. Calyx calyptrate (f. 41. *f.*). Receptacle expanded (f. 41. *b.*).

10 RÖME'RIA. Petals 4. Stamens indefinite. Stigma 1. Capsules elongated, 3-4-valved, 1-celled.

11 GLAU'CIUM. Petals 4. Stamens indefinite. Stigma bilamellate. Capsules elongated, 2-valved, and 2-celled from the cellular dissepiment. Seed without a glandular crest.

12 CHELIDÒNIUM. Petals 4. Stamens indefinite. Capsules elongated, 2-valved, 1-celled. Stigma 2-lobed. Seeds furnished with a glandular crest.

13 HYPE'COUM. Petals 4, inner ones usually 3-lobed. Stamens 4. Stigmas 2. Capsules elongated, 2-valved, knotted or jointed transversely.

I. PAPA'VER (from *papa*, pap, or thick milk; or *pappo*, to eat of pap. The juice of the poppy was formerly used in children's food to make them sleep, and in some parts of Holland they still use the seeds to produce the same effect. From *papa* the Latins changed the name of it to *Papaver*, the Anglo-Saxons to *Papig*, the English to *Poppy*, and the French to *Pavot.*) Tourn. inst. 237. t. 119. Lin. gen. no. 648. Schreb. gen. 881. Gært. fruct. 1. p. 289. t. 60. Juss. gen. 236. Lam. ill. t. 51.

LIN. SYST. *Polyándria, Polygýnia.* Sepals 2, convex, deciduous (f. 38. *a.*). Petals 4 (f. 38. *b.*). Stamens indefinite. Style none. Stigmas 4-20, radiating, sessile, crowning the disk at the top of the ovary (f. 38. *c.*). Capsules obovate (f. 38. *d.*), 1-celled, constantly with 4 to 20, carpels inclosed in a membranous production of the thalamus (f. 38. *e.*), opening by short valves under the crown or the stigmas. Placentas drawn out on the inside into incomplete dissepiments, one in the centre of each valve. Seeds reniform. Perennial or annual herbs, usually pilose, and a white juice flows from them in every part when cut. Leaves pinnately lobed or cut; lobes generally cut, and their teeth are usually terminated by a hair. Peduncles axillary, solitary, 1-flowered, naked, inflexed before the expansion of the flower. Flowers erect, white, red, yellow or variegated.

§ 1. *Capsules hispid. Scapes radical.*

1 P. NUDICAU'LE (Lin. spec. 725.) capsules hispid, obovate-oblong; sepals beset with bristles; peduncles radical, very long; leaves pinnately-lobed; lobes toothed or cut, acute. ♃. H. Native of Eastern Siberia, in the province of Argunskoi; in the Altaian Alps, and in Dauria at the rivers Jngoda and Schilka; also in barren grounds of North America, from lat. 64° to lat. 69°. every where upon the shores throughout the whole breadth of the continent and in the islands. Sims, bot. mag. t. 1633.—Dill. hort. elth. 302. t. 224. f. 291. Petals yellow, rarely white. Stigmas 6-12.

Var. β, glabràtum (D. C. syst. 2. p. 70. prod. 1. p. 118.) ♃. H. Native of Eastern Siberia. Leaves and scapes nearly smooth.

Var. γ, radicàtum (D. C. l. c.) ♃. H. P. nudicaûle, Oed. fl. dan. t. 41. P. radicàtum, Rottb. ex Horn. in litt. Native of Norway, rare; Greenland, and Unalaschka. A small very hairy plant, with a distinct habit, but without character.

Naked-stemmed Poppy. Fl. June, Aug. Clt. 1730. Pl. ½ ft.

2 P. RUBRO-AURANTI'ACUM (Fisch. in litt. bot. mag. t. 2344.) capsules hispid, obovate-oblong; sepals bristly; peduncles radical, very long, covered with appressed hairs; leaves pinnately lobed; lobes cut, lobules terminated by a bristle. ♃. H. Native of Dauria. P. nudicaûle δ, rubro-aurantìacum, D. C. l. c.

Red-orange-flowered Poppy. Fl. June, Aug. Clt. 1822. Pl. ½ ft.

3 P. MICROCA'RPUM (D. C. syst. 2. p. 71.) capsules hispid,

obovate-globose; sepals pilose; peduncles radical; leaves pinnately-lobed; lobes cut or toothed, acutish. ♃. H. Native of Kamschatka. A species between *P. nudicaúle* and *P. Pyrenàicum*, but distinguished from them in the capsules being small obovate-globose. Flowers small, of a copper-colour. Stigmas 4.

Small-capsuled Poppy. Fl. Ju. Aug. Clt. 1822. Pl. ¼ to ½ ft.

4 P. PYRENA'ICUM (Willd. enum. 563.) capsules hispid, obovate; sepals bristly; peduncles radical; leaves pilose, pinnately-lobed; lobes cut or toothed, bluntish. ♃. H. Native of the south of Europe, on calcareous mountains, among rocks and stones in sunny places, Pyrenees, Mount Baldo, Italy, Cevennes. Stigmas usually 4.

Var. a, lùteum (D. C. syst. 2. p. 71.) ♃. H. Argemòne Pyrenàica, Lin. spec. 728. P. aurantìacum, Lois. not. 84. P. suavèolens, Lapeyr. suppl. 72.—Barrl. icon. t. 764. P. alpìnum, Gouan. hort. 253. Vill. daup. and All. ped. Lapeyr, pyr. abr. 296. Flowers yellow or citron-coloured, sweet-scented.

Var. β, puniceum (D. C. syst. 2. p. 72.) ♃. H. P. Pyrenàicum, Willd. enum. 563. P. alpìnum β, Lapeyr. abr. 296. Native of the Pyrenees at a place called Port-de-Plan. Flowers scarlet, with a yellow spot at the base of each petal.

Pyrenean Poppy. Fl. June, Aug. Clt.? Pl. ¼ to ½ foot.

5 P. ALPI'NUM (Lin. spec. 725.) capsules hispid, obovate-oblong; sepals rather pilose; peduncles radical; leaves smoothish, bipinnate, with fine acutish lobules. ♃. H. Native of the higher Alps in sunny places, among rocks and stones in Austria. Carinthia, Carniola and Switzerland, &c. Jacq. fl. austr. t. 83. Sweet, fl. gard. t. 247. P. Bursèri, Crantz. austr. 2. p. 132. t. 6. f. 4. Petals white, nearly orbicular, each furnished with a greenish-brown claw. Stigmas 5-6.

Alpine Poppy. Fl. Ju. to Aug. Clt. 1759. Pl. ¼ to ½ foot.

§ 2. *Capsules hispid. Stem leafy.*

6 P. HY'BRIDUM (Lin. spec. 725.) capsules hispid, obovate-globose, torose; sepals pilose; stem leafy, many-flowered; leaves pinnate; lobes multifid, linear. ⊙. H. Native throughout Europe, a pest in cultivated fields. Smith, engl. bot. t. 43. P. hispidum, Lam. fl. fr. 3. p. 147. Flowers small, scarlet, each petal with a dark claw. Stigmas 5-8.

Hybrid Corn Poppy. Fl. June, July. Britain. Pl. 1 foot.

7 P. ARGEMO'NE (Lin. spec. 725.) capsules hispid, club-shaped, elongated; sepals smoothish; stem leafy, many-flowered; leaves bipinnate; lobes linear. ⊙. H. Native throughout Europe in sandy places and cultivated fields. Smith, engl. bot. t. 643. Oed. fl. dan. t. 867. Curt. fl. lond. 5. t. 38. Schkuhr. handb. 2. p. 69. t. 140. P. clavígerum, Lam. fl. fr. 3. p. 175. Petals pale scarlet, with a black spot at the base of each. Stigmas 4-6.

Var. β, uniflòra; stem 1-flowered. P. marítima, With. brit. 486.

Argemone-like Corn Poppy. Fl. May, July. Britain. Pl. 1 f.

§ 3. *Capsules smooth* (f. 38. *d.*), *or at the top alone a little pilose.*

8 P. DU'BIUM (Lin. spec. 726.) capsules smooth, obovate; sepals pilose; stem many-flowered, hispid with spreading bristles; bristles on the peduncles appressed; leaves pinnate-parted; lobes deeply-toothed. ⊙. H. Native of sandy and cultivated fields throughout the whole of Europe. Smith, engl. bot. t. 644. Schkuhr. handb. 2. p. 69. t. 140. Oed. fl. dan. 902. Schrank. fl. mon. 3. t. 229. P. parviflòrum, Lam. fl. fr. 3. p. 173. Flowers small, deep-scarlet. Stigmas 4-6.

Var. β. flore-albo (Balb. fl. taur. 85. P. dùbium, Jacq. fl. austr. 1. p. 17. t. 25.) Native of Tauria and Austria. Flowers white, with the claws of the same colour or darker. A species between *P. Argemòne* and *P. Rhœ'as*. Flowers varying from intense scarlet to a pale red and even white, furnished with a blackish or self-coloured claw.

Doubtful Corn Poppy. Fl. Ju. Jul. Britain. Pl. 1 to 2 ft.

9 P. OBTUSIFO'LIUM (Desf. atl. 1. p. 407.) capsules smooth, obovate; sepals pilose; stem few-flowered, somewhat hispid with spreading bristles; leaves bipinnate-parted; lobules ovate. ⊙. H. Native of the North of Africa near Belida. Like *P. dùbium*, but the capsules are one half shorter. Flowers rose-coloured, about the size of those of *P. Argemòne*. Stigmas 8-10.

Blunt-leaved Corn Poppy. Fl. Ju. Jul. Clt. 1828. Pl. 1 ft.

10 P. RHŒ'AS (Lin. spec. 726.) capsules smooth, obovate; sepals pilose; stem many-flowered, scabrous with spreading bristles; leaves pinnate-parted; lobes elongated, deeply-toothed, acute. ⊙. H. Native throughout Europe, North of Africa, and Asia; very common and a great pest in corn fields, imported with wheat. Smith, eng. bot. t. 645. Curt. fl. lond. 3. t. 32. Woodv. med. bot. 512. t. 186. Flowers varying from scarlet to flesh-coloured and white, with or without a spot at the base, and scarlet with white margins, and white with scarlet margins, double, and semi-double. Being a very common weed it has many provincial names in English, besides its more classical ones of *Corn Poppy, Red* and *Scarlet Poppy, Corn Rose, Cop Rose, Cup Rose, Canker* or *Canker Rose, Red-weed, Head-wark*, &c. The petals of this plant give a fine red colour when infused, and are supposed to possess slightly anodyne qualities. The young plants are admitted among esculents in Occitania, and the juice of the capsules as a succedaneum for opium. An extract from them has been successfully employed as a sedative; and some foreign practitioners even prefer this extract to opium. The flowers and tops are enumerated among the narcotics. Ροιας signifies a wild poppy.

Rhœas or Common Corn Poppy. Fl. June, July. Britain. Pl. 1 foot.

11 P. TRI'LOBUM (Spreng. fl. hal. suppl. D. C. prod. 1. p. 119.) capsules smooth, roundish; sepals pilose; stem many-flowered, smooth; leaves cuneated at the base, 3-lobed at the top. ⊙. H. Native of Halle in corn-fields. Like *P. Rhœ'as*, but will be found to be sufficiently distinct by comparing the characters. Flowers small, red. Stigmas 6-7.

Three-lobed-leaved Corn Poppy. Fl. Ju. Jul. Clt. 1827. Pl. 1 ft.

12 P. LÆVIGA'TUM (Bieb. suppl. p. 364.) capsules smooth, obovate; sepals smooth; stem 1 or few-flowered, nearly smooth; leaves profoundly pinnatifid; lobes entire, linear, acute. ⊙. H. Native on hills about Odessa, and of Caucasus. P. glabéllum, Steven, ined. Flowers small, red, size of those of *P. dùbium*. Stigmas 6-7.

Smooth Corn Poppy. Fl. June, Jul. Clt. 1823. Pl. 1 foot.

13 P. ROU'BIÆI (Vig. diss. 39. no. 4. t. 1. f. 1. good) capsules smooth, roundish; sepals pilose; stem many-flowered, pilose; leaves bipinnate-parted, villous; lobes linear, terminated by a hair. ⊙. H. Native of sandy places near Montpelier. Like *P. Rhœ'as*, but distinct from the leaves being bipinnate-parted, and a truly distinct habit. Plant scarcely ½ foot high. Flowers like those of *P. Rhœ'as*, but of a paler red. Stigmas 7-8.

Roubieu's Corn Poppy. Fl. Ju. Jul. Clt. 1823. Pl. ½ ft.

14 P. ARENA'RIUM (Bieb. suppl. p. 364.) capsules oblong, smooth, or with very few bristles; sepals hispid; leaves bipinnatifid; segments linear; stem many-flowered, covered with spreading bristles, those on the peduncles appressed, all caducous. ⊙. H. Native of Caucasus in sandy fields at the river Terek. Corolla red, with a dark bottom.

Sand Corn Poppy. Fl. June, July. Clt. 1828. Pl. 1 foot.

15 P. FLORIBU'NDUM (Desf. choix. cor. 62. t. 46.) capsules smooth, oblong; sepals pilose; stem many-flowered, hispid; leaves rather pilose, lower ones pinnate-parted, upper ones pin-

natifid; lobes cut, lobules each terminated by a bristle. ⊙. H. Native of Armenia. Ker. bot. reg. t. 134. P. virgàtum, Smith, in Rees' cycl. no. 9. Plant glaucous and hispid with spreading, stiff, bristle-like, yellowish hairs, branching. A splendid branching species, with numerous red flowers. Stigmas 5-6.

Abundant-flowered Poppy. Fl. Ju. Jul. Clt. 1815. Pl. 1 ft.

16 P. HO'RRIDUM (D. C. syst. 2. p. 79.) capsules smooth, elliptic; sepals hispid; stem few-flowered, hispid with stiff bristles; leaves somewhat stem-clasping, glaucous, sinuately pinnatifid; lobules bristly at the top of the nerves. ⊙. H. Native of New Holland. Deless. icon. sel. 2. t. 6. Sweet, fl. gard. t. 173. Like *P. setígerum*. Flower of a brick-colour. The whole plant is covered with bristles except the capsules. Stigma 8-rayed.

FIG. 38.

Horrid or New Holland Poppy. Fl. Ju. Jul. Clt. 1825. Pl. 1 ft.

17 P. GARIEPI'NUM (Burch, cat. geogr. pl. afri. austr. no. 1633.) capsules smooth, obovate-oblong; sepals bristly; stem many-flowered, rough, with innumerable bristles; leaves sessile, hispid, sinuately-pinnatifid; lobes distant, ovate. ⊙. H. Native of South Africa at the river Gariep or Orange-river. Like *P. hórridum*. Petals of a scarlet-orange colour. Stigmas 8-rayed.

River *Gariep* Poppy. Fl. Jul. Aug. Pl. 3-4 feet.

18 P. ORIENTA'LE (Lin. spec. 727.) capsules smooth, somewhat globose; sepals pilose; stem 1-flowered, scabrous, and leafy; leaves pinnate-parted, hispid; lobes oblong, serrated. 2. H. Native of Armenia about Erzerum. Curt. bot. mag. t. 57. P. grandiflòrum, Mœnch. meth. 247. P. spectábile, Sal. prod. 377. This beautiful plant is very frequent in gardens, where it is a great ornament. Flowers large, one on each stem, of an intense scarlet or blood-colour, usually furnished with a dark-purple mark at the bottom of each petal. A double flowering variety is sometimes seen in the gardens. Calyx generally of 3 sepals as in *Argemòne*, not as in the rest of *Papàver*, of 2 sepals. Stigmas usually 12, violet. The green heads of this plant are eaten by the Turks, although they possess an unpleasant, acrid, and somewhat stinging taste. This may probably be the species that yields the Turkey opium?

Oriental Poppy. Fl. May, June. Clt. 1714. Pl. 2-3 feet.

19 P. BRACTEA'TUM (Lindl. coll. t. 23.) flowers furnished with bracteas, 4-5 petalled; capsules smooth, obovate; sepals pilose; stem simple, 1-flowered, scabrous and leafy; leaves and bracteas pinnate-parted, hispid; lobes oblong, serrated. 2. H. Native of Caucasus near Mount Beschtau, and on the sides of mountains. Very like *P. orientàle*, but truly distinct, from the hairs of the calyx and peduncles being appressed, not spreading, also from its flowering a little earlier. Ker. bot. reg. t. 658. P. pulchérrimum, Fisch. in litt. Sepals usually 3, as in *P. orientàle*. This is the most splendid of all the poppies, and is one of the greatest ornaments of borders when in flower. Flowers large, scarlet, one on the top of each stem, usually with a dark mark at the bottom of each petal; stigmas 12-16, violet.

Bracteate-flowered Poppy. Fl. May, June. Clt. 1817. Pl. 3 to 5 feet.

20 P. PILO'SUM (Smith, fl. græc. t. 492.) capsules smooth, obovate; sepals pilose; stem many-flowered, hairy, with spreading pili; leaves stem-clasping, cut, pilose on both surfaces. 2. H. Native of Bithynia on Mount Olympus. Plant about the size of *P. somníferum*, but pale green, not glaucous, also the flowers are about the same size, of a pale lurid-scarlet, or of an intense orange colour, with a white mark at the bottom of each petal. Stigmas 6-8.

Pilose Poppy. Fl. July. Pl. 2 to 3 feet.

21 P. SETI'GERUM (D. C. fl. fr. 5. p. 585.) capsules smooth, obovate; sepals rather setose; stem smooth, few-flowered; leaves stem-clasping, glaucous, inciso-repand, each tooth terminated by a bristle. ⊙. H. Native of the Stœchades Islands. Deless. icon. sel. 2. t. 7. Sweet, fl. gard. t. 172. Perhaps this is only the wild plant of *P. somníferum, var. nigrum*, which it very much resembles. Flowers of a violet colour or whitish. Stigmas 6-8-rayed.

Bristle-bearing Poppy. Fl. May, Aug. Clt. 1824. Pl. 1 to 2 ft.

22 P. SOMNI'FERUM (Lin. spec. 736.) capsules obovate or globose, and are as well as the calyx smooth; stem smooth, glaucous; leaves stem-clasping, repand-toothed; teeth bluntish. ⊙. H. Native of the Morea, Egypt, Asia, Europe from Portugal to Petersburgh, in fields, Japan, Mauritius, &c. &c. Lam. ill. t. 451. Smith, fl. græc. t. 491.

Var. α, nìgrum (D. C. syst. 2. p. 82. prod. 1. p. 120.) capsules globose opening by holes under the stigmas; seeds black; peduncles many. Bull. herb. t. 57. Petals usually purple, sometimes white, and therefore it is perhaps referable to the oleiferous plant called *Œilette*. The seed of this variety is commonly called Maw-seed.

Var. β, álbum (D. C. l. c.) capsules ovate-globose, not opening by holes under the stigmas; peduncles solitary; seeds and petals white. Woodv. med. bot. t. 185. Smith, engl. bot. 2145.

A very variable plant about 3 or 4 feet high, very common in fields and gardens. The flowers are either single, semi-double or double, in variety β, white or red, with petals sometimes fringed, in variety α, purple, rose, or lilac, variegated and edged with the same colours, never blue nor yellow, nor mixed with these colours, generally with a black or purple mark at the bottom of each petal. Petals either entire, toothed, or fringed. Seeds black in the plants with purple flowers, white in those with white flowers, but the plant which grows spontaneous about Petersburgh has white flowers and black seeds. From the white-seeded variety, and probably from both, opium is obtained from the heads by incision and sometimes by expression. There is also an esculent oil obtained from the seeds of both varieties by expression. According to Linnæus a capsule of *Papàver somníferum* contained 32,000 seeds.

Papàver Somníferum is originally a native of the warmer parts of Asia, but is sometimes found apparently wild in Britain. It is often cultivated in gardens for the variety and beauty of its blossoms as well as for its seeds. Many attempts have been made in this country to obtain opium from its capsules, and Mr. Ball obtained a premium from the Society of Arts for specimens of British opium, in no respect inferior to the best eastern opium. Mr. Young, a respectable surgeon in Edinburgh, has also obtained it of excellent quality and in considerable quantity. But we apprehend the climate, besides the destruction by insects, is an insuperable obstacle to its becoming a profitable branch of horticulture in Britain. It was very early cultivated in Greece, perhaps at first solely for the sake of its seed, which was used as food. It is extensively cultivated in most of the states of Europe in the present age, not only on account of the opium, for which it is reared in Turkey, Persia, and India, but also on account of the capsules and of the bland oil obtained from the seeds. All the parts of the poppy abound in a narcotic milky juice, which is partially extracted, together with a considerable quantity of mucilage by decoction. The liquor is strongly pressed out, suffered to settle, clarified with white of eggs and evaporated to a due consistence, yields about one-fifth or one-sixth of the weight of the heads of extract, which possesses the virtues of opium in a very inferior degree, and does not come to this country unless

when used to adulterate the genuine opium. The heads are gathered as they ripen, and as this happens at different times, there are annually three or four gatherings. They are brought to market in bags, each containing about 3000 heads and sold to the druggists. The London market is chiefly supplied from Mitcham in Surrey. The heads or capsules possess anodyne properties; they are chiefly employed boiled in water, as fomentations to inflamed and ulcerated surfaces, and the syrup prepared from them with inspissated decoction, is used as an anodyne for children, and to allay the tickling cough in chronic catarrh and phthisis. A strong decoction of the dried heads, mixed with as much sugar as is sufficient to reduce it to the consistence of a syrup, becomes fit for keeping in a liquid form, and is the only officinal preparation of the poppy. It is, however, a very unequal preparation, as the real quantity of opium it contains is very uncertain; as a medicine it is by no means equal to syrup, to which a certain quantity of solution of opium is added. The seeds of the poppy are simply emulsive, and contain none of the narcotic principle. They yield a considerable quantity of oil by expression.

The milky juice of the poppy in its more perfect state, which is the case in warm climates only, is extracted by incisions made in the capsules and inspissated; and in this state forms the opium of commerce. The mode of obtaining it seems to have been nearly the same in the time of Dioscorides, as is at this day adopted. The plants, during their growth, are carefully watered and manured, the watering being more profuse as the period of flowering approaches, and until the capsules are half grown, when it is discontinued, and the collection of the opium commences. At sunset longitudinal incisions are made upon each half-ripe capsule, passing below upwards and not penetrating to the internal cavity. The night dews favour the exudation of the juice, which is collected in the morning by women and children, who scrape it from off the wounds with a small iron scoop, and deposit the whole in an earthen pot, where it is worked by wooden spatules in the sunshine, until it attains a considerable degree of thickness. It is then formed by the hand into cakes which are laid in earthen basins to be further exsiccated, when it is covered over with poppy or tobacco leaves. Such is the mode followed in India, and according to Kæmpfer's account, nearly the same is practised in Persia; and when the juice is drawn in a similar manner in this country, and inspissated, it has all the characters of pure opium.

Two kinds of opium are found in commerce, distinguished by the names of Turkey and East Indian opium. The Turkey opium is a solid compact perfectly transparent substance, of moderate specific gravity, possessing a considerable degree of tenacity, yet somewhat brittle, if half cut through; the section dense and a little shining; of a dark brown colour, becoming softer by the heat of the fingers, with difficulty reduced to powder, unless in the cold, after having been long dried in small pieces. Powder of a light brown, and readily plastic when baked together; when moistened marking on paper a light brown interrupted streak, scarcely colouring the saliva when chewed, at least only tinging it of a greenish colour, and rendering it frothy, exciting at first a nauseous bitter taste, which soon becomes acrid with some degree of warmth, and having a peculiar disagreeable smell. The best kind of opium is in flat pieces; and besides the large leaves in which they are enveloped, they are covered with the reddish capsules of a species of *Rumex* used in packing it. The round masses which have none of the capsules adhering to them are evidently inferior in quality. Opium is bad if it is soft or friable, mixed with any impurities, have an intensely dark or blackish colour, a weak smell, a sweetish taste, or draws upon paper a brown continuous streak. The East Indian opium has much less consistence, being sometimes not thicker than tar, and always ductile. Its colour is much darker; its taste more nauseous and less bitter, and its smell rather empyreumatic. When imported it is considerably cheaper than Turkey opium, and is supposed to be only half the strength. One-eighth of the weight is allowed for the enormous quantity of leaves with which it is enveloped. In the East Indies when opium is not good enough to bring a certain price, it is destroyed under the inspection of public officers. No opium of this kind is now brought to Europe. Mr. Ker relates that at Bahar it is frequently adulterated with cow-dung, the extract of the poppy procured by boiling and various other substances. In Malava it is mixed with oil of *Sésamum*, which is often one half of the mass; ashes and dried leaves of the plant are also used. It is also adulterated with the aqueous extract of the capsules; the extracts of *Glaúcium lùteum*, *Lactùca viròsa* and *Glycyrrhìza glàbra*, and sometimes with gum arabic, tragacanth, aloes, and many other articles.

The action of opium on the living system has been the subject of the keenest controversy. Some have asserted that it is a direct sedative, and that it produces no stimulant effects whatever; while others have asserted as strongly that it is a powerful and highly diffusible stimulus, and that the sedative effects which it undeniably produces are merely the consequences of previous excitement. The truth appears to be that opium is capable of producing a certain degree of excitement, while the sedative effects which always succeed are incomparably greater than could be produced by the previous excitement. The stimulant effects are most apparent from small doses. These increase the energy of the mind, the frequency of the pulse, and the heat of the body, excite thirst, render the mouth dry and parched, and diminish all the secretions and excretions, except the cuticular discharge, which they increase. These effects are succeeded by languor and lassitude. In larger doses the stimulant effects are not so apparent, but the excitability is remarkably diminished, and confusion, vertigo, and sleep are produced. In excessive doses it proves a violent narcotic poison, exciting headach, vertigo, delirium, and convulsions, accompanied with a very slow pulse, stertorous breathing, and a remarkable degree of insensibility or stupor, terminated by apoplectic death. The effects of an overdose are best counteracted by the exhibition of repeated doses of diffusible stimuli, and chiefly by not permitting the person to yield to his desire of sleeping. A solution of an alkaline carbonate should also be injected to decompose the opium and render the morphia insoluble. The exhibition of a powerful emetic, and for this purpose sulphate of zinc or sulphate of copper dissolved in water should be immediately swallowed, and the vomiting kept up for a considerable time and urged by irritation of the fauces. Large draughts of vinegar and water or other acidulated fluids should afterwards be frequently taken, and the powers of the habit supported by brandy, coffee, and cordials. Currie recommends the affusion of warm water at 106 degrees for the removing the drowsiness. By habit the effects of opium on the body are remarkably diminished. There have been instances of four grains proving fatal to adults, while others have been known to consume as many drachms daily. The habitual use of opium produces the same effects with habitual dram-drinking; tremors, paralysis, stupidity, and general emaciation; and like it can scarcely ever be relinquished. In disease, opium is chiefly employed to mitigate pain, diminish morbid sensibility, procure sleep, allay inordinate actions, and to check diarrhœa and other excessive discharges. It is contra-indicated in gastric affections, plethora, a highly inflammatory state of the body, and determination of the blood to particular viscera.

The Turks call opium *afioni*, and in the *teriakihana* or opium shops of Constantinople they take it in graduated doses from 10 grains to 100 grains in a day. It is mixed with rich syrup and the inspissated juices of fruit to render it more palatable and

less intoxicating, and is taken with a spoon or made up into lozenges, stamped with the words *Mash Allah*, literally meaning "The work of God." The Tartar couriers, who travel great distances, and with astonishing rapidity, take nothing else to support them during their journeys (Dall. const. p. 78.). There is, however, some reason to suppose that the *Mash Allah* or *Maslash* of the Turks contains other narcotics, as those of *hemp* *Lòlium temuléntum*, as well as *opium*.

The use of opium for the purpose of exhilarating the spirits, has long been known in Turkey, Syria, and China, and of late years it has been unfortunately adopted by many, particularly females, in this country. Russel says that in Syria, when combined with spices and other aromatics, he has known it taken to the amount of three drachms in 24 hours. Its habitual use cannot be too much reprobated. It impairs the digestive organs, consequently the vigour of the whole body, and destroys also gradually the mental energies. The effects of opium on those addicted to its use, says Russel, are at first obstinate costiveness, succeeded by diarrhœa and flatulence, with the loss of appetite and a sottish appearance. The memories of those who take it soon fail, they become prematurely old, and then sink into the grave objects of scorn and pity. Mustapha Shatoor, an opium-eater in Smyrna, took daily 3 drachms of crude opium. The visible effects at the time were the sparkling of his eyes and great exhilaration of spirits. He found the desire of increasing his dose growing upon him. He seemed twenty years older than he really was; his complexion was very sallow, his legs small, his gums eaten away, and his teeth laid bare to the sockets. He could not rise without swallowing half a drachm of opium. (Phil. trans. xix. p. 289.)

M. Sertuerner infused four ounces of powdered opium in repeated portions of cold distilled water, and filtered the solution through cloth. It was evaporated in a glass vessel, with a gentle heat, to 8 ounces; which, after standing 8 days, deposited 6 grains of sulphate of potass. The remaining fluid was diluted with distilled water, and yielded a flocculent precipitate on the addition of caustic ammonia, which, after being washed successively with sulphuric ether, caustic ammonia, and alcohol, yielded 3 drachms of a fine brownish-white powder, to which M. Sertuerner gave the name of Morphium, now Morphia, and which may be further purified by solution in boiling alcohol. It seemed to be perfectly free from ammonia yet it possessed all the characteristics of genuine alkali, colouring rhubarb brown and fernambuc violet, and forming neutral salts with acids. It has a peculiar bitter astringent taste, and its solution leaves a red stain on the skin. Its crystals are very obtuse, single or double pyramids, with a square or long rectangular base, or prisms with trapezoid base. It dissolves in 82 parts of boiling water, from which it crystallizes on cooling; in 36 of boiling and 42 of cold alcohol, and in 8 of sulphuric ether. The fluid from which the Morphia was precipitated, after being heated to 120° Fah. to expel the ammonia, was filtered, and a solution of muriate of barytes or of acetate of lead, added as long as there was any precipitate. The white precipitate, when washed and dried, weighed 7 drachms, and consisted of the barytes mixed with a new acid, to which M. Sertuerner gave the name of *Meconic*, and which he separated by sulphuric acid. This mode of obtaining it has not, however, succeeded with others, but M. Choulant, by mixing the meconate of barytes with an equal weight of vitreous boracic acid, and subliming, obtained the meconic acid in the form of shining scales of a fine white salt. Its taste is at first sour and cooling, but afterwards unpleasantly bitter. It reddens vegetative blues, and combines with alkalies and earths, and gives a cherry red colour to solutions of iron; its crystals are quadrangular tables, and it is soluble in twice its weight in water and also in alcohol and ether. When purified by repeated solutions, it crystallized in rectangular prisms, with rhomboidal bases. It was solid, white, had no taste or smell, was insoluble in cold water and soluble in 400 parts of boiling water, did not affect vegetable blues, was soluble in 24 parts of boiling alcohol, and 110 cold, as well as in hot ether and oil of almonds and olives below the boiling temperature, &c. When burnt it gives out a thick smoke and ammoniacal odour. It was supposed by Sertuerner to be meconate of Morphia, but Robiquet considered it as a peculiar principle which he has called *Narcotin*, and has shewn that it may be obtained almost pure by acting upon the soft watery extract of opium by ether, which dissolves scarcely any thing but the *Narcotin*. M. Robiquet has altered and improved upon Sertuerner's process for obtaining Morphia by boiling the watery solution of opium with pure magnesia, and then extracting the Morphia from the precipitate of alcohol. So far as it has been analyzed, the essential constituents of opium seem to be 1. morphia, 2. narcotin, 3. meconic acid, 4. an unnamed acid, 5. a substance like caoutchouc, 6. one like febrin, 7. a resin, 8. gum.

Opium is not fusible, but is softened even by the heat of the fingers. It is highly inflammable. It is partially soluble both in alcohol and in water. The solutions of opium are transparent, and have a brown and vinous colour. The watery solution is not decomposed by alcohol. The narcotic virtues of opium are imparted by distillation to alcohol and to water; and they are diminished, or entirely dissipated, by long boiling, roasting, or great age. The part of opium which is not soluble either in water or alcohol is chiefly caoutchouc. By evaporating a watery solution of opium to the consistence of syrup Desrosnes obtained a precipitate which was increased by diluting the extract with a little cold water. He dissolved this in hot alcohol, from which it again separated on cooling.

M.M. Orfila and Magendie have each made experiments to ascertain the effects of the various principles contained in opium, but these physiologists do not agree in their results. Pure crystallized morphia has little or no effect, on account of its little solubility in the juices of the stomach; but all its solutions in acids, oil, and alcohol, excite the same narcotic effects as the opium itself, and in a smaller dose. Magendie considers the narcotin as the exciting principle of opium; but this is denied by Orfila, who asserts that it produces nausea, vomiting, debility, accelerated circulation, and death, without the vertigo or affection of the senses, palsy of the extremities, plaintive cries or convulsions, which arise from morphia.

Opium has been used with good effects in numerous diseases, particularly in intermittent fevers; typhoid fevers, accompanied with watchfulness and diarrhœa. When combined with calomel, it has lately been much employed in inflammations from local causes, such as wounds, fractures, burns, absorption of morbid poisons, as in swelled testicles, and even in active inflammation, accompanied with watchfulness, pain, and spasm, after blood-letting. In small pox, when the convulsions before eruption are frequent, or when the accompanying fever is of a typhoid type, opium is liberally used: it is likewise given from the fifth day onwards, and is found to allay the pain of suppuration, to promote the ptyalism, and to be otherwise useful. In dysentery, after the use of gentle laxatives, or along with them, opium, independently of any effect it may have on the fever, is of consequence in allaying the tormina and tenesmus, and in obviating that laxity of bowels, which so often frequently remain after that disease. In diarrhœa the disease itself generally carries off any offending acrimony; and then or after purgatives opium is used with great effect even in the most symptomatic cases it seldom fails to alleviate. In cholera and pyrosis it is the best remedy. It is given to allay the pain, and favour the descent of calculi, and to give relief to jaundice and dysuria, proceeding from spasm. In colic it is

employed with laxatives, and often prevents ileus and inflammation, by relieving the spasm. Even in ileus it is sometimes used to allay the vomiting, the spasms, and the pain. It is of acknowledged use in different species of tetanus; affords relief to the various spasmodic symptoms of dyspepsia, hysteria, hypochondriasis, asthma, rabies canina, &c. and has been found useful in some kinds of epilepsy. In syphilis it is useful in combating symptoms, and in counteracting the effects resulting from the improper use of mercury. It is found useful in certain cases of threatened abortion and lingering delivery, in convulsions during parturition, and in after pains and excessive flooding. The administration of opium to the unaccustomed is sometimes very difficult. The requisite quantity is wonderfully different in different persons, and in different states of the same person. A quarter of a grain will in one adult produce effects which ten times the quantity will not do in another; and a dose that might prove fatal in cholera or colic, would not be perceptible in many cases of tetanus or mania. When given in too small a dose it is apt to produce disturbed sleep, and other disagreeable consequences; but sometimes a small dose has the desired effect, while a larger one gives rise to vertigo and delirium; and with some constitutions it does not agree in any dose or form. Its stimulant effects are most certainly produced by the repetition of small doses, its anodyne by the giving of a full dose at once. In some it seems not to have its proper effect till after a considerable time. The operation of a moderate dose is supposed to last in general about eight hours from the time of taking it. Externally opium is used to diminish pain, and remove spasmodic affections. It is found particularly serviceable in chronic ophthalmia, when accompanied with morbidly increased sensibility. Opium is exhibited in various ways, or in combination with aromatics, astringents, camphor, soap, emetics, bitters, distilled waters, mucilage, syrups, acids, carbonate of ammonia, ether, acetate of lead, potass, and unctuous substances, &c.; but made up in substance in the form of a pill, lozenge or electuary are its most efficient forms.

Sleep-bearing, or Common, or Opium Poppy. Fl. July, Aug. Pl. 3-4-feet.

23 P. Cauca'sicum (Bieb. fl. taur. 2. p. 5.) capsules ovate-oblong, smooth; stem much branched, and is, as well as the peduncles, beset with deciduous bristles; leaves glaucous, pinnatifid; lobes ovate-oblong, each terminated by a bristle. ⊙. H. Native of gravelly places towards Caucasus, about the falls of the Terek, and about the bottom of mount Kasbeck; at the falls of Chodjal; also in Iberia about Tiflis. Sims, bot. mag. 1672. A glaucous branching plant. Petals very fugaceous, colour of those of *Glaúcium corniculàtum*, and about the size of those of *P. Rhœ'as*. Capsules small, crowned by a 5-8-angled stigma.

Caucasian Poppy. Fl. June, Aug. Clt. 1813. Pl. 1 foot.

24 P. Armeni'acum (Lam. dict. 1. p. 247.) capsules elliptical-oblong, and are, as well as the calyx, smooth; stem much branched, smoothish; leaves pinnate; lobes linear, each terminated by a bristle. ⊙. H. Native of Armenia. Argemòne Armeniàca, Lin. spec. 727. Very like *P. Caucásicum*. Flowers red; stigma pyramidal. The Argémone Armenìaca of Sab. hort. rom. 4. t. 66. has the calyx 3-valved, and hispid capsules; and therefore differs from this plant.

Armenian Poppy. Fl. June, July. Clt. 1815. Pl. 1 f.?

25 P. fu'gax (Poir. dict. 5. p. 118.) capsules ovate, and are, as well as the calyx, smooth; stem much branched, twiggy, and is, as well as the peduncles, nearly smooth; leaves pinnatifid; lobes lanceolate, each terminated by a bristle. ⊙. H. Native of Persia, on mount Elwend. Petals fugacious, of a pale carmine colour. Capsule crowned by a 4-5-angled pyramidal stigma.

Fugacious-petalled Poppy. Fl. Jun. July. Clt. 1827. Pl. 1 ft.

26 P. turbina'tum (D. C. syst. 2. p. 84.) capsules turbinate, and are, as well as the calyx, smooth; stem few-flowered; peduncles with a few spreading bristles; leaves pinnatifid; lobes ovate, entire, not terminated at top by a bristle. ⊙. H. Native of the East, between Bagdad and Kermancha. Petals almost like those of *P. dùbium*, and of the same colour. Stigmas 6-7-rayed. Herb glaucous.

Turbinate-capsuled Poppy. Fl. June, July. Pl. 1 foot.

† *A species not sufficiently known.*

27 P.? integrifòlium (Vig. diss. 38.) ♃ ? ⊙ ? Native of Spain. Bocc. mus. p. 77. t. 65. f. 1. Barr. obs. p. 47. t. 1191. Perhaps this is a variety of *P. Rhœ'as*; but, according to the observations of Bertoloni, it is nothing more than a bad figure of *Seriòla Æthnénsis* before flowering.

Cult. Shewy plants with flowers of various hues. The perennial species may be increased by dividing the plants at the roots, but the common and best way is by seeds. The annual kinds may be sown in the open border, about the middle or end of March, where they are intended to remain, as they do not bear transplanting. They all thrive best in a light rich soil. The *P. nudicaúle* and varieties, *microcárpum*, *rubro-aurantiàcum*, *pyrenàicum* and varieties, and *P. alpìnum*, are beautiful little plants, and should be kept as alpines, in pots; or otherwise they are very apt to damp off in the winter, especially in the neighbourhood of London.

II. ARGEMO'NE (from *argema*, cataract of the eye, which is derived from *αργος*, *argos*, white. The name *αργεμωνη* was given by the Greeks to a plant, which was supposed to cure cataract of the eye.) Tour. inst. 239. t. 121. Lin. gen. no. 649. Gært. fruct. 1. p. 287. t. 60. Lam. ill. t. 452. Juss. gen. 236. D. C. syst. 2. p. 85. prod. 1. p. 120.

Lin. syst. *Polyándria*, *Monogýnia*. Sepals 2 or 3, concave, mucronate. Petals 4-6. Stamens indefinite. Style scarcely any. Stigmas 4-6, radiating, pitted, free. Capsules obovate, 1-celled; valves 4-6, opening at the top; placentas linear. Seeds spherical, scrobiculate. Annual glaucous herbs, abounding in a yellow juice, and covered with stiff prickles. Leaves sessile, repand-sinuated; usually spotted or painted with white; recesses spiny-toothed. Peduncles axillary, always erect. Flowers from yellow to white.

1 A. Mexica'na (Lin. spec. 727.) leaves profoundly repand-sinuated, spiny, blotched with white; flowers solitary; calyx smooth; capsules prickly, 3-4-valved; petals 4-6; stigmas 4-5. ⊙. H. Native of Mexico, Louisiana, and from Florida to Canada, West Indies, Brazils, Africa, St. Helena, Ascension, East Indies, Sandwich Islands, &c. Curt. bot. mag. t. 243. Sab. hort. rom. 4. t. 65. Mill. fig. 1. t. 50. A. spinòsa, Mœnch. meth. 227. A. versícolor, Sal. prod. 376. Ecthrus triviàlis, Lour. cochin. 1. p. 421. This plant is called by the Spaniards in Mexico *Figo del inferno*, or *Devil's fig*. In the West Indies it is called *Yellow thistle*. An oil is expressed from the seeds of this plant, which is used in Mexico for shining wood. The yellow juice with which the plant abounds, when reduced to a consistence, is not distinguishable from gamboge. In very small doses it is probably of equal efficacy, given in dropsies, jaundice, and cutaneous eruptions. It is esteemed very detersive, and generally used in diseases of the eyes; but the infusion is looked upon as a sudorific and resolutive. The seeds are said to be a much stronger narcotic than opium.

Mexican Poppy. Fl. July, Aug. Clt. 1592.

2 A. albiflòra (Horn. hort. hafn. 469. Sims, bot. mag. t. 2342.) leaves sessile, feather-nerved; petals usually only 3. ⊙. H. Native of Georgia and Louisiana. Flowers white. A. Mexicana β, albiflòra, D. C. syst. 2. p. 86. prod. 1. p. 120.

White-flowered Mexican Poppy. Fl. July, Aug. Clt. 1820. Pl. 1 foot.

3 A. ochroleu'ca (Sweet, brit. fl. gard. t. 242.) leaves profoundly sinuated or pinnatifid, glaucescent; nerves with prickly bristles; flowers solitary; stamens few; capsules oblong, deeply 5-6-furrowed, covered with somewhat reflexed prickles; stigmas 5-6, distinct, spreading, purple. ⊙. H. Native of Mexico. Leaves blotched with white. Flowers pale-yellow; calyx of 3-sepals; petals 6, crenated. Stem prickly.

Cream-flowered Mexican Poppy. Fl. Aug. Sept. Clt. 1827. Pl. 2-4 feet.

4 A. grandiflòra (Sweet brit. fl. gard. t. 226.) leaves sinuated, smooth, spiny-toothed; nerves unarmed; flowers panicled, polyandrous; calyx smooth; capsules bluntly quadrangular, almost unarmed. ♃. H. or ⊙. H. Native of Mexico. Flowers large, white. Stigmas 4, with as many pale-blue pits. Anthers yellow. Plants raised from seed, not flowering till October; but when the roots have existed through the winter, they will flower early in the summer.

Great-flowered Mexican Poppy. Fl. July, Oct. Clt. 1827. Pl. 2-3 feet.

Cult. Argemòne is a genus of beautiful hardy annuals, and should be sown in the open flower-border about the end of March or beginning of April; or the rarer kinds may be sown on a hotbed, and afterwards planted out into the borders.

III. MECONO'PSIS (from *μηκων, mekon*, a poppy; and *οψις, opsis*, resemblance; appearance of plants.) Vig. diss. p. 20 and 48. f. 3. D. C. fl. fr. suppl. p. 586. syst. 2. p. 86. prod. 1. p. 120.

Lin. syst. *Polyándria, Monogynia.* Sepals 2, pilose. Petals 4. Stamens indefinite. Style short. Stigmas 5-6, radiated, convex, free. Capsules obovate, 1-celled; valves 5-6, opening at the top; placentas thin, narrow, hardly drawn out on the inside into narrow membranes. A perennial herb, abounding in a yellow juice. Leaves pinnate, glaucous underneath. Peduncles long, inflexed, before the expansion of the flower; hence the flower-bud is drooping. Flowers yellow, erect. A genus between *Papàver* and *Argemòne*.

1 M. Ca'mbrica (Vig. diss. p. 48. f. 3.) capsules smooth; leaves numerous on the lower part of the stem, pinnate, stalked; lobes toothed, somewhat decurrent. ♃. H. Native of many parts of Europe, especially in the Pyrenees, Russia, France, &c. in shady humid places; and Britain particularly North Wales, about Llanbarris; about Kendal, Westmoreland; in shady lanes near Kirkby Lonsdale. P. Cámbricum, Lin. spec. 727. Engl. bot. t. 66.—Dill. elth. 300. t. 223. f. 290. P. lùteum, Lam. fl. fr. 3. p. 173. P. flàvum, Mœnch. meth. 247. Argemòne Cámbrica, Desp. in dict. sci. nat. 2. p. 481. Flowers about the size of those of *P. Rhœ'as*. Petals very fugaceous, of a sulphur-yellow colour.

Welsh Poppy. Fl. May, August. England and Wales. Pl. 1 foot.

Cult. The Welsh Poppy is rather an ornamental plant. It grows best in a rich light soil, in a shady situation. It may be either increased by dividing the plants at the root or by seeds.

IV. STYLO'PHORUM (from *στυλος, stylos*, a column or style; *φορεω, phoreo*, to bear; having long styles.) Nutt. gen. 2. p. 8. Mecanópsis, sect. Stylóphorum, D. C. syst. 2. p. 87.

Lin. syst. *Polyándria, Monogýnia.* Sepals 2, pilose, deciduous. Petals 4. Style long, columnar. Stigma 4-lobed or entire. Capsule oblong or globose, 4-valved, echinated, opening at the top. Placentas narrow. Perennial herbs, yielding a yellow juice, with undivided or pinnate leaves. Peduncles inflexed before the expansion of the flower, and sometimes ever after. Flowers yellow or crimson.

1 M. petiola'tum (Nutt. gen. amer. 2. p. 8.) capsules echinated; leaves pinnate, stalked, smooth, 2-3 on each stem; leaflets 5. ♃. H. Native of North America, in woods on the banks of the river Ohio. Meconópsis petiolàta, D. C. syst. 2. p. 87. S. Ohiénse, Spreng. syst. 2. p. 570. Leaves pinnate; lobes 5, oblong, toothed; teeth blunt. Flowers deep yellow, about the size of those of *Glaúcium flàvum*. Stigma 4-furrowed. Capsule bristly. Seeds crested at the hilum.

Stalked-leaved Stylophorum. Fl. May, June. Pl. 1 foot.

2 S. diphy'llum (Nutt. gen. 2. p. 7.) capsules? leaves 2, pinnatifid, sessile, rather pilose. ♃. H. Native of North America, along the sides of rivulets, and in shady woods of Kentucky and Tennessee, and on the banks of the river Missouri. Chelidònium diphýllum, Mich. fl. bor. amer. 1. p. 309. Meconópsis diphýlla, D. C. syst. 2. p. 88. Plant smaller than the *S. petiolàtum*, and less glaucous, and furnished with shining hairs. Leaves 2 on each stem, lobately-pinnatifid; lobes roundish or blunt. Peduncles usually proliferous. Flowers yellow. Capsule bristly.

Two-leaved Stylophorum. Fl. March, May. Pl. 1 foot.

3 S. paniculà'tum; plant very bristly; stem branched; cauline leaves undivided, oblong, sessile; flowers panicled; capsules spherical, beset with imbricate bristles. ♃. F. Native of Nipaul in Gosaingsthan, where it is called *Espoo swa* by the natives. Meconópsis Napaulénsis, D. C. prod. 1. p. 121. S. Napalénsis, Spreng. syst. 2. p. 570. Papàver paniculàtum, D. Don, prod. fl. nep. p. 197. Flowers crimson or yellow, about the size of those of *Papàver Rhœ'as*. Calyx beset with starry down. Style erect, cylindrical, half an inch long. Stigma capitate, entire. Herb very poisonous.

Panicled-flowered Stylophorum. Pl. 3 to 4 feet.

4 S. simplicifòlium; plant beset with bristles; leaves undivided, lanceolate, obtuse, quite entire, stalked; scape 1-flowered; flower nodding; capsules oblong, very bristly. ♃. H. Native of Nipaul in Gosaingsthan in the alpine region of the Himalaya, where it is called *Ohaee* and *Themei-Sowang* by the natives. Papàver simplicifòlium, D. Don, prod. fl. nep. 197. Flowers crimson, with a dark purple claw at the base of each petal. Anthers spirally twisted. Style cylindrical, thick, one-half the length of the ovary. Stigma capitate, tetragonal.

Simple-leaved Stylophorum. Pl. 1½ foot.

Cult. A beautiful genus of plants. The species require to be planted in a shady situation, in a light rich soil. They may be either increased by dividing the plants at the roots or by seeds. They will all require to be protected during winter by a frame.†

V. HUNNEMA'NIA (John Hunneman, a very zealous botanist, who has introduced more plants into Britain than any other individual.) Sweet. brit. fl. gard. 3. t. 276.

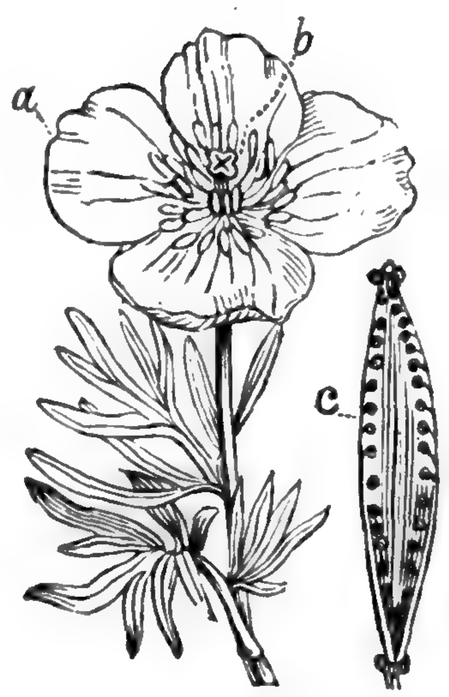
Lin. syst. *Polyándria, Monogýnia.* Sepals 2, concave, deciduous. Petals 4 (f. 39. *a.*). Stamens numerous; anthers linear (f. 39. *b.*). Ovary oblong; style short, permanent; stigma peltate, 4-furrowed, obsoletely 4-lobed. Capsule silique-formed, rather compressed, 10-ribbed, 1-celled, 2-valved; valves bearing many seeds at the edges (f. 39. *c.*). Seeds rather globose, tubercled on the outside. Albumen cartilaginous.—An erect somewhat suffruticose plant, with decompound glaucous leaves and solitary terminal yellow flowers, like those of *Eschscholtzia Califórnica*.

1 H. fumariæfòlia (Sweet. l. c.) leaves decompound and triternate, glaucous; leaflets linear, bluntish. ♂. or ♄. F. Native of Mexico. (f. 39.)

Fumitory-leaved Hunnemania. Fl. July, Oct. Clt. 1827. Pl. 2 to 3 feet.

Cult. This beautiful plant will require to be sheltered through the winter by a frame. In the summer it will grow very well in the open border, or against a wall. It may be either increased by seeds or cuttings; the former method is by far the best.

FIG. 39.



VI. SANGUINA'RIA (from *sanguis*, blood; because all parts of the plant, especially the roots, yield a red juice when cut or broke.) Dill. hort. elth. 252. Lin. gen. no. 645. Lam. ill. t. 449. Juss. gen. p. 236. D. C. syst. 2. p. 88. prod. 1. p. 121.

Lin. syst. *Polyándria, Monogýnia.* Sepals 2, ovate, caducous. Petals 8-12. Stamens 24. Stigma bisulcate. Capsules oblong, 2-valved, ventricose, acute at both ends; valves deciduous; placentas 2, permanent. A small perennial American herb, abounding in a blood-coloured juice, with one leaf and one scape rising from each bud. Flowers white.

1 S. Canade'nsis (Lin. spec. 734.) ♃. H. Native of North America in dry woods in a fertile soil, from Canada to Florida, and on the banks of the river Delaware. Curt. bot. mag. t. 162. Bigel. med. bot. 1. p. 75. t. 7. Trunk of root horizontal, subterraneous, yielding a red juice when cut. Leaf radical, kidney-shaped, lobed like the leaf of the fig. Scape 4 inches high, 1-flowered. Flowers double or single, large or small. The whole plant dyes yellow, and is called by the indigenous Americans *Puccoon*, and not inaptly by the farriers *Turmeric*.

The medical properties of *Sanguinària* are those of an acrid narcotic. When taken in a large dose it irritates the fauces, leaving an impression in the throat for a considerable time after it is swallowed. It occasions heart-burn, nausea, faintness, vertigo, and diminished vision. At length it vomits, but in this operation it is less certain than other emetics in common use. The above effects are produced by a dose of from eight to twenty grains of the fresh powdered root. When given in smaller doses, such as produce only nausea, it has been found useful in several complaints. In still smaller doses, or such as do not excite nausea, it has acquired some reputation as a tonic-stimulant. Professor Smith of Hanover, New Hampshire, found the powder to operate violently as an emetic, and produced great prostration of strength during its operation. Snuffed up the nose it proved sternutatory, and left a sensation of heat for some time. Applied to fungous flesh, it proved escharotic, and several polypi of the soft kind were cured by it in his hands. He found it of great use in the incipient stages of pulmonary consumption, given in as large doses as the stomach would bear, and repeated in cases of great irritation, he combined it with opium. Some other complaints were benefitted by it, such as acute rheumatism and jaundice. Professor Ives of New Haven, North America, considers the *Blood-root* an important remedy in many diseases, particularly of the lungs and liver. He observed, that in typhoid pneumonia, in plethoric constitutions, when respiration is very difficult, of greater benefit than any other remedy; in such cases the dose must be large, and repeated until it excites vomiting or relieves the symptoms. He infuses from a scruple to half a drachm of the powdered root in half a gill of hot water, and gives one or two tea-spoonfuls every half hour in urgent cases. This treatment has often removed the symptoms in half an hour. Dr. Ives thinks highly of its use in influenza and pthisis, and particularly in hooping cough. In large doses to produce vomiting, he says, it often removes the croup. Dr. Macbride of Charlestown says, the *Blood-root* is useful in hydrothorax, given in doses of sixty drops three times a day, and increased until nausea followed each dose. He prefers the pill or powder in a dose of two to five grains, and vinous infusion to the spirituous tincture. The tincture may be made by digesting an ounce of the powdered root in eight ounces of diluted alcohol. This preparation possesses all the bitterness, but less of the nauseating qualities, than the infusion. In the dose of a small tea-spoonful it is used by many practitioners as a stimulating tonic, capable of increasing the appetite and promoting digestion.

Canadian Blood-root or Puccoon. Fl. March, May. Clt. 1680. Pl. ¼ to ½ foot.

Cult. This being a dwarf plant should be planted near the front of the flower border; it will thrive well in a light sandy loam or peat soil, and it is easily increased by dividing the roots or by seeds.

VII. BOCCO'NIA (in honour of Paolo Bocconi, M. D. a Sicilian botanist, author of the *Museum des Plantes*, and *Histoire Naturelle de l'ile de Corse*, &c. died 1704.) Plum. gen. 35. t. 25. Lin. gen. no. 591. Juss. gen. 236. Gært. fruct. 1. p. 204. t. 44. f. 1. D. C. syst. 2. p. 89. prod. 1. p. 121.

Lin. syst. *Polyándria, Monogýnia.* Sepals 2, ovate, deciduous. Petals none. Stamens 8-24. Stigmas 2, spreading. Capsules two-valved, elliptical, 1-seeded. Seed 1, erect, fixed to the bottom of the capsule, inwrapped in soft pulp at the base; hilum filiform; albumen fleshy. Embryo very minute, erect. American shrubs from 2 to 10 feet high, abounding in a yellow juice. Leaves stalked, glaucous, form of those of the oak. Flowers in terminal panicles, with the branches and branchlets furnished each with one bractea. This genus does not well agree with the rest of *Papaveràceæ*, from its 1-seeded capsules, as well as in the flower being destitute of petals.

1 B. frute'scens (Lin. spec. 634.) leaves oval-oblong, cuneated at the base, pinnatifid. ♄. S. Native of Mexico, Cuba, St. Domingo, Jamaica, Guadaloupe, on the mountains. Lam. ill. t. 394. Lodd. bot. cab. t. 83. B. quercifòlia, Mœnch. suppl. 122. B. glaúca, Sal. prod. 377. The juice of this shrub is acrid, and is used in the West Indies to take off warts.

Var. β, cérnua (Moc. et Sesse icon. fl. mex. ined.) perennial; scapes 1-flowered.

Var. γ, subtomentòsa (Lher. in herb. Dombey.) leaves on the under surface, especially at the nerves, somewhat tomentose; lobes much crenated. ♄. S. Native of Peru. This variety is called by the Peruvians *Palo de Tinto* or *Palo Amarillo*.

The sepals of all the varieties are more or less brown.

Frutescent Tree Celandine. Fl. Jan. April, in its native country. Britain, Oct. to Jan. Clt. 1739. Shrub 3 to 10 feet.

2 B. integrifo'lia (H. B. et Kth. nov. pl. gen. 1. p. 119. t. 35.) leaves oblong, tapering towards each end, entire, or scarcely crenated. ♄. S. Native of Peru on the Andes towards Casca. Leaves flat. Panicles crowded. Flowers greenish.

Var. β, Mexicàna (D. C. syst. 2. p. 91.) margins of leaves somewhat revolute; panicles loose. ♄. S. Native of New Spain. Flowers green or brownish.

Entire-leaved Tree Celandine. Fl.? Clt. 1822. Shrub 9 ft.

Cult. Shrubs with fine foliage but with insignificant bloom. They grow well in a rich light soil. Ripened cuttings root readily, under a hand-glass in a pot of sand, plunged in a moderate heat, or they may be increased by seed, which usually ripen in plenty.

VIII. MACLE'AYA (Alexander Mac Leay, F.R.S. F.L.S. colonial secretary New South Wales, a profound entymologist) R. Br. in Clapp. and Denham's trav. append. p. 18.

Lin. syst. *Polyándria, Monogýnia.* Sepals 2, caducous (f. 40. *a.*). Petals none. Stamens 24-28 (f. 40. *b.*). Stigmas 2 (f. 40. *c.*) spreading. Capsule elliptical, with many-seeded placentas. Seeds fixed to parietal placentas. Albumen fleshy. Embryo very minute, erect. A perennial herbaceous plant, 4 or 5 feet high, with roundish cordate, obsoletely-lobed leaves, glaucous on the under surface. Flowers disposed in large panicles, brownish.

FIG. 40.

1 M. corda'ta (R. Br. l. c.) ♃. H. Native of China. Boccònia cordàta, Willd. spec. 2. p. p. 841. Jacq. fragm. 63. t. 93. f. 1. Sims, bot. mag. t. 1905 (f. 40.).

Cordate-leaved Macleaya. Fl. Ju. Jul. Clt. 1795. Pl. 3-5 ft.

Cult. This is a very ornamental, stately, herbaceous plant, when grown in a rich soil; it is easily increased by dividing the roots in spring.

IX. ESCHSCHO'LZIA (in honour of Fred. Eschscholz, M.D. a celebrated naturalist, who accompanied Kotzebue round the world.) Cham. in horæ, phys. berol. p. 74. t. 15. Hook. fl. bor. amer. p. 34.

Lin. syst. *Polyándria, Tetragýnia.* Calyx mitre-shaped, deciduous (f. 41. *f.*), never separating into 2 sepals. Petals 4 (f. 41. *a.*), with their claws inserted into the throat of the receptacle. Receptacle dilated, with an expanded, fringed, or entire border (f. 41. *b.*). Stamens indefinite. Styles 4, 2 long and 2 short (f. 41. *c.*). Capsules silique-formed (f. 41. *d.*), 2-valved. Seeds fixed to the margins of the valves (f. 41. *e.*). A perennial herb with tuberous roots. Leaves glaucous, tripinnatifid, the segments linear. Flowers large, yellow, not unlike those of *Glaúcium lùteum.*

FIG. 41.

1 E. Califo'rnica (Cham. l. c.) ♃. H. Native of the north-west coast of America on the dry sandy banks of streams. Lindl. bot. reg. 1168. Hook. bot. mag. 2887. Stigmas 4, 2 longer than the others. Seeds globose, almost black. This plant is a beautiful ornament to our gardens. It was first discovered by Mr. Menzies more than 40 years ago, and plants were raised about that time in Kew Gardens (f. 41.).

Californian Poppy. Fl. May, Nov. Clt. 1790? Pl. 1 foot.

Cult. A very ornamental plant of easy culture. It will thrive in any kind of soil, and is easily increased by seeds. It is well adapted for borders.

X. RÖME'RIA (in honour of John James Römer, M.D., Professor of Botany at Landshut, died 1820, author of several botanical works). Medik. in ust. ann. 1792. vol. 3. p. 15. D. C. syst. 2. p. 92. prod. 1. p. 122. but not of Mœnch nor Thunb.

Lin. syst. *Polyándria, Monogýnia.* Sepals 2, pilose. Petals 4. Stamens indefinite. Stigma bilamellate, or 3-lobed. Capsules elongated, 1-celled, 2, 3, or 4-valved; valves opening from the top to the base. Seed kidney-shaped, scrobiculate, destitute of a glandular crest. Annual herbs, yielding yellow juice. Leaves pinnate-parted; lobes narrow, multifid; lobules linear, terminated by a hair-like point. Flowers violet.

1 R. hy'brida (D. C. syst. 2. p. 92.) siliques 3-4-valved, erect, beset with stiff bristles at the top. ⊙. H. Native of the south of Europe and the north of Africa in cultivated fields and vineyards, especially in the region of the Mediterranean. In England rare in corn fields between Swaffham and Burwell, Cambridgeshire, and other parts of that county, and about 4 miles from Aylsham towards Cromer. Glaúcium hýbridum, Dum. cours. bot. cult. ed. 2. vol. 4. p. 472. Chelidònium hýbridum, Lin. spec. 724. Smith, engl. bot. 201. Chel. violàceum, Lam. fl. fr. 3. p. 169. R. violàcea, Medik. in ust. ann. p. 15. Glaúcium triválve, Mœnch. meth. 249. Glaúcium violàceum, Juss. gen. 236. Smith, fl. græc. t. 490. Flowers violet, bluish, or purple.

Var. β, eriocárpa (D. C. syst. 2. p. 93.) siliques beset with stiff hairs from the base to the top. Chelidònium dodecándrum, Forsk. fl. ægyp. p. 100. ⊙. H. Native of Egypt.

Var. γ, velutìna (D. C. syst. 2. p. 93.) stems clothed with soft villi. Chelid. hýbridum, Bieb. fl. taur. 2. p. 3. Native of Tauria.

Hybrid Römeria. Fl. May. June. Brit. Pl. ¾ foot.

2 R. refra'cta (D. C. syst. 2. p. 93.) siliques 3-4-valved, glabrous; pedicels a little recurved. ⊙. H. Native of Tauria about Derbent. Deless. icon. sel. 2. t. 8. Glaúcium refráctum, Stev. in litt. Very like *R. hýbrida*, but differing in the leaves being bipinnatifid, and by the segments being more blunt. Capsules drooping, or refracted from the recurved pedicels. Flowers violet.

Refracted-capsuled Römeria. Fl. May, Jul. Clt. 1823. Pl. ¾ ft.

3 R. biva'lvis (D. C. syst. 2. p. 93.) siliques 2-valved, setose, somewhat incurved. ⊙. H. Native of Syria. Leaves pinnately-multifid; lobes linear, pinnate-parted. Petals violet.

Two-valved-Capsuled Römeria. Fl. Ju. Jul. Pl. ¾ foot.

Cult. This is a beautiful genus of annuals; they only require to be sown in the open border, where they are intended to remain, early in the spring.

XI. GLAU'CIUM (Γλαυκος, *Glaucos*, in mythology, the name of a fisherman who leaped into the sea and became a sea-god; also sea-green or glaucous, in allusion to the colour of the plants and their habitation by the sea-side.) Tourn. inst. 254. t. 130. Gært. fruct. 2. p. 165. t. 115. Juss. gen. 236. D. C. syst. 2. p. 94. prod. 1. p. 122.

Lin. syst. *Polyándria, Monogýnia.* Sepals 2. Petals 4. Stamens indefinite. Capsules elongated, 2-valved; valves opening from the top to the bottom, 2-celled, with a cellular dissepiment. Stigma bilammellate. Seeds ovate, reniform, destitute of a glandular crest. Evergreen, glaucous, biennial or annual herbs, abounding in a copper-coloured acrid juice, which is said to be poisonous and to occasion madness. Roots perpendicular. Radical leaves stalked; stem ones sessile, stem-clasping; more or less cut; lobes broad, blunt. Peduncles axillary, or terminal, 1-flowered. Flowers yellow or crimson. The English name of the genus, *Horn-Poppy*, is given to it on account of the long horn-like pods.

1 G. fla'vum (Crantz. fl. austr. 2. p. 114.) stem glabrous; stem-leaves repand; capsules scabrous with tubercles. ♂. H. Native of south and middle Europe on the sea-shore in the sand or mud; plentiful in Britain; also on the sea-shore of Carolina and Virginia. Chelid. Glaúcium, Lin. spec. 724. Fl. dan. 585.

Schkuhr. handb. 2. p. 70. t. 140. Smith, engl. bot. t. 8. G. lùteum, Scop. carn. 1. p. 369. Hook, fl. lond. t. 56. G. glaúcum, Mœnch. meth. 249. G. littoràle, Sal. prod. 377.

Yellow Horn-Poppy. Fl. Jul. Aug. England. Pl. 2 feet.

2 G. fu'lvum (Smith, exot. bot. 1. p. 11. t. 7.) stem glabrous; stem-leaves rotundo-sinuated; capsules scabrous; flowers nearly sessile. ♂. or ♃.? H. Native of the south of Europe in gravelly and sandy places by the sea-side. Chelid. fúlvum, Poir. suppl. 5. p. 606. Chelid. glàbrum, Mill. dict. no. 5. Chelid. corniculàtum, var. β, Lam. dict. 1. p. 714. Petals brick-coloured, cuneated at the base, and yellow; often somewhat bifid at the top, very blunt.

Fulvous Horn-Poppy. Fl. Aug. Sept. Clt. 1802. Pl. 2 ft.

3 G. cornicula'tum (Curt. fl. lond. 6. t. 32.) stem pilose; stem leaves pinnatifid; capsules setose. ☉. H. Native of Europe, particularly towards the south, in sandy fields; in England on the sea-coast or sandy fields, very rare and perhaps a doubtful native. Portland island (Lobel).

Var. α, *phœníceum* (D. C. syst. 2. 96.) ☉. H. Chelid. corniculàtum, Lin. spec. 724. Mill. fig. 1. t. 143. Glaúcium phœníceum, Smith, engl. bot. t. 1433. Fl. græc. t. 489. Chelid. phœníceum, Lam. fl. fr. 3. p. 169. Chelid. aurantìacum, Sal. prod. 1. p. 377. Flowers crimson. An elegant plant.

Var. β, *flaviflòrum* (D. C. syst. 2. p. 97.) Glaúcium corniculàtum, flore flavo, Stev. in litt. ☉. H. Native of Tauria by way sides. Not distinct from the var. α, except the yellow flowers.

Horned Poppy. Fl. Ju. Jul. Britain. Pl. ¾ foot.

4 G. ru'brum (Smith, fl. græc. t. 488.) stem pilose; stem leaves pinnatifid; capsules rather pilose. ♂. H. Native between Smyrna and Bursa, and also in Rhodes Island by way sides. Petals of a reddish-copper colour. Capsules beset with very soft hairs, at last smooth, never rough with bristles.

Red Horn-Poppy. Fl. June, July. Clt. 1828. Pl. 1 foot.

5 G. tri'color (Berh. ex Spreng. syst. app. p. 203.) leaves lyrately-pinnatifid, rather pilose; pods hairy; petals contiguous, with a broad dark spot at the base of each. ☉. H. Native of Thuringia and Podolia. Like *G. corniculàtum, var. phœníceum.* Flowers scarlet with a black spot at the base of each petal.

Three-coloured-flowered Horn Poppy. Fl. June, Aug. Clt. 1829. Pl. ¾ foot.

6 G. Pe'rsicum (D. C. syst. 2. p. 97.) leaves glaucous, velvety, radical ones pinnate, lower segments smallest, terminal one kidney-shaped. ♂. or ♃. H. Native of Persia about Tehraun.

Persian Horn-Poppy. Fl. Ju. Jul. Clt. 1829. Pl. ½ to 1 ft.

Cult. The species of Horn Poppy will thrive well in any common garden soil; they are easily raised from seeds which ripen in great abundance; these may be sown where the plants are intended to reinain. Some of the species are very pretty, particularly *G. corniculàtum, rùbrum, fúlvum, trícolor*, and *Pérsicum.*

XII. CHELIDO'NIUM (from χελιδων, *chelidon*, a swallow; it is said the plant flowers at the time of the arrival of swallows and dries up at their departure) C. Bauh. pin. 144. Gært. fruct. 2. p. 164. t. 115. f. 5. Juss. gen. 236. D. C. syst. 2. p. 98. prod. 1. p. 122.

Lin. syst. *Polyándria, Monogýnia.* Sepals 2, smooth. Petals 4. Stamens indefinite. Capsules elongated, 1-celled, 2-valved; valves opening from the base to the top; stigma 2-lobed. Seeds furnished with a glandular crest. Evergreen perennial herbs, abounding in an acrid saffron-coloured juice. Leaves stalked, pinnate; segments toothed or lobed. Peduncles axillary, bearing many 1-flowered umbellate pedicels, which are furnished each at the base with two little bracteas. Flowers small, yellow. The English name of the genus *Celandine* is a corruption of *Chelidònium.*

1 Ch. ma'jus (Mill. dict. no. 1. Oed. fl. dan. t. 676.) peduncles umbellate; leaves pinnate; segments roundish, dentately-lobed; petals elliptical, entire. ♃. H. Native throughout the whole of Europe, except Lapland, in shady places along the sides of walls in hedges and thickets, also in New England and Pennsylvania, but certainly introduced there. In England in waste grounds and thickets, especially on chalky soil. Ch. màjus, var. α, Lin. spec. 723. Smith, engl. bot. t. 1531. Mill. fig. 1. t. 92. f. 1. Schrank, fl. mon. 2. t. 120. A very common plant, from 1-2 feet high, with either double or single flowers. An infusion of the root does good in jaundice, gout, and calculi, it is also used to give a colour to cotton. The juice, taken inwardly, is good against dropsy, applied externally will remove warts, tetters, ring-worms, itch, and clean foul ulcers, diluted with milk it consumes white opaque spots on the eyes. A decoction of the plant kills the vermin which are sometimes engendered in putrid ulcers in horses.

Great or Common Celandine. Fl. April, Oct. Brit. Pl. 2 ft.

2 Ch. lacinia'tum (Mill. dict. no. 2.) peduncles umbellate; leaves pinnate; segments cut into many linear, acute, laciniated lobes; petals serrated or cut. ♃. H. Native of Germany in hedges. In England about Wimbledon in Surrey; also on the Altaian mountains along the borders of rivulets. Ch. május, var. β, Lin. spec. 724. Ch. quercifòlium, Will. fl. lorr. 2. p. 613.—Mill. fig. t. 92. f. 2. This plant possesses the same qualities as the last.

Var. β, *fumariæfòlium* (D. C. syst. 2. p. 99.) lobes of leaves cleft into more deep, more irregular, and much more linear lobules.—Mor. hist. 2. p. 258.

Jagged-leaved Celandine. Fl. April, Oct. Brit. Pl. 2 feet.

3 Ch. grandiflo'rum (D. C. prod. 1. p. 123.) peduncles umbellate; leaves pinnate; segments roundish, dentately-lobed; petals roundish, crenated. ♃. H. Native of Dauria about Nerchinsky-savod.

Great-flowered Celandine. Fl. April, Oct. Clt. 1818. Pl. 2 ft.

† *Species not sufficiently known.*

4 Ch. Sine'nse (D. C. syst. 2. p. 100.) ♃. ♄. H. Native of divers provinces in China, but commonly cultivated. Ch. majus, Lour. coch. 1. p. 402. From the description of Loureiro it differs from *Ch. màjus* by the stems being suffruticose, and the peduncles many-flowered, not umbellate. Flower yellow. Root long, yellow in the inside, and is, according to Loureiro, extremely bitter, and greatly esteemed among the natives of Cochin-china for a variety of uses in medicine.

Chinese Celandine. Fl.? Pl. 2 feet.

5 Ch. Japo'nicum (Thunb. fl. jap. 221.). Native of Japan. Leaves stalked, pinnate. Flowers yellow, axillary, solitary, stalked. Fruit unknown, therefore it is a very doubtful species.

Japan Celandine. Fl.? Pl. 2 feet.

Cult. The species of this genus thrive well in any common garden soil, and they are easily increased by seeds, or dividing the plants at the root. They grow most freely in damp shady situations.

XIII. HYPE'COUM (from ὑπηχεω, *hypecheo*, to rattle; noise of the seeds in the pods when shaken.) Tourn. inst. 230. t. 115. Lin. gen. 171. Gært. fruct. 2. p. 164. t. 115. Juss. gen. 236. Lam. ill. t. 88. D. C. syst. 2. p. 101. prod. 1. p. 123.

Lin. syst. *Tetrándria, Digýnia.* Sepals 2, lanceolate. Petals 4, inner ones usually 3-lobed. Stamens 4. Stigmas 2, somewhat stipitate. Capsules silique-formed, 2-valved, transversely knotted or articulated, with 2 lateral placentas. Seeds solitary

in each articulation, alternately fixed on both sides of the placentas. Embryo filiform, arched. Albumen fleshy.—Small annual herbs, yielding a yellow juice, which is affirmed to have the same effect as opium. Radical leaves, smooth, glaucous, stalked, pinnate; segments pinnately-multifid. Stem, or floral leaf, sessile, situated under the branches or pedicels. Flowers small, terminal, umbellate, yellow.

1 H. procu'mbens (Lin. spec. 181.) capsules articulated, compressed, arched; petals 3-lobed, external ones smooth on the back. ⊙. H. Native of Europe, from Spain to Astracan, in sandy places. Lam. ill. no. 1720. t. 88. Schkuhr. handb. 1. p. 90. t. 27. Smith, fl. græc. 155. H. nodòsum. Lam. fl. fr. 2. p. 640. H. arcuàtum, Mœnch. meth. 217. The 2 outer petals largest. Central segment of the inner petals toothed.

Procumbent Hypecoum. Fl. Jun. Jul. Clt. 1596. Pl. $\frac{1}{4}$ foot.

2. H. littora'le (Wulf. in Jacq. coll. 2. p. 205. icon. rar. 2. t. 309.) capsules articulated, compressed, arched; petals all entire, linear-spatulate, outer ones pubescent on the back. ⊙. H. Native of Carinthia, along the sandy shores of the Adriatic sea; also in Mauritania, along the Mediterranean. Very like *H. procúmbens*.

Sea-shore Hypecoum. Fl. Jun. Jul. Pl. $\frac{1}{4}$ foot.

3 H. imbe'rbe (Smith fl. græc. 2. p. 47. t. 156.) capsules articulated, compressed, arched; sepals dentately-fringed; petals 3-lobed, all beardless. ⊙. H. Native of the island of Cyprus. Inner petals half trifid, not 3-parted; lateral lobes oblong, devaricating.

Beardless-petalled Hypecoum. Fl. Jun. July. Pl. $\frac{1}{4}$ foot.

4 H. pa'tens (Willd. hort. berl. t. 5.) capsules articulated, cylindrical, curved; petals glabrous, outer ones nearly entire, unguiculate, heart-shaped; inner ones 3-parted. ⊙. H. Native of sandy deserts near Alexandria; plentiful in the peninsula of Ras-Otten, and the island of Crete. Mnemosílla Ægyptìaca, Forsk. ægyp. 122. The two exterior petals are large and unguiculate, with a very broad acute limb, appearing as if it were furnished with a lobule on both sides; and hence it is nearly halbert-shaped.

Spreading Hypecoum. Fl. April, May. Pl. $\frac{1}{4}$ foot.

5 H. pe'ndulum (Lin. spec. 181.) capsules knotted, cylindrical, pendulous; petals glabrous, the 2 outer ones ovate-oblong, pendulous, the 2 inner ones 3-parted. ⊙. H. Native of Europe, from Spain to the Caspian Sea, in sandy fields. Mill. fig. t. 250. f. 1. Petals smooth, pale-yellow, large, oval-oblong, entire, tapering a little towards the base.

Pendulous-capsuled Hypecoum. Fl. May, July. Clt. 1640. Pl. $\frac{1}{4}$ foot.

6 H. ere'ctum (Lin. spec. 181.) capsules not articulated, erect, compressed; petals glabrous, outer ones wedge-shaped, somewhat 3-lobed, inner ones trifid; lateral lobes somewhat 2-lobed, middle one small. ⊙. H. Native of Dauria, at the rivers Lelenga, Angara, Kourba, &c.; and beyond the Baikal, even unto the mountains of China. Amm. ruth. 58. t. 9. This species has the largest flowers of any in the genus. Sepals small, lanceolate, pointed.

Erect-capsuled Hypecoum. Fl. June, July. Clt. 1759. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. The species of this genus only require to be sown in the flower border where they are intended to remain.

Order XIII. FUMARIA'CEÆ. (plants agreeing with *Fumària* in many important characters.) D. C. syst. 2. p. 105. Fumarièæ, D. C. theor. ed. 2. p. 244.

Calyx of two small deciduous membranous sepals, (f. 24. *o.*). Petals 4, (f. 42. *h. b.*) irregular, usually connected at the base, sometimes all free, sometimes only with the lower one free, (f. 42. *l.*), and the rest connected, the 2 exterior ones alternating with the sepals, sometimes both are equally drawn out at the base into a hollow spur, or gibbosity, (f. 24. *o.*) sometimes with the lower one flat, and the upper one with a spur, (f. 42. *h. k.*) or gibbosity at the base. Stamens 6, connected together into 2 bundles, (f. 42. *j.* 44. *e.*) very rarely all free; these bundles appear as if they were 3-anthered filaments, (f. 42. *j.* 44. *e.*) or the filament bearing an 8-celled anther, the lateral anthers being 1-celled, the intermediate ones 2-celled. Ovary 1, (f. 42. *c.*) constantly of 2-connected carpels (f. 42. *e.*). Style filiform (f. 42. *i.*). Stigma bilamellate, (f. 42. *d.*). Capsules dry, of various forms, sometimes silique-formed (f. 42. *e.* f. 44. *b.*) with opposite valves, and 2 nerve-formed permanent placentas at the sutures, many-seeded, sometimes 2-valved 2-seeded, with the valves connected and indehiscent, sometimes valveless and 1-seeded, (f. 42. *m. n.*) from abortion; sometimes baccate, many-seeded, (f. 43. *g. p.*) Seeds fixed to the lateral placentas, (f. 42. *g.* f. 44. *b.*), horizontal, ovate-globose, shining, black, furnished at the base with aril or a caruncle. Albumen fleshy. Embryo in the seeds of indehiscent fruit small and straight, those in the dehiscent capsules longer and a little arched. Cotyledons oblong, flat. Herbs yielding a watery juice. Roots annual or perennial, fibrous or tuberous. Stems annual, herbaceous, usually angular. Leaves usually decompound, from the petiole being branched, smooth. Racemes terminal, or opposite the leaves. Bracteas membranous, one under each pedicel, as well as furnished with sepal-like bracteoles on each pedicel. Flowers purple, white, or yellow, emulating those of *Polygala*. The herbs are bitter and scentless; they are reckoned slightly diaphoretic and aperient. The juice was prescribed by old practitioners against obstructions of the viscera and liver, but is more especially used for curing various cutaneous eruptions. This order differs from *Papaveràceæ*, to which it is very closely allied, in abounding in watery juice, instead of a milky juice, and in the petals being irregular, usually connected, as well as in the stamens being diadelphous. It differs from *Cruciferæ* in the calyx being of 2 sepals, as well as in the structure of the petals and seeds, and disposition of the stamens. The plants contained in *Fumariàceæ* are all natives of the temperate zones.

Synopsis of the Genera.

I. Diely'tra. Petals 4, the 2 outer equally spurred or gibbous at the base, (f. 42. *o.*). Silique 2-valved, many-seeded, (f. 42. *i. o. p.*).

II. Dactylica'pnos. Petals 4, deciduous, (f. 43. *a.*); the 2 exterior ones sessile, gibbous at the base; the 2 inner ones on long claws, (f. 43. *c.*). Berries cylindrical-oblong, (f. 43. *g.*) many-seeded, (f. 43. *p.*).

III. Adlu'mia. Petals 4, connected together into a monopetalous, spongy, permanent corolla, which is not gibbous at the base, (f. 42. *a.*) Silique 2-valved, many-seeded, (f. 42. *e.*) (f. 42. *a. b. c. d. e.*).

IV. Cystica'pnos. Petals 4, one of which is gibbous at the base. Capsule bladdery, many-seeded, (f. 42. *f. g.*).

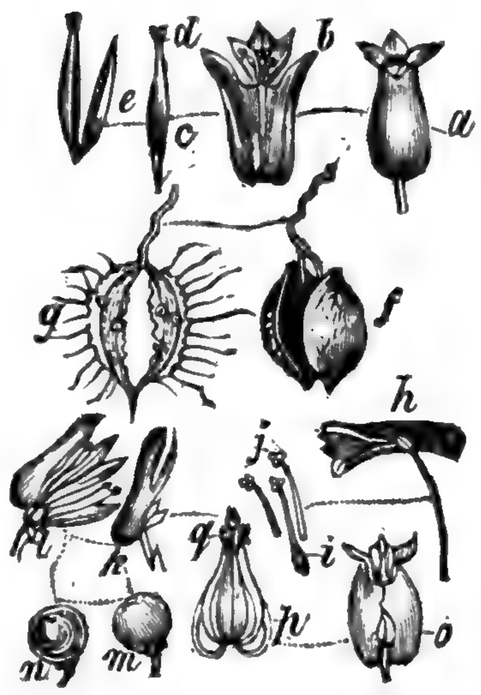
V. Cory'dalis. Petals 4, one of which is spurred at the base. (f. 44.) Silique 2-valved, compressed, many-seeded, (f. 44. *b.*).

VI. Sarcoca'pnos. Petals 4, one of which has a spur at the base, (f. 42. *h.*) Capsule 2-valved, indehiscent, 2-seeded, (f. 42. *h. i. j.*).

VII. Fuma'ria. One of the petals gibbous or spurred at the base, (f. 42. *k.*) Capsule indehiscent, 1-seeded, (f. 42. *m. n.*).

VIII. Discoca'pnos. One of the petals with an obtuse spur at the base. Capsule indehiscent, 1-seeded, flat, girded by a wing in the centre.

FIG. 42.



I. DIELY'TRA (from δις, *dis*, double; and ελυτρον, *elytron*, a sheath; alluding to the two sheath-like spurs at the base of the flower.) Börckh. in Röm. arch. 2. p. 46. D. C. syst. 2. p. 107. prod. 1. p. 125.

Lin. syst. *Diadélphia, Hexándria.* Petals 4, the 2 exterior ones equally spurred or gibbous at the base (f. 42. *o.*). Stamens 6, altogether free (f. 42. *p.*), or approximating into two bundles, or joined at the top (f. 42. *g.*), and free at the base, (f. 42. *p.*). Capsules 2-valved, many-seeded. Perennial herbs with tuberous, horizontal, or fibrous roots. Leaves stalked, multifid, usually all radical, seldom cauline. Flowers racemose, white or purple.

1 D. cucullà'ria (D. C. syst. 2. p. 108.) spurs 2, straight, acute; scape naked; raceme simple. ♃. H. Native of North America, in rich mould among rocks on the sides of hills, from Canada to Virginia; also in the Alleghany mountains, and common on the subalpine regions of the Blue mountains, in open woody places. Fumària cucullària, Lin. spec. 983. Sims, bot. mag. t. 1127. Corýdalis cucullària, Pers. ench. 2. p. 269. Cucullària bulbòsa, Raf. in Desv. journ. bot. 1809. 2. p. 159. Root tuberous, of a very bitter taste. Flowers unilateral, white, but yellow at the tip. This plant is aptly called in America *Dutchman's Breeches*, alluding to the two horns at the base of the flower.

Var. β; divaricàta (D. C. syst. l. c.) spurs divaricate. Fumària cucullària, Mill. dict. no. 9. Perhaps a proper species. This is the *D. cucullària* of Hook, fl. bor. amer. 35.

Hooded-spurred Dielytra. Fl. May, July. Clt. 1731. Pl. ¾ foot.

2 D. bracteo'sa (D. C. syst. 2. p. 109.) spurs 2, straight, acute; stem leafy; bracteas cut. ♃. H. Native of North America? Corýdalis bracteòsa, Spreng. syst. 3. p. 162. Very like *D. cucullària*, but differing in its smaller stature, and the lobes of the leaves being fewer, broader, and a little shorter, as well as in the bracteas being cut. Root tuberous. Flowers white, tipped with yellow.

Bracteate Dielytra. Fl. May, July. Cult. 1823. Pl. ½ foot.

3 D. formòsa (D. C. syst. 2. p. 109.) spurs 2, short, somewhat incurved, blunt; scape naked; racemes rather compound; stigma 2-angled. ♃. H. Native of North America, on the cliffs of shady rocks, on the tops of the mountains in Virginia, Carolina, and Canada; also at Nootka Sound. Fumària formòsa, Andr. bot. rep. 393. Sims, bot. mag. 1335. Corýdalis formòsa, Pursh fl. amer. sept. 2. p. 462. Coryd. biaurìta, Horn. hort. hafn. 2. p. 668? Roots horizontal. Flowers bright-red.

Beautiful Dielytra. Fl. May, Jul. Cult. 1796. Pl. ½ foot.

4 D. exi'mia (D. C. syst. 2. p. 109.) spurs 2, somewhat incurved, blunt, short; scape naked; racemes compound; stigma 4-angled. ♃. H. Native of North America, at Nootka Sound. Fumària exímia, Ker. in bot. reg. 1. t. 50. Corýdalis exímia, Spreng. syst. 3. p. 162. An elegant plant, very like *D. formòsa*, but larger in all its parts, of a paler green colour. Root horizontal. Flowers rose-coloured.

Choice Dielytra. Fl. May, July. Clt. 1812. Pl. ½ foot.

5 D. specta'bilis (D. C. syst. 2. p. 110.) spurs 2, very blunt, ventricose, short; stem leafy; segments of leaves obovate-cuneate, cut. ♃. H. Native of Siberia, on the frontiers of China, and in the north of China. Fumària spectábilis, Lin. amœn. 7. p. 457. t. 7. spec. 953. Capnórchis spectábilis, Börck. in Röm. arch. 1. p. 2. p. 46. Corýdalis spectàbilis, Pers. ench. 2. p. 269. A plant with large showy purple flowers, each nearly an inch long.

Remarkable Dielytra. Fl. May, July. Clt. 1816. Pl. ½ ft.

6 D. tenuifòlia (D. C. syst. 2. p. 110.) spurs 2, very short and very blunt; scape naked, 1-3-flowered; pedicels shorter than the calyx; leaves multifid; lobules linear. ♃. H. Native of Kamtschatka. Deless. icon. sel. 2. t. 9. f. B. Corýdalis tenuifòlia, Pursh. fl. amer. sept. 2. p. 462. Root tuberous. Flowers large in proportion to the plant, pale red, tipped with a more intense colour.

Fine-leaved Dielytra. Fl.? May, July. Clt. 1824. Pl. ¼ foot.

7 D. Canade'nsis (D. C. prod. 1. p. 126.) spurs 2, short, blunt; scape naked, simple, few-flowered; pedicels short; leaves multifid; lobes linear; stigma stretched out, 4-lobed. ♃. H. Native of Canada, about Montreal. Corýdalis Canadénsis, Gold in edin. phil. journ. 1822. p. 330. D. exímia, B. Hook, fl. bor. amer. 35. Leaves glaucous. Herb 6-8 inches long. Flowers white. Root horizontal.

Canadian Dielytra. Fl. May, July. Clt. 1822. Pl. ½ foot.

8 D. lachenaliæflòra (D. C. syst. 2. p. 111.) spurs 2, very short and very blunt; scape naked, 2-4-flowered; pedicels longer than the calyx; leaves multifid; lobes linear, very acute. ♃. H. Native of Siberia, beyond the Baikal, and about Ochotskoi, as well as in the islands of the extreme north-west coast of America, and at Behring's Straits. Corýdalis Lachenaliæflòra, Fisch. in litt. Rud. in mem. sci. petersb. 1. t. 19. Fumària tenuifòlia, Led. mem. acad. petersb. 5. p. 515. no. 37. Fumària cucullària, Pall. Flowers fine red, very like those of *D. tenuifòlia*, but smaller. Roots horizontal.

Lachenalia-flowered Dielytra. Fl. May, Jul. Clt. 1824. Pl. ½ ft.

9 D. sca'ndens (D. Don, prod. fl. nep. p. 198.) spurs 2, very blunt; racemes simple, corymbose, opposite the leaves; leaves bipinnate; leaflets oval-oblong, mucronulated, smooth, glaucous beneath, lower ones 2-3-parted; petioles of the primary leaves profoundly 2-parted, the rest cirrhiferous branches. ⊙. H. Native of Nipaul. Stem climbing. Perhaps this is *Dactylicápnos thalictrifòlia*.

Climbing Dielytra. Pl. cl.

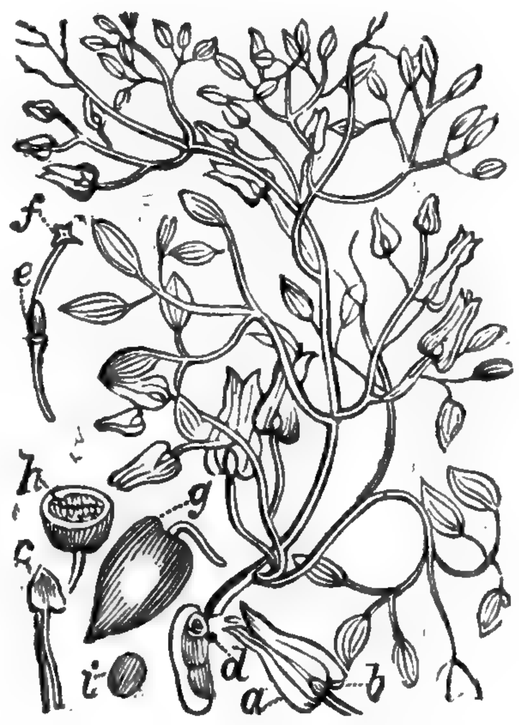
Cult. A pretty genus of perennial herbaceous plants. They thrive best in a light rich soil, and are easily increased by dividing the plants at the roots or by seeds. The *D. scándens* being an annual plant, will only require to be sown in the open border, or to be raised on a hot-bed, and afterwards planted out.

II. DACTYLICA'PNOS (from δακτυλος, *dactylos*, a finger; καπνος, *kapnos*, fumitory, probably in allusion to the divided tendrils.) Wall. tent. fl. nap. p. 51. t. 39.

Lin. syst. *Diadélphia, Hexándria.* Petals 4, cruciate (f. 43. *a.*) deciduous; the 2 exterior ones sessile, equally gibbous at the base (f. 43. *b.*), the 2 inner ones are on long claws (f. 43. *c.*). Stamens 5-6, collected into 2 bodies. Stigma 4-lobed (f. 43. *f.*). Berries cylindrical, oblong (f. 43. *g.*), many-seeded (f. 43. *h.*).—A smooth scandent glaucous herb, with the stem and branches filiform and twisted. Petioles ending in branched tendrils. Leaves triternate. Racemes axillary or opposite the leaves, on long peduncles. Flowers about 20, large, oblong, flattish, nodding, yellow with a rufescent mouth, fragrant, dilated

at the base into two horns or gibbosities. Peduncles filiform; pedicels each furnished with a linear bracteole at the base. Stem 2-3 feet high. Berries indehiscent, fleshy, soft, pale-violet. In habit the plant agrees with *Cysticápnos*, but the flowers resemble those of *Dielýtra*.

FIG. 43.



1 D. thalictrifòlia (Wall. l. c.) ♃? F. Native of Nipaul on Sheopore (f. 43.).

Thalictrum-leaved Dactylicapnos. Fl. June, July. Pl. cl.

Cult. This singular plant has not yet been introduced to Britain, it is therefore not ascertained whether it would stand the climate without protection during winter. It will no doubt grow freely in a mixture of loam and peat, and can only be increased by seeds, or cuttings.

III. ADLU'MIA (from *adlumino*, to fringe with purple; flowers bordered with purple.) Rafin. in Desv. jour. bot. 1809. 2. p. 169. D. C. syst. 2. p. 111. prod. 1. p. 126.

Lin. syst. *Diadélphia*, *Hexándria*. Petals 4, joined into a permanent monopetalous corolla (f. 42. *a*.) which is bigibbose and spongy at the base. Stamens diadelphous, adnate to the corolla at the base (f. 42. *b*.). Capsules oval-oblong, 2-valved, many-seeded (f. 42. *e*.). A smooth delicate climbing herb, with tendrilled petioles.

1 A. cirrhòsa (Raf. l. c.) ♂. H. Native of Canada and Carolina in humid shady places in beech woods. Corýdalis fungòsa, Vent. choix. t. 19. Fumària fungòsa, Ait. hort. kew. ed. 1. vol. 3. p. 1. Bicúculla fumarioìdes, Börck. in Rœm. arch. 1. p. 2. p. 46. Capnoìdes scándens, Mœnch. suppl. 215. Fumària récta, Mich. fl. bor. amer. 2. p. 51. Flowers whitish or pale-rose-coloured. Seeds 4-6, shining, black.

Tendrilled Adlumia. Fl. June, Sept. Clt. 1788. Pl. cl.

Cult. The seeds of this plant may be sown under a hedge or shrub in a moistish situation, or it may be sown in the open border, with dead branches stuck in around the plants in order to support them, as in the case of peas.

IV. CYSTICA'PNOS (from κυστις, *kystis*, a bladder, and καπνος, *kapnos*, one of the Greek names for fumitory; in allusion to the bladdery capsules.) Börh. lugd. 391. Gært. fruct. 2. p. 161. t. 115. D. C. syst. 2. p. 112. prod. 1. p. 126.

Lin. syst. *Diadélphia*, *Hexándria*. Petals 4, deciduous, the upper one of which is gibbose at the base. Stamens diadelphous. Capsules bladdery (f. 42. *f*.), many-seeded (f. 42. *g*.), oval-globose, 2-valved, with the placentas connected by membranous net-work (f. 42. *g*.). A climbing, smooth, dichotomous, slender herb, with bipinnate leaves, which are tendrilled at the top, and the segments are 3-lobed. Flowers small, racemose, white, tipped with red.

1 C. Africa'na (Gært. l. c.) ⊙. H. Native of the Cape of Good Hope. Fumària vesicària, Lin. spec. 984. Corydalis vesicària, Pers. ench. 2. p. 269.

African Bladder Fumitory. Fl. June, Aug. Clt. 1696. Pl. cl.

2 C. Alexandri'na (Link, and Ott. in litt.) this plant does not appear to differ from the last species. ⊙. H. Native of Alexandria.

Alexandrian Bladder Fumitory. Fl. Ju. Aug. Clt. 1827. Pl. cl.

Cult. The seeds of these plants may be sown in the open border, and being climbing plants they should be supported by small dead branches, or allowed to climb up the side of a hedge.

V. CORY'DALIS (κορυδαλις, one of the Greek names of Fumitory; it is derived from κορυδαλος, *korydalos*, a lark, because the spur of the flower resembles the spur of a lark.) D. C. fl. fr. 4. p. 636. syst. 2. p. 113. prod. 1. p. 126. Pers. ench. 2. p. 269. Capnoìdes, Tourn. inst. 423. t. 237.

Lin. syst. *Diadélphia*, *Hexándria*. Petals 4, the upper one of which has a spur at the base (f. 42. *h*.), sometimes all joined at the base, sometimes with the lower one free, and the rest joined, but when they begin to decay, they all become free and deciduous. Stamens (f. 44. *e*.) diadelphous. Capsules 2-valved, compressed, oval-oblong or linear, many-seeded (f. 44. *b*.). Smooth, usually glaucous herbs, with ternate or pinnate-cut leaves. Racemes terminal or opposite the leaves, with a bractea under each pedicel. Roots fusiform, tuberous, or fibrous.

§ 1. *Leonticoìdes (a name applied to this section, because the plants it contains resemble Leóntice, which see.) Root fusiform. Stem simple, bearing 2 opposite leaves.*

1 C. verticilla'ris (D. C. syst. 2. p. 114.) stem quite simple, 2-leaved; leaves glaucous, opposite, biternate, lobes or segments linear. ♂. H. Native of Persia on Mount Elwend. Flowers 8 lines long. Spur of flowers conical-subulate, blunt. Flowers small, white?

Whorled-leaved Corydalis. Pl. ¼ foot.

2 C. oppositifòlia (D. C. syst. 2. p. 114.) stem quite simple, 2-leaved; leaves glaucous, opposite ternate; petioles branched, middle one ternate; segments or lobes ovate. ♂. H. Native of Syria, between Aleppo and Mossul. Flowers white, an inch long, with a spur 6 lines long.

Opposite-leaved Corydalis. Pl. ½ foot.

3 C. diphy'lla (Wall. tent. fl. nap. p. 54.) root? stem short, simple, or furnished with 1 axillary flowering branch, bearing 2 leaves in the middle; leaves opposite, stalked, triternate; segments cuneated, obtuse, deeply 2-lobed or entire; bracteas linear-oblong, cuspidate, large, exceeding the floriferous peduncles, but equal with the fructiferous ones. ♃.? F. Native of Nipaul on mountains about Sirinagur. Flowers yellowish, an inch long, tipped with purple, disposed in racemes about 1 or 2 inches long. Sepals crested. This species probably belongs to the present section.

Two-leaved Corydalis. Fl. June, Aug. Pl. 2 feet.

4 C. meifo'lia (Wall. tent. fl. nap. p. 52. t. 41.) herb erect; root long, fusiform; leaves supra-decompound; segments capillary; flowers in loose racemes, on long stalks; bracteas decompound, setaceous; siliques much shorter than the peduncles. ♃. F. Native of Nipaul on Gosaingsthan. Herb smooth, fleshy, erect. Stems tufted. Flowers large, yellow, nodding, resembling those of *C. nóbilis*. Sepals 2, kidney-shaped, with a purple border. Siliques cuneated, compressed, 4-8-seeded. Leaves resembling those of *Mèum Athamánticum*.

Meum-leaved Corydalis. Pl. 1 foot.

5 C. lóngipes (D. C. prod. 1. p. 128. Wall. tent. fl. nap. p. 53. t. 42.) root branched; stem procumbent or erect, very slender; leaves triternate; lobes obovate, a little cut, obtuse; lower bracteas cut; siliques linear-cuneated, compressed, about equal in length to the pedicel. ♃. F. Native of Nipaul on Sheopore, also on Gosaingsthan. Fumària bulbòsa, Thunb. fl. jap. 277.? C. bulbòsa, Pers. ench. 2. p. 269. Root slender, perpendicular. Stems angular. Racemes terminal. Flowers secund, yellow; sepals kidney-shaped, fringed.

Long-pedicelled Corydalis. Pl. 1 foot.

§ 2. *Capnìtes. Roots tuberous. Stem simple, bearing a few alternate leaves.*

6 C. RUTÆFÒLIA (D. C. syst. 2. p. 115.) stem simple, not scaly at the base; leaves 2, nearly opposite, glaucous, ternate; segments ovate, or with the middle one 3-parted; bracteas ovate. ♃. H. Native of the island of Cyprus. Fumària rutæfòlia, Smith, fl. græc. t. 667. Flowers yellow? Spur horizontal, blunt, callose at the tip, nearly half an inch long, longer than the flower.

Rue-leaved Corydalis. Pl. $\frac{1}{4}$ foot.

7 C. DECU'MBENS (Pers. ench. 2. p. 269.) stem simple, decumbent; leaves biternate; lobes wedge-shaped, 3-toothed; bracteas ovate, entire; racemes 3-4-flowered. ♃. H. Native of Japan. Fumària bulbòsa. Thunb. nov. act. petrop. 12. p. 102. t. A. Fumària bulbòsa, Thunb. jap. 27? but not Lin. Flowers yellow, with the spur the length of the limb.

Decumbent Corydalis. Pl. decumbent.

8 C. PAUCIFLÒRA (Pers. ench. 2. p. 269.) stem simple, not scaly at the base; leaves biternate, 2 or 3 on each stem under the middle; segments 3-parted; lobes obovate; bracteas ovate, acute; racemes crowded, few-flowered. ♃. H. Native of the Altaian mountains in Siberia, and island of St. Lawrence in Behring's Straits. Deless. icon. sel. 2. t. 9. f. A. Fumària pauciflòra, Stev. in Willd. spec. 3. p. 861. F. Altàica, Ledeb. Flowers purplish; spur thick, incurved at the top, very blunt, rather longer than the tube.

Var. β, aquilegifòlia (D. C. syst. 2. p. 116.) hardly different from the species, except the racemes are 7-8-flowered, and the flowers nearly an inch long. Fumària aquilegifòlia, Patrin. ind.

Var. γ, Altàica (Fumaria Altàica, Led. in mem. acad. peterb. 5. 1815. p. 551.) Flowers pendulous.

Few-flowered Corydalis. Fl. April, May. Clt. 1823. Pl. 6 to 7 inches, erect.

9 C. MARSCHALLIA'NA (Pers. ench. 2. p. 269.) stem simple, not scaly; leaves 2, situated above the middle of the stem, biternate; lobes oval, entire or bifid; racemes short; bracteas ovate. ♃. H. Native of Tauria, also on the mountains in the Ukraine under trees. Deless. icon. sel. 2. t. 10. Fumària Marschalliàna, Pall. nov. act. petrop. 10. p. 315. Flowers sulphur-coloured; spur straight or hardly incurved, blunt (f. 44.).

FIG. 44.

Marschall-Bieberstein's Corydalis. Fl. April, May. Clt. 1823. Pl. $\frac{3}{4}$ foot.

10 C. AMBI'GUA (Cham. in Schlecht. Linnæa. 1. p. 558.) stem almost simple, erect, scaly below; leaves 2-3, biternate; segments oval, obtuse, somewhat cuneated, the first ones on long petioles; raceme many-flowered, loose; bracteas entire; siliques linear, erect. ♃. H. Native of Siberia, Kamtschatka, and the north-west coast of America. Fumària ambígua, Pall. in herb. Willd. Flowers on long peduncles, yellow, a little nodding; spur obtuse, straight. Root a solid tuber (f. 44. *f*.).

Ambiguous Corydalis. Pl. $\frac{1}{2}$ foot.

11 C. LONGIFLÒRA (Pers. ench. 2. p. 269.) stem simple, furnished with leafy scales under the leaves; leaves biternate; segments 3-parted; lobes oval-oblong; bracteas oblong, entire; racemes elongated, 10-flowered; spur longer than the pedicels. ♃. H. Native of Siberia on the Altaian mountains, and on the hills about Zmeof, as well as at Jrtish in saltish fields. Fumària Schangìni, Pall. act. petrop. 1779. 2. p. 267. t. 14. f. 1 and 2. Flowers pale-purple; spur slender, awl-shaped at the apex, and somewhat incurved, nearly half an inch long.

Var. β, caudàta (Lam. dict. 2. p. 569.) hardly differing from the species, unless that the flowers are smaller and the lobes of the leaves a little blunter. Native of the north of China on mountains about Pekin.

Long-flowered Corydalis. Fl. April, May. Pl. 1 foot.

12 C. TUBERÒSA (D. C. fl. fr. 4. p. 637. syst. 2. p. 117.) stem simple, not scaly; leaves 2, biternate; segments cuneated, cleft; bracteas ovate, entire; root hollow. ♃. H. Native of Europe, from Sweden to Portugal, in hedges and under trees in rather humid situations. Fumària càva, Mill. dict. no. 7. Curt. bot. mag. 332. Fumària bulbòsa, Scop. carn. no. 864. Fumària màjor, Roth. germ. 1. p. 300. Corýdalis bulbòsa, Pers. ench. 2. p. 69. Corýdalis càva, Wahl. helv. 2. p. 126. Flowers horizontal, purple.

Var. β, albiflòra (Sims, bot. mag. t. 2340.) flowers white.

Tuberous-rooted Corydalis. Fl. Feb. May. Clt. 1596. Pl. $\frac{1}{2}$ ft.

13 C. FABA'CEA (Pers. ench. 2. p. 269.) stem nearly simple, erect, scaly under the lower leaf; leaves 3 or 4 stalked, biternately-cut; segments oblong, bluntish; bracteas ovate, acute, longer than the pedicels; root solid. ♃. H. Native of Sweden, Denmark, Germany, Vallais, France, &c. in shady mountains. Fumària fabàcea, Retz. prod. ed. 2. no. 859. Horn. fl. dan. t. 1394. F. intermèdia, Ehrh. Like *C. tuberòsa*, but differing in the roots being solid, not hollow. Plant and flowers smaller. Flowers purple.

Bean-like Corydalis. Fl. April, June. Clt. 1815. Pl. $\frac{1}{2}$ foot.

14 C. CAUCA'SICA (D. C. syst. 2. p. 119.) stem very simple, erect, scaly under the lower leaf; leaves 2, biternate; segments cut into linear lobes; bracteas oblong, entire; racemes rather loose. ♃. H. Native of Caucasus on wooded mountains. Fumària fabàcea, Bieb. fl. taur. 2. p. 145. Differing from *C. fabàcea*, in the stems being very simple, and bearing only 2 leaves, not 3 or 4-leaves, and in the segments being cleft into linear lobes, not oblong bluntish ones.

Caucasian Corydalis. Fl. Feb. May. Clt. 1820. Pl. $\frac{1}{2}$ foot.

15 C. BULBÒSA (D. C. fl. fr. 4. p. 637.) stem simple, erect, scaly under the lower leaf; leaves 3 or 4 stalked, biternate; segments cuneated or oblong, and are as well as the bracteas cut at the top; root solid. ♃. H. Native under hedges and in woods in rather humid places; nearly throughout Europe; also in Tauria and Siberia; in England about Kendal and other parts of Westmoreland; also at Perry Hall, near Birmingham; at Wickham, Hampshire. Fumària sólida, Smith, engl. bot. t. 1471. Curt. bot. mag. 231. Fumària bulbòsa, Mill. dict. no. 8. Fumària Hallèri, Willd. prod. no. 704. F. mìnor, Roth. fl. germ. 1. p. 300. Corýdalis digitàta, Pers. ench. 2. p. 269. Fumària digitàta, Lejeun. fl. spa. 2. p. 89. C. densiflòra, Presl. Flowers purplish, seldom white.

Var. β, viridiflòra (D. C. syst. 2. p. 120.) flower green; roots hollow.—Lobel. icon. t. 760. f. 1. Swert. floril. 2. t. 7. f. 4.—Bauh. hist. 3. p. 1. p. 205. f. 1.—Morr. hist. 2. sect. 3. p. 261. t. 12. f. 7.

Bulbous-rooted Corydalis. Fl. April, May. England. Pl. $\frac{1}{2}$ ft.

16 C. ANGUSTIFO'LIA (D. C. syst. 2. p. 120.) stem simple, scaly under the lower leaf; leaves 2, stalked, biternate; segments cleft into linear lobes; bracteas deeply-serrated at the apex. ♃. H. Native of Iberia and near Odessa. Fumària angustifòlia, Bieb. fl. taur. 2. p. 146. Very like *C. bulbòsa*, but differing in the lobes of the leaves being much more elongated and truly linear, not cuneated or oblong. Flowers purplish.

Narrow-leaved Corydalis. Fl. Apr. May. Clt. 1819. Pl. $\frac{1}{2}$ ft.

17 C. PE'RSICA (Schlecht. in Linnæa. vol. 1. p. 567.) leaves thrice ternate; leaflets wedge-shaped, sharply-cut; bracteas entire, ovate; capsules nodding. ♃. H. Native of Hyrcania. Flowers purplish?

Persian Corydalis. Pl. $\frac{1}{2}$ foot.

18 C. INCI'SA (Pers. ench. 2. p. 269.) stem simple, erect;

leaves biternate; segments acutely-cut; bracteas oblong-cuneated, cut, shorter than the pedicels. ♃. H. Native of Japan. Fumària incìsa, Thunb. nov. act. petrop. 12. p. 104. t. D. Differing from *C. nóbilis*, to which it is nearly allied by the teeth of the leaflets being acuminated, and the bracteas deeply-toothed, and which are shorter than the pedicels. Flowers yellow; spur straight.

Cut-leaved Corydalis. Fl. May. Pl. ¾ foot.

19 C. BRACTEA'TA (Pers. ench. 2. p. 269.) stem simple, erect, scaly near the base; leaves 2, biternate; segments cleft into linear lobes; bracteas cuneated, profoundly cut at the apex, longer than the pedicels; spur straight, long. ♃. H. Native of Siberia on the Altaian mountains, and about Zmeof and Salair. Fumària bracteàta, Stev. in Willd. spec. 3. p. 858. Flowers sulphur-yellow, horizontal, an inch long; spur longer than the pedicel.

Bracted Corydalis. Fl. May, June. Clt. 1823. Pl. ¾ foot.

20 C. GOVENIA'NA (Wall. tent. fl. nap. p. 55.) root? leaves all stalked, oblong, bipinnate; leaflets cuneated, profoundly pinnatifid, linear-oblong, obtuse, ending in an entire or 2-lobed point; racemes loose, secund; bracteas wedge-shaped, deeply lobed, exceeding the peduncles in length, upper ones lanceolate, entire. ♃.? G. Native of the East Indies on the mountains of Gurval. This species seems to be intermediate between *C. nóbilis* and *C. bracteàta*. Racemes rounded or oblong. Flowers yellow, crowded exactly like those of *C. nóbilis*. Sepals kidney-shaped, toothed. Siliques not seen.

Goven's Corydalis. Pl. 1 foot.

21 C. NÓBILIS (Pers. ench. 2. p. 269.) stem simple, erect, not scaly; leaves bipinnate; segments cuneated, cut at the top; bracteas acute, entire or cut. ♃. H. Native of Siberia, Altaia, and on the banks of the Kolyvan in shady places. Fumària nóbilis, Jacq. vind. t. 116. Sims, bot. mag. t. 1953. Ker. bot. reg. 395. Flowers pale-yellow, with a long spur, which is blunt and incurved at the point. A beautiful plant.

Var. β, *odontophýlla* (D. C. syst. 2. p. 122.) bracteas all ovate, and deeply toothed. Habit slenderer than that of the species.

Noble Corydalis. Fl. May. Clt. 1783. Pl. ¾ foot.

22 C. SCOULE'RI (Hook, fl. bor. amer. p. 36. t. 13.) leaf usually solitary, 3 or 4 times pinnate, longer than the raceme, which is nearly simple; leaflets obliquely oval or oblong, decurrent entire and lobed; bracteas oblong, longer than the pedicels. ♃. H. Native of the north-west coast of North America in dark shady woods; plentiful near the confluence of the Columbia with the sea. Root thick, woody, with a scaly neck. Flowers pendent, rose-coloured.

Scouler's Corydalis. Pl. 1 to 2 feet.

23 C. HAMILTO'NII; stem simple; leaves triternate, radical ones on long stalks; leaflets 3-lobed; bracteas 3, sessile, digitate; pedicels terminal, elongated, 1-flowered, somewhat umbellate; capsules linear, one half shorter than the pedicels. ♃. F. Native of Nipaul at Narain-Hetty C. lóngipes, D. Don. prod. fl. nep. p. 198. Habit of *C. Sibírica*. Flowers purple, but yellow on the inside. Spur straight, very blunt. Plant glaucous, smooth.

Hamilton's Corydalis. Pl. ¼ foot.

24 C. JU'NCEA (Wall. tent. fl. nap. p. 54. t. 42.) root? stem erect, quite smooth, and simple, 2-3-leaved; leaves linear-lanceolate, quite entire; racemes elongated; silique, equal in length to the pedicels. ♃. F. Native of Nipaul at Gosaingsthan. Radical leaves not seen. Flowers yellow, nodding, with purple mouths; spur cylindrical, obtuse. Siliques deflexed, compressed, 4-5-seeded. In consequence of the root being unknown it is doubtful whether this plant belongs to the present section.

Rush-like Corydalis. Fl. Aug. Pl. 1 to 3 feet.

25 C. PÆONIÆFO'LIA (Pers. ench. 2. p. 260.) stem erect, branched; leaves bipinnate; segments ovate, ultimate ones lobed; bracteas oblong-linear, acute; capsules ovate. ♃. H. Native of Siberia at the bottom of rocks near the rivers Lena, Biela and Jama, also between Jrkoutsk and Ochotskoi. Fumària pæoniæfòlia, Steph. in Willd. spec. 3. p. 859.—Gmel. fl. sib. 4. p. 66. t. 34. Flowers large, purple, half an inch long, with a conical, straight, somewhat acute spur. Trunk of root horizontal?

Pæony-leaved Corydalis. Fl. May. Clt. 1823. Pl. ¾ ft.

§ 3. *Capnoìdes, (plants agreeing in character with C. capnoìdes.) Roots fibrous. Stem branched; stem leaves many, alternate.*

26 C. GLAU'CA (Pursh, fl. amer. sept. 2. p. 463.) stem erect, branched; leaves bipinnate, glaucous; pinnulæ somewhat pinnatifid; segments stalked, cuneated, trifid; bracteas oblong, acute, shorter than the pedicels; capsules linear. ⊙. H. Native on rocky declivities of mountains in Canada, also on the Alleghany Mountains. Fumària sempervìrens, Lin. spec. 984. Mill. fig. 1. 78. Fumària glaúca, Curt. bot. mag. t. 179. C. sempervìrens, Pers. ench. 2. p. 269. Flower mixed with red and yellow, as in *Aquilègia Canadénsis*. Spur blunt one half or 3-times shorter than the corolla.

Glaucous Corydalis. Fl. Jul. Aug. Clt. 1683. Pl. 1 or 1½ ft.

27 C. STRI'CTA (Steph. ex Fisch. in litt.) stem erect, somewhat branched; leaves glaucous, pinnate; segments pinnately and acutely cut; bracteas linear, somewhat shorter than the pedicels; capsules ovate-lanceolate. ♃. H. Native of Siberia. Flowers unknown, but they are probably yellow; fructiferous pedicels a line and a half long, deflexedly-spreading.

Straight Corydalis. Fl.? Clt. 1825. Pl. ¾ foot.

28 C. CHÆROPHY'LLA (D. C. prod. 1. p. 128. Wall. tent. fl. nap. p. 52. t. 40.) stem erect, branched; leaves tripinnatifid, glaucous; segments cuneate-obovate, 3-lobed, blunt and mucronated; racemes dense, spiked; bracteas small, acute, lower ones serrated; capsules obovate-oblong, longer than the pedicels. ⊙.? ♃.? Native of Nipaul on Sheopore. Flowers pale, yellow, scentless. Sepals fringed, permanent; spur ascending. Like *C. lùtea*.

Chervil-leaved Corydalis. Fl. June, July. Pl. 1 to 3 feet.

29 C. SIBI'RICA (Pers. ench. 2. p. 270.) stem nearly erect, branched; leaves somewhat glaucous, bipinnate; segments cut into oblong-linear lobes; bracteas linear, nearly equal in length with the pedicels; capsules oval, hardly longer than the pedicels. ♃. H. Native of Siberia in the regions beyond the Baikal, at the rivers Angara and Lena, also in Dauria. Fumària impàtiens, Patrin, ined. Fumària Sibírica, Lin. fil. suppl. 314. —Gmel. sib. 4. p. 65. t. 33. Flowers yellow, usually recurved. Herb sensible to the touch, according to Patrin.

Siberian Corydalis. Fl. Ju. Jul. Clt. 1824. Pl. 1 to 3 feet.

30 C. IMPA'TIENS (Fisch. in D. C. syst. 2. p. 124.) stem somewhat diffuse, branched; leaves glaucous, bipinnate; segments cut into oblong-linear lobes; bracteas setaceous linear, nearly equal in length with the pedicels; capsules linear, twice longer than the pedicels. ⊙. H. Native of Dauria, and also near Kiachta. Fumària impàtiens, Pall. itin. ed. min. 3. p. 233? Very near to *C. glaúca*, and especially to *C. Sibírica*, but differing in the capsules being elastic, and becoming rolled up when touched. Flowers yellow.

Impatient-capsuled Corydalis. Fl. June, July. Clt. 1820. Pl. 1 to 2 feet.

31 C. AU'REA (Willd. enum. 740.) stem diffuse, branched; leaves glaucous, bipinnate; pinnulæ pinnatifid and cut; lobes oblong-linear; bracteas lanceolate-linear, acuminated, denticulated, and are, as well as the linear terete capsules, 4 times longer than the pedicels. ⊙. ♂. H. Native of Pennsylvania, Virginia,

and Canada, extending as far north as the Rocky Mountains, on shaded rocks. Fumària aúrea, Muhl. in Willd. enum. 740. Ker. bot. reg. t. 66. Curt. bot. mag. t. 66. Flowers yellow, half an inch long; spur straight, blunt.

Golden-flowered Corydalis. Fl. May, July. Clt. 1683. Pl. ½ foot.

32 C. fla'vula (Raf. in Desv. journ. bot. 1808. 1. p. 224.) stem somewhat branched; leaves glaucous bipinnate; lobes oblong-linear; bracteas ovate, pointed; capsules linear, torulose, twice the length of pedicels. ⊙. ♂. H. Native of North America, about Philadelphia. Flowers yellow. Calyx small, leafy.

Small yellow-flowered Corydalis. Fl. June, July. Pl. ½ foot.

33 C? racemòsa (Pers. ench. 2. p. 270.) stem branched, erect; leaves bipinnate; segments ovate, bluntly 3-lobed, toothed; bracteas thrice the length of the pedicels. ♃. H. Native of Japan, on rocks and old walls. Fumària racemòsa, Thunb. nov. act. petrop. 12. p. 103. t. B. Flowers yellowish; spur short, blunt. Perhaps the fruit is monospermous; if so, it is a true *Fumària*.

Racemose-flowered Corydalis. Fl. June, July. Pl. ½ foot.

34 C. capnoi'des (Pers. ench. 2. p. 270.) stem branched, diffuse; leaves bipinnate; segments obovate, cuneated, trifid; bracteas large, leafy, cut, stalked; spur awl-shaped, as long as the rest of the flower; capsules thrice the length of the pedicels. ⊙. H. Native of Mauritania and Tangiers, in fissures of rocks, and on walls. Fumària capnoìdes, Lin. spec. 984. F. álba, Mill. dict. no. 3.—Pluck. alm. t. 90. f. 2. Flowers white or whitish.

Capnos-like Corydalis. Fl. May, July. Clt. 1596. Pl. ½ foot.

35 F. lu'tea (Pers. ench. 2. p. 270.) stem branched, diffuse; leaves biternate; segments obovate, cuneated, trifid; bracteas linear-subulate, three times shorter than the pedicel; pods nearly cylindrical, narrow, shorter than their pedicels. ♃. H. Native of many places in the south of Europe, in the fissures of rocks, and on old walls; also in England, on old walls, near Castleton, Derbyshire, and near Fountain's Hall, near Fountain's Abbey, Yorkshire. Fumària lùtea, Lin. mant. 258. Eng. bot. 588. Mill. icon. 1. t. 136. f. 1. illus t. 60. Fumària capnoìdes. With 620. Capnoìdes lùtea, Gært. fruct. 2. p. 163. t. 115. f. 3. Corýdalis capnoìdes β, D. C. syst. 2. p. 126. Flowers yellow. Leaves thrice ternate, rather glaucous, green; segments wedge-shaped, with rounded lobes.

Yellow Corydalis. Fl. May, Sept. England. Pl. 1 foot.

36 C. acau'lis (Pers. ench. 2. p. 270.) scapes naked; radical leaves pinnate; segments obovate-cuneated, trifid or ternate. ⊙. H. Native of Carinthia. Fumària acaùlis, Wulf. in. Jacq. coll. 2. p. 203. icon. rar. 3. t. 554. Lam. ill. t. 597. f. 3. Flowers pale-yellow. Spur short.

Stemless Corydalis. Fl. July, Sept. Clt. 1826. Pl. ¼ foot.

37 C. Urale'nsis (Fisch. in D. C. syst. 2. p. 127.) stem erect, somewhat branched, scarcely longer than the radical leaves; leaves ternate, on long stalks; segments 3-parted; lobes somewhat cut; racemes few-flowered; bracteas cut at the top. ♃? H. Native of the Ural mountains, at Awsan, Petrowsky Sawod. Habit nearly of *C. acaúlis*, but very distinct. Flower yellow, with a straight slender spur, 6 lines in length.

Ural Corydalis. Fl? Clt. 1823. Pl. ¼ foot.

38 C. brevifòra (D. C. syst. 2. p. 127.) stem branched, diffuse; leaves biternate; petioles somewhat tendrilled; segments 3-parted into oblong-linear lobes; bracteas oblong, nearly equal in length with the pedicels. ⊙. H. Native of Kamtschatka. This plant is allied on the one side to *C. lùtea*, and on the other to *C. claviculàta*. Flowers pale-yellow; spur straight, broad, rather acute, occupying one half the length of the flower.

Short-flowered Corydalis. Fl. May, Sept. Clt. 1823. Pl. 1½ foot.

39 C. clavicula'ta (D. C. fl. fr. 4. p. 638.) stem branched, diffuse, scandent; leaves bipinnate; petioles tendrilled; segments oval, entire; bracteas oblong, shorter than the pedicels. ⊙. H. Native in bushy, shady, rather hilly situations, on a gravelly, stony, or sandy soil throughout Europe; England in several places. Fumària claviculàta, Lin. spec. 985. Smith, eng. bot. t. 103. Flowers white, variegated with blue or grey; spur short, blunt.

Claviculate Corydalis. Fl. June, July. England. Pl. 1 to 4 feet high. Cl.

40 C. pa'llida (Pers. ench. 2. p. 270.) stem branched, decumbent; leaves bipinnate; bracteas acutely-toothed. ♃? H. Native of Japan. Fumària pállida, Thunb. nov. act. petrop. 12. p. 103. t. C. F. lùtea, Thunb. fl. jap. 277. Flowers pale-yellow; spur blunt, longish.

Pale-flowered Corydalis. Fl. June, July. Pl. 1 to 2 feet.

41 C. cra'cca (Schlecht. et Cham. in Linnæa, vol. i. p. 567.) stem climbing; leaves bipinnatifid; segments obovate, entire, or cut; petioles tendrilled; bracteas lanceolate, entire, scale-formed, equal to the pedicels in length; racemes sessile; pods pendulous, many-seeded. ⊙. H. Native of Cape of Good Hope. Flowers flesh-coloured. Like *C. claviculàta*.

Cracca-like Corydalis. Pl. cl.

Cult. The species of this genus are all very beautiful; they will thrive well in a light, rich soil. They are very ornamental for the front of flower-borders, or they will succeed well in rock-work; they are increased by dividing the plants, or by seeds; the bulbous-rooted species by offsets; the annual kinds by seeds, which may be sown where they are intended to remain. The greater part of them will thrive well under trees, if the ground be not too dry.

VI. SARCOCA'PNOS (from σαρξ σαρκος, *sarx sarkos*, flesh; καπνος, *capnos*, the Greek name for Fumitory; alluding to the leaves being thick or fleshy.) D. C. syst. 2. p. 129. prod. 1. p. 129.

Lin. syst. *Diadélphia, Hexándria.* Petals 4, free, the upper one with a short spur at the base. Stamens diadelphous; capsules 2-valved, indehiscent, 2-seeded; valves 3-nerved, flattish. Perennial branched, somewhat tufted, smooth or pilose herbs, with fibrous roots, and short racemes of flowers.

1 S. enneaphy'lla (D. C. syst. 2. p. 129.) leaves from the branched petioles triternate; segments ovate-orbicular. ♃. H. almost a ♄. Native of Spain and Portugal in the fissures or chinks of humid calcareous rocks. Fumària enneaphýlla, Lin. spec. 984. Lam. ill. t. 597. f. 4. Corýdalis enneaphýlla, D. C. fl. fr. supp. p. 587.—Bocc. 2. p. 83. t. 73. Barrl. icon. t. 42. Base of stems somewhat suffruticose. Flowers whitish, tipped with red.—A singular variety of this plant was gathered about Trillo, in Spain, by Thibaud, with the branches and petioles beset with long, soft, distant hairs.

Nine-leaved Sarcocapnos. Fl. May, July. Clt. 1714. Pl. ¼ to ½ foot.

2 S. crassifo'lia (D. C. syst. 2. p. 130.) leaves undivided or ternate; segments ovate. ♃. H. Native of Mauritania near Tlemsen in the fissures of moist rocks. Fumària crassifòlia. Desf. alt. 2. p. 126. t. 173. A tufted smooth evergreen herb with pale yellow somewhat corymbose flowers.

Thick-leaved Sarcocapnos. Fl.? Pl. trailing.

Cult. These plants will thrive well in the open border, or in the moist parts of rock-work in a light rich soil; and they may be either propagated by dividing the plants at the root or by seeds.

VII. FUMA'RIA (from *fumus*, smoke; in allusion to the disagreeable smell of the plant. The French, with the same meaning, call it *Fumeterre*, whence our English Fumitory). Tourn. inst. p. 422. t. 237. Gært. fruct. 2. p. 162. t. 115. D. C. syst. 2. p. 130. prod. 1. p. 129.

LIN. SYST. *Diadélphia, Hexándria.* Petals 4, lower one linear free, (f. 42. *l.*), the 3 upper ones connate at the base, middle one of these with a spur at the base (f. 42. *k.*). Stamens diadelphous. Capsules indehiscent, 1-seeded (f. 42. *m. n.*). Style deciduous. Smooth, slender herbs, with alternate-decompound leaves. Flowers small, racemose, white, or purplish.

SECT. I. PLATYCA'PNOS (from πλατυς, *platys*, broad, καπνος, *capnos*, fumitory; broad podded fumitory.) D. C. syst. 2. p. 131. Pods compressed.

1 F. SPICA'TA (Lin. spec. 985.) pods compressed, oval, smooth; racemes spicate; pedicels much shorter than the bracteas; stems erect. ⊙. H. Native of the south of Europe in cultivated fields. —Morr. hist. 2. p. 261. sect. 3. t. 12. f. 11. Leaves glaucous, stalked, multifidly-decompound into crowded linear awl-shaped lobes. Flowers white at the base and purple at the apex.

Var. β, aurantìaco-cròcea (D. C. syst. 2. p. 131.) ⊙. H. Native of Spain. Distinguished from the species by its smaller habit and orange-copper-coloured flowers.

Spiked-flowered Fumitory. Fl. May, Aug. Clt. 1714. Pl. 1 or 1½ foot.

2 F. TURBINA'TA (Smith, in D. C. syst. 2. p. 132.) pods compressed, turbinate, truncate, striated; stems somewhat climbing; petioles cirrhose at the top. ⊙. ? H. Native of the Levant. F. claviculàta, Lin. herb. Flowers racemose, small; perhaps purplish?

Turbinated-podded Fumitory. Pl. 2 feet.

3 F. CORYMBO'SA (Desf. act. soc. hist. nat. par. 1. p. 26. t. 6. fl. atl. 2. p. 124.) pods ovate, compressed, pointed, dotted; racemes somewhat corymbose; frutiferous pedicels, much longer than the bracteas; stems diffuse. ♃. H. Native of Algiers near Tlemsan in the fissures of rocks. F. Africàna, Lam. dict. 2. p. 569. Leaves on long petioles, pinnate; segments 5, cut or parted; lobes oblong. Flowers pale at the base and purple at the apex.

Corymbose-flowered Fumitory. Fl. Ju, Jul. Pl. procumbent.

SECT. II. SPHÆROCAPNOS (σφαιρα, *sphaira*, a sphere, καπνος, *capnos*, fumitory; round podded fumitory.) D. C. syst. 2. p. 131. Pods globose (f. 42. *m.*)

4 F. CAPREOLA'TA (Lin. spec. 985.) pods globose; fructiferous pedicels recurved, longer than the bracteas; racemes oblong; stems somewhat climbing; leaves bipinnate; petioles somewhat tendrilled. ⊙. H. Native of western and southern Europe in the fissures of rocks and among stones. D. C. icon. rar. 1. t. 34. Savi. mat. med. 14. t. 1. f. 1. Herb procumbent or scandent. Flowers whitish, tipped with dark-purple; spur compressed, blunt, short, mitre-formed.

Var. β? Burchéllii (D. C. syst. 2. p. 133.) peduncles spreading; fructiferous pedicels double the length of the bracteas. Fumària, no. 1298, Burch, cat. geogr. pl. afri. austr. Perhaps a proper species. Native of Cape of Good Hope among bushes by the sides of rivulets, particularly about the place called Roggeweld's-Karo.

Tendrilled Fumitory. Fl. May, Sept. Clt.? Pl. cl.

5 F. LICHTENSTEI'NII (Schlecht. Linnæa, 1. p. 569.) stem weak, climbing; leaves bipinnate, tendrilled; segments lanceolate, cut; flowers small; deflowered pedicels, capillary elongated, 6-times longer than the bracteas. ⊙. H. Native of Cape of Good Hope. Flowers flesh-coloured. Racemes short, crowded, at length elongated. Fumària micrántha, Licht. mss. Pods not known.

Lichtenstein's Fumitory. Pl. cl.

6 F. ME'DIA (Lois. not. p. 101.) pods globose, rather depressed; fructiferous pedicels erect, double the length of the bracteas; racemes loose; stems erect; leaves supra-decompound; petioles somewhat tendrilled. ⊙. H. Native throughout Europe in cultivated fields. In England sparingly at Edmonton, and a few other places near London; more plentifully about Barnstaple, and elsewhere in Devonshire; about Battersea in fields and garden grounds; in Sussex; very abundant about Liverpool; in Canada near Quebec and in Newfoundland. F. capreolàta, Lightf. fl. scot. 380. Smith, engl. bot. t. 943. F. agrària, Lag. cat. hort. madr. 1815. p. 21. This plant is most like *F. officinàlis*, but the leaves are less glaucous and their tendrils twisting round other plants. Flowers pale, with the tip of each petal deep red.

Var. β, prehensíbilis (Kit. ined. hort. pesth. 1812. p. 10.) leaves thickish, almost succulent, shorter than those of the species. Perhaps a proper species. ⊙. H. Native of Hungary.

Intermediate Fumitory. Fl. Ju. Sep. England. Pl. 3 or 4 ft.

7 F. OFFICINA'LIS (Lin. spec. 984.) pods globose, retuse; fructiferous pedicels erect, double the length of the bracteas; racemes rather loose; stem diffuse; leaves supra-decompound; lobes linear. ⊙. H. Native in corn-fields and cultivated land throughout the world; plentiful in Britain. Smith, eng. bot. t. 589. Mill. icon. 1. t. 136. f. 2. Blackw. herb. t. 237. Fl. dan. t. 940. Curt. fl. lond. 2. t. 52. Woodv. med. bot. 241. t. 88. Sav. mat. med. p. 14. t. 1. f. 2. Mart. fl. rus. t. 68. F. pulchélla, Sal. prod. 377. Flowers pale red, deep red at the summit. The leaves are succulent, saline, and bitter. The expressed juice, in doses of 2 ounces, taken twice a-day in whey, is useful in hypochondriacal, scorbutic, and cachetic habits. It corrects acidity and strengthens the stomach; Hoffman prefers it to all other medicines as a sweetener of the blood. There is no doubt of its utility in obstructions of the viscera, and the diseases arising from them. The celebrated Boerhaave frequently prescribed it in black jaundice and bilious colics. An infusion of the leaves was used as a cosmetic to remove freckles and clear the skin, and Dr. Cullen has experienced its good effects in many cutaneous disorders. The same physician thought it useful as a tonic wherever bitter medicines are advisable.

Var. β, grandiflòra (D. C. syst. 2. p. 135.) flowers larger and pale purple. ⊙. H. Native of Cape of Good Hope. F. officinàlis, Burm. prod. fl. cap. p. 20.

Officinal Fumitory. Fl. May, Aug. Britain. Pl. ½ foot.

8 F. PARVIFLO'RA (Smith, engl. bot. t. 590.) pods globose, somewhat mucronated; fructiferous, pedicels erect, longer than the bracteas; racemes loose; stems diffuse; leaves supra-decompound; lobes linear, channelled. ⊙. H. Native of the south of Europe, as well as in England in cultivated fields about Woldham near Rochester and near Epsom. It is also a common weed throughout the East Indies. Smith, engl. bot. t. 590. F. spicàta β, Lin. syst. veg. ed. 13. p. 470. F. tenuifòlia, Sym. syn. p. 200. F. Sícula, Pisan. cat. hort. panorm. 1816. Very like *F. officinàlis* but smaller in all its parts. Flowers pale red. In the East Indies this is a very common weed, it is called in the Bengalee *Bun-sulpha*, in Hindostanee *Sulpha-saug*. It possesses a bitterish taste. Dr. Whitlaw Ainslie speaks of it in his Materia Medica of Hindostan, p. 16. under the name of *F. officinàlis*, being in use among the Mahomedans as a diuretic, and is employed in maniacal cases, and as a diobstruent. He says it is called *Pitpatra* in Hindostanee, *Shoutra* in Persia, *Dukhanee* and *Bucklututmelic* in Arabic.

Small-flowered Fumitory. Fl. Aug. Sept. Engl. Pl. ½ ft.

9 F. LEUCA'NTHA (Viv. fl. cors. app. in Schlecht. Linnæa, vol. 1. p. 502.) pods globose, wrinkled, 1-seeded; flowers in racemose spikes; leaves supra-decompound, finely dissected into linear furrowed lobes. ⊙. H. Native of Corsica and other parts of the south of Europe. F. parviflòra, Lam. dict. 11. p. 567. but not of Smith. Fumaria foliis tenuissimis, flore albo. Tourn. inst. 422. Flowers white.

White-flowered Fumitory. Fl. Aug. Sept. Clt.? Pl. ½ ft.

10 F. VAILLA'NTII (Lois. not. p. 102.) pods globose, hardly mu-

cronulate; fructiferous pedicels erect, longer than the bracteas; racemes short; stems rather erect; leaves supra-decompound; lobes linear, flat. ⊙. H. Native of France in sandy fields about Paris, Montpelier, &c. Vaill. bot. par. 56. t. 10. f. 6. Very like *F. parviflòra*, but the branches are erect, not spreading nor procumbent, and the whole plant is more glaucous, and the flowers of a deeper purple colour.

Vaillant's Fumitory. Fl. May, Aug. Clt. 1816. Pl. ½ ft.

11 F. densiflo'ra (D. C. cat. hort. monsp. 113. syst. 2. p. 137.) pods globose; fructiferous pedicels erect, longer than the bracteas; racemes dense; calyx toothed; stems erectish; leaves supra-decompound, lobes linear, thickish. ⊙. H. Native about Montpelier in stony fields and on walls. Flowers of an intense purple colour but occasionally white.

Dense-flowered Fumitory. Fl. May, Jul. Clt. 1820. Pl. ½ ft.

† *A species not sufficiently known.*

12 F. micra'ntha (Lag. cat. hort. madr. p. 21.) ⊙. H. Native of Spain in fields near Tudela and about Murcia. Leaves pinnately-decompound, linear, very narrow; calyx cordate-rounded, broader than the tube of the corolla (Lag.). Flowers pale purple.

Small-flowered Fumitory. Fl. June, July. Clt. 1824.

Cult. The species are mostly weedy-looking plants, and are scarcely worth cultivating. The annual kinds should be sown in the open border, and treated as other hardy annuals, except *F. mèdia*, *capreolàta*, and *turbinàta*, which are really worth cultivating; these should be sown under a hedge, where they will climb up and make a very beautiful appearance. *F. corymbòsa* will do well if planted in rock-work.

VIII. DISCOCA'PNOS (*δισκος*, *discos*, a disk; *καπνος*, *kapnos*, the Greek name for Fumitory; wing in the centre of orbicular flat capsule). Schlecht. in Linnæa 1. p. 569.

Lin. syst. *Diadélphia*, *Hexándria*. Flowers of Fumaria. Capsule orbicular, flat, membranous, with a nerve running through the middle on both sides from the base to the style, mucronate, 1-celled, girded by a wing in the centre, perepheric, indehiscent, 1-seeded. Seed lenticular, compressed, finely granulated, shining. This genus differs from *Fumaria*, Sect I. *Platycápnos*, in the fruit being membranous, and girded by a wing. A glaucous herb, with bipinnate tendrilled leaves; segments wedge-shaped, cut. Racemes opposite the leaves, stalked, 5-8-flowered. Flowers red, with an obtuse spur.

1 D. Mu'ndtii (Schlect. l. c.) ⊙. H. Native of Cape of Good Hope. Fumària Múndtii, Spreng. syst. app. p. 264.

Mundt's Discocapnos. Fl. Aug. Pl. cl.

Cult. This plant only requires to be sown in the open ground in April, and treated as other hardy annuals.

Order XIV. CRUCI'FERÆ (from *crux*, *crucis*, a cross, and *fero*, to bear; in allusion to the four petals being disposed cross-wise). (f. 45. *o.* f. 48. *e.* f. 49. *a.* f. 50. *b.*) Juss. gen. 237. D. C. syst. 2. p. 139. prod. 1. p. 131. Adans. fam. 2. p. 409.

Calyx of 4 sepals (f. 45. *n.* f. 50. *c.*). Petals 4, alternate with the sepals, disposed cross-wise, constantly distinct and free (f. 45. *o.* f. 51. *e.*). Stamens 6, (f. 45. *h. g.* f. 49. *e. c.*) the two in front of the lateral sepals are solitary, and shorter than the rest (f. 45. *g.* f. 49. *c.* f. 51. *c.*) and are inserted lower down, the 4 longest approximate in pairs (f. 45. *g.* f. 49. *e.* f. 50. *a.*) in front of the other sepals. Anthers 2-celled, bursting inwards (f. 49. *e.*). Receptacle small, bearing a few glands between the stamens and the petals. Carpels 2, c'osely connected together by one pistil (f. 47. *f. m.* &c.). Ovary 1 (f. 49. *d.*) short, or elongated, those with the short ovary are usually crowned by a short style (f. 51. *b.*) Stigmas 2, approximate (f. 46. *l. g. &c.*) or spreading (f. 46. *n. &c.*); siliques (f. 47. *f. &c.*) (long pods) or silicles (f. 46. *h. &c.*) (short pods) usually 2-celled, 2-valved (f. 46. *h. &c.*), very rarely 1-celled (f. 47. *d. &c.*). The cells are usually separated by a thin dissepiment situated vertically, and girded by a placentarious nerve (f. 46. *r.*). Seeds in each cell, 1 (f. 47. *b.*) 2 or numerous, (f. 46. *l.*) fixed to both sides of the placenta (f. 46. *g.*) usually pendulous (f. 46. *l.* f. 47. *b. &c.*) rarely solitary from abortion (f. 47. *d. h.*) always hanging by an umbilical thread, which is usually free (f. 47. *b. &c.*). Albumen wanting. Embryo oily, curved. Radicle terete, tending to the umbilicus. Cotyledons 2, opposite (f. 45. *j.*), inclining various ways above the radicle, which are explained in the characters of the tribes.

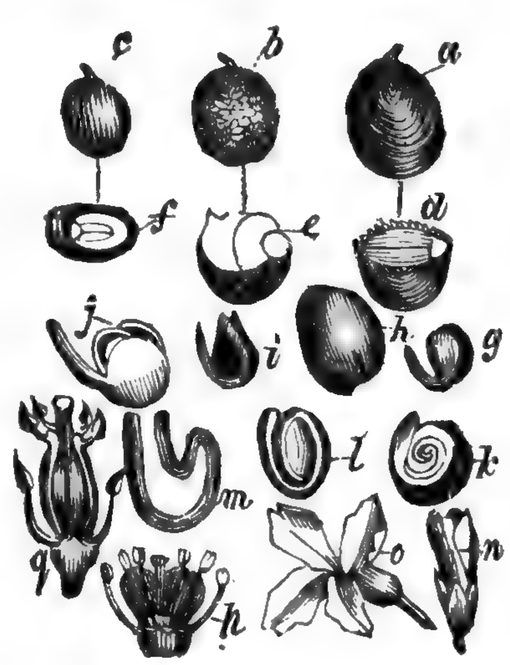
This order consists of annual, perennial or biennial herbs, rarely suffrutescent, stems, however, never exceeding the height of three feet, the perennials have thick roots, the biennials and annuals have slender roots, usually perpendicular and undivided. The young roots are tipped with a little sheath, called the Coleorhiza, which is produced by the extended ruptured coat of the epidermis, when the rootlets first appear. The stems are round and somewhat angular, branched, and often, even in the annual species, indurated at the base. The branches rise from the axillæ of the leaves, but the uppermost ones are abortive in the annual species. Racemes usually opposite to the leaves, sometimes the terminal branch is abortive, when the raceme appears to be terminal, but this is merely owing to that circumstance. The leaves are simple, usually radical or alternate, rarely opposite, as in *Eunòmia* and *Lunària*, feather-nerved, entire toothed, pinnatifid, lyrate or variously dissected, the lower ones usually stalked, the uppermost ones sessile. Flowers white, yellow, or purple, but in some species of *Helióphila* they are blue; they are mostly sweet-scented, and easily changed to double. Flowering racemes at first sub-corymbose (f. 49.), at length much elongated (f. 51.). This order differs from *Papaveràceæ* and *Fumariàceæ* in the calyx being of 4 sepals, not 2, as well as in the seeds being destitute of albumen. It differs from *Resedàceæ* in the seeds being furnished with an umbilical cord, from *Datisceæ* in the seeds being destitute of albumen, and from *Capparídeæ* in the receptacle not being hemispherical nor elongated, as well as in pods being furnished with a dissepiment, and in the very different habit of the plants, and the disposition of the stamina. The plants contained in this order are chiefly confined to the temperate zones; their station is variable, many inhabit open sandy places, some form the vegetation about the limits of perpetual snows of lofty mountains, and many follow the footsteps of man through all parts of the world. The seeds of all the species retain their vegetative power a considerable time, therefore they may be introduced in a living state from any part of the world.

The plants of this class have always been celebrated for their anti-scorbutic qualities. These seem to reside in an acrid oily volatile principle, and varying in the degree of abundance in which it is found in different species. It is particularly abundant in the seeds of *mustard* and *garden-rocket*, in the roots of

horse-radish, and in the leaves of *Lepídium latifòlium* which administered act powerfully upon the gastric organs, or applied externally inflame the skin and operate nearly as severely as blisters. A slighter degree of acrimony is found in the *scurvy-grass*, and the roots of the *garden-radish*, &c. and these therefore operate more gently and perhaps more safely when eaten, and scarcely at all when applied to the skin. Whatever may be the degree of acrimony in these plants, they all appear when eaten to produce some specific action upon the digestive organs, and thence upon scorbutic humours, for which reason the *horse-radish*, *water-cress*, *garden-radishes*, and even *cabbages* are eminently anti-scorbutic. They are also admitted by physicians as diuretic, sialogogue, and diaphoretic. It is only when the acrid principle is diffused over a considerable quantity of fleshy and watery substance that cruciferous plants become eatable, as in the leaves and stems of *cabbages*, *cauliflowers*, and *sea-kale*, and in the roots of *radishes* and *turnips*. It is to be remarked that cruciferous plants are always eatable when their texture is succulent and watery. Even in these plants the proportion of acrid principle is much diminished by exclusion from light. Plants of this order are also remarkable for containing a greater quantity of azote than most vegetables, for which reason ammonia is generally evolved in their fermentation or putrefaction, to which circumstance it is possible that the two remarkable phænomena are to be attributed, viz. that cruciferous plants contain a greater portion of nutritive matter than most herbaceous plants, and that they require either a very rich soil, manured with animal substance, or at least a situation near the habitation of men. The embryos of all these plants are filled with oil, and the seeds of *Camelìna satìva*, *Brássica campéstris*, *var. oleífera*, some species of *Rocket*, &c. are cultivated in many parts of Europe for the sake of their expressed oil, which is used either for culinary purposes or for lamps. (Decandolle, syst. 2. p. 143 and 144.)

Synopsis of the Genera.

FIG. 45.



SUBORDER I. PLEURORHI'ZEÆ. D. C. syst. 2. p. 146. prod. 1. p. 132.

Cotyledons flat, accumbent (f. 46. *c.* f. 45. *g.*). *Radicle lateral* (f. 45. *h. g. d.*). *Seeds compressed* (f. 46. *g. h.*).

TRIBE I.

ARABI'DEÆ *or* PLEURORHI'ZEÆ. *Siliquòsæ. D. C. syst. 2. p. 146. prod. 1. p. 132.*

Silique dehiscent, with a linear dissepiment, which is, more or less, broader than the seeds (f. 46. *b.*). *Seeds oval, compressed, usually margined. Cotyledons flat, accumbent* (f. 46. *c.* f. 45. *g. d. h.*), *parallel with the dissepiment.*

1 MATHI'OLA. Silique somewhat cylindrical. Stigmas connivent, thickened or horned on the back (f. 48. *b.*). Calyx besaccate at the base.

2 CHEIRA'NTHUS. Silique terete or compressed. Stigma 2-lobed or capitate. Calyx besaccate at the base.

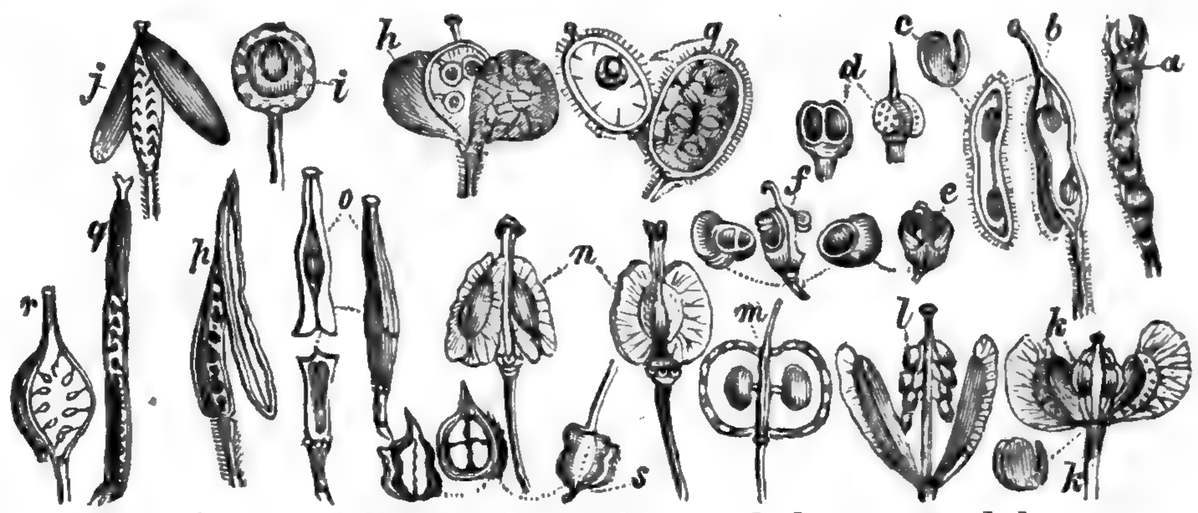
3 NASTU'RTIUM. Silique rather terete, short, or declinate. Stigma somewhat 2-lobed. Calyx equal at the base, spreading.

4 LEPTOCARPÆ'A. Silique rather terete, very slender. Stigma sessile, 2-lobed. Calyx spreading, equal.

5 NOTO'CERAS. Silique tetragonally 2-edged; each valve ending in a mucrone or horn at the top (f. 46. *a.*).

6 BARBARE'A. Silique tetragonally 2-edged; valves without a mucrone or horn at the top. Calyx equal at the base.

FIG. 46.



7 STEVE'NIA. Silique oblong, few-seeded, narrowed between the seeds (f. 46. *b.*); valves flat, somewhat torulose. Calyx bisaccate at the base.

8 BRA'YA. Silique oblong, somewhat cylindrical, with flattish valves and a sessile stigma. Seeds few, ovate. Calyx equal at the base. Cotyledons perhaps incumbent.

9 TURRI'TIS. Silique linear; valves flat. Seeds in 2 rows in each cell.

10 A'RABIS. Silique linear; valves flat, with a nerve in the middle of each. Seeds in one row in each cell.

11 OUDNE'YA. Silique sessile, linear, beaked; valves flat, with a nerve in the middle. Seeds in 1 row. Stigmas connate, distinct at the top. Calyx closed, bisaccate at the base.

12 MACROPO'DIUM. Silique linear, stalked; valves flat, with a nerve in the middle.

13 CARDA'MINE. Silique linear; valves flat, nerveless, usually separating with elasticity. Umbilical cord slender.

14 PTERONEU'RUM. Silique lanceolate; valves flat, nerveless, usually separating with elasticity. Placentas with nerved wings. Umbilical cord dilated.

15 DENTA'RIA. Silique lanceolate; valves flat, nerveless, usually separating with elasticity. Placentas not winged. Umbilical cord dilated.

16 PA'RRYA. Silique broad-linear; valves flat, more or less distinctly veined. Seeds with broad margins, disposed in something like 2 rows. Umbilical cord adnate to the dissepiment above. Lobes of stigma approximate. Calyx bigibbous at the base.

TRIBE II.

ALYSSI'NEÆ *or* PLEURORHI'ZEÆ LATISE'PTÆ. *D. C. syst. 2. p. 147. prod. 1. p. 156.*

Silicle opening longitudinally; dissepiment broad-oval, me

branous; valves flat or concave. Seeds compressed, usually margined (f. 46. *g. h.*). *Cotyledons flat, accumbent, parallel with the dissepiment* (f. 46. *c.* f. 45. *g. d.*).

17 Luna'ria. Silicle stalked, elliptical or lanceolate; valves flat. Umbilical cord long, adhering to the dissepiment. Calyx somewhat bisaccate at the base. Petals quite entire. Stamens toothless.

18 Rico'tia. Silicle sessile, oblong, adult ones 1-celled, in consequence of the dissepiment having vanished; valves flat. Calyx valvular, bigibbous at the base. Petals emarginate. Stamens toothless.

19 Farse'tia. Silicle sessile, oval (f. 46. *g.*), or oblong; valves nearly flat (f. 46. *g.*); dissepiment 1-nerved, veiny; seeds winged (f. 46. *g.*) Calyx closed, hardly bisaccate at the base. Petals entire. Funicle free. Filaments toothless. Anthers linear.

20 Koni'ga. Silicle sessile, somewhat ovate, with flattish valves and 1 or many-seeded cells; funicle adnate to the base of the dissepiment. Seeds usually marginate. Calyx spreading. Petals quite entire. Filaments toothless.

21 Bertero'a. Silicle sessile, elliptical or obovate; valves flat or concave. Calyx equal at the base. Petals 2-parted. Lesser stamens toothed.

22 Aubrie'tia. Silicle oblong; valves convex. Seeds not margined. Calyx bisaccate at the base. Petals entire. Lesser stamens toothed.

23 Vesica'ria. Silicle globose, inflated; valves hemispherical. Seeds numerous (beyond 8). Petals entire.

24 Schiwere'ckia. Silicle ovate; valves convex, somewhat depressed lengthwise in the middle. Seeds numerous. Calyx equal at the base. Petals entire. Larger stamens toothed.

25 Adyse'ton. Silicle roundish, pointed with the style, with compressed valves. Seeds 2 in each cell, or sometimes solitary from abortion. Calyx equal at the base. Petals emarginate. Stamens all or some of them toothed.

26 Aly'ssum. Silicle roundish, with a convex disk and a retuse apex; funicle adhering to the base of the dissepiment. Seeds 2 in each cell, with membranous wings. Calyx equal at the base. Petals emarginate. Stamens all or some of them toothed.

27 Onodo'ntea. Silicle orbicular (f. 46. *h.*) or elliptical; valves flat or convex in the centre, somewhat inflated (f. 46. *h.*). Seeds 2-4 in each cell (f. 46. *h.*). Calyx equal at the base. Stamens all toothless.

28 Disco'vium. Silicle lenticular, with an entire dissepiment and keeled valves and many-seeded cells. Style permanent; stigma blunt. Calyx closed. Cotyledons accumbent?

29 Menio'cus. Silicle sessile, elliptical; valves flat. Seeds 6-8 in each cell. Calyx equal. Petals entire. Larger stamens toothed.

30 Clype'ola. Silicle orbicular, 1-celled, 1-seeded; valves flat. Calyx equal. Petals entire. Stamens toothed.

31 Pelta'ria. Silicle orbicular, 1-celled, in consequence of the dissepiment having vanished, 1 (f. 46. *i.*) or 4-seeded; valves flat. Calyx equal. Petals entire. Stamens toothless.

32 Petroca'llis. Silicle sessile, oval; valves flattish. Seeds 2 in each cell. Umbilical cord adhering to the dissepiment.

33 Dra'ba. Silicle sessile, oval or oblong (f. 46. *j.*); valves flat or convex (f. 46. *j.*). Seeds numerous, immarginate (f. 46. *j.*). Calyx equal. Petals entire. Stamens all toothless.

34 Ero'phila. Silicle oval or oblong; valves flat. Seeds numerous, immarginate. Calyx equal. Petals 2-parted. Stamens toothless.

35 Cochlea'ria. Silicle sessile, ovate-globose or oblong; valves ventricose. Seeds numerous, immarginate. Calyx equal, spreading. Petals entire. Stamens toothless.

Tribe III.

Thlaspi'deæ *or* Pleurorhi'zeæ Angustise'ptæ *(D. C. syst. 2. p. 248. prod. 1. p. 175.) Silicle dehiscent, with a very narrow dissepiment* (f. 46. *k. l.*) *and keeled navicular valves* (f. 46. *k. l. m. n.*). *Seeds oval* (f. 46. *l.*) *sometimes margined* (f. 46. *n.*). *Cotyledons flat, accumbent, contrary to the dissepiment* (f. 46. *k.* f. 45. *a. d.*).

§ 1. *Cells of silicle 2 or many-seeded.*

36 Thla'spi. Silicle emarginate at the apex (f. 46. *k. l.*); valves navicular, winged on the back (f. 46. *k. l.*); cells 2 (f. 46. *k.*) or many-seeded (f. 46. *l.*).

37 Huchi'nsia. Silicle elliptical; valves navicular, wingless; cells 2, rarely many-seeded.

38 Teesda'lia. Silicle oval, emarginate at the apex; valves navicular; cells 2-seeded. Stamens each furnished with a scale on the outside at the base.

39 Platyspe'rmum. Silicle oblong, crowned by the short thick style; valves navicular; cells 4-5 seeded. Seeds with a broad margin.

§ II. *Cells of silicle* 1-*seeded.*

40 Ibe'ris. Two outer petals largest. Silicle much compressed, truncately emarginate.

41 Thysanoca'rpus. Petals shorter than the sepals, equal. Silicle much compressed, with a broad wing round the margin, emarginate at the apex.

42 Biscute'lla. Silicle flat, biscutate (f. 46. *m.*); cells adnate laterally to the axis; style long, permanent (f. 46. *m.*). Embryo inverted.

43 Megacarpæ'a. Silicle flat, biscutate; cells adnate laterally to the axis. Style wanting.

44 Cremo'lobus. Silicle flat, biscutate; cells marginate, hanging from the top of the axis. Style somewhat pyramidal.

45 Menonvi'llea. Silicle somewhat stipitate, biscutate; cells (f. 46. *n.*) with the margin expanded into a wing, ending in the parallel disk (f. 46. *n.*).

Tribe IV.

Eclidie'æ *or* Pleurorhi'zeæ Nucumenta'ceæ *(D. C. syst. 1. p. 149. prod. 1. p. 184.). Silicle indehiscent* (f. 46. *d.*); *valves concave, indistinct* (f. 46. *d.*) *or not separating; dissepiment elliptical, sometimes with scarcely any trace of a dissepiment. Seeds oval, very few. Cotyledons flat, accumbent, parallel with the dissepiment* (f. 45. *d. g. h.*).

46 Eucli'dium. Silicle drupaceous, ovate, with the sutures manifest; style awl-shaped (f. 46. *d.*). Cells 1-seeded (f. 46. *d.*).

47 Ochthòdium. Silicle coriaceous, somewhat globose; stigma sessile; dissepiment thick; cells 1-seeded.

48 Pugiònum. Silicle coriaceous, transversely oval, echinated all over, and terminated by a long point, 1-celled and 1-seeded from abortion.

Tribe V.

Anastati'ceæ *or* Pleurorhi'zeæ Septula'tæ *(D. C. syst. 2. p. 149. prod. 1. p. 185.). Silicle opening longitudinally* (f. 46. *f.*); *valves concave, bearing on the inside transverse horizontal small dissepiments, separating the seeds* (f. 46. *f.*). *Seeds immarginate. Cotyledons flat, accumbent, parallel with the dissepiment* (f. 45. *d. g. h.*).

49 Anasta'tica. Silicle ventricose (f. 46. *e.*); valves appendiculated on the outside at the top (f. 46. *f. e.*).

50 More'ttia. Silicle ovate; valves not appendiculated.

Tribe VI.

Cakili'neæ *or* Pleurorhi'zeæ Lomenta'ceæ *(D. C. syst. 2. p. 149. prod. 1. p. 185.). Silique or silicle, separating transversely into 1-2-celled, 1-2-seeded joints* (f. 46. *o.*). *Seeds immarginate. Cotyledons flat, accumbent, parallel with the dissepiment* (f. 45. *d. g. h.* f. 46. *c.*).

51 Caki'le. Silicle 2-jointed, compressed (f. 46. *o.*), upper joint ensiform. Seeds solitary in the cells, upper one erect, lower one pendulous (f. 46. *o.*).

52 Cordyloca'rpus. Silique rather terete, torose; joints numerous, terminal one thick globose, echinated. Seeds all pendulous.

53 Chori'spora. Silique rather terete, with numerous equal joints. Seeds all pendulous.

Sub-order II. NOTORHI'ZEÆ (D. C. syst. 2. p. 150. prod. 1. p. 186.). Cotyledons flat, incumbent (f. 45. *i.*). Radicle dorsal (f. 45. *i. e.*). Seeds ovate, immarginate.

Tribe VII.

Sisy'mbreæ *or* Notorhi'zeæ Siliquòsæ. *Siliques 2-celled, opening longitudinally* (f. 46. *p.*). *Valves concave* (f. 46. *p.*) *or keeled. Seeds ovate or oblong, immarginate. Cotyledons flat, incumbent, contrary to the dissepiment* (f. 45. *i.*).

54 Malco'mia. Silique rather terete. Stigma simple, ending in a long taper-point.

55 He'speris. Silique rather terete, or somewhat tetragonal (f. 46. *p.*). Stigmas 2, erect, connivent. Calyx bisaccate at the base.

56 Andreo'skia. Silique rather terete, sessile; valves somewhat convex. Style short, slender. Calyx equal at the base.

57 Sisy'mbrium. Silique rather terete, sessile upon the torus. Stigmas 2, rather distinct, or connate into a head. Calyx equal at the base.

58 Allia'ria. Silique rather terete, somewhat tetragonal from prominent nerves. Calyx loose.

59 Ery'simum. Silique tetragonal (f. 46. *q.*). Calyx closed.

60 Lepta'leum. Silique rather terete, sessile. Stigmas 2, connivent. Calyx equal at the base. Stamens 4.

61 Stanle'ya. Silique rather terete, stalked above the torus.

Tribe VIII.

Cameli'neæ *or* Notorhi'zeæ Latise'ptæ *(D. C. syst. 2. p. 150. prod. 1. p. 201.). Silicle with concave valves and an elliptical dissepiment in its greatest diameter* (f. 46. *r.*). *Seeds ovate. Cotyledons flat, incumbent, contrary to the dissepiment* (f. 45. *i.*).

62 Stenope'talum. Silicle elliptical; valves flat; cells many-seeded. Style wanting.

63 Cameli'na. Silicle obovate or almost globose, with ventricose valves, and many-seeded cells (f. 46. *r.*). Style filiform (f. 46. *r.*).

64 Eude'ma. Silicle ovate, with concave valves and many-seeded cells, with the dissepiment holed at the top.

65 Ne'slia. Silicle somewhat globose, indehiscent, 1-celled, 1-seeded, from the dissepiment having vanished; valves concave.

66 Eutre'ma. Silicle linear, lanceolate, 2-edged, crowned by a capitate stigma, with keeled valves and many-seeded cells; dissepiment incomplete.

67 O'reas. Silicle lanceolate, compressed, flat, 1-celled from the dissepiment having vanished, many-seeded; valves flattish, marked with a middle nerve. Seeds hanging by elongated funicles.

FIG. 47.

Tribe IX.

Lepedi'neæ *or* Notorhi'zeæ Angustise'ptæ *(D. C. syst. 2. p. 151. prod. 1. p. 202.). Silicle with a very narrow dissepiment; valves keeled* (f. 47. *a. b.*) *or very concave. Seed solitary in the cells* (f. 47. *a. b.*) *or very few, ovate, immarginate. Cotyledons flat, incumbent, parallel with the dissepiment* (f. 45. *i.*).

68 Capse'lla. Silicle triangular, cuneated at the base, with wingless navicular valves. Seeds numerous in the cells.

69 Senebie'ra. Silicle twin; valves ventricose, or somewhat keeled, almost indehiscent, 1-seeded.

70 Lepi'dium. Silicle ovate (f. 46. *a.*) or somewhat cordate; valves keeled (f. 47. *a.*), rarely ventricose, dehiscent; cells 1-seeded (f. 47. *a.*).

71 Bivonæ'a. Silicle oval, emarginate, with keeled valves, and 4-6-seeded cells.

72 Euno'mia. Silicle oval; valves keeled. Seeds 2 in each cell, with the umbilical cords somewhat connected.

73 Æthione'ma. Silicle oval, usually emarginate, with navicular valves (f. 47. *b.*) and 1 (f. 47. *b.*) or 2-seeded cells. Larger stamens either united or toothed.

74 Redo'wskia. Silicle inflated, tapering into the pedicel at the base, terminated by the style, 1-celled from the dissepiment having vanished; valves with a nerve running along their middle. Seeds 8-10. Cotyledons unknown.

Tribe X.

Isati'deæ *or* Notorhi'zeæ Nucumenta'ceæ *(D. C. syst. 2. p. 151. prod. 1. p. 209.). Silicle 1-celled from the dissepiment having vanished, 1-seeded, with indistinct or indehiscent keeled valves* (f. 47. *d.*). *Seeds ovate-oblong. Cotyledons flat, incumbent, apparently in the same direction as the dissepiment should be.*

75 Aphra'gmus. Silicle lanceolate, acute, with flat nerved valves, without any dissepiment. Seeds in 2 series, pendulous. Cotyledons thick.

76 Tausche'ria. Silicle oval, almost boat-shaped, 1-celled, 1-seeded, with navicular indehiscent valves.

77 Isa'tis. Silicle elliptical, flat, 1-celled, 1-seeded; valves keeled, navicular, hardly dehiscent (f. 47. *d.*).

78 My'agrum. Silicle compressed, almost cuneated, with two empty hollows at the top, and 1-celled 1-seeded at the base.

79 Sobole'wskia. Silicle oblong, compressed, 1-celled, 1-seeded, valveless, membranous.

Tribe XI.

Anchonie'æ *or* Notorhi'zeæ Lomenta'ceæ *(D. C. syst. 2. p. 152. prod. 1. p. 212.). Silicle or silique separating transversely into 1-seeded joints* (f. 47. *e.*). *Cotyledons flat, incumbent* (f. 45. *i.*).

80 Goldba'chia. Stamens free. Silique 2-jointed, with hardly any style.

81 Ancho'nium. Larger stamens, connate. Silique 2-jointed, crowned by the beak-like compressed style (f. 47. *e.*).

82 Steri'gma. Larger stamens connate to the middle (f. 50. *a.*). Silique rather terete, at length separating into many joints.

Sub-order III. ORTHOPLO'CEÆ. (D. C. syst. 2. p. 152. prod. 1. p. 213.)

Cotyledons incumbent, folded together or plaited lengthwise through their middle, and inwrapping the radicle in the recess (f. 45. *j. f.*). Style usually enlarged, with a cell and seed at its base. Seeds generally globose, always immarginate.

Tribe XII.

Brassi'ceæ *or* Orthoplòceæ Siliquo'sæ *(D. C. syst. 2. p. 152. prod. 1. p. 213.). Silique with the valves opening lengthwise* (f. 47. *f. o. g.*) *and a linear dissepiment. Cotyledons folded together* (f. 45. *j. f.*).

83 Bra'ssica. Silique rather terete, crowned by a small short blunt style (f. 47. *f.*). Seeds disposed in one row (f. 47. *f.*). Calyx closed.

84 Sina'pis. Silique almost terete with nerved valves; style small, short, acute. Seeds disposed in one series. Calyx spreading.

85 Morica'ndia. Silique tetragonal, somewhat 2-edged. Seeds disposed in two rows. Calyx bisaccate at the base.

86 Diplota'xis. Silique compressed, linear (f. 47. *g.*). Seeds disposed in 2 rows (f. 47. *g.*). Calyx equal at the base.

87 Eru'ca. Silique almost terete, crowned by a large conical or ensiform style. Seeds in one row. Calyx equal at the base.

Tribe XIII.

Ve'lleæ *or* Orthoplòceæ Latise'ptæ *(D. C. syst. 2. p. 152. prod. 1. p. 223.). Silicle with concave valves, opening lengthwise and an elliptical dissepiment* (f. 47. *c.*). *Seeds globose. Cotyledons folded together* (f. 45. *j. f.*).

88 Ve'lla. Larger stamens connate. Style ovate, flat, at the top of a tongue-shaped silicle.

89 Bòleum. Larger stamens connate. Style slender, somewhat conical at the top of a beak-formed silicle.

90 Carrichte'ra. Stamens all free. Style ovate, flat, leafy (f. 47. *c.*).

91 Succòwia. Stamens all free. Style slender, conical. Valves of silicle echinated.

92 Savi'gnya. Silicle sessile, elliptical; valves rather convex. Umbilical cord short, free. Calyx valvular in the bud, equal at the base. Petals entire. Stamens toothless. Seeds imbricate, in two rows. Cotyledons conduplicate. (R. Brown.)

Tribe XIV.

Psychi'neæ *or* Orthoplòceæ Angustise'ptæ (*D. C. syst. 2. p. 153. prod. 1. p. 224.*). *Silicle with keeled* (f. 47. *j.*) *or navicular valves, and a very narrow dissepiment. Seeds compressed. Cotyledons folded together* (f. 45. *f. j.*).

93 Schòuwia. Silicle oval; valves furnished with a narrow wing on the back, their whole length.

94 Psychi'ne. Silicle as if it were triangular, narrowed at the base; valves furnished with a wing on their back at the top (f. 47. *j.*).

Tribe XV.

Zi'lleæ *or* Orthoplòceæ Nucamenta'ceæ *(D. C. syst. 2. p. 153. prod. 1. p. 224.). Silicle indehiscent, ovate, or globose, 1-celled, 1-seeded* (f. 47. *i.*). *Valves indistinct* (f. 47. *i.*). *Seeds globose. Cotyledons folded together* (f. 45. *f. j.*).

95 Zi'lla. Silicle 2-celled; cells 1-seeded.

96 Murica'ria. Silicle 1-celled, 1-seeded (f. 47. *i.*). Seed inserted laterally. Petals equal.

97 Calepi'na. Silicle 1-celled, 1-seeded. Seed hanging from the top of the silicle. Outer petals rather larger than the inner ones.

XVI.

Rapha'neæ *or* Orthoplo'ceæ Lomentaceæ *(D. C. syst. 2. p. 153. prod. 1. p. 225.). Silicle or silique separating or dividing transversely into one or few-seeded joints or cells* (f. 47. *k. m.*). *Seeds globose. Cotyledons folded together* (f. 47. *j. f.*).

98 Cra'mbe. Silicle 1 (f. 47. *h.*) or 2-jointed, lower joint abortive, upper joint globose, 1-seeded (f. 47. *h.*).

99 RAPI'STRUM. Silicle 2-jointed, upper joint ovate, wrinkled. Seeds solitary in the cells, the one in the upper joint is erect, and the one in the lower is pendulous.

100 DIDE'SMUS. Silicle 2-jointed, each joint containing 1-2 seeds, lower joint truncate at the top, upper one bearing the style.

101 ENARTHROCA'RPUS. Silique 2-jointed, lower joint obconical, short 1-2-seeded, upper one 9-10-seeded, but loculate within (f. 47. *k.*).

102 RA'PHANUS. Silique transversely many-celled or separating into many joints (f. 47. *m.*).

SUB-ORDER IV. SPIROLO'BEÆ. (D. C. syst. 2. p. 154. prod. 1. p. 228.) Cotyledons incumbent, linear, spirally or rather circinately twisted (f. 45. *k. l.*).

TRIBE XVII.

BUNIA'DEÆ *or* SPIROLO'BEÆ NUCAMENTA'CEÆ *(D. C. syst. 2. p. 154. prod. 1. 228.). Silicle nucumentaceous, indehiscent, 2-4-celled* (f. 46. *s.*). *Cotyledons truly circinately twisted* (f. 45. *k. l.*).

103 BU'NIAS. Character the same as that of the tribe.

TRIBE XVIII.

ERUCARIE'Æ *or* SPIROLO'BEÆ LOMENTA'CEÆ *(D. C. syst. 2. p. 154. prod. 1. p. 230.). Silique lomentaceous, 2-jointed, lower joint 2-celled, upper one ensiform* (f. 47. *l.*). *Cotyledons replicate, somewhat spiral* (f. 45. *l.*).

104 ERUCA'RIA. Character the same as the tribe.

SUB-ORDER V. DIPLECOLO'BEÆ. (D. C. syst. 2. p. 154. prod. 1. p. 230.) Cotyledons incumbent, linear, with 2 legs or a double plait, that is to say, plaited twice crosswise (f. 45. *m.* f. 47. *p.*). Seeds depressed.

TRIBE XIX.

HELIOPHI'LEÆ *or* DIPLECOLO'BEÆ SILIQUO'SÆ *(D. C. syst. 2. p. 154. prod. 1. p. 231.). Silique elongated* (f. 47. *o.*) *rarely oblong or oval; dissepiment linear or oval; valves flat, or in those with elongated siliques they are rather convex* (f. 47. *o.*).

105 CHAMI'RA. Calyx with 2 spurs at the base.

106 HELIO'PHILA. Calyx equal at the base.

TRIBE XX.

SUBULARIE'Æ *or* DIPLECOLO'BEÆ LATISE'PTÆ *(D. C. syst. 2. p. 155. prod. 1. p. 235.). Silicle oval* (f. 47. *n.*) *with an elliptical dissepiment, convex valves, many-seeded cells, and a sessile stigma* (f. 47. *n.*).

107 SUBULA'RIA. Silicle oval, with convex valves, with 4 seeds in each cell, and a sessile punctiform stigma (f. 47. *n.*). Calyx closed.

108 PLATYPE'TALUM. Silicle oval, with convex valves with numerous seeds in each cell. Style very short, crowned by a spreading stigma. Calyx a little spreading. Petals dilated.

TRIBE XXI.

BRACHYCARPE'Æ *or* DIPLECOLO'BEÆ ANGUSTISE'PTÆ *(D. C. syst. 2. p. 155. prod. 1. p. 235.). Silicle didymous* (f. 51. *a.*) *with a very narrow dissepiment, very ventricose valves, 1-seeded cells, and a short style* (f. 51. *a. b.*).

109 BRACHYCARPÆ'A. Character the same as the tribe (f. 51. *a.*).

SUB-ORDER VI. SCHIZOPETALIE'Æ. Cotyledons 4, spirally twisted. Petals pinnatifid.

110 SCHIZOPE'TALON. Character the same as the sub-order.

SUB-ORDER I. PLEURORHI'ZEÆ (from πλευρον, *pleuron*, a side, and ῥιζα, *rhiza*, a root;) radicle at the side of the cotyledons, (f. 45. *h. g. d.*) D.C. syst. 2. p. 161. prod. 1. p. 132. Cotyledons flat, accumbent (f. 46. *c.* f. 45. *g.*). Radicle lateral (f. 45. *g. d.*). Seeds compressed, sometimes marginate.

Tribe I.

ARABI'DEÆ (from *Arabis*, and *idea*, shape of a thing; plants agreeing with *Arabis* in important characters,) or PLEURORHI'ZEÆ (see sub-order) SILIQUO'SÆ (*siliqua*, a long pod; pods long.) D. C. syst. 2. p. 161. prod. 1. p. 132. Silique dehiscent, with a linear dissepiment more or less broader than the seeds (f. 46. *b.*). Seeds oval, compressed, usually margined. Cotelydons flat, accumbent (f. 46. *c.* f. 45. *g.*), parallel with the dissepiment.

I. MATHI'OLA (in honour of Peter Andrew Mathioli, an Italian physician, died in 1577; he was first physician to Ferdinand of Austria, and author of a commentary upon the works of Dioscorides.) R. Br. in hort. kew. ed. 2. vol. 4. p. 119. D. C. syst. 2. p. 162. prod. 1. p. 133.

LIN. SYST. *Tetradynàmia Siliquòsa.* Silique roundish. Stigmas connivent, thickened or horned (f. 48. *b.*) on the back. Calyx bisaccate at the base. Seeds compressed, disposed in 1 series, numerous (f. 48. *a.*). Mostly herbs, very rarely suffruticose, erect, nearly the whole species are covered with a soft white stellate down, sometimes they are scabrous, with pedicellate glands. Leaves alternate, oblong, entire, or sinuately-toothed. Racemes terminal. Pedicels without bracteas. Flowers purple or white, sometimes of a dark dreary colour, generally sweet-scented. The leaves of all the species, as well as those of *Cheiránthus*, and many other plants of this class may be used as pot-herbs or salads.

SECT. I. PACHYNO'TUM (from παχυς, *pachys*, thick; νωτος, *notos*, the back; stigmas.) D. C. syst. 2. p. 163. prod. 1. p. 132. Petals obovate. Stigmas thick, not horned on the back. The plants contained in this section are very ornamental.

1 M. INCANA (R. Br. in Ait. hort. kew. ed. 2. vol. 4. p. 119.) stem suffruticose at the base, erect, simple or branched; leaves lanceolate, quite entire, hoary; siliques somewhat cylindrical, without glands. ♂. ♄. H. Native of the south of Europe near the sea; in England on rocky cliffs to the east of Hastings. Cheiránthus incànus, Lin. spec. 924. Smith, engl. bot. 1935. Mill. illust. t. 55.—Weinm. phyt. t. 643. f. *a. e.* and 644. f. *a. b.* —Cheiránthus álbus and coccíneus, Mill. dict. Flowers varying from single to double, from scarlet to purple, and white or even variegated with these colours: these varieties have been designated under various names by authors before the days of Linnæus.

Queen, Brompton or *Hoary* Stock. Fl. May, Oct. England. Pl. 1 to 2 ft.

2 M. A'NNUA (Sweet, hort. suburb. lond. 147.) stem herbaceous, erect, branched; leaves lanceolate, blunt, hoary; pods somewhat cylindrical, without glands. ⊙. H. Native of the south of Europe by the sea-side. Cheiránthus incànus, Lin. spec. 925. Schkuhr. handb. 2. t. 184.—Bauh. hist. 2. p. 875. f. 1. Mathìola incàna, var. δ, R. Br. in Ait. hort. kew. ed. 2. vol.

4. p. 119. Hesperis æstìva, var. α, Lam. dict. 3. p. 324. Flowers varying from single to double, from scarlet to purple and white, or variegated with these colours.

Ten-week or *Annual* Stock. Fl. May, Oct. Clt. 1731. Pl. 1 to 2 feet.

3 M. glabra'ta (D. C. syst. 2. p. 165.) stem suffruticose, erect, branched; leaves lanceolate, smooth; siliques somewhat compressed, without glands. ♄. H. Native?—M. incàna, var. ε, R. Br. in Ait. hort. kew. ed. 2. vol. 4. p. 119. Leucòjum álbum, Blackw. herb. t. 181. Chieránthus glàbrus, Mill. dict. no. 9. Ch. glabérrimus, Colla, antol. bot. 5. p. 861.—Weinm. phyt. t. 642. f. 2.—Morr. hist. sect. 3. t. 8. f. 2, &c. Allied to *M. incàna*, but the whole plant is smooth and green, not hoary. Flowers varying from single to double, from white to purple and scarlet, never variegated.

Wall-flower-leaved or *Smooth* Stock. Fl.My.Oct. Clt.? Pl.1 ft.

4 M. Græ'ca (Sweet, hort. suburb. lond. 147.) stem herbaceous, erect, branched, leaves lanceolate, smooth; siliques somewhat compressed, without glands. ⊙. H. Native of Greece and the neighbouring islands. Cheiránthus Græ'cus, Juss. in Pers. ench. 2. p. 201. Hésperis æstìva, var. β, Lam. dict. 3. p. 324. Distinguished from *M. ánnua* in the leaves being smooth and green, not hoary; and from the rest of this section by its being the only green leaved annual. Flowers purple. Perhaps the four foregoing species have originated from one, and not unlikely from this plant?

Smooth-leaved Annual or *Grecian* Stock. Fl. May, Oct. Clt.? Pl. 1 foot.

5 M. fenestra'lis (R. Br. in Ait. hort. kew. ed. 2. vol. 4. p. 119.) stem suffruticose, erect, simple; leaves crowded, obovate, downy, and revolute; siliques pubescent, without glands, broadest at the base. ♂. H. Native of Crete on rocks by the sea-side. Cheiránthus fenestràlis, Lin. fil. dec. 31. t. 16. Jacq. hort. vind. 2. t. 179. Hésperis fenestràlis, Lam. dict. 3. p. 324. Flowers scarlet or pale purple, a little smaller than those of *M. incàna*.

Fenestrelles Stock. Fl. July, Aug. Clt. 1759. Pl. 1 foot.

6 M. elli'ptica (R. Br. in Salt. voy. abyss. app. p. lxv.) stem suffruticose, twisted, branched; leaves stalked, elliptical, hoary; siliques cylindrical, downy. ♃. ♄. H. Native of Abyssinia at the bottom of mount Taranta. Flowers sweet-scented. Differing but little from *M. incàna*.

Elliptic-leaved Stock. Fl. Feb. March. Pl. 1 foot.

7 M. sinua'ta (R. Br. in Ait. hort. kew. ed. 2. vol. 4. p. 120.) stem somewhat erect, herbaceous, branched; leaves oblong, downy, lower ones sinuated; siliques compressed, velvety, and muricated with glands. ♂. H. Native of the south of Europe along the sandy sea coast, also in Britain on the coasts of Cornwall and Wales, near Pembroke, Abermeney, and Llanddwyn. Cheiránthus sinuàtus, Lin. spec. 926. Smith, engl. bot. t. 462. Smith, fl. græc. t. 640. Ch. tricuspidàtus, Huds. angl. ed. 1. p. 450. Ch. muricàtus, Lam. fl. fr. 2. p. 507. Hésperis sinuàta, Lam. dict. 3. p. 323. Flowers of a dingy-red colour, about the size of those of *M. incàna*, sweet-scented in the evening. The whole plant has an alkaline bitterish taste.

Sinuated-leaved or Great Sea Stock. Fl. Aug. Britain. Pl. 2 ft.

8 M. acau'lis (D. C. syst. 2. p. 168.) stem almost none; leaves linear, sinuately-toothed, downy with stellate pubescence; flowers rising from the root. ⊙. H. Native of Egypt. Cheiránthus acaúlis, Balb. in litt. Spreng. nov. prov. p. 10. no. 19. The siliques are unknown, and therefore it is very doubtful what genus it belongs to. Flowers purplish. A very small plant.

Stemless Stock. Fl. May, Aug. Clt. 1823. Pl. ¼ foot.

9 M.? Pe'rsica (D. C. syst. 2. p. 168.) stem erect, suffrutescent at the base, hoary with velvety and glandular pubescence at the apex; leaves canescent, radical ones oblong, entire, stalked; siliques pubescent, without glands. ♃. H. Native of Persia. Cheiránthus Pérsicus, Pall. in herb. Lamb. Habit of *Mathìola*, but the colour of the flowers is yellow; therefore it is possibly a species of *Hésperis* or *Cheiránthus*.

Persian Stock. Pl. ¾ foot.

Sect. II. Lupe'ria (from λυπηρος, *luperos*, melancholic, sad; colour of flowers.) D. C. syst. 2. p. 169. prod. 1. p. 133. Back of stigmas thick, not horned. Petals oblong, from dirty yellow to a livid purple colour, sweet-scented in the evening.

10 M. tene'lla (D. C. syst. 2. p. 169.) stem herbaceous, erect, almost simple; leaves oblong, sinuately-toothed, drawn out at the base, canescent with stellate pubescence; siliques pubescent, without glands. ⊙. H. Native of the island of Cyprus. Flowers the colour of *M. tristis*, but paler.

Slender Stock. Fl. June, July. Clt. 1820. Pl. ½ foot.

11 M. torulo'sa (D. C. syst. 2. p. 169.) stem erect, a little branched, flocculosely-scabrous; leaves linear, nearly entire, downy; siliques rather torulose, beset with scabrous glandular and velvety pubescence. ♄. G. Native of Cape of Good Hope. Cheiránthus torulòsus, Thunb. prod. 108. Habit very near to that of *Hésperis*. Flowers small, of a dirty purplish-yellow.

Torulose-siliqued Stock. Fl. May, Aug. Clt. 1816. Pl. 1 or 2 ft.

12 M. Tata'rica (D. C. syst. 2. p. 170.) stem erect, nearly simple, glabrous; leaves hoary-tomentose, irregularly and runcinately-toothed; siliques very smooth, cylindrical, somewhat torulose. ♃. H. Native of the south of Tartary on rocks. Hésperis Tatárica, Pall. itin. 1. app. 117. t. O. Flowers of a livid purplish-yellow colour. Root fusiform, fleshy.

Tartarian Stock. Fl. May, Aug. Clt. 1826. Pl. 1 or 3 feet.

13 M. odorati'ssima (R. Br. in Ait. hort. kew. ed. 2. vol. 4. p. 120.) stem erect, branched; leaves downy or pubescent, toothed or pinnatifid; siliques compressed, somewhat hoary. ♄. G. Native of the calcareous mountains of Tauria and on rocks in eastern Caucasus, and in Iberia about Tiflis. Sims, bot. mag. t. 1711. Hésperis odoratíssima, Poir. suppl. 3. p. 195. Chieránthus odoratíssimus, Bieb. casp. 116. no. 22. Flowers dirty cream-coloured, or when old purplish-brown, sweet-scented in the evening.

Var. β, *Tanaicénsis* (D. C. syst. 2. p. 170.) plant covered with appressed pubescence; siliques one-half shorter than those of the species. Cheiránthus frágrans, Fisch. cat. hort. gor. 1812. p. 51. ♄. G. Native on the cretaceous hills at Tanaim.

Sweetest-scented Stock. Fl. June, July. Clt. 1795. β in 1822. Shrub 1 or 2 feet.

14 M. va'ria (D. C. syst. 2. p. 171.) stem erect, almost simple, and nearly naked: leaves linear, blunt, quite entire, hoary; flowers nearly sessile; siliques compressed; petals oval, waved. ♄. G. Native of south of Europe in many places, particularly in the region of the Mediterranean. Cheiránthus vàrius, Smith, fl. græc. t. 636. Ch. trístis Suffren, Curt. bot. mag. 729. Flower nearly the same colour as those of *M. tristis*, but they are larger.

Var. β, Cheiránthus trístis, var. Sabaùda. All. ped. no. 991. Cheiránthus Vallesiàcus, Gay. ined. in herb. Gaud. Native of Vallais.

Variable Stock. Fl. May, July. Clt. 1820. Pl. ½ foot.

15 M. tri'stis (R. Br. in Ait. hort. kew. ed. 2. vol. 4. p. 120.) stem suffruticose at the base, erect, branched; leaves downy, linear, entire, or toothed; flowers nearly sessile; petals oblong; siliques nearly cylindrical. ♄. G. Native of stony places exposed to the sun in the south of Europe by the sea-side, viz. Portugal, Spain about Madrid, Greece, Piedmont, Mauritania, &c. Cheiránthus trístis, Lin. spec. 925. Ch. fruticulòsus, Lin. spec. ed. 2. p. 925. but not of his Mantissa. Hésperis angustifòlia, Lam. dict. 3. p. 322.—Barrl. icon. t. 803. Bocc. mus. 148. t. 111. Flowers dirty-yellow or greenish-brown, sweet-scented in the evening.

Sad-flowered Stock. Fl. May, July. Clt. 1768. Shrub 1 foot.

SECT. III. PINA'RIA (from πιναρος, *pinaros*, dirty, unclean; colour of flowers.) D. C. syst. 2. p. 172. prod. 1. p. 172. Back of stigmas drawn out into three horns (f. 48. *b*.). Petals oblong (f. 48. *e*.), from dirty yellow to purplish.

16 M. CORONOPIFO'LIA (D. C. syst. 2. p. 173.) stem erect, much branched from the base; leaves linear, dentately-pinnatifid, hoary; siliques somewhat torulose, and somewhat 3-pointed at the apex, without glands. ♃. H. Native of Sicily near Palermo on rocks at the monastery of del Parco, and on the mountains near Athens. Cheiránthus coronopifòlius, Smith, fl. græc. t. 637.—Barrl. icon. t. 999. f. 1 and 2. Very near to *M. trístis* and *M. lívida*. Petals of a dirty-purple colour.

Var. β, Hispánica (D. C. syst. 2. p. 173.). Cheiránthus parviflòrus, Thib. ined. ♃. H. Native of Spain. Perhaps a proper species. Differing from the species by its greater stature, but especially by the siliques being 3-times longer.

Buck-horn-leaved Stock. Fl. May, Aug. Clt. 1818. Pl. 1 or $1\frac{1}{2}$ foot.

17 M. OXY'CERAS (D. C. syst. 2. p. 173.) stem erect, branched, glandular; leaves velvety, sinuately-repand, upper ones entire; siliques cylindrical, somewhat velvety and glandular, tricuspidate at the apex, lateral points somewhat reflexed. ⊙. H. Native of sandy deserts near Damascus. Deless. icon. sel. 2. t. 11. This species is very like *M. lívida*, but the flowers are sessile, of a livid-purple colour.

Var. a, stem glandular from the base to the top. ⊙. H. Native of sandy deserts near Damascus.

Var. β; stem somewhat glandular only at the base. ⊙. H. Native of Persia.

Var. γ; lower leaves pinnatifid. ⊙. H. Native between Aleppo and Mosul.

Sharp-horned-siliqued Stock. Fl. July, Aug. Clt. 1820. Pl. $\frac{3}{4}$ ft.

18 M. LI'VIDA (D. C. syst. 2. p. 174.) stem somewhat diffuse, much branched; leaves oblong-linear, lower ones sinuated, covered with velvety down interspersed with glands; siliques somewhat cylindrical, pubescent and glandular, tricuspidate at the apex, points ascending longer than the stigma. ⊙. H. Native of Egypt in a desert near Caira, at Caid-Bey. Deless. icon. sel. 2. t. 12. Cheiránthus trístis, Forsk. fl. æg. arab. p. 119. Cheiránthus lívidus, Delile, ill. fl. æg. p. 19. no. 581. The whole plant in form and colour of flowers is like *M. trístis*, but it is an annual, not a shrub. Flowers livid-purple (f. 48.).

Livid-flowered Stock. Fl. July, Aug. Clt. 1820. Pl. $\frac{1}{2}$ foot.

19 M. LONGIPE'TALA (D. C. syst. 2. p. 174.) stem somewhat diffuse, branched, and somewhat pubescent; leaves oblong, sinuately-toothed; ovaries cylindrical, downy, without glands, three-pointed: petals longer than the calyx. ⊙. H. Native of the Levant about Bagdad. Very like *M. lívida*. Lamina of petals yellow at the base, but purplish at the top.

Long-petalled Stock. Fl. May, July. Clt. 1819. Pl. $\frac{1}{2}$ foot.

SECT. IV. ACINÒTON (from ακις, *akis*, a point; νωτος, *notos*, the back; back of stigmas horned.) D. C. syst. 2. p. 175. prod. 1. p. 134. Petals obovate, blunt or emarginate, pale purple or white. Siliques 3-pointed at the top. Seeds not margined. This section is perhaps sufficient to form a distinct genus.

20 M. TRICUSPIDA'TA (R. Br. in hort. kew. ed. 2. vol. 4. p. 120.) stem nearly erect, branched; leaves sinuately-pinnatifid; points of siliques 3, acute, nearly equal in length. ⊙. H. Native along the Mediterranean sea in the sand, from Spain to Alexandria. Cheiránthus tricuspidàtus, Lin. spec. 926. Schkuhr. handb. 2. p. 250. no. 1846. t. 184. Smith, fl. græc. t. 639. Cheiránthus villòsus, Forsk. æg. arab. p. 120. Hésperis tricuspidàtus, Lam. dict. 3. p. 323. Flowers purple, like those of *M. sinuàta*.

Three-pointed-siliqued Stock. Fl. Ju. Jul. Clt. 1739. Pl. $\frac{3}{4}$ ft.

21 M. PARVIFLÒRA (R. Br. in Ait. hort. kew. ed. 2. p. 121.) stem nearly erect, branched; leaves lanceolate, downy, repand-toothed; flowers sessile; siliques cylindrical, 3-pointed; points acute, middle one longest, blunt. ⊙. H. Native of the south of Spain, and in the empire of Morocco. Cheiránthus parviflòrus, Schousb. in Schrad. journ. 3. p. 369. Hésperis parviflòra, Poir. 3. p. 194. not of D. C. Flowers purple, like those of *M. tricuspidàta*, but they are one-half smaller.

Small-flowered Stock. Fl. Ju. July. Clt. 1799. Pl. $\frac{1}{2}$ foot.

22 M. LUNA'TA (D. C. syst. 2. p. 176.) stem nearly erect, branched; leaves oblong, repand-toothed, pubescent; pedicels short; siliques cylindrical, 3-pointed, lateral points somewhat incurved, much longer than the middle one. ⊙. H. Native of Spain. An intermediate plant between *M. tricuspidàta* and *M. parviflòra*. Flowers purple, like those of *M. sinuàta*.

Lunate-pointed-siliqued Stock. Fl. Ju. Jul. Clt. 1821. Pl. $\frac{1}{2}$ ft.

23 M. PUMI'LIO (D. C. syst. 2. p. 177.) stem very short; leaves pinnatifidly-sinuated, hoary; siliques tricuspidate; points blunt, longer than the stigma. ⊙. H. Native of Rhodes Island. Cheiránthus pumìlio, Smith, fl. græc. t. 638. Hésperis lácera, Sibth. in herb. Banks. Flowers few, purple, about the size of those of *M. sinuàta*.

Dwarf Stock. Fl. June, July. Pl. 1 or 2 inches.

24 M. HU'MILIS (D. C. syst. 2. p. 177.) stem very short; leaves oblong; rather hoary, sinuately-toothed; flowers nearly sessile; siliques nearly cylindrical, adult ones smooth, tricuspidate, points very short. ⊙. H. Native of Egypt about Rosetta. Flowers purple, rather distant.

Humble Stock. Fl. June, July. Pl. 2 or 3 inches.

† *Species not sufficiently known.*

25 M. BICO'RNIS (D. C. syst. 2. p. 177.) ⊙. or ♂. H. Native of Greece? Cheiránthus bicórnis, Smith, prod. fl. græc. 2. p. 26. Leaves hoary, pinnatifid; petals oblong; siliques torulose, furnished at the top with two acute horizontally spreading spines, which are one-half longer than the bifid stigma. Perhaps this plant may belong to the third section? D. C. Flowers purple.

Two-horned-podded Stock. Fl.? Pl. $\frac{1}{2}$ foot.

26 M. CRUCI'GERA (D. C. syst. 2. p. 177.) ♃. H. Native of Sicily on the mountains called di-Madonia and di-Castelbuono.—Bocc. mus. p. 148. t. 111. Flowers violet. Siliques erect, tricuspidate at the apex. Perhaps this species belongs to the fourth section.

Cross-bearing Stock. Pl. $\frac{3}{4}$ foot?

27 M. RUPE'STRIS (D. C. syst. 2. p. 714.) ♄. H. Native of Sicily on rocky mountains. Hésperis rupéstris, Raf. specch. 2. p. 46. Very like *M. incàna*, but the leaves are blunt and stalked. Petals emarginate. Calyx evidently gibbous. Flowers purple?

Rock Stock. Pl. 1 foot.

28 M. FASCICULA'TA (D. C. syst. 2. p. 714.) ♄. H. Native of Sicily by the sea-side near Messina.—Cup. panph. 1. t. 144. ed. Raf. t. 14. f. 2. Hésperis fasciculàta, Raf. specch. 2. p. 7. Allied to *M. tricuspidàta*, but the leaves are sessile, linear, entire, acute, and in fascicles. Flower purple? Perhaps this is the same as *M. crucigera?*

Fascicled-leaved Stock.

Cult. In order to procure fine double *Stock-Gilliflowers*, *Brompton* and *Queen-stocks*, is to make choice of such single flowering plants as grow near many double ones, for it has been observed that seed saved from plants growing among double kinds have produced a much greater number of double flowering

plants, than those which have been saved from plants separated from the double ones. Sow the seed in May, and after they reach two or three inches high they should be thinned at least 9 inches asunder, and the plants so taken out may be planted at about 6 inches apart in the flower border, if the following winter should be severe, the plants should be sheltered by mats, and in the following May and June they will become the greatest ornament of the flower border. Fine double varieties may be propagated by cuttings, which take root readily if planted under a hand-glass and shaded. The *Annual* or *Ten-week-stock* should be sown at three or four different times, February, March, April, and May, the plants from the last sowing will continue to flower till Christmas. Care should be taken in preserving only such single flowering plants for seed, both of the *Stock-Gilliflower* and *Ten-week-stock*, as have flowers of a fine colour. All the biennial and hard shrubby species of *Mathìola* should be treated in the same manner as that recommended for the *Stock-Gilliflower*, and all the annual species in the manner recommended for *Ten-week-stocks*. Fine double stocks may be planted in pots, in order that they may be sheltered by a frame during winter. *M. fenestràlis* thrives best if sown on rock-work. The green-house shrubby kinds thrive best in a light soil, mixed with sand, and cuttings will strike root readily if planted under a hand-glass.

II. CHEIRA'NTHUS (*cheiri* or *kheyry*, the Arabic name of a plant, with very red sweet-scented flowers, and *ανθος*, *anthos*, a flower, or perhaps from *χειρ*, *cheir*, the hand, and *ανθος*, a flower; hand-flower.) R. Br. in Ait. hort. kew. ed. 2. vol. 5. p. 118. D. C. syst. 2. p. 178. prod. 1. p. 135. Cheiránthus species, Lin. Juss. and Lam.

Lin. syst. *Tetradynàmia*, *Siliquòsa*. Siliques terete or compressed. Stigma 2-lobed or capitate. Calyx bisaccate at the base. Seeds in one series, ovate, compressed. Biennial, perennial, or suffruticose herbs, with oblong or lanceolate entire or toothed leaves. Racemes elongated. Pedicels bractless, filiform. Flowers of various colours, yellow, white, or purple, or party-coloured. The genus is called *Wall-flower*, from the species growing commonly on walls.

Sect. I. Chei'ri (see genus for derivation; plants agreeing with *Ch. Cheìri*.) D. C. prod. 1. p. 135. Style almost none. Seeds not margined.

1 C. chei'ri (Lin. spec. 924.) leaves lanceolate, quite entire, covered with 2-parted pressed hairs, or smooth; siliques linear; lobes of stigma recurved. ♄. ♂. H. Native throughout Europe on old walls and among stones. Schkuhr. handb. 2. no. 1840. t. 184. Blackw. herb. t. 176. Flowers varying in size from single to double, from yellow to rusty and blood-coloured, or variegated with the same colours. Some of the varieties of this plant are very ornamental, particularly the double kinds, and the flowers of all possess an agreeable odour. Being an acrid and hardy evergreen, it is sometimes sown in pastures along with parsley, thyme, &c. as a preventive of the rot in sheep.

The most remarkable varieties of common Wall-flower are the following:

α, *flore simplici*. Single yellow.
β, *flore pleno*. Double yellow.—Lob. icon. 33. f. 2.
γ, *máximus*. Large flowered yellow.
δ, *serràtus*. Large yellow, saw-leaved.
ε, *pátulus*. Double yellow, spreading.
ζ, *ferrugíneus*. Double rusty.
ϑ, *vàrius*. Double variegated with purple and yellow.
ι, *flavéscens*. Large double, pale yellow.
κ, *thyrsoìdeus*. Bunch-flowered, yellow.
λ, *gynántherus*. Flowers with anthers changed into carpels.
μ, *hæmánthus*. Single and double, bloody-flowered.

Cheiri or Common Wall-flower. Fl. April, Jul. Clt. 1573. Pl. 1 to 2 feet.

2 C. fruticulòsus (Lin. mant. 94. not of spec. ed. 1.) leaves lanceolate, acute, most hoary beneath, with simple pressed hairs. ♄. H. Native of Britain on old walls. Smith, engl. bot. t. 1934. Cheiránthus cheìri, Huds. ang. 287. Hook. fl. lond. t. 147? D. C. syst. 2. p. 180. var. *μ*. Flowers yellow, corymbose, sweet-scented.

Shrubby Wall-flower. Fl. April, May. Britain. Shrub 1 or 1½ ft.

3 C. alpi'nus (Lin. mant. 93. exclusive of the synonymes,) leaves lanceolate, somewhat toothed, covered with starry-pubescence; stem simple, straight; siliques spreading, six times longer than the pedicels; seeds appendiculate. ♃. H. Native of Norway and Lapland on the sides of high mountains. Wahl. fl. lap. no. 333. t. 12. f. 1. Jacq. fl. austr. t. 74. Flowers yellow, sweet-scented.

Alpine Wall-flower. Fl. April, July. Clt. 1820. Pl. ½ foot.

4 C. capita'tus (Dougl. in Hook. fl. bor. amer. p. 38.) plant rather rough; leaves linear-lanceolate, more or less toothed or entire, tapering much to the base, and are as well as the stem covered with close-pressed 2 parted hairs; flowers rather large, in dense corymbs; silique 3-times longer than the pedicel. ⊙. H. Native of North America on rocky places on the Columbia, near the sea and at Puget Sound, and on the coast of California. Ch. àsper, Schlecht. et Cham. in Linnæa. vol. 1. p. 14. Stem branched. Flowers yellow. Style thick, about a line long, terminated by a capitate stigma. Seeds compressed, not margined.

Capitate Wall-flower. Fl. June, July. Clt. 1826. Pl. 1 foot.

5 C. ochroleu'cus (Hall. fil. ex Schleich. cat. helv. p. 16.) leaves oblong-lanceolate, somewhat toothed, covered with 2-parted hairs, or smooth; stems decumbent, branched; petals obovate; siliques erect, pointed by the permanent style. ♃. H. Native of the Alps of Jura on the mountains called Chasseral and Falconario, among stones and on rocks, and at a place called *Creux du Van*. Ch. dùbius, Sut. fl. helv. 2. p. 65. Ch. decúmbens, Schlecht. cat. helv. Erýsimum ochroleùcum, var. *α*, D. C. fl. fr. ed. 3. vol. 4. p. 658.—Hall. hist. no. 449. t. 14. Flowers pale yellow, scarcely scented.

Cream-coloured Wall-flower. Fl. April, July. Clt. 1819. Pl. procumbent.

Sect. II. Cheiroi'des (from *cheiri*, and *idea*, form, similarity.). D. C. prod. 1. p. 136. Style filiform. Seeds margined. Siliques 4-angled. Psilóstylis, Andrz. in litt.

6 C. tenuifo'lius (Lher. st. nov. p. 92.) leaves linear, quite entire, somewhat silky with 2-parted hairs; stem frutescent, branched. ♄. F. Native of Madeira. Flowers yellow.

Fine-leaved Wall-flower. Fl. May, Ju. Clt. 1777. Sh. 2 ft.

7 C. muta'bilis (Lher. st. nov. 1. p. 92.) leaves linear, lanceolate, pointed, finely serrated, somewhat downy with 2-parted hairs; stem frutescent, branched. ♄. F. Native of Madeira. Curt. bot. mag. t. 195. Flowers at first cream-coloured, afterward becoming purple or striped.

Changeable-flowered Wall-flower. Fl. March, May. Clt. 1777. Shrub 2 or 3 feet.

8 C. longifòlius (Vent. malm. t. 83.) leaves very long, linear-lanceolate, pendulous, acuminated, remotely serrated, rather downy with 2-parted hairs; stem frutescent, branched. ♄. F. Native of Teneriffe. Hésperis longifòlia, Poir. suppl. 3. p. 195. Like *Ch. mutábilis*. Flowers at first white, afterwards becoming blue or purple.

Long-leaved Wall-flower. Fl. Sep. Dec. Clt. 1815. Sh. 2 to 3 ft.

9 C. scopa'rius (Willd. enum. p. 681.) leaves linear-lanceolate, acuminated, entire, rather pubescent with appressed 2-parted hairs; stem shrubby, branched. ♄. F. Native of

Teneriffe. Hésperis cinèrea, Poir. suppl. 3. p. 196. Very like *Ch. mutábilis*, but evidently distinct.

Var. a, purpuráscens (D. C. syst. 2. p. 184.) flowers at first white, then purplish. ♄. F.

Var. β, æruginòsus (D. C. l. c.) flowers at first rust-coloured, afterwards paler, and suffused with red.

Var. γ, chamæ'leo (D. C. l. c.) flowers at first orange, afterwards purple. Ch. cheìri, var. Chamæ'leon, Ker. bot. reg. t. 219. These are very ornamental plants.

Broom Wall-flower. Fl. May, Oct. Clt. 1812. Sh. 2 to 3 ft.

10 C. semperflòrens (Schousb. moroc. ed. germ. p. 181.) leaves linear-lanceolate, quite entire, roughish; stem shrubby, branched; siliques compressed; pedicels one-half shorter than the calyx. ♄. F. Native of the kingdom of Morocco and about Mogodor. Flowers yellow or white.

Ever-flowering Wall-flower. Fl. Jan. Dec. Clt. 1815. Sh. 1 or 2 ft.

11 C. linea'ris (Vent. malm. p. 83. not of Thunb.) leaves linear, quite entire, smoothish; stem shrubby, branched; siliques compressed, tapering to both ends. ♄. F. Native of Teneriffe. Ch. frutéscens, Pers. ench. 2. p. 201. Very like *Ch. semperflòrens*, but the plant is more shrubby and the leaves are shorter and narrower. Flowers white, never yellow.

Linear-leaved Wall-flower. Fl. Mar. Jul. Clt. 1815. Shrub 1 or 2 feet.

12 C. linifòlius (Pers. ench. 2. p. 201.) leaves linear, quite entire, scabrous, crowded; stem shrubby, branched; siliques somewhat cylindrical, three times longer than the calyx; pedicels one half shorter than the calyx. ♄. F. Native of Spain, Hésperis semperflòrens, *var. β*, Poir. suppl. 3. p. 196. Hésperis linifòlius, Desf. cat. hort. par. ed. 1. p. 129. Very like *Ch. semperflòrens*, but easily distinguished from it by the young leaves being crowded into the axillæ of the old ones, as well as by the flowers being purplish, not yellow nor white.

Flax-leaved Wall-flower. Fl. March, Aug. Clt. 1815. Shrub 1 to 2 feet.

† *Species not sufficiently known.*

13 C.? Syri'acus (D. C. syst. 2. p. 185.) leaves ovate-oblong, cordately-auriculate, toothed, smooth; stem erect, flexuous, branched, smooth. ♂. H. Native of Syria. Hésperis Syrìacus, Rauw. or. p. 74. with a figure.—Cam. hort. med. p. 74. t. 19.—Mor. oxon. 2. p. 252. sect. 3. t. 10. f. 4. &c. Flowers not seen.

Syrian Wall-flower. Pl. 2 feet.

14 C.? pulche'llus (Willd. spec. 3. p. 523.) leaves linear-lanceolate, acutely toothed, rather pubescent with 2-parted hairs. ♃. H. Native of Cappadocia. A small plant with a shrubby base. Petals obovate yellow, size of those of Erýsimum Helvéticum. Seeds unknown.

Pretty Wall-flower. Fl.? Pl. ½ foot.

15 C.? salìnus (Lin. mant. 93.) leaves lanceolate, blunt, quite entire, downy; stem erect; anthers inclosed. ♄. H. Native of Siberia and Tartary near salt pits. ? Hésperis salìna. Lam. dict. 3. p. 324. Very like *Mathìola incàna*, but 8-times smaller. Flowers purple with a yellowish throat, sweet-scented.

Salt-pit Wall-flower. Pl. ½ foot.

16 C. Palla'sii (Pursh. fl. amer. sept. 2. p. 436.) leaves lanceolate-linear, attenuated, repand-toothed, smoothish; stem simple, erect, round. ♂. H. Native of North America, on the North-West coast. C. denticulàtus, Willd. herb. Stem pubescent with small 2-parted-hairs. Flowers nearly like those of *Mathìola incàna*, but dark-purple. Siliques somewhat cylindrical, crowned by the small subcapitate stigma.

Pallas's Wall-flower. Fl. Jul. Pl. ¼ foot.

17 C. pygmæ'us (Adams, in. mem. soc. mosc. 5. p. 114.) leaves linear-lanceolate, quite entire, rather hispid; stem simple, ascending; racemes corymbose; siliques very long, somewhat 4-sided; stigma 2-lobed. ♃. H. Native of Siberia, at Cape Bykofskoy on the sea shore. Like *Ch. alpìnus*, but differing from it in the leaves being linear-lanceolate, and rather hispid, as well as in the flowers being small violet, not sulphur-coloured. Perhaps a species of *Erýsimum*.

Pygmy Wall-flower. Fl. Jul. Pl. ¼ foot.

18 C. flexuòsus (Smith. fl. græc. t. 634.) ⊙. H. Native of the island of Cyprus. Leaves obovate roundish. Stem diffuse, flexuous; siliques spreading, stiff, pungent.

Flexuous-stemmed Wall-flower. Pl. ½ foot.

19 C. odora'tus (Pall. ex. Spreng. syst. 2. p. 896.) stem simple, erect, smooth; leaves white with dense tomentum, radical ones pinnatifidly-serrated, stalked, cauline ones oblong, sessile, with cartilaginous teeth; flowers in racemose-spikes; calyx smooth. ♃. H. Native of the North of Persia.

Sweet-scented Wall-flower. Pl. ½ foot.

Cult. The hardy shrubby species, such as fine varieties of common *Wall-flower*, should be encreased by young cuttings, which will soon strike root; if planted under a hand glass. The greenhouse or frame kinds will thrive well in a light rich soil; and young cuttings planted in the same kind of soil, will strike most freely under a hand glass. The perennial or herbaceous species may be increased by dividing the plants at the root, by young cuttings planted under a hand glass, or by seeds. The biennial and annual species, only require to be sown in the open border; some of the tenderer sorts, or those natives of warmer climates, may be sown in a gentle hot bed in the month of March, and transplanted into the open borders about the middle or end of April. The whole of the species answer well to be planted or sown on rock-work, and even the tenderer species will survive the winter in such a situation.

III. NASTU'RTIUM (from *nasus*, the nose, and *tortus*, tormented; acrid taste of *N. officinàle*, which affects the muscles of the nose.). R. Br. in hort. kew. ed. 2. vol. 4. p. 109. D. C. syst. 2. p. 187. prod. 1. p. 137. but not of Haller and Mœnch.

Lin. Syst. *Tetradynàmia, Siliquòsa.* Silique nearly cylindrical, short or declinate. Stigma somewhat two-lobed. Calyx equal at the base, spreading. Seeds small, not margined, disposed in two irregular series. Herbs usually aquatic, smooth, branched, easily rooting. Stems cylindrical. Leaves variable, usually pinnately-cut. Racemes many-flowered, without bracteas; pedicels filiform. Flowers white or yellow. Siliques generally declinate. This genus differs from *Sisýmbrium*, which it is very much like, in the cotyledons being accumbent, not incumbent.

Sect. I. Carda'minum (from *καρδια, kardia*, the heart, and *δαμαω, damao*, to subdue; stomachic quality of the plant.) D. C. syst. 2. p. 188. prod. 1. p. 137. Petals white, larger than the calyx. Siliques nearly cylindrical. Glands 4, at the base of the stamens. Seeds reticulately-wrinkled. Cotyledons obliquely incumbent. Perhaps a proper genus.

1 N. officina'le (B. Br. in hort. kew. ed. 2. vol. 4. p. 110.) leaves pinnate; leaflets ovate, somewhat cordate, repand; upper leaves pinnatifid, with narrow segments; terminal leaflets large. ♃. H. W. Native in rivulets throughout the world; plentiful in Britain in clear spring rivulets and ponds. Sisýmbrium Nastúrtium, Lin. spec. 917. Fl. dan. t. 690. Smith. eng. bot. t. 855. Curt. fl. lond. 6. t. 44. Woodv. med. bot. 1. p. 134. t. 48. Lun. hort. jam. 2. p. 269. There are two or three varieties of this plant but they are of little consequence.

Water-cress is well known for its agreeable warmth and flavour, in the form of a salad, it is esteemed a wholesome stomachic, and is recommended by many physicians as an antiscor-

butic. It acts as a gentle stimulant and diuretic; for these purposes the expressed juice, which contains the peculiar taste and pungency of the herb, may be taken in doses of an ounce or two, and continued for a considerable time (Dunc. ed. disp. 474.). The juice was formerly used with that of *Scurvy-grass* and *Seville-oranges* to form a popular remedy under the name of spring juices. The water-cress has been cultivated in the neighbourhood of London, to a considerable extent since 1808, as a salad. A running stream of clear water is essential to its cultivation; in the bed of this stream the plants are inserted in rows, in the direction of the current, and all that is necessary is to take up and re-plant occasionally, and to keep the plants free of mud and weeds, or any accumulation of extraneous matter. They will not grow so freely in a muddy bottom as amongst sand and gravel, neither will their flavour be so good. Some cultivate them in water beds, but they never prosper so well nor is their flavour so good as when cultivated in natural streams. The Spring or Autumn is the best time for transplanting the water-cress. Some market gardeners, who can command a small stream of water, grow the water-cress in beds sunk about two feet in a retentive soil, with a very gentle slope from one end to the other. Along the bottom of this bed, which may be of any convenient length and breadth, chalk or gravel is deposited, and the plants are inserted, about six inches apart every way. Then according to the slope and length of the bed, dams are made six inches high across it, at intervals; so that when these dams are full, the water may rise not less than three inches on all the plants included in each. The water being turned on will circulate from dam to dam, and the plants, if not allowed to run to flower, will afford abundance of young tops in all but the winter months. A stream of water not larger than what will fill a pipe of an inch bore, will suffice to irrigate in this way the eighth of an acre. As some of the plants are apt to rot off in the winter, the plantation should be laid dry two or three times a year, and all weeds and decayed parts removed, and vacancies filled up. Water-cress grown in this way is, however, far inferior to that grown in natural streams.

Officinal or Common Water-cress. Fl. Jun. July. Britain. Pl. 1 to 2 feet.

Sect. II. Brachy'lobos (βραχυς, *brachys*, short, λοβος, *lobos*, a pod; pods short). D. C. syst. 2. p. 190. prod. 1. p. 137. Petals yellow. Siliques somewhat cylindrical or elliptical. Glands of the receptacle small.

2 N. sylve'stre (R. Br. in hort. kew, ed. 2. vol. 4. p. 110.) leaves pinnate; leaflets lanceolate, serrated, or cut. ♃. H. Native of moist pastures and along the sides of rivers and rivulets throughout Europe, North of Asia, Persia and Tauria, China, New Holland, and also in North America by the river Delaware, where it has probably been introduced; plentiful in Britain in gravelly wet meadows about the margins of rivers and ditches. Sisýmbrium sylvéstre, Lin. spec. 916. Smith, engl. bot. t. 2324. Curt. fl. lond. fasc. 3. t. 41. Sisýmbrium vulgàre, Pers. ench. 2. p. 196. Root creeping extensively. Petals golden, longer than the calyx.

Wild Nasturtium or Water Rocket. Britain. Fl. June, Sept. Pl. 1 foot.

3 N. palu'stre (D. C. syst. 2. p. 191.) leaves pinnatifid, auricles stem-clasping, ciliated, with the lobes confluent, toothed, smooth; root fusiform; petals equal in length with the calyx; pods blunt at both ends, rather turgid. ⊙. H. Native throughout Europe, Persia, China, Java, and North America, about the banks of rivers, ponds, and ditches, and in damp but not very watery meadows; frequent in Britain. Sisýmbrium palústre, Leys. fl. hal. no. 679. Schkuhr. handb. 2. t. 187. Sisýmbrium terréstre, With. brit. 582. Curt. fl. lond. 5. t. 49. Smith, engl. bot. 1747. Stok. mat. med. 3. p. 447. Sisýmbrium amphíbium *a*, Huds. 298. β. Lin. fl. suec. ed. 2. p. 232. Sisýmbrium Islándicum, Oed. fl. dan. t. 490. Myàgrum palústre, Lam. dict. 1. p. 572. Flowers small, yellow.

Var. β, *pusíllum*, (D. C. syst. 2. p. 192.) ⊙. H. Native of South of France. Myàgrum pusíllum, Lam. dict. 1. p. 572. Vill. dauph. 3. p. 341. t. 39. Plant small. Leaves divided into more linear lobes than the species.

Var. γ, *barbareæfòlium* (D. C. syst. 1. c.), ⊙. H. Brachylobos barbareæfòlius, Desv. journ. bot. 1814. vol. 3. p. 170. Sisýmbrium barbareæfòlium, Del. fl. æg. ill. p. 19. Native of Egypt about Rosetta. Plant larger in all its parts than the species, and the leaves are more profoundly pinnatifid.

Var. δ? *tanacetifòlium* (D. C. syst. 1. c.). ⊙. H. Sisýmbrium tanacetifòlium, Walt. fl. carol. ex Bosc. Plant dwarfer; leaves profoundly cut; lobes pinnatifid; siliques longer than those of the species.

Var. ε? *brévipes* (D. C. syst. 1. c.) differing from the species in the pedicels being very short, fructiferous ones hardly a line long and with the stigma nearly sessile. ⊙. H. Native of Porto-Ricco. Perhaps a distinct species.

Var. ζ, *Blùmei*; auricles wanting. Native of Java.

Marsh Nasturtium or Small jagged Water Radish. Fl. June, Sept. Britain. Pl. 1 foot.

4 N. Portorice'nse (Spreng. syst. 2. p. 882.) leaves interruptedly pinnate, smooth; segments oblong, obtuse, repand-crenate; petals smaller than the calyx; siliques rather cylindrically-linear, crowned by the almost sessile stigma. ♃. F. Native of Porto Ricco and St. Domingo.

Portorico Nasturtium. Pl. 1 foot.

5 N. a'nceps (D. C. prod. 1. p. 137.) leaves pinnatifid, very smooth; auricles stem-clasping; stems creeping; petals larger than the calyx; pods pointed at both ends, two-edged. ♃. H. Native on the banks of rivers above the water, among sand, about Upsal. Sisýmbrium ánceps, Wahl. fl. ups. p. 223. Sisýmbrium amphíbium terréstre, Ehrh. beitr. 5. p. 22. Lin. spec. ed. 2. p. 917. Fl. dan. 984. Flowers yellow.

Two-edged-podded Nasturtium or Water Radish. Fl. June, July. Clt. 1823. Pl. 1 foot.

6 N. micra'nthum (D. C. prod. 1. p. 137.) pubescent; leaves pinnate; leaflets opposite, deeply jagged, with the terminal leaflet roundish-ovate; petals larger than the calyx; pods erect, linear-oblong, smooth. ⊙. ♃.? Native of the East Indies. Sisýmbrium micránthum. Roth. nov. pl. spec. 324. Like *N. palústre*. Flowers small, yellow.

Small-flowered Nasturtium or Water Radish. Fl. June, Aug. Pl. 1 foot.

7 N. Madagascarie'nse (D. C. syst. 2. p. 192.) leaves pinnate; leaflets stalked, pinnatifid; lobes ovate, toothed, terminal one largest. ⊙.? S. Native of the eastern coast of Madagascar. Flowers small, not sufficiently known.

Madagascar Nasturtium or Water Radish. Pl. 1 foot.

8 N. Mexica'num (Moc. Sesse, and Cerv. fl. mex. icon. ined. and D. C. syst. 2. p. 193.) leaves pinnatifid, smooth; lobes oblong, sinuately-toothed, blunt; petals equal in length with the calyx; pods declinate, somewhat twisted, three times longer than the calyx. ⊙? ♃? H. Native of Mexico on the margins of rivulets. Perhaps sufficiently distinct from *N. palústre*.

Mexican Nasturtium or Water Radish. Pl. 1 foot.

9 N. Bonarie'nse (D. C. syst. 2. p. 193.) leaves pinnate-parted; lobes distant, linear, somewhat toothed, smooth; pods nearly erect, terete-compressed, twice or thrice longer than the pedicels. ⊙. H. Native of Buenos-Ayres. Sisýmbrium Bonariénse, Poir. dict. 7. p. 205. Flowers yellow. Root perpendicular.

Buenos-Ayrean Nasturtium or Water Radish. Pl. ¾ foot.

10 N. ceratophy'llum (D. C. syst. 2. p. 193.) leaves linear,

pinnatifidly-toothed, smoothish; pods shorter than the pedicel. ⊙. H. Native of Mauritania in sandy places near Cafsa. Sisýmbrium ceratophýllum, Desf. atl. 2. p. 82. t. 154. Flowers yellow; petals entire, one half longer than the calyx.

Horn-leaved Nasturtium or Water Radish. Fl. June, July. Clt. 1820. Pl. ¾ foot.

11 N. CORONOPIFO'LIUM (D. C. syst. 2. p. 194.) leaves lanceolate, pinnatifidly-toothed, pubescent; stem almost naked, ascendant; pods linear, incurved, length of the pedicels. ⊙. H. Native of North Africa in a sandy desert near Cafsa. Sisýmbrium coronopifòlium, Desf. atl. 2. p. 82. t. 154. Stems tufted. Lower leaves almost like those of *Plantàgo corónopus*. Flowers yellow.

Buckhorn-leaved Nasturtium or Water Radish. Fl. winter; in England in July, Sept. Clt. 1820. Pl. ¾ foot.

12 N. BURSIFO'LIUM (D. C. syst. 2. p. 194.) leaves villous, radical ones pinnatifid, stem ones sagittate, entire, acuminated; stems erect, and are as well as pedicels hispid. ⊙. H. Native of Kamtschatka. Sisýmbrium bursifòlium, Patr. ined. Root simple, perpendicular. Petals larger than the calyx, pale yellow.

Shepherd's-*purse-leaved* Nasturtium or Water Radish. Fl. June, Aug. Clt. 1818. Pl. ½ foot.

13 N. SAGITTA'TUM (R. Br. in hort. kew. ed. 2. vol. 4. p. 111.) pubescent; radical leaves dentately-runcinate, stem ones sagittate, oblong, blunt; stems erect, branching from the base; pods deflexed. ♃. H. Native of Siberia at the Caspian sea. Sisýmbrium. mólle. Jacq. icon. rar. 1. t. 122. Sisymbrium sagittàtum, Ait. hort. kew, ed. 1. vol. 2. p. 390. Flowers pale yellow.

Arrow-leaved Nasturtium or Water Radish. Fl. May, June. Clt. 1780. Pl. ½ to 1 foot.

14 N. GLAUCOPHY'LLUM (D. C. syst. 2. p. 195.) very smooth; radical leaves stalked, obovately-orbicular, crenate, leathery; upper ones linear, scale-like. ♃? H. Native of Persia near Teheran. Deless. icon. sel. 2. t. 14. Stems slender. A very distinct species from the whole. Perhaps it belongs to section *Clandestinària*. Flowers yellow.

Glaucous-leaved Nasturtium or Water Radish. Pl. 1 foot.

15 N. LIPPIZE'NSE (D. C. syst. 2. p. 195.) radical leaves stalked, obovate, toothed, or somewhat lyrate, upper ones pinnate-parted; lobes linear, entire; pods linear, declinate. ♃. H. Native of Croatia, Dalmatia, Carinthia, Hungary, about Lippa, and about Constantinople, &c., in rocky places, Sisýmbrium Lippizénse, Wulf. in Jacq. coll. 2. p. 161. icon. rar. 3, t. 505. Sisýmbrium sylvéstre, var. β, Willd. spec. 3. p. 490. An intermediate species between *N. Pyrenàicum* and *N. sylvéstre*. Flowers yellow.

Lippa Nasturtium or Water Radish. Fl. May, June. Clt. 1820. Pl. ¾ foot.

16 N. PYRENA'ICUM (R. Br. in hort. kew, ed. 2. vol. 4. p. 110.) radical leaves stalked, obovate or lyrate, stem ones stem-clasping, pinnate-parted; lobes linear, entire; pods oval, pointed with the style. ♃. H. Native of Spain and the Pyrenees and many other parts of the south of Europe, in dry hilly or mountainous pastures or in the fissures of rocks. Sisýmbrium Pyrenàicum, Lin. spec. 917. Brachýlobos Pyrenàicus, All. ped. no. 1013. t. 18. f. 1. Myàgrum Pyrenàicum, Lam. dict. 1. p. 571. Lepídium stylòsum, Pers. ench. 2. p. 187. Root creeping. Flowers small, yellow.

Var. β, *Brachýlobos Domingénsis*, Desf. jour. 1814. vol. 3. p. 183. Sisýmbrium Domingénse, Poir. suppl. 5. p. 161. ♃. Native of St. Domingo.

Pyrenean Nasturtium or Water Radish. Fl. May, June. Clt. 1775. Pl. ½ to 1 foot.

17 N. AMPHI'BIUM (R. Br. in hort. kew, ed. 2. vol. 4. p. 110.) leaves oblong-lanceolate, lyrately-pinnatifid or serrated; root fibrous; petals larger than the calyx; pods ellipsoid, pointed with the style. ♃. H. Native nearly throughout the whole of Europe, also in North America and Japan in rivers and ditches and places about their banks not constantly overflowed; plentiful in Britain. Sisýmbrium amphíbium, Lin. spec. 917. Smith, engl. bot. t. 1840. Sisým. Roìpra, Scop. carn. ed. 2. no. 823. Camelìna aquática, Brot. fl. lus. 1. p. 564. Sisymb. diversifòlium, Stok. bot. mat. med. 3. p. 450. Root not creeping. Flowers small, bright yellow.

Var. α, *indivìsum* (D. C. syst. 2. p. 197.) leaves all somewhat entire or serrated, not, or scarcely auricled at the base. Sisýmbrium aquáticum, Gars. fig. t. 549.

Var. β, *variifòlium* (D. C. syst. l. c.) some of the leaves are serrated, others pectinately pinnatifid, and others are capillaceously-multifid.—Bauh. hist. 2. p. 867. f. 2.

Var. γ, *auriculàtum* (D. C. syst. l. c.) leaves undivided, eared at the base. Sisýmbrium stoloníferum, Presl. fl. cech. p. 137.

Amphibious Yellow Cress or Great Water Radish. Fl. June, Aug. Britain. Pl. aquatic.

18 N. NA'TANS (D. C. syst. 2. p. 198.) emersed leaves lanceolate, entire, or serrated, immersed ones bi-tripinnatifid, with capillary segments; pods obovate, length of style. ♃. H. Native of Siberia in stagnant, saltish water at the river Alei, also of North America in water in Canada about Montreal. Deless. icon. sel. 2. t. 15. Myàgrum nàtans, Patr. ined. Flowers smaller than those of *N. amphíbium*, pale yellow, or almost white.

Floating Yellow Cress or Water Radish. Fl. June, Aug. Clt. 1826. Pl. floating.

19 N. HETEROPHY'LLUM (D. Don, prod. fl. nep. p. 202.) smooth; stem angular, a little branched; leaves toothletted, obovate, or rhomboid, entire, or somewhat lyrate, lower ones stalked, upper ones sessile; siliques almost cylindrical, elongated, straight. ⊙. H. Native of Java and Nipaul. Flowers small, white.

Variable-leaved Nasturtium. Pl. ½ foot.

20 N. SPA'RSUM (D. Don, prod. fl. nep. p. 202.) leaves pinnate; leaflets oval-oblong, obtuse, deeply serrated, pubescent, mucronulate; corymbs few-flowered; siliques terete, twice the length of the pedicels; stem erect, branched. ⊙. H. Native of Nipaul.

Scattered Nasturtium. Pl. ½ foot.

SECT. III. CLANDESTINA'RIA (from *clandestinus*, hidden, secret; in allusion to the small, hardly evident petals, as well as from the species being imperfectly known). D. C. syst. 2. p. 198. prod. 1. p. 139. Petals none, or very small, and white. Pods somewhat cylindrical. A doubtful section. The generic characters of the species are not sufficiently known. Perhaps some of them belong to *Sisýmbrium*, others to *A'rabis*.

21 N. BENGHALE'NSE (D. C. syst. 2. p. 198.) leaves obovately-cuneated, toothed at the apex; pods somewhat cylindrical and rather turgid; pedicels a little shorter than the pods, furnished with bracteas. ⊙? H. Native of Bengal, Sinàpis Benghalénsis, Roxb. ined. This species and the following are allied to *Kibèra*, the IVth section of *Sisýmbrium* in the disposition of their flowers, but differ essentially in the short pods and accumbent cotyledons. Petals small, white.

Bengal Nasturtium. Fl. in summer. Clt. 1820. Pl. 1 foot.

22 N. DIFFU'SUM (D. C. prod. 1. p. 139.) leaves smooth, stalked, oval-oblong, toothed, lower ones somewhat pinnatifid; pods cylindrical, 3-times longer than the pedicels, distinct from the style; some of the pedicels are furnished with bracteas, some are naked. ⊙. H. Native of Java. Stems many, diffuse. Pedicels 3 lines long. Petals small, white.

Diffuse Nasturtium. Pl. 1 foot.

23 N. MICROSPER'MUM (D. C. syst. 2. p. 199.) leaves smooth,

radical ones stalked, pinnate-parted, cauline ones stem-clasping, deeply serrated; pods somewhat cylindrical; pedicels very short, furnished with bracteas. ⊙. H. Native of China in the province of Shantong. Flowers small, white, sessile, solitary, in the bosom of the bracteas.

Small-seeded Nasturtium. Pl. ½ foot.

24 N. clandesti'num (Spreng. nov. prov. p. 29. no. 63.) leaves pinnate; lobes cordate, roundish, stalked, repand, terminal one large; pods somewhat cylindrical, elongated. ⊙. H. Native of Brasil. Flowers inconspicuous, without petals. Like *N. officinàle*.

Hidden-petalled Nasturtium. Fl. Ju. Jul. Clt. 1820. P. ½ ft.

25 N. I'ndicum (D. C. syst. 2. p. 199.) smooth; lower leaves spatulate, runcinately-toothed, upper ones lanceolate, tooth-letted; pods somewhat cylindrical, 4-times longer than the pedicels. ⊙. H. Native of the East Indies and China. Sisýmbrium I'ndicum, Lin. mant. 93. Flowers small, without petals.

Var. β, Sisýmbrium Sinàpis, Burm. fl. ind. 140. exclusive of the synonyms. Native of Java.

Var. γ, Sisýmbrium apétalum. Desf. cat. hort. par. 1804. p. 130. but not of Lour. Sisymb. dùbium, Pers. ench. 2. p. 199.

Indian Nasturtium. Fl. June, Jul. Clt. 1820. Pl. ½ foot.

26 N. ape'talum (D. C. syst. 2. p. 200.) leaves downy, hastate at the base, pinnatifid at the apex; pods somewhat cylindrical, declinate. ⊙? H. Native of Cochin-China in gardens and in humid places. Sisýmbrium apétalum, Lour. coch. ed. Willd. 2. p. 486. Root fusiform. Petals wanting.

Petalless Nasturtium. Pl. ½ foot.

27 N.? arabifo'rme (D. C. syst. 2. p. 220.) leaves smooth, bluntly sagittate, oblong-lanceolate, pointed, entire; pods somewhat cylindrical, ascending; petals oblong, longer than the calyx. Native of South America between Santa Rosa de la Sierra and Puerto de Varientos, at the height of 4050 feet. Arabis resediflòra, H. B. et Kth. nov. spec. amer. 5. p. 81. Flowers white; petals oblong-linear, drawn out at the base, double the length of the calyx.

Arabis-like Nasturtium. Pl. 1½ foot.

† *Species not sufficiently known.*

28 N. nebrode'nse (Raf. in Desf. journ. 1814. vol. 2. p. 270.). Native of the Nebrodes in Sicily. Sisýmbrium Nebrodénse, Poir. suppl. 5. p. 161. Radical leaves stalked, oblong, wedge-shaped, stem ones sessile, ovate toothed. Pods oval-oblong. Petals equal in length with the calyx.

Nebrode Nasturtium. Pl. 1 foot.

29 N. hi'spidum (D. C. syst. 2. p. 201.). Native of Pennsylvania. Sisýmbrium híspidum, Poir. suppl. 5. p. 161. but not of Vahl. nor Mœnch. Brachýlobos híspidus, Desf. jour. 1814. vol. 3. p. 183. Leaves somewhat villous, pinnatifidly-runcinate; lobes toothed; teeth acute. Pods short, elliptical.

Hispid Nasturtium. Pl. 2 feet.

30 N. atrovi'rens (D. C. syst. 2. p. 201.) ⊙. H. Native of China. Sisýmbrium atrovírens, Horn. hafn. suppl. p. 72. Habit of *N. amphíbium*. Lower leaves lyrately-pinnatifid, upper ones ovate-lanceolate, repandly-toothed. Pods arched.

Evergreen Nasturtium. Fl. Ju. July. Clt. 1821. Pl. 1 ft.

31 N. myriophy'llum (Spreng. syst. 2. p. 883.) leaves bipinnate, and are as well as the erect branched stem, hoary with stellate pubescence; leaflets oblong, obtuse, cut; racemes strict; flowers small; siliques lanceolate, smooth, erect, terminated by the short style. Native of Quito. Sisýmbrium myriophýllum, Willd. in herb. Humb.

Myriad-leaved Nasturtium. Pl. 2 feet.

Cult. The species are mostly weedy and not worth cultivating for ornament, and therefore they are only fit for the arrangements in botanic gardens. Those species belonging to sections *Cardáminum* and *Brachýlobos*, require a moist soil, some will require to be planted in water. The annual species may be sown in the open borders early in the spring. The rest will grow under any circumstances.

IV. LEPTOCARPÆ'A (λεπτος, *leptos*, slender, καρπος, *karpos*, a fruit; slender pods.) D. C. syst. 2. p. 201. prod. 1. p. 140.

Lin. Syst. *Tetradynàmia, Siliquòsa.* Silique nearly cylindrical, very slender, almost parallel with the axis. Stigma sessile, two-lobed. Calyx spreading, equal. Seeds small, disposed in one or perhaps in two series. The cotyledons are perhaps incumbent, and if so, it should have been placed next to *Sisýmbrium*. An annual, erect, branching, herb, with pinnate-parted leaves and yellow scentless flowers.

1 L. lœse'lii (D. C. syst. 2. p. 202.). ⊙. H. Native of Germany and other parts of Europe, on walls and similar places. Sisýmbrium Lœsèlii, Lin. spec. 921. Jacq. fl. aust. t. 324. Schkuhr. handb. 2. no. 1904. t. 187. Sisýmbrium híspidum, Mœnch. suppl. 83. Turrìtis Lœsèlii, R. Br. in hort. kew. ed. 2. vol. 4. p. 109. Leaves stalked, pinnate-parted, somewhat lyrate; lobes deeply toothed, accuminated. Racemes terminal, elongated. Pedicels filiform, slender, bractless, spreading obliquely.

Lœsel's Leptocarpæa. Fl. May, Aug. Clt. 1683. Pl. 1 foot.

Cult. The seeds of this plant should be sown in the open border, or on rock-work, where it will succeed better, and it may afterwards be allowed to sow itself. Not worth general cultivation.

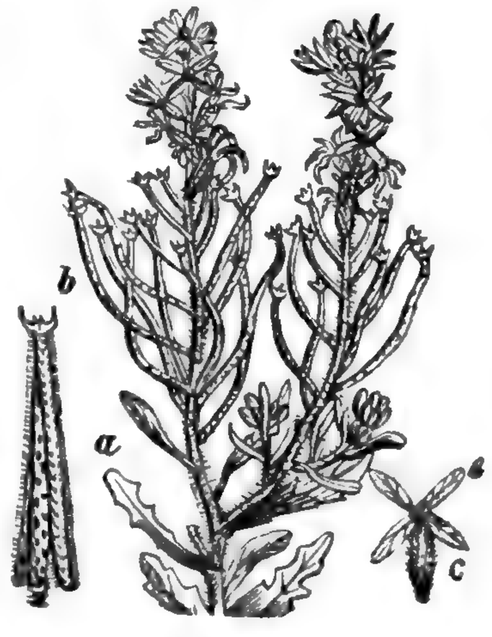
V. NOTO'CERAS (from νωτος, *notos*, the back, and κερας, *keras*, a horn;) pods furnished with horns or points on the back at the apex (f. 46. *a*.). R. Br. in hort. kew. ed. 1812. vol. 4. p. 117. D. C. syst. 2. p. 202. prod. 1. p. 140.

Lin. Syst. *Tetradynàmia, Siliquòsa.* Silique quadrangular, 2-edged, the valves are drawn out at top into a horn or mucrone. Seeds oval, compressed. Small annual herbs with erect or procumbent stems, and oblong or nearly linear, entire or sinuated leaves. Racemes opposite the leaves, also situated at the lower part of the stem. Flowers small, sometimes without petals.

Sect. I. Dicera'tium (from δις, *dis*, two, κερας, *keras*, a horn; pods furnished with two horns or points at the apex.) Lag. el. hort. madr. 1815. p. 20. D. C. syst. 2. p. 203. prod. 1. p. 140. Silique dehiscent, 2-horned. Seeds compressed. Cotyledons parallel with the dissepiment. Flowers small, yellow. Leaves entire, covered with appressed strigose 2-parted hairs.

1 N. Canarie'nse (R. Br. in hort. kew. ed. 2. vol. 4. p. 117.) pods 2-horned; petals equal; leaves entire; hair pressed, 2-parted strigose, fixed by their centre, scattered. ⊙. H. Native of the Canary Islands, particularly Teneriffe. Jacq. fil. ecl. t. 111. Erýsimum bicórne, Ait. hort. kew. ed. 1. vol. 2. p. 394. Seeds nearly orbicular, compressed, 4 in each cell.

FIG. 48.



Canary-Island Notoceras. Fl. Aug. Sept. Clt. 1779. Pl. ½ foot.

2 N. Hispa'nicum (R. Br. in hort. kew. ed. 2. vol. 4. p. 117.) pods 2-horned; petals unequal; leaves entire; hairs strigose, fixed by their middle; hence 2-parted, crowded. ⊙. H. Native of Spain, among sandy-calcareous rubbish.

Diceràtium prostràtum, Lag. elench. hort. madr. 1815. p. 20.—Deless. icon. sel. 2. t. 17. Very like *N. Canariénse*, but differing by its smaller, more rigid, and more prostrate habit.

Spanish Notoceras. Fl. Year. Clt. 1820. Pl. ½ trailing.

SECT. II. TETRACERA'TIUM (from τετρα, *tetra*, four-fold, and κερας, *keras*, a horn; pods furnished with four horns at the apex,) (f. 46. *a*.). D. C. syst. 2. p. 204. prod. 1. p. 140. Siliques 4-horned. Flowers small, perhaps without petals. Leaves sinuately-toothed. Plants covered with soft-branched down.

3 N. QUADRICÓRNE (D. C. syst. 2. p. 204.) pods 4-horned (f. 46. *a*.); leaves sinuately-toothed; down soft-branched. ⊙. H. Native of Siberia, between the rivers Volga and Kuma, or Kama. Erýsimum quadricórne, Steph. in Willd. spec. 3. p. 514. Deless. icon. sel. 2. t. 16.

Four-horned-podded Notoceras. Fl. May, Sept. Clt. 1817. Pl. ½ foot.

SECT.? III. MACROCERA'TIUM (from μακρος, *makros*, long, and κερας, *keras*, a horn; pods furnished with two long horns or points at the apex.) D. C. syst. 2. p. 204. prod. 1. p. 140. Siliques indehiscent, 2-horned. Seeds oblong, contrary to the dissepiment. Flowers white. Leaves pinnate. Perhaps a proper genus.

4 N.? CARDAMINEFÒLIUM (D. C. syst. 2. p. 205.) pods 2-horned; leaves smooth, pinnate. ⊙. H. Native of Pontus, in fields, at the Bosphorus, and in the Island of Cyprus. Deless. icon. sel. 2. t. 18. Lepídium cornùtum, Smith. fl. græc. t. 617. Andrzejówskia Cardámine, Rchb.—Buxb. cent. 1. p. 5. t. 9. f. 1. Stem simple or scarcely branched.

Lady's-Smock-leaved Notoceras. Fl. May, Aug. Pl. 1 foot.

Cult. These plants may be sown in the open border, in common garden soil; but, however, they answer better for rockwork. Not worth cultivating for ornament.

VI. BARBARE'A (anciently called herb of St. Barbara.) R. Br. in hort. kew. ed. 2. vol. 4. p. 109. D. C. syst. 2. p. 205. prod. 1. p. 140.

LIN. SYST. *Tetradynàmia*, *Siliquòsa*. Silique 4-sided; 2-edged; valves concave-keeled, awnless at the apex. Calyx equal at the base. Seeds disposed in one series. Herbs perennial, very smooth, with fibrous roots and erect stems. Racemes terminal, erect. Pedicels bractless. Flowers yellow.

1 B. VULGA'RIS (R. Br. in hort. kew. ed. 2. vol. 4. p. 109.) lower leaves lyrate, terminal lobe roundish; upper leaves obovate, toothed or pinnatifid; silique tetragonal, linear, pointed with the style. ♃. H. Native nearly throughout Europe, in moist waste places, about hedges and marshy meadows; plentiful in Britain, also in the islands of Unalaschka, Kamtschatka, and at the mouth of the Columbia river. Erýsimum Barbarèa, Lin. spec. 922. *Var. a*, and γ, Oed. fl. dan. t. 985. Smith. eng. bot. 443. Schkuhr. handb. no. 1834. t. 183. Schrank. mon. 2. t. 128. Erýsimum lyræfòlium, Stok. bot. mat. med. 3. p. 459.

Var. β, flore pleno (D. C. syst. 2. p. 206.) flowers double, yellow.

Var. γ, gràcilis (D. C. syst. 2. p. 206.) stem slender, sparingly branched; upper leaves somewhat cut. ♃. H. Native of Siberia and Kamtschatka. Perhaps a proper species. Plant intermediate between *B. vulgàris* and *B. præ'cox*.

The whole herb has a nauseous bitter taste, and is in some degree mucilaginous, and it is sometimes cultivated as a spring salad, but has nothing in flavour to recommend it. In Sweden they boil the leaves as kale. In Germany the plant is called *Winterkresse*, *Barbenkraut*, *Rapunzel*, *Seuskraut*, *Habichtskraut*, *Gebber Beyfuss* and *falsche Bumon*. In Denmark, *Vinterkars*. In Sweden, *Vinterkrass*. In France, *La Barbaree*, *l'herbe Saint Barbe*, *Roquette*, *l'herbe aux Charpentiers*. In Italy, *erba di Santa Barbara*, *Roquetta*. In Spain and Portugal, *Herva*, or *Herba de Santa Barbara* and *Ruqueta*.

Herb St. Barbara, *Common* Winter-Cress, or Yellow Rocked. Fl. May, Aug. Britain. Pl. 1 or 1¼ feet.

2 B. PRÆ'COX (R. Br. in hort. kew. ed. 2. vol. 4. p. 109.) lower leaves lyrate, terminal lobe ovate; upper leaves pinnate-parted; lobes linear-oblong, quite entire; silique linear-elongated, compressed 2-edged, crowned by a very short thickened style. ♃. H. Native of France, England, (most common in Devonshire) in watery, grassy places, or on the banks of ditches. Also of North America, on banks of rivers; abundant from Canada to Lat. 68°. Erýsimum præ'cox, Smith. fl. brit. 2. p. 707. eng. bot. t. 1129. Erýsimum tenuifòlium, Stok. bot. mat. med. 3. p. 460.

This plant is called in German, *Americanisher*; in French, *Cresson d'Amerique*, or *Roquette des Jardins*. In English, *American-Cress*, or *Black American-Cress*, *French-Cress*, or *Belle isle-Cress*. It is generally liked as a winter cress, and early spring salad, resembling in flavour the common water-cress, but rather more bitter. It is in demand in some places throughout the year. It is raised from seeds, and for every ten feet of drill, a quarter of an ounce will be requisite. Sow in a bed of light dry earth, rather in drills nine inches apart than broadcast. For winter and spring use make a sowing in the last fortnight of August or beginning of September, on a warm sheltered border. If wanted throughout summer sow every six weeks from March to August, giving a sunny or shaded situation, according to the advancement of the season. Water occasionally in hot dry weather. At the approach of winter, shelter the plants, by laying a few light twigs among them, so as not to interfere with their growth, and upon these a covering of fern, reeds, or dry litter. The plants being cut, or the outside leaves stripped off, shoot again for another gathering. Let a few choice plants, raised in spring, run to seed; which will be ready to gather before the decline of summer.

Early Winter-Cress. Fl. April, Oct. Britain. Pl. 1 to 1½ feet.

3 B. RUPI'COLA (Moris. stirp. sard. elench. fasc. 1. ex. bull. sc. July, 1828. p. 348.) plant tufted; lower leaves on long petioles, simple or somewhat lyrate, with the terminal lobe cordate-ovate; upper leaves deeply pinnatifid; siliques long, straight; petals obovately-spatulate. ♃. H. Native of Sardinia, upon rocks in the mountains. This species is very like *B. præ'cox*.

Rock Winter-Cress. Fl. Ap. Ju. Pl. 1 foot.

4 B. TAU'RICA (D. C. syst. 2. p. 207.) radical and lower leaves pinnatifidly-lyrate; terminal lobe and upper leaves ovate, toothed; pedicels spreading; pods ascending. ♃. H. Native of Tauria and Volhynia, in ditches and hedges; also in the Alps of Caucasus. Erýsimum arcuàtum, Presl. fl. cech. 138. Barbarèa arcuàta, Andrz. in. litt. and Rchb. Root creeping.

Taurian Winter-Cress. Fl. June, Sept. Clt. 1826. Pl. 1½ foot.

5 B. IBE'RICA (D. C. syst. 2. p. 208.) radical and lower leaves pinnate-parted, lyrate; lateral lobes ovate; terminal one cordate, entire; upper leaves bluntly-auricled at the base. ♃. H. Native of Siberia, at Achalgory; also of Podolia? Cheiránthus Ibéricus, Willd. enum. 2. p. 681. Cheiránthus lævigàtus, Willd. herb. Barbarèa stricta, Bess. enum. volh. no. 1551. Pods straight, pressed to the rachis.

Iberian Winter-Cress. Fl. May, Aug. Clt. 1816. Pl. ¾ foot.

6 B. PLANTAGI'NEA (D. C. syst. 2. p. 208.) lower leaves dentately-lyrate, lateral lobes tooth-like, terminal one large, somewhat cordate; upper leaves ovate; pods somewhat incurved. Native of the Levant, Deless. icon. sel. 2. t. 19. Sisýmbrium Barbarèa, Lin. spec. 921. Very like *B. vulgàris*, but

it is larger in all its parts. Radical leaves lyrate, emulating those of *Dorònicum plantagíneum*.

Plantain-leaved Winter-Cress. Fl. May, Aug. Clt. 1799. Pl. 1 to 2 feet.

7 B. integrifòlia (D. C. syst. 2. p. 208.) radical leaves entire, oblong, stalked; stem ones auriculately-stem-clasping. ♃. H. Native of Cappadocia. Pods unknown, but from the habit of the plant it appears to be related to *Barbarèa*.

Entire-leaved Winter-Cress. Pl. ½ foot.

Cult. None of these plants are worth cultivating for ornament, except the double flowering variety of *Barbarèa vulgàris*, commonly called *Double-yellow Rocket*, which is certainly a very ornamental plant for flower borders; this may be increased by cuttings, suckers, or dividing the plants at the root. The *B. præ'cox* is cultivated in gardens as a spring salad, and this as well as the rest of the species are easily increased by seed, or dividing the plants at the root. They thrive best in a damp or moist situation, in any kind of soil.

VII. STEVE'NIA (in honour of Christian Steven, Counsellor of the university of Moscow, author of a paper on some new plants from Caucasus, published in Lin. Transactions, vol. xi.) Adams, et Fisch. in mem. loc. nat. mosc. 5. p. 84. D. C. syst. 2. p. 209. prod. 1. p. 141.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique oblong, few-seeded, narrowest between the seeds (f. 46. *b.*); valves flat, somewhat torulose. Calyx bisaccate at the base. Herbs greyish-velvety from branched down. Stems erect, cylindrical, more or less branched, rarely simple. Leaves oblong, entire. Flowers white or purplish. Pods erect pubescent. Racemes terminal: pedicels bractless.

1 S. alyssoìdes (Adams, et Fisch. l. c. 5. p. 84.) stem somewhat ascendant, much branched; pods shorter than the pedicels. ⊙. H. Native of Siberia, in the mountains about Werkhojana, and among stones on the banks of the river Lena, below Shigansk. Flowers white; petals oval-oblong, entire. Deless. icon. sel. 2. t. 20. The whole plant is covered with stellate hairs.

Alyssum-like Stevenia. Fl. Jun. Aug. Clt. 1823. Pl. ¾ foot.

2 S. cheranthoìdes (D. C. syst. 2. p. 210.) stem strictly erect, simple or sparingly branched; pods longer than the pedicels. ♂. H. Native of Ulterior Siberia. Altaia, on a stony hill on the western side of the town, called Gazimour. Deless. icon. sel. 2. t. 21. Sisýmbrium tomentòsum, Stev. in litt. Cheiránthus salìnus, Willd. herb. Root hard, rather woody. Flowers varying from white to purplish.

Var. β, A'rabis incarnàta, Pall. in herb. Lamb. Differs from the species in having longer leaves, which are nearly an inch long, and in having a more branched stem.

Wall-flower-like Stevenia. Fl. Jun. Aug. Clt. 1823. Pl. ½ ft.

Cult. The species of this genus answer well for ornamenting rock-work, where the seeds should be sown in the spring, but not sooner than the end of March.

VIII. BRA'YA (in honour of Gabriel, Count Bray, a Bavarian nobleman and botanist.) Sternb. et Hopp. diss. with a figure. ex Gœtt. anzeig. Jan. 1827. p. 155. D. C. syst. 2. p. 210. prod. 1. p. 141.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique oblong, somewhat cylindrical; with flattish valves and a sessile stigma. Seeds few, ovate. Calyx equal at the base.—Small herbs with the habit of *A'rabis cærùlea*, villous with branched down. Leaves linear smooth; radical ones crowded, stem ones few. Racemes terminal, at first corymbose, afterwards lengthening out. Pedicels shorter than the calyx. Flowers purplish.

1 B. alpìna (Sternb. et. Hopp. l. c.) leaves spatulately-linear, entire; fructiferous, racemes short. ♃. H. Native of Upper Carinthia and Salisburgh, in the Alps. Deless. icon. sel. 2. t. 22.

Alpine Braya. Fl. April, May. Clt. 1821. Pl. 1 inch.

2 B. glabe'lla (Richard, in Frankl. narr, journ. p. 743.) leaves linear, for the most part remotely toothed; fructiferous, racemes loose, elongated. ♃. H. Native of Copper mountains, from Point Lake to the Arctic Sea. Stems erect, ribbed. Pods torulose.

Smooth Braya. Fl. April, June. Pl. 3 inches.

3 B. pilòsa (Hook. fl. bor. amer. t. 17. f. A.) stem woody at the base; leaves lanceolate, pilose rosulate, entire; scapes naked; racemes crowded many-flowered, at length elongated; stigma slightly 2-lobed. ♃. H. Native of North America, perhaps on the Rocky Mountains. Every part of the plant appears to be more or less pilose. A beautiful tufted plant.

Pilose Braya. Fl. April, June. Pl. ½ foot.

Cult. The species of this genus are pretty little alpine plants; they should be kept in pots of a small size, which should be well drained with potsherds, and treated as other alpine plants. The mould which answers them best, is an equal mixture of sand, loam, and peat. They may be increased by dividing the plants at the root, or by seeds. If they would stand the winter unsheltered, they would be a desirable addition to rock-plants.

IX. TURRI'TIS (from *turris*, a tower; in allusion to the disposition of the foliage on the stems, which gives to them a pyramidal form; from the same reason the plants are called *Tower-Mustard.*) Dill. nov. gen. in pl. giess. p. 120. t. 6. Gært. fruct. 2. p. 297. t. 143. D. C. syst. 2. p. 211. prod. 1. p. 141.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique linear, with flat valves. Seeds in two rows in each cell. Herbs erect, adult ones usually smooth, but the younger ones are scabrous. Cauline leaves clasping the stem, somewhat sagittate, radical ones toothed, drawn out along the petiole. Racemes elongated. Pedicels bractless. Flowers white, or sulphur-coloured.

1 T. gla'bra (Lin. spec. 930.) erect; radical leaves stalked, toothed, pilose; cauline ones broad-lanceolate, sagittate, clasping the stem, quite entire, smooth glaucous; pods narrow-linear; erect, six times longer than the pedicels; petals hardly longer than the calyx. ♂. H. Native throughout Europe in dry exposed situations: in Britain, on banks by road sides, in a dry gravelly soil, rare in Scotland; also of North America, from Hudson's Bay to the Rocky Mountains, and as far north as lat. 64°. Smith, eng. bot. t. 777. Fl. dan. t. 809. Schkuhr. handb. 2. no. 1859. t. 185. Stok. bot. mat. med. 3. p. 464. A'rabis perfoliàta, Lam. dict. 1. p. 219. A'rabis glàbra, Weim. cat. hort. dorp. 1810. p. 18. Sisýmbrium simplicíssimum, Lapeyr. abr. 382. Flowers pale, sulpher-coloured.

Var. β, ramòsa (D. C. syst. 2. p. 212.) Turrìtis màjor, Clus. hist. 2. p. 126. f. 2.

Smooth or Common Tower Mustard. Fl. May, June. Britain. Pl. 2 or 3 feet.

2 T. salsuginòsa (D. C. syst. 2. p. 212.) leaves smooth, lower ones toothed, cauline ones entire, clasping the stem; pods erectish, four times longer than the pedicels. ⊙. H. Native of Siberia. Very common about salt lakes, and on the gravelly banks of ditches, especially at the lakes Irtish and Baical, and in Dahuria, beyond the river Kur. Sisýmbrium salsugíneum, Pall. itin. 2. append. no. 114. t. V. ed. gall. min. 8. p. 342. no. 348. t. 64. Flowers small white. Seeds yellow.

Brine Tower Mustard. Fl. May, Jun. Clt. 1819. Pl. 2 ft.

3 T. hispídula (D. C. syst. 2. p. 213.) leaves scabrous with flocky, down, cauline ones clasping the stem, oblong-lanceolate, and somewhat serrated; pods erectish, somewhat scabrous, three times longer than the pedicel. ⊙. H. Native of South Ame-

rica, in the kingdom of Quito, in the mountain Cotopaxi, at the height of 6600 feet. A'rabis andícola, H. B. et Kth. nov. spec. amer. 5 p. 81. Petals white, linear, blunt. Seeds innumerable, small, brown.

Hispidish Tower-Mustard. Pl. 2 feet.

4 T. móllis (Hook. fl. bor. amer. p. 40.) erect; lower leaves spatulate, sinuately-toothed, upper ones lanceolate, broadly-sagittate, quite entire, all as well as the stem and pedicels covered with numerous spreading soft hairs; siliques linear-elongated, erect. ⊙. H. Native of North America, on the shores of the Arctic Sea. Flowers white.

Soft Tower-Mustard. Fl. May, Jul. Clt. 1826. Pl. 1 foot.

5 T. strícta (Graham in edinb. phil. journ. July, 1829. p. 7. Hook. l. c.) erect, smooth; leaves lanceolate, radical ones stalked, toothed, cauline ones sagittate, half stem-clasping, a little toothed, siliques linear-elongated, erect. ⊙. H. Native of North America, in prairies of the Rocky Mountains and about Fort Vancouver, on the Columbia. Flowers pure white.

Straight-podded Tower-Mustard. Fl. Jun. Jul. Clt. 1826. Pl. ½ to 1 foot.

6 T. pa'tula (Graham, in edin. phil. journ. July, 1829. p. 7. Hook. l. c. but not of Ehrh. or Willd.) erect; leaves lanceolate, radical ones stalked, toothed, cauline ones sagittate, half-stem-clasping, smooth, and a little toothed; flowers spreading, as well as linear-elongated siliques. ⊙. H. Native of North America. Flowers rather large, of a beautiful rose-purple colour.

Var. α, subpubéscens; radical leaves sparingly pubescent. Native from Canada to Lat. 68°., and from Hudson's Bay to the Rocky Mountains, and even to Fort Vancouver, on the Columbia.

Var. β, incàna; radical leaves hoary with pubescence. Native on the highest summits of the Rocky Mountains.

Spreading Tower-Mustard. Fl. Ju. July. Clt. 1826. Pl. 1 ft.

7 T. retrofra'cta (Hook. flor. bor. amer. p. 41.) plant erect, hoary-pubescent, or smooth; leaves lanceolate, radical ones stalked-toothed, cauline ones sagittate, half-stem-clasping, smooth, a little toothed; flowers drooping; siliques linear, elongated, and are, as well as the pedicels, bent backwards. ⊙. H. Native of North America, from Hudson's Bay to the Rocky Mountains, and from Canada to Lat. 68°., at the Mackenzie River. A'rabis retrofrácta, Graham, in edin. phil. journ. July, 1829. Flowers white, with a faint purplish tinge.

Retrofracted pedicelled Tower-Mustard. Fl. Ju. July. Clt. 1826. Pl. 1 foot.

8 T. diffu'sa (Hook. fl. bor. amer. p. 41.) plant quite smooth, glaucous; stems branched, diffuse; radical leaves spatulate, almost entire, cauline ones sagittate, hardly toothed; siliques linear, spreading, twice as long as the pedicels. ⊙. H. Native of North America on the shores of the Arctic Sea. Flowers small, and probably white. This may prove to be a species of *A'rabis*.

Diffuse Tower-Mustard. Pl. diffuse.

Cult. As the species of this genus are all weedy-like plants, they are only fit for the arrangements in botanical gardens. They only require to be sown in the open border; or on rock-work, in any kind of soil.

X. A'RABIS (originally from Arabia, but this name is not very precise, as the species of the genus are found in many parts of the world, in arid, stony, and sandy places, in cold and mild climates). Lin. gen. no. 818. Lam. ill. t. 563. D. C. syst. 2. p. 213. prod. 1. p. 142.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique linear, with flat, 1-nerved valves. Seeds oval, or orbicular, compressed, in 1 row in each cell. Cotyledons flat. Herbs annual or perennial, more or less branched. Radical leaves usually stalked, cauline ones sessile or clasping the stem, entire or toothed, rarely lobed. Hairs variable, but usually those on the stems are simple, and those on the leaves are either bifid or trifid. Racemes terminal; pedicels bractless. Flowers white, very rarely red. The genus is called *Wall-Cress* in English, because the species usually grow in stony places or on walls.

Sect. I. Aloma'tium (from α, priv. and λωμα, *loma*, fringe, in allusion to the seeds being destitute of a wing round their edge, or with a very narrow one). D. C. syst. 2. p. 214. prod. 1. p. 142. Seeds not edged, or girded with a very narrow wing.

§ 1. *Obovatipétala. Cauline leaves cordate, clasping the stem. Limb of petals obovate, spreading, distinct from the claw.*

1 A. ve'rna (R. Br. in hort. kew, ed. 2. vol. 4. p. 105.) cauline leaves cordate, clasping the stem, toothed, scabrous with 3-parted hairs; pedicels shorter than the calyx; stigma somewhat emarginate. ⊙. H. Native throughout the south of Europe in corn fields and gravelly places. Hésperis vérna, Lin. spec. 928. Smith, fl. græc. 641. A'rabis violàcea, Mœnch. meth. 259. Turritis purpùrea, Lam. fl. fr. 2. p. 491.—Mor. hist. 2. p. 241. sect. 3. t. 8. f. 5. Petals small, purple, with a white claw.

Vernal Wall-Cress. Fl. May, June. Clt. 1710. Pl. ¼ to ¾ ft.

2 A. ro'sea (D. C. syst. 2. p. 215.) cauline leaves oblong, somewhat cordate and somewhat stem-clasping, scabrous with branched hairs; pedicels longer than the calyx; stigma apiculated. ♂. H. Native of Calabria about Cozenza. Petals rose-purple, oblong, somewhat wedge-shaped, double the length of the calyx. Deless. icon. sel. 2. t. 23.

Rose-coloured-flowered Wall-Cress. Fl. May, July. Pl. 1 ft.

3 A. visco'sa (D. C. syst. 2. p. 216.) leaves distantly-toothed, scabrous with branched hairs; radical leaves stalked, obovate-oblong, very blunt, cauline ones ovate-cordate, clasping the stem; pedicels equal in length with the calyx, which is hairy. ♃. H. Native of the north of Persia on the Alps. Cardámine viscòsa, Gmel. in herb. Pall. A tufted plant, with white flowers.

Clammy Wall-Cress. Fl. April, May. Pl. ½ foot.

4 A. alpi'na (Lin. spec, 928.) leaves many-toothed, lanceolate, acute, villous with branched hairs, radical ones somewhat stalked, cauline ones cordate, clasping the stem; pedicels longer than the calyx, which is smoothish. ♃. H. Native of Europe on rocks and among stones in calcareous mountains, in sunny situations; Spain, Lapland, Greenland, Switzerland, Pyrenees, also Madeira and Labrador, &c. Curt. bot. mag. t. 226. A tufted plant, with white flowers.

Var. β, Clusiàna (Schrank, fl. mon. 2. p. 125.) leaves more sparingly and more bluntly toothed. Clus. hist. 2. p. 125. f. 2.

Var. γ, nàna (Baugm. trans. 2. p. 263.) A dwarfer plant.

Alpine Wall-Cress. Fl. March, May. Clt. 1596. Pl. ½ ft.

5 A. a'lbida (Stev. in cat. hort. gor. 1812. p. 51.) leaves few-toothed, hoary, or downy with branched hairs; radical leaves obovate-oblong, cauline ones cordately-sagittate, clasping the stem; pedicels longer than the calyx. ♃. H. Native of Tauria and Caucasus on rocks. Jacq. fil. ecl. 1. p. 105. t. 71. A. Caucásica, Willd. enum. suppl. p. 45. Schrank. hort. mon. t. 24. A. alpìna, Pall. ined. Cheiránthus móllis, Horn. hort. hafn. p. 615. Very like *A. alpìna*, but easily distinguished from it by its larger flowers and few-toothed leaves. A tufted plant with white flowers.

White-leaved Wall-Cress. Fl. Jan. May. Clt. 1798. Pl. ¾ ft.

6 A. undula'ta (Link. enum. hort. berl. 2. p. 161.) stem erect, and is hairy as well as the oblong-toothed waved leaves; pods spreading; style the breadth of the pod. ♃. H. Native of the south of Europe. Like *A. álbida*, but the whole plant is

smaller in all its parts, and the leaves are less hoary. A tufted rather straggling plant with white flowers.

Waved-leaved Wall-Cress. Fl. May, Aug. Pl. ½ foot.

7 A. Billardie'rii (D. C. syst. 2. p. 218.) leaves few-toothed, hoary or downy with branched hairs, lower ones obovately-wedge-shaped, upper ones oblong and clasping the stem; pedicels longer than the calyx; pods, when nearly ripe, spreading. ♃? H. Native of Syria near Damascus, on a mountain called Dgebel-cher. A tufted plant with white flowers. Like *A. alpìna*. Pods smooth, an inch and a half long.

La Billardiere's Wall-Cress. Pl. ¼ foot.

8 A. brevifo'lia (D. C. syst. 2. p. 218.) leaves with a few blunt teeth, downy with branched hairs, radical ones obovate, stem ones cordately-sagittate, ovate, nearly entire; pedicels longer than the calyx; pods spreading, rather curved. ♃. H. Native of Syria. A tufted plant, with white flowers.

Short-leaved Wall-Cress. Pl. ½ foot.

9 A. thyrsoi'dea (Smith, fl. græc. t. 642.) leaves obovate, bluntly-toothed, hoary with branched hairs, cauline ones clasping the stem; racemes capitate; pedicels rather shorter than the calyx; pods curved, ascendant. ♃. H. Native of Bithynia on the top of Mount Olympus. A tufted plant with white flowers.

Thyrse-flowered Wall-Cress. Pl. ½ foot.

10 A. longifo'lia (D. C. syst. 2. p. 219.) leaves toothed, hoary with branched hairs, lower ones obovately-oblong, on long stalks, cauline ones oblong, somewhat stem-clasping; pedicels longer than the calyx. ♃. H. Native of Persia. Very like *A. álbida*, but distinct. Deless. icon. sel. 2. t. 25. A tufted plant, with white flowers.

Long-leaved Wall-Cress. Fl. May, Aug. Clt. 1820. Pl. 1 ft.

11 A. mo'llis (Stev. mem. soc. nat. mosc. 3. p. 270.) leaves grossly-toothed, somewhat pubescent with small stellate hairs, lower ones on long petioles, cordate-roundish, cauline ones ovate-cordate, clasping the stem. Native of Caucasus on shaded rocks. Having the appearance of *Alliària officinàlis*. Flowers white.

Soft Wall-Cress. Fl. May, July. Clt. 1823. Pl. 2 feet.

12 A. toxophy'lla (Bieb. fl. taur. suppl. p. 448.) leaves somewhat pubescent with small stellate hairs, radical ones oblong, stalked, rather sinuately-toothed, stem ones sagittate-lanceolate, quite entire; pedicels longer than the calyx. ♂. H. Native of sunny fields on the lower Volga, not far from the colony of Sarepta, on hills about Catherinoslaw, also in the desert of Issim. Sisýmbrium salsugíneum, Schlecht. in herb. Willd. A very distinct and elegant species. Flowers white, about the size of those of *A. alpìna*.

Bow-leaved Wall-Cress. Pl. 1 foot.

§ 2. *Oblongipétala. Cauline leaves cordate, clasping the stem. Petals oblong, or linear-cuneated, erect.*

13 A. auricula'ta (Lam. dict. 1. p. 219.) leaves somewhat toothed, scabrous with branched hairs, lower ones oval, drawn out at the base into the petiole; stem ones bluntly cordate-auriculate; pedicels hardly longer than the calyx; pods smooth or pubescent.

Var. α, A. áspera (All. ped. auct. p. 18. t. 2. f. 2.). Native of Piedmont, Occitania, Provence, &c. on hills in sandy or gravelly soil.

Var. β, A. erécta (Vill. dauph. 3. p. 319. t. 37.). Native of Spain in the same kind of situations as the rest.

Var. γ, Turrìtis pátula, (Ehrh. beitr. 7. p. 259? Waldst. et Kit. hung. 1. p. 59. t. 59.) Native of Hungary, &c.

Var. δ, dasycárpa (Andrz. in litt.) pods pubescent. ⊙. H. Native of Thuringia and South Podolia. A. récta, Baugm. fl. trans. 2. p. 267. Pods pubescent, Wallr. All the above varieties have been considered by some botanists sufficient to constitute distinct species, but they agree in habit and character, and can scarcely be considered even varieties. Petals white, oblong.

Ear-leaved Wall-Cress. Fl. May. Cult. 1805. Pl. ¾ foot.

14 A. saxa'tilis (All. ped. no. 973.) leaves somewhat toothed, scabrous with branched hairs, lower leaves oval, drawn out a little along the petiole, stem ones acutely-cordate-auriculate; pedicels at last 4-times longer than the calyx. ♂. H. Native among rocks in the lower mountains of Provence, Dauphiny, Savoy, Vallais, and Piedmont. A. nova, spec. Vill. dauph. 3. p. 319. t. 37. Petals white.

Var. β, Tourrette Cantonénse, (Reyn. mem. swiss. 1. p. 168.) Plant a little more hoary than the species.

Stone Wall-Cress. Fl. May, 1805. Pl. ¾ foot.

15 A. crispa'ta (Willd. enum. 684.) leaves acutely-toothed, scabrous with branched hairs, lanceolate, clasping the stem, waved, radical ones drawn out along the petiole; pedicels longer than the calyx; pods spreading. ♃. H. Native of Carniola. A tufted plant with obovate-oblong, blunt, white petals.

Crisp-leaved Wall-Cress. Fl. May. Clt. 1816. Pl. ½ foot.

16 A. sagitta'ta (D. C. fl. fr. suppl. 592. syst. 2. p. 221.) leaves a little toothed, scabrous with branched hairs, radical ones ovate or oblong, drawn out along the petiole, stem ones lanceolate, sagittately-cordate; pedicels length of calyx; pods strictly erect. ♂. H. Native throughout the temperate parts of the northern hemisphere in rugged places, among stones, &c. This is a very variable plant, even in the same situation.

Var. α, Gerardiàna (D. C. syst. 2. p. 222.) leaves scabrous, stem ones drawn out into auricles at the base. ♂. H. Native of the south of Europe, particularly in the south of France, Italy, &c.

Var. β, subglabràta (D. C. syst. l. c.) leaves nearly smooth, stem ones auriculately-sagittate; racemes compound. ⊙. H. Native of Vascony. Flowers white.

Var. γ, ovàta (D. C. syst. l. c.) leaves scabrous, radical ones ovate toothed, cauline ones clasping the stem. ♂. H. Native of North America. A. ovàta, Poir. suppl. 5. p. 557.

Var. δ, oblongàta (D. C. l. c.) leaves scabrous, radical ones ovate-oblong, toothed, with the petiole shorter than the leaf, cauline ones sagittate, clasping the stem. ♂. H. Native of North America, Turrìtis oblongàta, Raf. amer. monthl. mag. 2. p. 44.

Var. ε, longisiliquòsa (D. C. syst. l. c.) pods 10-times longer than the pedicels. A. longisiliquòsa, Wallr. sched. p. 359.

Arrow-leaved Wall-Cress. Fl. May, Jul. Clt.? Pl. ¾ ft.

17 A. hirsu'ta (Scop. carn. ed. 2. n. 835.) leaves toothed, scabrous with branched hairs, radical ones ovate-oblong, drawn out along the petiole, stem ones ovate or lanceolate, sagittate; pedicels length of the calyx; pods numerous, erect. ♂. H. Native of middle and northern Europe in fields and rugged places, viz. Germany and Austria, also of North America from Hudson's Bay to the Rocky Mountains, and at the Columbia river on the north-west coast and from Canada to lat. 68°, as well as in the island of Unalaschka and Kamtschatka; in England, Sussex, in Switham Botton near Croydon, on the walls of Lakenham church-yard near Norwich, also near Bury, &c. Frequent on dry rocks in Scotland, Schrank. fl. mon. 3. t. 248. Turrìtis hirsùta, Lin. spec. 930. Jacq. icon. rar. 1. t. 126. Smith, engl. bot. t. 587. Schkuhr. handb. 2. t. 185. Fl. dan. t. 1040. A'rabis montàna, Lam. dict. 1. p. 219. Turrìtis ovàta, Pursh, fl. amer. sept. 2. p. 438. Turrìtis sagittàta, Richards. in Frankl. 1st journ. ed. 2. app. p. 26. Scarcely distinct from *A. sagittàta*, unless that the leaves are not sagittate at the base. Flowers white.

Hairy Wall-Cress. Fl. May, July. Britain. Pl. ¾ or 1 ft.

18 A. stenope'tala (Willd. enum. suppl. 46.) leaves hispid, grossly toothed, radical ones oblong-lanceolate, stalked, cauline

ones ovate, clasping the stem ; petals erect, linear, twice the length of the calyx. ♂. H. Native of Kamtschatka. Horn. hafn. 2. p. 619. A. hirsùta, var. Cham. et Schlech. in Linnæa 1. p. 15. Petals linear, blunt, white. Pods very upright.

Narrow-petalled Wall-Cress. Fl. Jul. Clt. 1826. Pl. ¾ ft.

19 A. curtisi'liqua (D. C. syst. 2. p. 223.) leaves oblong, nearly entire, ciliated with simple hairs, radical ones drawn out along the petiole ; cauline ones clasping the stem a little ; pedicels length of calyx ; pods erect. ♂. H. Native of Scania. Turrìtis curtisíliqua, Fries ex Horn. herb. Flowers white.

Short-podded Wall-Cress. Fl. May, Jul. Clt. 1820. Pl. ¾ ft.

§ 3. *Sessilifòlia. Stem leaves sessile ; petals oblong, or linear-cuneated, erect.*

20 A. Allio'nii (D. C. fl. fr. 4. p. 676.) leaves smooth, radical ones ovate-oblong, somewhat toothed, drawn out at the base, stem ones sessile, ovate, serrated ; pedicels rather longer than the calyx ; pods erect. ♃. H. Native of Piedmont in humid meadows. Turrìtis stricta, All. auct. p. 18. T. nemorénsis, Wulf. Flowers white. Calyx pale, at last spreading a little. Stem simple.

Allioni's Wall-Cress. Fl. May, June. Clt. 1804. Pl. 1 to 2 ft.

21 A. mura'lis (Bertol. dec. ital. 2. p. 37.) leaves covered with branched hairs, radical ones spatulate, bluntly-toothed, stem ones ovate, acutely toothed ; racemes straight ; pedicels at last double the length of the calyx. ♃. H. Native of Etruria. Cevennes, Savoy and Vallais on rocky mountains. A'rabis hùmilis, Schleich. pl. helv. A tufted plant, with white flowers. Petals oblong.

Wall-Cress. Fl. May, June. Clt. 1820. Pl. ½ foot.

22 A. stri'cta (Huds. angl. 292.) leaves ciliated-scabrous, with bifid hairs, radical ones oblong, tapering to the base, somewhat lyrately-pinnatifid, stem ones oblong, almost entire ; racemes straight ; pedicels hardly longer than the calyx ; pods elongated, erect. ♃. H. Native of the temperate parts of Europe on calcareous rocks. In England on lime-stone rocks, particularly on St. Vincent's Rocks near Bristol, and on the south side of the Avon about a mile below the hot wells, but sparingly. It is also said to be a native of Labrador. Smith, engl. bot. t. 614. Turrìtis Ràyi, Vill. dauph. 3. p. 326. t. 38. A. híspida, Ait. hort. kew. ed. 1. vol. 2. p. 400. but not of Lin. A. hírta, Lam. dict. 1. p. 220. A. montàna, Bern. A tufted plant, with white flowers.

Straight Wall-Cress. Fl. May, June. Britain. Pl. ¼ to ½ ft.

23 A. cilia'ta (R. Br. in hort. kew, ed. 2. vol. 4. p. 107.) leaves somewhat toothed, smooth, ciliated, radical ones nearly sessile, oval-oblong, stem ones oblong ; racemes straight ; pedicels length of calyx. ♂. H. Native of the Alps in the southern parts of Europe, particularly the Pyrenees. In Ireland by the sea-side at Rinville, Cunnamara, &c. Turrìtis alpìna, Lin. syst. veg. ed. 13. p. 505. Willd. spec. 3. p. 545. Smith, engl. bot. t. 1746. Turrìtis ciliàta, Willd. spec. 3. p. 544. A. Madònia, Presl. Closely allied to *A. stricta,* but differs from it in the root being biennial, not perennial. Flowers white.

Ciliated-leaved Wall-Cress. Fl. Jul. Aug. Ireland. Pl. ¼ ft.

24 A. inca'na (Roth. cat. bot. 1. p. 79.) leaves all sessile, and somewhat toothed, hoary with branched hairs, radical ones obovate-oblong, stem ones oblong ; racemes erect ; pedicels at least twice as long as the calyx. ♂. H. Native of dry fields in Switzerland and France. Turrìtis mìnor, Schleich. pl. helv. Petals white, oblong, double the length of the calyx.

Hoary Wall-Cress. Fl. May, June. Clt. 1816. Pl. ¼ foot.

25 A. Thalia'na (Lin. spec. 926.) leaves pilose, a little toothed, radical ones stalked, ovate-oblong ; stem branched ; pods ascendant ; pedicels much longer than the calyx. ⊙. H. Native of Europe from Spain to Petersburgh, and from England to Greece ; also in Tauria, Persia, Dauria, and Teneriffe. On walls, dry banks, cottage roofs, and dry sandy ground ; plentiful in Britain. Smith, engl. bot. t. 901. Vahl. fl. dan. t. 1106. Curt. lond. 2. t. 49. Schkuhr. handb. 2. t. 195. A. ramòsa, Lam. fl. fr. 2. p. 510. Sisym. Thaliànum Monnard. Flowers white.

Var. β. A. parviflòra, Raf. amer. month. mag. 1. p. 43. 1819. Jan. p. 194. ⊙. H. Native of North America, in dry fields and on old walls, from New England to Virginia. Petals emarginate, hardly longer than the calyx. A'rabis Thaliàna Pursh.

Thalius's Wall-Cress. Fl. April, Jul. Britain. Pl. ¼ to 1 ft.

26 A. serpyllifòlia (Vill. dauph. 3. p. 318. t. 37.) leaves almost entire, scabrous with branched hairs, radical and stem ones oval, narrowed a little at the base ; racemes rather loose ; pedicels length of calyx. ♂. H. Native of the Alps of Provence, Dauphiny, Vallais, Pyrenees, on rocky parts of mountains. Flowers white.

Wild-Thyme-leaved Wall-Cress. Fl. June, Jul. Clt. 1820. Pl. ¼ to ½ foot.

27 A. spatula'ta (D. C. syst. 2. p. 227.) leaves entire, rough, lower ones spatulate, narrowed into the petiole, upper ones roundish, small ; racemes short ; pedicels length of calyx ; pods erect. ⊙. H. Native of Buenos Ayres, in fields, and in the suburbs of Monte-Video. Petals white, small, scarcely longer than the calyx. Sisýmbrium spatulàtum, Poir. dict. 7. p. 224.

Spatulate-leaved Wall-Cress. Fl. Aug. Pl. ¼ foot.

28 A.? Commersònii (D. C. syst. 2. p. 228.) leaves almost entire, ciliated, radical ones ovate-spatulate, stalked, stem ones scarcely any ; racemes short ; pedicels longer than the calyx. ⊙.? H. Native of Buenos Ayres. Sisýmbrium bellidifòlium, Poir. dict. 7. p. 220. Petals white, hardly longer than the calyx. Seed small, brownish.

Commerson's Wall-Cress. Pl. ¼ foot.

29 A. pube'scens (Poir. suppl. 1. p. 413.) leaves pubescent, deeply-toothed, radical ones spatulately-lanceolate, narrowed into the petiole, stem ones lanceolate ; pedicels very short ; pods pubescent, erect. ♂.? H. Native of Algiers on the mountains. Turrìtis pubéscens, Desf. alt. 2. p. 92. t. 163. Petals linear, white, double the length of the calyx.

Pubescent Wall-Cress. Fl. May, June. Pl. 1 to 2 feet.

30 A. pa'rvula (Dufour, in D. C. syst. 2. p. 228.) leaves pubescent, a little toothed, lower ones obovate, stem ones ovate ; pedicels very short ; pods pubescent, spreading a little. ⊙. H. Native of Navarre and near Tudela in Spain. A. Römeriàna, Andrz. ined. Petals, when dry, pale yellow.

Small Wall-Cress. Pl. ¼ foot.

§ 4. *Obovatipétila. Cauline leaves sessile or stalked; limb of petals obovate or cuneated, distinct from the claw.*

31 A. procu'rrens (Waldst. et Kit. hung. 2. p. 154. t. 144.) leaves ovate, quite entire, smooth, ciliated with 2-parted hairs, radical ones narrowed into the petiole, stem ones sessile, pointed ; stolons creeping ; pods spreading. ♃. H. Native of Bosnia and Servia on shaded limestone rocks. Nastúrtium procúrrens, Andrz. ined. A creeping tufted plant. Petals white, double the length of the calyx.

Procurrent Wall-Cress. Fl. May, June. Clt. 1819. Pl. ¾ foot.

32 A. præ'cox (Waldst. et Kit. ined. ex Willd. enum. p. 684.) leaves oblong, acute, sessile, quite entire, smooth ; stem strigose ; stolons creeping ; pods spreading. ♃. H. Native of Hungary. A creeping tufted plant. Petals obovately-cuneated, white, double the length of the calyx.

Early-flowering Wall-Cress. Fl. Ap. Ju. Clt. 1819. Pl. ½ to ¾ ft.

33 A. Schiwereckia'na (Andrz. in litt. D. C. prod. 1. p. 145.) leaves entire, scabrous with crowded branched hairs, radical ones rosulate, obovate, stem ones oblong, erect, sessile ;

stems roughish; pods erect, smooth. ♃. H. Native of Austria. Like *A. scàbra* in habit, but the pods are one-half narrower and the seeds are hardly margined. Flowers white.

Schwereck's Wall-Cress. Fl. May, June. Clt. 1824. Pl. ½ ft.

34 A. petræ'a (Lam. dict. 1. p. 221.) leaves smooth, ciliated or scabrous with simple or bifid hairs; radical ones on longish stalks, entire, toothed, or lyrate, stem ones oblong-linear, entire or toothed; stem usually branched; pods erectly-spreading; stigma capitate; petals obovate, unguiculate. ♃. H. Native of many parts of Europe, also in the island of Unalaschka.

Var. α, Crantziana (D. C. syst. 2. p. 230.) pod long. A. Crantziàna, Ehrh. herb. 78. A. Thaliàna, Crantz. austr. 1. p. 39. t. 3. f. 2. Native of Austria and Transylvania in fissures of rocks and among stones. Flowers white or purplish.

Var. β, híspida (D. C. l. c.) Sisýmbrium arenòsum, Lin. fl. suec. 233. not of his spec. pl. Oed. fl. dan. t. 386. A'rabis híspida, Lin. fil. suppl. 298. Welch Rocket Cress, Pet. herb. brit. t. 50. f. 3. Cardámine petræ'a, Huds. ang. 293. Native of Scotland and Wales on mountains in fissures of rocks and among stones.

Var. γ, hastulàta (D. C. l. c.) Cardámine hastulàta, Smith, engl. bot. t. 409. Horn. fl. dan. 1462. Native of Britain and Norway, in the fissures of rocks and among stones.

Var. δ, Færoénsis (D. C. l. c.) Cardámine Færoénsis, Horn. fl. dan. 1382. Native of Færo island in the fissures of rocks and among stones.

Var. ε, runcinàta (D. C. l. c.) A. petræ'a, Lam. dict. 1. p. 22. Cardámine petræ'a, Lin. spec. 913. A. runcinàta, Lam. dict. 1. p. 222. Native of Sweden and the Pyrenees, in fissures of rocks and among stones.

Little tufted plants with white flowers.

Alpine *Rock* or Wall-Cress. Fl. June, Jul. Britain. Pl. ¼ foot.

35 A. ambi'gua (D. C. syst. 2. p. 231.) leaves smoothish, radical ones sinuately-lyrate, middle ones oblong-oval, toothed, upper ones oblong-linear, entire; stem almost simple; pods rather erect. ♃. H. Sisýmbrium Tilèsii, Led. in mem. acad. petersb. 5. 1815. p. 548. Flowers white or purplish.

Var. α, glàbra (D. C. syst. 2. p. 231.) leaves and stems smooth. Native of Kamtschatka.

Var. β, intermèdia (D. C. l. c.) leaves smooth; stem hispid at the base. Native of Unalaschka in sandy and grassy places.

Var. γ, scàbra (D. C. l. c.) leaves pilose, scabrous; stem smooth. Native of Siberia.

Ambiguous Wall-Cress. Fl. May, June. Clt. 1824. Pl. ½ foot.

36 A. lyra'ta (Lin. spec. 926.) radical leaves lyrately-pinnatifid, smooth or ciliated, stem ones linear; stem hispid at the base, a little branched; pedicels spreading a little; pods erect. ♃. H. Native of North America in cultivated fields and dry hills, particularly on rocks in Pennsylvania about West Chester, and from thence to Canada, extending westward to the Rocky Mountains, and to the islands of the Polar seas. A'rabis petræ'a, Hook. fl. bor. amer. p. 42. Flowers white.

β, A. Kamtschática (Fisch. in litt.) flowers smaller; petals twice the length of the calyx, not thrice its length, as in the species, and the pods are longer and thicker.

Lyrate-leaved Wall-Cress. Fl. May, Ju. Clt. 1823. Pl. ½ foot.

37 A. areno'sa (Scop. fl. carn. ed. 2. no. 857. t. 40.) leaves villose with forked hairs, radical ones lyrately-pinnatifid, stem ones deeply-toothed; stem branched, hispid, with simple hairs; pedicels and pods spreading. ♂. H. Native of middle Europe, viz. Carniola, Transylvania, Germany, Alsatia, France, Spain, &c. in vineyards in gravelly places and on rocks. Schrank. fl. mon. 3. t. 256. Hook. exot. fl. t. 221. Sisýmbrium arenòsum, Lin. spec. 919. Turritis arenòsa, Lapeyr. abr. 387. Petals obovate, rose-coloured, very rarely white or blueish. Pods linear, spreading.

Var. β, Kamtschática; biennial; stems more numerous from the root, thicker, less branched, and less hairy; flowers much smaller; petals obovate. ♂. H. Native of Kamtschatka. A. arenòsa, Cham. et Schlecht. in Linnæa. 1. p. 17.

Gravel Wall-Cress. Fl. April, July. Clt. 1798. Pl. ½ foot.

38 A. Halle'ri (Lin. spec. 929.) lower leaves lyrate, stalked; terminal lobe ovate; upper leaves lanceolate, cut; stem branched, slender, clothed with soft villi; pedicels and pods spreading. ♃. ♂. H. Native of moist mountainous places near rivulets in Transylvania, Hungary, Piedmont, Switzerland, Austria, even to the confines of Bohemia, &c. &c. Walds. et Kit. hung. 2. p. 126. t. 120. A. stolonífera Clairv. herb. val. 223. Lower branches weak, having the appearance of runners, but not rooting. Petals obovate, white, double the length of the calyx.

Var. β, Kamtschática; flowers smaller. ♃. H. Native of Kamtschatka. A. Hallèri, Cham. et Schlecht. in Linnæa. 1. p. 17.

Haller's Wall-Cress. Fl. May, June. Clt. 1816. Pl. ¾ foot.

39 A. stoloni'fera (Horn. hort. hafn. 618.) radical leaves somewhat lyrate, stalked; terminal lobe cordate, stem leaves oblong, sinuately-toothed; stem stoloniferous at the base, pubescent; pedicels and pods spreading. ♃. H. Native of Carniola. Cardámine stolonífera, Scop. fl. carn. ed. 2. no. 818. t. 39. Like *A. Hallèri*, but much smaller and slenderer, with creeping rooting runners. Flower white. Pods very slender, half an inch long.

Stoloniferous Wall-Cress. Fl. May, June. Clt. 1819. Pl. ½ ft.

40 A. Ovire'nsis (Wulf. in Jacq. coll. 1. p. 196. icon. rar. 1. t. 125.) lower leaves stalked, oval, pectinately-toothed at the base, upper ones oblong, narrowed at the base; stem weak, smooth; pods somewhat spreading, scarcely longer than the pedicels. ♃. H. Native in calcareous rocky moist places in the Alps of Oviro, Carinthia, Transylvania, on the Carpathian mountains in the region of the Pìnus Múghus, &c. Rœm. fl. eur. 7. t. 6. Sturn. deutchl. fl. icon. Nastúrtium Ovirénse, Andrz. ined. Flowers pale, red, rarely white.

Oviro Wall-Cress. Fl. June, July. Clt. 1824. Pl. ½ to ¾ foot.

41 A. O-Waihie'nsis (Cham. et Schlecht. in Linnæa. 1. p. 17.) leaves repand-toothed, rather scabrous, radical ones stalked, lyrately-pinnate, with about 3 pairs of leaflets, stem ones almost wanting; stem ascending, smooth, bearing flowers almost to the base; siliques erectly-spreading, 3-times longer than the pedicels. ♃. H. Native of the Sandwich islands, particularly in O-Wahu. Root thickish. Stem numerous, proliferous at the base. Flowers small, white, with oblong-entire petals, which are hardly longer than the calyx.

O-Wahu Wall-Cress. Pl. 1 foot.

42 A. Cevenne'nsis (D. C. syst. 2. p. 234.) leaves all stalked, ovate, acuminated, grossly-toothed, somewhat velvety with small hairs; pedicels and pods spreading. ♂. H. Native of the Cevennes, in rugged shady places. Hésperis inodòra, Gouan. fl. monsp. p. 167. Flowers pale-violet, almost like those of *A. arenòsa*. Seeds brownish. Deless. icon. sel. 2. t. 26.

Cevennes Wall-Cress. Fl. Ju. Jul. Clt. 1820. Pl. 1 to 2 feet.

43 A. lasio'loba (Link. enum. hort. berl. 2. p. 163.) stem leaves and pods downy with stellate hairs; radical leaves lyrate, upper ones entire. ♂. H. Native of Mexico. Racemes short. Calyx spreading. Style nearly a line long.

Woolly-podded Wall-Cress. Fl. Ju. Jul. Clt. 1826. Pl. 1½ foot.

Sect. II. Lomo'spora (from λωμα, *loma*, a fringe, and σπορα, *spora*, a seed; seeds girded by a membranous wing.) D. C. syst. 2. p. 234. prod. 1. p. 146. Seeds marginate, or girded by a broad membranous wing.

§ 1. *Oblongipétala. Cauline leaves clasping the stem. Petals oblong-linear.*

44 A. TURRI'TA (Lin. spec. 930.) leaves stem-clasping, rather acute, somewhat toothed, pubescent; pedicels length of calyx; pods all on one side, recurved. ♂. H. Native of Spain, France, Switzerland, Italy, Sicily, and Transylvania, on mountains in hedges and coppices, also in Britain, on old walls, but rare, particularly on the college walls of Oxford and Cambridge, and in Scotland on the castle of Cliesh, Kinrosshire. Jacq. fl. austr. t. 11. Smith, engl. bot. 178. Turrìtis ochroleùca. Lam. fl. fr. 2. p. 490. A. umbròsa, Crantz. austr. p. 39. Flowers crowded, cream-coloured. Petals oblong-linear. Pods 3 inches long, all on one side, curved downwards as they ripen. Leaves acuminated.

Var. β, longisíliqua (D. C. syst. 2. p. 235.) A. umbròsa, Steven in litt. Native of Tauria. Pods 4 or 5 inches long.

Var. γ, péndula (Lach. obs. p. 10. but not of Lin.) Poir. suppl. 2. p. 410. exclusive of the synonyms. Turrìtis péndula, Desf. cat. ed. 2. p. 152. Pods much curved when ripe.

Tower Mustard or *Tower* Wall-Cress. Fl. May, June. Britain. Pl. 1½ foot.

45 A. PE'NDULA (Lin. spec. 930.) leaves clasping the stem, toothed, oblong, dilated, cordate at the base; stem furrowed, hispid; pedicels 3 times longer than the calyx; pods drooping. ⊙. H. Native of Siberia near the river Lena.—Jacq. hort. vind. 3. p. 20. t. 34. Petals white, oblong-linear. Pods loose, pendulous.

Var. β, Americàna. A. péndula, Nutt. gen. amer. 2. p. 70. Native of North America on the borders of the river Missouri near Fort Mandan.

Pendulous-podded Wall-Cress. Fl. My. Ju. Clt. 1752. Pl. 1 ft.

46 A. PATRINIA'NA (D. C. syst. 2. p. 236.) leaves oblong, acuminated, somewhat serrated, cordate, stem-clasping, villous; stem round, hispid; pedicels 3 times longer than the calyx; pods pendulous. ♂. H. Native of Siberia at Ufa near Chamanaikha, Deless. icon. sel. 2. t. 27. A. péndula, Patr. herb. Perhaps this is only a var. of *A. péndula.* Seed girded by a narrow wing. Flowers white.

Patrin's Wall-Cress. Fl. June, July. Clt. 1827. Pl. 2 feet.

47 A. OXY'OTA (D. C. syst. 2. p. 236.) leaves scabrous, with branched hairs, cauline ones acutely-sagittate, oblong-linear, a little toothed; stem hispid with simple hairs; pedicels 3 times longer than the calyx. ♂. H. Native of Eastern Siberia. Allied to the two preceding plants. Petals oblong, white.

Sharp-eared-leaved, Wall-Cress. Fl. June, July. Pl. 1 foot.

§ 2. *Cuneipétala. Cauline leaves sessile. Petals oblong or linear-cuneated.*

48 A. HELIO'PHILA (D. C. syst. 2. p. 237.) leaves sessile, linear, entire, hoary with pressed, short, 2-parted hairs; pedicels shorter than the calyx; pods erect. ⊙.? H. Native of the East Indies, Java, &c. Helióphila incàna, Burm. fl. ind. 140. t. 46. f. 2. Helióphila canéscens, Willd. spec. 3. p. 528. Petals linear, very narrow, hardly longer than the calyx.

Sun-loving Wall-Cress. Pl. 1 foot.

49 A. LÆVIGA'TA (D. C. syst. 2. p. 237.) radical leaves obovate, stalked, sinuately-toothed, cauline ones linear, sessile, quite entire; pods erect; seeds margined. ♂.? H. Native of North America on rocks from Pennsylvania to Virginia, but rare; and about Lake Huron. Turrìtis lævigàta, Willd. spec. 3. p. 513. Flowers small, few, white, in corymbose-racemes. Plant smooth, glaucous.

Smooth Wall-Cress. Fl. May, June. Clt. 1821. Pl. 1 foot.

50 A. CANADE'NSIS (Lin. spec. 929.) cauline leaves sessile, oblong-lanceolate, acuminated, remotely serrate-toothed; pedicels 3 times longer than the calyx; pods linear, pendulous, somewhat falcate; seeds with a very broad wing. ♃. H. Native of North America in shady rocky situations, from Canada to Virginia.—Pluk. alm. 136. t. 86. f. 8. Petals white, linear, longer than the calyx.

Var. α, móllis (Raf. amer. monthl. mag. 2. p. 43. but not of Steven.) plant covered with soft down.

Var. β, falcàta (Mich. fl. bor. amer. 2. p. 31.) Pods falcate.

Canadian Wall-Cress. Fl. May, July. Clt. 1768. Pl. 2 feet.

51 A. PU'MILA (Wulf. in Jacq. coll. 2. p. 59. fl. aust. 3. t. 281.) leaves smooth, almost entire, radical ones obovate, stem ones ovate or oblong; racemes nodding; pedicels twice as long as calyx; pods erect, 3 times longer than the pedicels. ♃. H. Native of the Alps from Provence to Transylvania on rocks and among stones. A. bellidifòlia, Crantz. austr. 42. t. 2. f. 3. but not of Jacq. A. ciliàris, Willd. enum. 2. p. 684. A. scàbra, All. ped. 974. A. nùtans, Mœnch. meth. 258. Ait. hort. kew. ed. 2. vol. 4. p. 105. Sims, bot. mag. t. 2219. Turrìtis alpìna, Braun. fl. sal. 2. t. 2. f. 1. Petals oblong-cuneated, white. A tufted plant.

Dwarf Wall Cress. Fl. June, July. Clt. 1658. Pl. ¼ foot.

52 A. BELLIDIFÒLIA (Jacq. obs. 1. p. 22. t. 12. fl. aust. 3. t. 280.) leaves smooth, almost entire, radical ones obovate, stem ones ovate; racemes erect; pedicels 3 times longer than the calyx; pods 4 times longer than their pedicels. ♃. H. Native of the Eastern Pyrenees in stony grassy places, and near fountains and rivulets on the Carpathian mountains. Turrìtis bellidifòlia, All. ped. no. 980. t. 40. f. 1. Petals oblong-cuneated, double the length of calyx. Pods linear. A tufted plant, with white flowers.

Var. β, Turrìtis alpìna, Jacq. in Murr. syst. veg. 502. Willd. spec. 3. p. 545.

Daisy-leaved Wall-Cress. Fl. Ju. Aug. Clt. 1773. Pl. ¼ to ¾ ft.

53 A. CÆRU'LEA (Wulf. in Jacq. coll. 2. p. 56.) leaves smooth, almost entire, radical ones oblong-obovate, cauline ones few, oblong; racemes nodding; pedicels length of calyx; pods erect. ♃. H. Native of the Alps from Provence to Carinthia and Salzburgh, near the limits of perpetual snow. Sturn. deutsch. fl. with a figure. Turrìtis cærùlea, All. ped. no. 981. t. 40. f. 2. Petals oblong, pale or dirty blue. A tufted plant.

Blue-flowered Wall-Cress. Fl. Jul. Aug. Clt. 1793. Pl. ½ foot.

§ 3. *Obovatipétala. Cauline leaves sessile or wanting. Limb of petals spreading, obovate.*

54 A. STELLULA'TA (Bertol. in Desv. journ. bot. 1813. vol. 2. p. 76. amœn. ital. p. 101.) leaves scabrous with stellate-hairs, radical ones obovate, cauline ones oblong, very few; pods twice the length of their pedicels, containing 16 or 20 seeds. ♃. H. Native on the summits of the Appenines. A. pùmila, Pollin. Very like *A. petræ'a var. Crantziana* in habit, but it is evidently different, from the seeds having a broad wing. A pretty little plant, with white flowers.

Starry-haired Wall-Cress. Fl. June, July. Pl. ½ foot.

55 A.? VOCHINE'NSIS (Spreng. pug. 1. p. 46. no. 80.) leaves ciliated, with 2-parted appressed hairs, radical ones obovate, cauline ones few, oblong; pods 4 or 6-seeded, length of their pedicels. ♃. H. Native of the Alps of Carniola about Vochin, also of Carinthia on Mount Selenitz and Mount Cren. Dràba móllis, Scop. carn. no. 789. t. 34. Subulària alpìna, Willd. spec. 3. p. 424. A. serpyllifòlia, Hoppe. Stem prostrate and creeping. Petals white, obovate, narrowed at the base, twice or thrice the length of the calyx.

Vochin Wall-Cress. Fl. July. Clt. 1826. Pl. ½ foot.

56 A. COLLI'NA (Tenore. prod. fl. neap. 39. app. hort. neap. 1815. p. 59.) leaves oblong, sinuately-toothed, hoary with stellate hairs; radical leaves stalked, cauline ones sessile; pods 8 times longer than their pedicels. ♃. H. Native on arid hills about Naples. Petals white, obovate, spreading, double the length of the calyx. Habit of *A. alpìna.*

Hill Wall-Cress. Fl. June, July. Clt. 1823. Pl. ¼ to ½ foot.

† *Species not sufficiently known.*

57 A. Stelle'ri (D. C. syst. 2. p. 242.) plant hispid with 2-forked hairs; lower leaves oblong-spatulate, upper ones half-stem-clasping, oblong, toothed; racemes corymbose; petals cuneated, oblong. ♃. H. Native of Kamtschatka. A. péndula, Steller in herb. Pall. not Lin. Petals white, twice the length of calyx. A. Kamtschàtica, Willd. herb.

Steller's Wall-Cress. Pl. ½ foot.

58 A. lu'cida (Lin. fil. suppl. 298.) leaves shining, clasping the stem. ♃. H. Native of Pannonia. Petals white, linear, entire, narrowed at the base, twice as long as the calyx. This plant comes very near to *A. ciliàta var. glàbra.*

Shining-leaved Wall-Cress. Fl. Ju. July. Clt. 1790. Pl. ½ ft.

59 A. re'ptans (Lam. dict. 1. p. 222.) leaves roundish, quite entire, hairy; runners reptant. ♃. H. Native of sandy fields, from Pennsylvania to Virginia. Pluk. alm. 281. t. 51. f. 5. Habit of *Hieràcium auricula.* Flowers small. Pods small, erect.

Reptant Wall-Cress. Fl. Jun. July. Pl. ¼ foot.

60 A. la'xa (Smith, prod. fl. græc. 2. p. 28.) radical leaves obovate, lyrately-toothed, hispid, cauline ones cordate-stem-clasping, very smooth; pods deflexed. ♃. H. Native of Laconia, in fields. Flowers white. Pods very long and very narrow.

Loose-podded Wall-Cress. Pl. 1½ foot.

61 A. petiola'ta (Bieb. fl. taur. 2. d. 126.) leaves ovate, stalked, smooth; lower ones lobed; upper ones repand; pods striated-angular, spreading. ♂. ♃. H. Native of Siberia. Flowers small, whitish, about the size of those of *Erýsimum cheiránthus.* Pods spreading, 2 or 3 inches long, obscurely 4-sided.

Stalked-leaved Wall-Cress. Fl. Jul. Pl. ¾ foot.

62 A. multiflòra (D. C. syst. 2. p. 243.) leaves sessile, lanceolate, toothed, scabrous; peduncles pressed, many-flowered, pods erect, slender, compressed, crowded; hairs forked. ♂. H. Native of the Pyrenees, on Mount Chatelet. Turrìtis multiflòra, Lapeyr. abr. 386.

Many-flowered Wall-Cress. Pl. ¾ foot.

63 A. integrifòlia (Lapeyr. abr. 385. suppl. p. 93.) hairy; leaves scabrous, lanceolate, quite entire, cauline ones clasping the stem; petals erect, twice the length of the calyx. ♂. ⊙. H. Native of the Pyrenees, at a place called Mail du Cristal.

Entire-leaved Wall-Cress. Pl. ½ foot.

64 A. lyræfòlia (D. C. syst. 2. p. 244.) smooth; stem straight, simple; radical leaves lyrate, stem ones sessile, oblong, acute, toothed; pods sickle-formed. ⊙. H. Native of North America, in woods, at the bottom of the Catskill Mountains. Turrìtis lyràta, Raf. amer. monthl. mag. 2. p. 44.

Lyre-leaved Wall-Cress. Pl.?

65 A. angustifòlia (Lam. dict. 1. p. 220.) radical leaves on long stalks, rhomboid, small, bidentate, cauline ones narrow-lanceolate, very entire.—Native? formerly cultivated in the Paris garden. Perhaps only a variety of *Cardámine alpìna.*

Narrow-leaved Wall-Cress. Pl.?

66 A.? siliculòsa (Lam. dict. 1. p. 221.) radical leaves oblong, on short stalks, smooth, toothed towards the apex; cauline ones few, narrow, entire.—Native of Siberia? Pods flat, narrowed at both ends, 4-lines long, 1 or 2-seeded.

Short-podded Wall-Cress. Pl.?

67 A. dasyca'rpa (Andrz. in litt. D. C. syst. 2. p. 244.) leaves hairy; hairs stellate; cauline leaves sagittate, almost entire; lobes diverging; pods hairy-scabrous, rather erect, with the breadth exceeding twice the length of style.—Native of Podolia. A. récta, Baugm.

Thick-podded Wall-Cress. Fl. Ju. July. Clt. 1828. Pl. ½ to ¾ foot.

Cult. The species of this genus are very proper for rock-work. *A'rabis, álbida, alpìna, arenòsa,* &c. will answer also for the front of flower-borders, as they flower earlier than most border flowers. The perennial species may be either encreased by dividing the plants at the root, by cuttings, or by seeds. The annual and biennial species are mostly weedy-like plants; therefore they are only fit to be preserved in botanical gardens. They should be sown on rock-work, and allowed afterwards to scatter themselves, for by this means they are more likely to be preserved.

XI. OUDNE'YA (to the memory of Dr. Oudney, who found the present plant in many of the Wadeys between Tripoli and Mourzuk, and remarks that camels and mules eat it.) R. Br. in append. to Denh. and Claph. journ. p. 14.

Lin. syst. *Tetradymàmia, Siliquòsa.* Silique sessile, linear, beaked, with flat 1-nerved valves. Funicle adnate to the dissepiment. Seeds in one row. Calyx closed, bisaccate at the base. Filaments distinct, toothless. Stigmas connate, distinct at the apex. A smooth, branched sub-shrub, with quite entire sessile, veinless leaves, lower ones obovate, upper ones almost linear, and bractless terminal racemes of flowers; petals obovate veiny. This genus differs from *A'rabis* in the form of the stigma.

1 O. Africana (R. Br. l. c.) ♄. F. Native between Tripoli and Mourzuk, in the Wadeys. Hésperis nítens, Viv. fl. lib. p. 38. t. 5. f. 3.

African Oudneya. Shrub 1 foot.

Cult. Should this plant be ever introduced into the gardens, it may be grown in pots filled with an equal quantity of sand and peat, and treated as other alpine plants. It may be either propagated by cuttings or by seeds.

XII. MACROPO'DIUM (from μακρος, *makros,* long, and πους ποδος, *pous podos,* a foot; in allusion to the pods standing on long pedicels or foot-stalks.) R. Br. in hort. kew. ed. 2. vol. 4. p. 108. D. C. syst. 2. p. 244. prod. 1. p. 149.

Lin. Syst. *Tetradynamia, Siliquòsa.* Silique linear, pedicellate, with flat 1-nerved valves; seeds orbicular, compressed, flat, girded by a very narrow membrane, disposed in one row in each cell, distant. Perennial or annual, smooth, erect, simple herbs; with ovate-lanceolate, pointed, serrated or jagged leaves, and long terminal racemes, with almost sessile flowers, which are disposed in the form of a spike.

1 M. niva'le (R. Br. in hort. kew. ed. 2. vol. 4. p. 108.) radical leaves ovate, on long stalks, unequally serrated, cauline ones lanceolate, acuminated, narrowed at the base, entire; flowers sessile; petals obovate. ♃. H. Native on the summits of the Altaian Mountains near the limits of perpetual snow. Cardámine nivàlis, Pall. itin. 2. app. no. 113. t. U. ed. gall. 8vo. app. p. 341. t. 68. f. 2. Cleòme nivàlis, Vahl. herb. A'rabis nivàlis, Spreng. syst. 2. p. 893. Root somewhat woody. Flowers white.

Snow Macropodium. Fl. Jun. Sep. Clt. 1796. Pl. 1 foot.

2 M. laciniа'tum (Hook, fl. bor. amer. p. 42.) leaves all stalked, jagged-pinnatifid; flowers on pedicels; petals narrow, linear. ⊙. H. Native of North America, common on dry rocks about Wallawallah, and at Priest's rapid on the Columbia. Flowers white.

Jagged-leaved Macropodium? Fl. June, July. Pl. 2 to 3 ft.

Cult. M. nivale succeeds well in a rich light soil in the open border; and cuttings will strike root freely under a hand-glass: notwithstanding it will sometimes thrive well in open borders, yet it is very apt to damp off in the winter; therefore we would advise a duplicate plant to be kept in a pot as an alpine or frame plant. *M. laciniàtus* being an annual will only require to be sown in the open ground early in spring.

XIII. CARDA'MINE (from καρδια, *kardia*, the heart; δαμαω, *damao*, to subdue; stomachic quality of the plants, or perhaps diminished from καρδαμων, *kardamon*, water-cress; taste similar.) Lin. D. C. syst. 2. p. 245. prod. 1. p. 149.

LYN. SYST. *Tetradynamia, Siliquòsa.* Silique linear; with flat nerveless valves, usually opening with elasticity. Seeds in one series, ovate, not margined. Umbilical cord slender. Cotyledons accumbent. Herbs usually smooth. Roots fibrous or granuliferous. Leaves stalked, entire, lobed, or pinnately-cut, usually very different in the same plant. Racemes terminal, bractless. Flowers white or red.

For the derivation of the English name of the Genus see *C. praténsis.*

§. 1. *Indivisæfòlia. Leaves nearly all undivided.*

1 C. RHOMBOÌDEA (D. C. syst. 2. p. 246.) plant at first hairy-pubescent, but at length smooth; leaves rather fleshy, ovate-rhomboid, obsoletely repand-toothed, smooth, lower ones roundish-cordate, on long petioles, cauline ones ovate, uppermost ones sessile; stem erect, flexuous; root tuberous and fibrous. ♃. H. B. Native of North America, on the borders of rivulets and springs, Rocky Mountains, thence to Hudson's Bay. A'rabis rhomboìdea and tuberòsa, Pers. ench. 2. p. 204. A'rabis bulbòsa, Muhl. cat. no. 104. Cardámine rotundifòlia, Hook. fl. bor. amer. p. 44. Pluk. amalth. t. 435. f. 6. Flowers rose-coloured, about the size of those of *C. praténsis.* The leaves taste like early spring cresses.

Rhomb-like-leaved Lady's-Smock. Fl. May, Jul. Clt. 1825. Pl. ¾ ft.

2 C. ROTUNDIFÒLIA (Mich. fl. bor. amer. 2. p. 30.) leaves rather fleshy, orbicular, somewhat toothed, smooth, stalked; stems weak, procumbent; root fibrous. ♃. H. B. Native of North America, on the borders of rivulets on the highest mountains of Carolina, Virginia, and New Hampshire; also in Pennsylvania, on the border of the river Brandywine, near West Chester. Flowers white.

Round-leaved Lady's-Smock. Fl. May, Jul. Clt. 1823. Pl. ½ foot decumbent.

3 C. SPATULA'TA (Mich. fl. bor. amer. 2. p. 29.) radical-leaves stalked, spatulate, entire, pubescent with 3-forked hairs, stem ones linear; stem decumbent. ♃. H. B. Native of Carolina, on the highest mountains. Pods linear, straight, spreading, somewhat reflexed. Stigma sessile, hardly acute. Flowers white?

Spatulate-leaved Lady's-Smock. Fl. May, Jun. Pl. ½ foot, decumbent.

4 C. ASARIFÒLIA (Lin. spec. 913.) leaves smooth; stalked, cordate-orbicular, somewhat sinuately-toothed; stem erect; pods erect, twice the length of the pedicel. ♃. H. B. Native of Piedmont, Italy, and several other places in Europe, in mountain rivulets. Sims, bot. mag. t. 1735. Flowers white, a little larger than those of *C. amàra.* Pods an inch long.

Var. β, diversifòlia; (D. C. syst. 2. p. 248.) cauline leaves pinnately-ternate; radical ones and upper ones orbicular, undivided. ♃. H. B. Native of Piedmont.

Asaribacca-leaved Lady's-Smock. Fl. Jun. Jul. Clt. 1710. Pl. 1 to 1½ foot.

5 C. I'NDICA (Burm. fl. ind. 140.) leaves ovate, crenulated, stalked, smooth, upper ones oblong-cuneated; stem erect; pods spreading; stigma sessile. ⊙.? S. Native of Java. Flowers small, white. Perhaps a species of *Nastúrtium*, referable to section *Clandestinària.*

Indian Lady's-Smock. Pl. ½ foot.

6 C. STYLÒSA (D. C. syst. 2. p. 248.) cauline leaves sagittate half-stem-clasping; oblong, acute, denticulated, smooth; stem erect; pods spreading, pointed with the style. ♃.? G. B. Native of New Holland. Flowers small, whitish.

Large-*styled* Lady's-Smock. Pl. 2 feet.

7 C. CHENOPODIFÒLIA (Pers. ench. 2. p. 195.) leaves ovate, somewhat sinuately-lobed; stem procumbent; pods erect; stigma sessile. ♃.? S. B. Native of South America, on the margins of rivulets about Monte Video. Poir, suppl. 2. p. 394. Flowers white. Pods smooth, linear, erect, compressed, one inch long.

Goosefoot-leaved Lady's-Smock. Fl. Nov. Pl. 1 foot, trailing.

8 C. BELLIDIFÒLIA (Lin. spec. 913.) leaves smooth, thickish, radical ones stalked, ovate, entire; cauline ones few, entire or somewhat 3-lobed, not eared at the base; pods erect; stigma almost sessile. ♃. H. B. Native of Europe, on the tops of mountains; also of North America, on the summits of the Rocky Mountains, throughout Arctic America but sparingly; islands of Unalaschka and St. Lawrence. C. Lenénsis, Ledeb. Flowers white.

Var. α, petiolàris (D. C. syst. 2. p. 249,) petioles longer than the entire leaf. Oed. fl. dan. t. 20. Smith, eng. bot. 2355.—Lin. fl. lapp. 260. t. 9. f. 2. Native of Lapland, Norway, and Scotland, in fissures of moist rocks.

Var. β, alpìna (D. C. l. c.) petiole rather shorter than the entire leaf. C. bellidifòlia, Crantz. fl. aust. 43. Wulf. in Jacq. misc. 1. p. 148. t. 17. f. 2. C. alpìna, Willd. spec. 3. p. 481. A'rabis bellidifòlia, Scop. carn. 2. p. 31. A. bellidioìdes, Lam. dict. 1. p. 220. Native of the Alps, of Europe, also in Scotland.

Var. γ, subtríloba (D. C. l. c. 250.) the upper leaves are somewhat 3-lobed, sometimes ternate. Native of the Alps and the Pyrenees. C. heterophylla, Baugm.

Daisy-leaved Lady's-Smock. Fl. Apr. Jun. Scotland. Pl. ¼ ft.

§. 2. *Trílobæ. Leaves for the most part 3-lobed.*

9. C. HAMILTONII; smooth; stem erect, branched, flexuous, radical leaves simple, kidney-shaped, repand-crenate, stalked; cauline leaves pinnate; leaflets 5, opposite, roundish, 3-lobed, terminal one large; siliques filiform, straight. ⊙. H. Native of Nipaul, at Narainhetty. C. débilis, D. Don, prod. fl. nep. p. 201. Herb slender, green. Flowers small, white.

Hamilton's Lady's-Smock. Fl. Oct. Pl. ½ foot.

10 C. RESEDIFÒLIA (Lin. spec. 913.) leaves smooth, membranous, stalked, radical ones undivided, stem ones drawn out on both sides at the base into an acute auricle; lower ones of these ternate, and the upper ones pinnately-5-lobed; pods erect, terminated by the style. ⊙. H. Native of Cevennes, Pyrenees, &c. in shady humid places. Sturn. fl. germ. icon. All. ped. no. 950. t. 57. f. 2. Jacq. fl. aust. app. t. 31. A'rabis resedifòlia, Lam. fl. fr. 2. p. 511. Flowers white.

Var. β, integrifòlia (D. C. prod. 1. p. 150.). A. hastulàta, Bertol. ined. Native of the Apennines. Leaves undivided.

Mignonette-leaved Lady's Smock. Fl. July. Clt. 1658. Pl. ¼ to ½ foot.

11 C. UNIFLO'RA (Mich. fl. bor. amer. 2. p. 29.) radical leaves 3-lobed, smooth; scapes 1-flowered. ♃? H. Native of North America on the rocks of Kentucky near Knoxville. Flowers white, smaller than those of *C. amàra.* Petals longer than the calyx. Pods linear, compressed.

One-flowered Lady's Smock. Pl. ⅛ foot.

12 C. MICROPHY'LLA (Adams, mem. soc. nat. mosc. 5. p. 111. Fisch. in litt. icon.) leaves ternate, or pinnately quinate, smooth, floral one simple, 3-toothed; scape few-flowered. ♃? H. Native of Siberia at Cape Bykofskoy-mys. C. minùta, Willd. herb. Pedicel filiform, only equalling the flower in length or rather longer than either flower or pod. Flowers white. Stem ascendant, branched, and rooting.

Small-leaved Lady's Smock. Fl. July. Pl. ⅛ to ¼ of a foot.

13 C. BONARIE'NSIS (Pers. ench. 2. p. 195.) leaves smooth, stalked, trifoliate; leaflets stalked, somewhat repand, middle leaflet 3-lobed; upper leaves simple or 3-lobed; pedicels furnished with bracteas. ♃? S. Native of South America in fields

at Buenos Ayres. C. repánda, Smith, herb. Flowers small, white. Pods slender, erect, compressed.

Buenos-Ayrean Lady's Smock. Pl. ½ foot.

14 C. ANTENIQUA'NA (Burch. cat. geogr. pl. afr. aust. no. 6043.) leaves trifoliate, pilose on the upper surface; leaflets stalked, ovate, toothed; pods erect; stems somewhat decumbent. ♃? G. Native of the Cape of Good Hope in the humid shady regions of Anteniqualand. C. Burchéllii, Spreng. syst. 2. p. 886. Root perpendicular. Flowers white, size of those of *C. parviflòra*. Petals blunt, double the length of the calyx.

Anteniqualand Lady's-Smock. Pl. ½ foot.

15 C. BORBO'NICA (Pers. ench. 2. p. 195.) leaves pilose on both surfaces, trifoliate, rarely pinnate; segments stalked, ovate, accuminated, toothed; pods erect. Native of the island of Bourbon. C. rubifòlia, Smith, herb. Petals white, a little longer than the calyx.

Var. β, *Allèvia* (Comm. ined.) leaves sometimes pinnate; segments 5. C. Africàna. Native of Bourbon. Vahl. symb. 2. p. 77.

Var. γ, *Arábica* (D. C. syst. 2. p. 252.) stem rather villous. C. Africàna. Native of Arabia. Vahl. symb. 2. p. 77.

Bourbon Lady's-Smock. Pl. ½ foot.

16 C. AFRICA'NA (Lin. spec. 914.) leaves smooth, ternate, rarely pinnate; segments stalked, ovate, pointed, toothed; pods spreading. ♃. G. Native of the Cape of Good Hope. Pluk. alm. 252. t. 101. f. 5. Flowers small, white. Pods spreading, linear.

African Lady's-Smock. Fl. May, June. Clt. 1691. Pl. 1 ft.

17 C. NASTURTIOI'DES (D. Don, prod. fl. nep. p. 201.) smooth; lower leaves ternate, terminal leaflet large, round, obsoletely 3-lobed; upper leaves simple, cuneate-ovate, 3-lobed; stem procumbent, branched. ☉. H. Native of Nipaul. Flowers small, white. C. nastúrtii, Spreng. syst. app. p. 241.

Nasturtium-like Lady's-Smock. Pl. ½ foot.

18 B. TRIFO'LIA (Lin. spec. 913.) leaves smoothish, ternate; segments sessile, rhomboidal-roundish, toothed; scape naked; lower branches root-like, creeping. ♃. H. B. Native of Italy, Hungary, Germany, Switzerland, France, &c. on shady parts of mountains. Sturn. deutsch. fl. icon. Jacq. aust. t. 27. Curt. bot. mag. t. 452. Petals white, with a broad cuneated claw, and a broad spreading obovate limb.

Three-leaved Lady's-Smock. Fl. March, May. Clt. 1629. Pl. ¼ to ½ foot.

19 C. BOCCO'NI (Viv. fl. cors. app. in Schlecht. Linnæa 1. p. 502.) cauline leaves alternately pinnate or ternate; pedicels filiform, spreading; leaflets roundish-ovate, 3 or unequally 5-lobed; siliques linear, deflexed. ♃. H. B. Native of Corsica. Bocc. mus. p. 171. t. 118. Flowers white?

Bocconi's Lady's-Smock. Pl. ½ foot.

20 C. CHILE'NSIS (D. C. syst. 2. p. 254.) upper surface of leaves pilose, ternate; segments almost petiolulate, ovate-lanceolate, crenated; stem somewhat ascendant. ♃? G. Native of Chili. Petals oblong, white, longer than the calyx. Pods linear, smooth, slender, ending in the style, which is hardly distinguishable from the pod.

Chile Lady's-Smock. March, April. Clt. 1825. Pl. ¼ foot.

21 C. TUBERO'SA (D. C. syst. 2. p. 254.) leaves smooth, radical ones on long stalks, kidney-shaped, stem ones pinnately-ternate; root tuberous. ♃. G. Native of Chili. Sisýmbrium tuberòsum, Lag. in litt. Petals white? 3-times longer than the sepals; younger pods linear, pointed by the style. Deless. icon. sel. 2. t. 29.

Tuberous-rooted Lady's-Smock. Pl. ½ to 1 foot.

22 C. PURPU'REA (Cham. et Schlecht. in Linnæa 1. p. 20.) plant smoothish; radical leaves and cauline ones trifoliate or quinate; lateral leaflets oval-roundish, acute, terminal one cordate-roundish, 3-toothed; bractea cuneated, 3-toothed, sessile at the base of the lower pedicel; petals reticulately veined; root creeping, slender, fibrous. ♃. H. Native of the island of St. Lawrence. Cape Lisburne at the northern entrance of Kotzebue's Sound. Flower deep purple, in loose racemes.

Purple-flowered Lady's-Smock. Pl. ½ foot.

23 C. ANGULA'TA (Hook. bot. misc. pt. 3. with a figure, fl. bor. amer. p. 44.) leaves all stalked, ternate, rarely quinate: radical ones roundish, cauline ones ovate or lanceolate, angular, or deeply lobed, smooth; root creeping, fibrous. ♃. H. Native of North America on the banks of Columbia River. Flowers pale rose-coloured, disposed in terminal and axillary corymbs.

Angular-leaved Lady's-Smock. Pl. 1½ foot.

§ 3. *Pinnàtæ. Leaves for the most part pinnate-parted.*

24 C. GRANULO'SA (All. auct. p. 16. exclusive of the synonyms of Dalechamp,) radical leaves stalked, ovate, somewhat cordate, stem ones pinnately-parted; lobes oblong, entire; root tuberously-granular. ♃. H. Native on hilly meadows about Turin. Petals obovate, blunt, white, size of those of *C. amàra*.

Granular-rooted Lady's-Smock. Fl. April, May. Clt. 1820. Pl. 1 foot.

25 C. AMA'RA (Lin. spec. 915.) leaves pinnate; segments of the radical ones roundish, of the stem ones angularly-toothed; style filiform, acutish; stems rooting at the base. ♃. H. B. Native throughout northern and middle Europe in watery places by the sides of rivers and brooks; about London in several places between Kew and Mortlake; near Ripon, and in King-street meadows, Norwich, and several other places. Vill. dauph. 3. p. 362. t. 39. Smith, engl. bot. t. 1000. Curt. lond. 3. t. 39. Schkuhr. handb. 2. t. 187. C. parviflòra, Lam. dict. 2. p. 183. C. nasturtiàna, Thuil. fl. par. ed. 2. vol. 1. p. 330. C. melanánthera, Stok. bot. mat. med. 3. p. 445.

Var. β, *plèna* (D. C. eyst. 2. p. 255.) flowers double. Besl. hort. eyst. ord. 1. t. 3. f. 4. This is probably the double variety of *C. praténsis*.

Var. γ, *trisécta* (D. C. l. c.) leaves ternate. C. trifòlia, Wahl. fl. lapp. no. 327. Native of Lapland and Sweden.

Var. ε, *umbròsa* (Lej. fl. spa. 2. p. 63.) stem and leaves villous. C. hirsùta, Oed. fl. dan. t. 148.? Native of Denmark. The flowers of all the varieties are white, cream-coloured, with violet anthers, and the plant before it flowers greatly resembles the *water-cress*, but the taste is bitter and nauseous.

Bitter Lady's-Smock. Fl. Apr. May. Britain. Pl. 1 to 2 ft.

26 C. ULIGINO'SA (Bieb. suppl. p. 438.) leaves pinnate; segments angularly-toothed, bluntish, those of the radical ones roundish, of the stem ones oblong; style very short, hardly narrower than the pod; runners creeping. ♃. H. B. Native of Tauria in wooded mountains about springs, and also in the Ukraine. C. amàra, Bieb. fl. taur. no. 1283. exclusive of the synonyms. Flowers white, like those of *C. amàra*. Pedicels nearly equal in length with the pods.

Bog Lady's-Smock. Fl. May. Clt. 1824. Pl. 1 foot.

27 C. PRORE'PENS (Fisch. in litt. 1819.) leaves pinnate; segments ovate, almost entire, terminal one roundish, somewhat 3-lobed; runners creeping; stem ascending, pubescent; pods hairy, shorter than the pedicels. ♃. H. B. Native of Siberia beyond the Baical, on the banks of the river Ingoda about Doroninsk. C. hirsùta, Pall. C. pubéscens, Stev. C. pilòsa, Willd. C. boreàlis, Andrz. all in litt. Pods erect, slender, hairy. Style filiform, a line long. Flowers white.

Most-creeping Lady's-Smock. Fl. May, June. Clt. 1825. Pl. ½ foot.

28 C. PRATE'NSIS (Lin. spec. 915.) leaves pinnate; segments of the radical ones roundish, of the stem ones linear or lanceolate, entire; style very short, hardly narrower than the pod;

stigma capitate. 4. H. B. Native throughout Europe in humid meadows; plentiful in Britain, also in the north of Asia and in North America about Hudson's Bay, Behring's Straits, in fact, throughout Arctic America. Lam. ill. t. 562. f. 1. Smith, engl. bot. 776. Curt. lond. t. 40. Woodv. med. bot. t. 30. Fl. dan. 1039. Schkuhr. handb. 2. t. 187. Flowers usually pink, sometimes they are to be seen white and purplish. A very common and variable plant. Root tuberous, like those of *Dentària*, which this species greatly resembles in habit.

Var. β, *flòre plèno;* flowers double and pink. Clus. hist. 2. p. 129. f. 1. Bauh. hist. 2. p. 889. f. 2.

Var. γ, *grandiflòra* (C. Bauh. pin. 104.) flowers large, white.

Var. δ, *débilis* (D. C. syst. 2. p. 257.) stem weak; segments of the upper leaves very narrow.

Var. ε, *stolonífera* (D. C. l. c.). C. praténsis monstròsa, Naunburg in Rœm. arch. 2. p. 14. t. 2.

Var. ζ, *angustifòlia* (Hook. fl. bor. amer. 1. p. 45.) leaflets of radical leaves lanceolate, tapering to the base, almost entire. Native of Igloolik and others of the islands in the Arctic sea.

This plant was long ago employed as a diuretic, and it has been again introduced in nervous diseases, such as epilepsy, hysteria, chorea, and asthma, &c. A drachm or two of the powder of the dried flowers is given twice or thrice a-day. It has little sensible operation, except that it sometimes acts as a diaphoretic. The flowers and leaves are agreeably pungent, and may be eaten with other herbs in a salad. They come with the cuckoo, whence one of its English names *cuckoo-flower*, and they cover the meadows as with linen bleaching, which is supposed to be the origin of the other English name, now extended to the whole genus, *Lady's Smock*.

Meadow Lady's-Smock or Cuckoo Flower. Fl. April, May. Britain. Pl. 1 to 1½ foot.

29 C. DENTA'TA (Schult. obs. no. 968.) leaves pinnate; segments stalked, those of the radical leaves are roundish, of the stem oblong and narrowed at the base, the terminal one wedge-shaped; pods obliquely erect, only equalling the breadth of the style. 4. H. B. Native of Galicia, Volhynia, and Podolia in marshes along banks of rivers and brooks. C. Buchtorménsis, Willd. ined. Flowers white like those of *C. amàra* or *C. uliginòsa*. Runners creeping.

Toothed-leaved Lady's-Smock. Fl. April, May. Clt. 1823. Pl. 1 foot.

30 C. PENNSYLVA'NICA (Muhl. cat. p. 60.) leaves pinnate, or pinnately-lyrate; lobes oval, angularly-toothed, blunt; stem erect; petals oblong; stigma minute, almost sessile, linear. 4. H. B. Native of North America in low meadows from New York to Pennsylvania, Poir. suppl. 2. p. 395. Pursh, fl. bor. amer. 2. p. 440. Flowers small, white; petals oblong-linear, a little longer than the calyx.

Pennsylvanian Lady's-Smock. Fl. May, Ju. Clt. 1818. Pl. 1 ft.

31 C. VIRGI'NICA (Lin. spec. 915.) leaves pinnate; segments lanceolate, somewhat auricled; stem erect; pods long, strictly erect. 4. H. B. Native of North America in low meadows from Canada to Carolina. A'rabis Virgínica, Poir. suppl. 1. p. 413.—Pet. gen. t. 105. f. 18. Pluk. alm. 251. t. 101. f. 4. Flowers white?

Virginian Lady's Smock. Fl. May, June. Pl. ¾ foot.

32 C. FLA'CCIDA (Cham. et Schlecht. in Linnæa. 1. p. 21.) stems branched, prostrate, flagelliform, rooting; leaves pinnate; leaflets angular or toothed, stalked; pedicels spreading, lower ones furnished with bracteas; siliques erect. 4. H. Native of Chile in humid grassy places. Flowers small, white, in short racemes. Leaves with 1-2 pair of leaflets and an odd one.

Flaccid-stemmed Lady's-Smock. Pl. creeping.

33 C.? TE'RES (Mich. fl. bor. amer. 2. p. 29.) leaves pinnate-parted, lyrate; lobes oval-oblong, terminal one somewhat 3-lobed; pods short, erect, terete. 4. H. W. Native of North America in inundated places from New England to New York. Flowers unknown. Perhaps a species of *Nastúrtium*.

Terete-podded Lady's-Smock. Fl. May, July. Pl. ¼ foot.

34 C. HIRSU'TA (Lin. spec. 915.) leaves pinnate; segments of the radical leaves stalked, roundish, mucronate, entire or notched; petals oblong; stigmas minute, almost sessile; pods spreading, smooth, but sometimes pilose. ⊙. H. B. Native of waste ground, especially in moist shady places, very frequent throughout Europe, Tauria, and Persia, also of North America; plentiful in Britain. Smith, engl. bot. t. 492. Curt. lond. 4. t. 48. Scop. carn. ed. 2. no. 817. t. 38. Schkuhr. handb. 2. t. 187. Stok. mat. med. 3. p. 445. C. flexuòsa, With. brit. 578. C. parviflòra, Lightf. fl. scot. 1104. C. impàtiens, fl. dan. t. 735. Flowers in corymbs, white. Dr. Hooker considers *C. Pennsylvánica* and *C. Virgínica* to be identical with this species.

Var. β, *máxima* (D. C. syst. 2. p. 260.) C. hirsùta máxima, Fisch. cat. hort. gorenk. 1808. p. 81. Plant large.

Var. γ, *prolífera* (D. C. l. c.). St. Hil. not Orl. p. 35. Calyx 3-flowered.

Hairy Lady's-Smock. Fl. May, June. Brit. Pl. ½ to 1 ft.

35 C. SYLVA'TICA (Link. in Hoffm. phyt. blatt. 1. p. 50.) leaves pinnate; segments regularly sinuate-toothed, mucronate; petals oblong; pods spreading, equalling the breadth of the style, and are as well as branches smooth. ⊙. H. Native throughout Europe in woods in moist places. Perhaps also in Britain, mixed with *C. hirsùta*. Flowers white, a little larger than those of *C. hirsùta*. C. hirsùta, Web. spec. gœt. p. 18. C. muscòsa, Vahl. herb.

Wood Lady's Smock. Fl. May, Ju. Clt. 1822. Pl. ½ to 1 ft.

36 C. UMBRO'SA (Andrz. cruc. ined. D. C. syst. 2. p. 260.) leaves pinnate, cut; segments entire, mucronate; petals oblong; pods rather spreading, twice longer than the breadth of the thick style, which are as well as branches smooth. ⊙. H. B. Native of Cevennes, Volhynia, and perhaps may be found every where mixed with *C. hirsùta* and *C. sylvática* in woods. Very like *C. hirsùta* and *C. sylvática*, but the whole plant is nearly smooth. Perhaps *C. tenélla* of Clark, voy. vol. 2. is identical with this. Flowers white.

Shady Lady's-Smock. Fl. May, Ju. Clt. 1823. Pl. ½ to 1 ft.

37 C. PARVIFLO'RA (Lin. spec. 919.) leaves pinnate-parted; lobes sessile, oblong, or linear, entire, lower ones remote from the stem; petals oblong-linear; pedicels somewhat spreading; pods erect. ⊙. H. B. Native of France about Nantes, Montpelier, in Provence, Transylvania, Russia at Tanaim, from the river Iaico to the Oby in grassy humid places. Gmel. sib. 3. p. 270. no. 37. t. 64. Wrangel, diss. Stockh. 1823. Very like *C. hirsùta*, but more slender and decumbent. Flowers small, white.

Small-flowered Lady's-Smock. Fl. April, May. Clt. 1800. Pl. ¾ foot.

38 C. IMPA'TIENS (Lin. spec. 914.) leaves pinnate; segments oval-oblong, mostly cut, lower stem ones approximate, acute, form of stipulas. ⊙. H. Native of shady, rather moist rocky situations, in many parts of Europe and the north of Asia. In the north of England under the rocks by the river side at Matlock-bath, Derbyshire, and in various parts of Westmoreland and Cumberland; rare in Scotland. Smith, engl. bot. t. 80. Fl. dan. t. 1339. C. parviflòra, var. β, Lam. fl. fr. 2. p. 500. C. apétala, Mœnch. meth. 259. Flowers small, sometimes without petals, sometimes furnished with small white oblong petals. Pods, when ripe, curling up when touched.

β. *eriocárpa* (D. C. syst. 2. p. 262.) pods pilose. C. dasycárpa, Bieb. suppl. 437. ⊙. H. Native of Iberia.

Impatient-podded Lady's-Smock. Fl. May, June. Britain. Pl. 1 to 2 feet.

39 C. LATIFO'LIA (Vahl. symb. 2. p. 7.) leaves pinnate,

smooth; segments 3 or 7, rather orbicular; angularly-toothed; pods erect, a little longer than the pedicels, pointed with the style. ♃. H. B. Native of the south of Europe along the borders of mountain rivulets, particularly in the Pyrenees. C. chelidònia, Lam. dict. 2. p. 183. exclusive of the synonym of Barrelier. C. raphanifòlia, Pourr. act. Toul. 3. p. 310. Flowers purplish, a little larger than those of *C. praténsis.* Herm. par. p. 203. t. 69.

Var. β, *Legionénsis* (D. C. syst. 2. p. 262.) segments of leaves 7. ♃. H. B. Native of Spain in the mountains of Leon.

Var. γ, *Calàbria;* segments of leaves smaller; pedicels shorter. ♃. H. B. Native of the kingdom of Naples near Scylla.

Broad-leaved Lady's-Smock. Fl. June, July. Clt. 1710. Pl. 1 to 2 feet.

40 C. MACROPHY'LLA (Willd. spec. 3. p. 484.) leaves pinnate, somewhat pubescent; segments 5, oval-lanceolate, pointed, unequally serrated. ♃. H. B. Native of Siberia and Altaia near the town of Mangasea. Dentària hirsútula, Andrz. in litt. C. chelidònia, Pall. itin. 3. p. 54.—Gmel. sib. 3. p. 269. t. 62. Flowers about the size and colour of those of *C. praténsis.* Habit of a species of *Dentària.* Branches of roòt creeping.

Long-leaved Lady's-Smock. Fl. June, Aug. Clt. 1820. Pl. 1 or 1½ foot.

41 C. CHELIDO'NIA (Lin. spec. 914.) leaves pinnate, rather smooth; segments stalked, ovate, toothed, lower segments pinnate, into 3 or 4 small segments. ♃. H. B. Native of Naples, Hungary, Croatia, &c. in wooded mountains in moist places. Waldst. et Kit. hung. 2. p. 149. t. 140. Petals oval, purple.

Celandine Lady's-Smock. Fl. March, April. Clt. 1739. Pl. 1 foot.

42 C. PETIOLA'RIS (D. C. syst. 2. p. 264.) leaves on long stalks, smooth, pinnate; segments 9-10, stalked, ovate, toothed, somewhat lobed; pods erect. ♃? H. B. Native of Northern Caucasus near Mosdock. C. chelidònia affìnis, Goldb. in litt. Flowers white, nearly the size of those of *C. thalictroìdes.* Radical leaves almost the length of the flower stems.

Stalked-leaved Lady's-Smock. Pl. ½ foot.

43 C. PECTINA'TA (Pall. herb. & D. C. syst. 2. p. 264.) leaves stalked, smooth, pinnate; segments 7-9, stalked, ovate, pectinately-lobed; pods spreading. ⊙? H. B. Native of Persia. Flowers small, white; petals oblong, bluntish. Herb pale green.

Pectinate-lobed-leaved Lady's-Smock. Fl. July. Pl. ½ foot.

44 C. HEDERA'CEA (D. C. syst. 2. p. 264.) leaves stalked, smooth, pinnate; segments 5, stalked, broad-ovate, and bluntly 3-lobed; pods erect. ♃? H. B. Native of Syria. Flowers small, white. Pods very slender. Deless. icon. sel. 2. t. 30. f. A.

Ivy-like-leaved Lady's-Smock. Fl.? Pl. ¼ to ½ foot.

45 C. GLACIA'LIS (D. C. syst. 2. p. 264.) leaves stalked, pinnate, somewhat ciliated; lower segments sessile, 2 pair, small, terminal one stalked, large, reniform; pods erect. ♃. H. B. Native of Terra del Fuego in moist places which are nearly always covered with snow. Sisýmbrium glaciàle, Forst. comm. Goett. 9. p. 32. Flowers white. Pods almost filiform.

Var. β, (D. C. l. c.) segments of leaves 3.

Icy Lady's-Smock. Pl. ¼ foot.

46 C. DE'BILIS (Banks, mss. and herb.) leaves stalked, smooth, pinnate; segments stalked, ovate, somewhat sinuated, mostly 2 pair, with an odd one which is kidney-shaped; stem weak; pods erect. ⊙? H. B. Native of New Zealand. Sisýmbrium heterophýllum, Forst. prod. p. 64. no. 250. Flowers small, white. Stems almost naked.

Weak-stemmed Lady's Smock. Pl. ¼ foot.

47 C. SARMENTO'SA (Forst. fl. app. p. 92. no. 529.) leaves stalked, smooth, pinnate; segments 5, ovate, cut at the base, lower ones stalked; stem almost naked, bearing runners at the base; pods spreading. ♃. G. B. Native of the island of Teatinos in the South Sea. Flowers small, white; pedicels filiform, at last spreading.

Straggling Lady's-Smock. Pl. ½ foot.

48 C. THALICTROI'DES (All. ped. no. 951. t. 57. f. 1.) leaves stalked, smooth, upper ones pinnate; segments 3-5, stalked, ovate, 3-lobed; stem weak; pods spreading. ♂. H. B. Native of the Alps of Piedmont, Dauphiny, and perhaps in Switzerland, in rugged moist places in woods. C. Plumìerii, Vill. dauph. 3. p. 359. t. 38. exclusive of the synonym of Bocconi. Flowers white, hardly smaller than those of *C. amàra,* with a yellowish throat and claws.

Meadow-Rue-like Lady's-Smock. Fl. Ju. Jul. Clt. 1819. Pl. ¾ ft.

49 C. GLAU'CA (Spreng. in litt. 1819.) leaves stalked, smooth, glaucous, rather fleshy, pinnate; segments 5 or 9, oblong, terminal one 3-lobed; stem diffuse, much branched; pods erect, smooth. ♃. H. Native of Calabria on a mountain near Reggio. Deless. icon. sel. 2. t. 31. C. Bergeriàna, Andrz. in litt. 1820. C. thalictroìdes, Tin. C. corydaloìdes, Cusson. Flowers white, nearly the size of those of *C. amàra.* A tufted plant.

Glaucous Lady's-Smock. Fl. May, Jul. Clt. 1824. Pl. ½ ft.

50 C. MARI'TIMA (Portenschlag, in litt. D. C. syst. 2. p. 266.) leaves stalked, smooth, glaucous, pinnate; segments 5 or 7, obovately cuneated, repand; stem diffuse, much branched: pods erect, smooth. ⊙. H. Native of Dalmatia in the peninsula of Sabioncello, formerly called Hyllis, in sand on the sea-shore. Welden. icon. ined. t. 12. Deless. icon. sel. 2. t. 32. This plant much resembles *Pteroneùrum carnòsum* and also *C. glaúcum,* but differs from them both by its being an annual. Stems purplish. Leaves somewhat fleshy. Flowers white.

Sea-side Lady's-Smock. Pl. ½ foot.

51 C. DIGITA'TA (Richards. in Frankl. 1st journ. ed. 2. app. p. 26.) leaves digitately-pinnate; lobes 7, sessile, linear, quite entire; style short, hardly narrower than the pod; stigma capitate; root creeping. ♃. H. Native in sterile places at the Arctic sea. Plant very smooth, simple, ascendant, creeping at the base. Flowers white, tinged with purple, in loose, many-flowered racemes. Calyx yellow.

Digitate-leaved Lady's-Smock. Fl. June, July. Pl. ¾ foot.

52 C. PURPU'REA (Cham. et Schlecht. Linnæa. 1. p. 20.) leaves radical, few, on long stalks, pinnate, with 2 pair of orbicular, obovate, or elliptical leaflets, and a very large, ovate, roundish, somewhat 3-lobed odd one, which is rather cordate at the base, and tapering into the petiole, all sessile; style a line long. ♃. H. Native of the island of St. Lawrence. Plant beset with a few simple, spreading, stiff hairs. Leaflets running into the rachis, quite entire. Flowers purple, in short 8-10-flowered racemes; petals twice as long as the calyx; anthers white.

Purple-flowered Lady's-Smock. Pl. 1 foot.

† *Species not sufficiently known.*

53 C.? MULTI'FIDA (Banks, herb. Pursh, fl. bor. amer. 2. p. 440.) pubescent, branched; leaves interruptedly-pinnate; segments bi-pinnatifid, the extreme lobes roundish, cut; pods shorter than the pedicels. ♃. H. Native of Eastern Florida. Nastúrtium multífidum, Spreng. syst. 2. p. 885. Perhaps a species of *Brachýlobus.*

Multifid-leaved Lady's-Smock. Pl.?

54 C.? MENZI'ESII (D. C. syst. 2. p. 267.) canescent from stellate hairs; leaves pinnate; segments bi-pinnatifid, lobes small, acute; pods length of the pedicels. Native of the west coast of North America. Nastúrtium Menzíesii, Spreng. syst. 2. p. 883. Perhaps also a species of *Brachýlobus.* Flowers unknown.

Menzies's Lady's-Smock. Pl. 1 foot.

55 C.? GERANIIFÒLIA (D. C. syst. 2. p. 268.) very smooth;

leaves somewhat bipinnate; segments deeply-lobed, acute; pods awl-shaped, erect.—Native of the Straits of Magellan. Sisýmbrum geraniifòlium, Poir. dict. 7. p. 218. Petals white, obovate.

Geranium-leaved Lady's Smock. Pl. 1½ foot.

56 C. scuta'ta (Thunb. in Lin. trans. 2. p. 62.) radical leaves stalked, ternate, cauline ones few, with the terminal lobe roundish. —Native of Japan. C. trifòlia, Thunb. fl. jap. 260. but not of Lin.

Shield-leaved Lady's-Smock. Pl. ¼ foot.

57 C. nemoro'sa (Lejeun. fl. spa. 2. p. 62.) ♃. H. Very villous; leaves pinnate; segments roundish-angular. Native of France in woods about Malmedy and Encival. Flowers terminal, few, corymbose, a little larger and of a more deep purple than those of *C. praténsis*.

Grove Lady's-Smock. Fl. May, June. Pl. 1 foot.

58 C. articulata (Pursh. fl. bor. amer. 2. p. 439.) stem naked; radical leaves lanceolate, deeply-toothed, smooth. ♃. H. Native of North America on the western coast. Pods turgid, somewhat jointed.

Jointed-podded Lady's-Smock. Pl. ½ foot.

59 C. occu'lta (Horn. hort. hafn. suppl. p. 71.) radical leaves roundish; cauline ones pinnate or ternate; flowers without petals. ⊙. H. Native of China. Perhaps a species of *Nastúrtium*.

Hid-petalled Lady's-Smock. Fl. Ju. July. Clt. 1820. Pl. 1 ft.

60 C. heterophy'lla (Lapeyr. abr. pyr. 377.) plant smooth, simple; radical leaves roundish, with toothed petioles, cauline ones lyrate. ♂. H. Native of the Pyrenees, on the top of the mountain called Pic-du-Midi. Perhaps the same as *C. heterophýlla* of Bory. in ann. gen. sc. ph. 3. p. 6.? Petals equal in length with the closed calyx. Pods blunt, with a blunt appendage. Flowers white.

Variable-leaved Lady's-Smock. Pl. ½ foot.

61 C. propi'nqua (Carm. in Lin. soc. trans. 12. p. 507.) plant very smooth; leaves pinnate; segments blunt, toothed, terminal one largest.—Native of Tristan da-Cunha on the sides of mountains. Allied to *C. glaciàlis*.

Allied Lady's-Smock. Pl.?

62 C. bi'color (Presl. fl. cech. 136.) leaves pinnate, stipulate; segments elliptical-lanceolate, sessile; sepals roundish. ♃. H. B. Native of Bohemia in humid fields.

Two-coloured Lady's-Smock. Pl. 1 foot?

63 C. Opi'cii (Presl. fl. cech. p. 136.) leaves pinnate, stipulate; segments repandly-angular, sessile, lower ones roundish. ♃. H. B. Native of Bohemia in moist meadows. There are two varieties of this plant, one with hairy, the other with smoothish petioles.

Opici's Lady's-Smock. Pl.?

64 C. refle'xa (Raf. fl. lud. p. 84. no. 269.) ♃. H. B. Native of North America, near water, particularly in Louisiana. Flowers white. Petals reflexed, longer than the calyx. Perhaps referable to *C. Pennsylvánica*. Leaves smooth, pinnate; segments toothed at the top; racemes elongated.

Reflexed-petalled Lady's Smock. Pl. ¾ foot.

65 C. angustifòlia (Raf. fl. lud. p. 84. no. 270.) leaves pinnate; segments linear, filiform; pods erect. ♃. H. B. Native of Louisiana near water. A small plant.

Narrow-leaved Lady's-Smock. Pl.?

Cult. The greater part of the species require a moist or damp shady situation, but in any kind of soil. Some of the rarer kinds may be planted in pots, and these placed in pans of water. *C. hirsùta*, and several other species, produce young plants from the leaves. All that is necessary is to lay the leaf on a moist grassy surface, or on moss kept moist. The plant propagates itself extensively in this way in moist soils; but the easiest and most certain method is by dividing the perennial species at the root. The annual and biennial kinds only require to be sown in the open border in a damp situation, where they may be allowed afterwards to sow themselves. Many of the perennial kinds are very ornamental plants, but the annual and biennial kinds have a weedy appearance, and therefore they are only proper to be preserved in botanical gardens.

XIV. PTERONEU'RUM (from *πτερον, pteron*, a wing, and *νευρον, neuron*, a nerve; placentas with winged nerves.) D. C. syst. 2. p. 269. prod. 1. p. 154.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique lanceolate, with flat nerveless valves, usually opening with elasticity. Placentas with winged nerves. Funicle dilated. Style 2-edged. Roots fibrous. Leaves pinnate, with stalked segments. Racemes terminal. Pedicels filiform, bractless. Flowers white. Fruit like that of *Dentària*; the rest of the plant like *Cardámine*.

1 P. Java'nicum (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 644.) leaves ternate; leaflets stalked, ovate-oblong, deeply-toothed, lateral ones unequal at the base. ♃. S. Native of Java.

Java Pteroneurum. Pl. 1 foot.

2 P. decu'rrens (Blum. l. c.) leaves pinnate; leaflets usually 5, ovate, repand-toothed, rather ciliated, running into the petiole at the base. ♃. S. Native of Java.

Decurrent-leaved Pteroneurum. Pl. 1 foot.

3 P. carnòsum (D. C. syst. 2. p. 270.) segments of leaves ovate and somewhat emarginate, rather glaucous. ♃. H. Native of Hungary on calcareous mountains among loose stones. Cardámine carnòsa, Waldst. et Kit. hung. 2. p. 137. t. 129. Calyx spreading. Corolla double the length of the calyx. Petals white, obovate. Root and leaves fleshy. Stem purplish at the base.

Fleshy-leaved Pteroneurum. Fl. July, Aug. Clt. 1824. Pl. 1 ft.

4 P. Græ'cum (D. C. syst. 2. p. 270.) segments of leaves stalked, nearly orbicular, dentately-lobed. ⊙. H. Native of Corsica, Sicily, Italy, Greece, and most of the islands in the Archipelago, on shaded mountains. Cardámine Græca, Lin. spec. 915. Gært. fruct. 2. t. 143. Lam. ill. t. 562. f. 2. Smith fl. græc. t. 631. Flowers white, hardly the size of those of *C. amàra*. Herb pale, green, somewhat glaucous, having the appearance of a species of *Fumària* or *Thalictrum*.

Grecian Pteroneurum. Fl. Ju. July. Clt. 1710. Pl. ½ foot.

Cult. These plants succeed best in light sandy soil, and are well adapted for rock-work. The *P. carnòsum* may be increased by dividing the plant at the root or by seeds. The *P. Græ'cum* by seeds, which may be either sown in the rock-work, or in the open boder. The *Java* species will require to be kept in a stove.

XV. DENTA'RIA (from *dens*, a tooth; tooth-like structure of roots; for the same reason it is called *Toothwort* in English.) Tourn. inst. 225. t. 111. Lin. gen. no. 811. Lam. ill. t. 562. Juss. gen. D. C. syst. 2. p. 271. prod. 1. p. 154.

Lin. syst. *Tetradynámia, Siliquòsa.* Silique lanceolate, with flat nerveless valves, usually opening with elasticity. Placentas not winged. Funicle dilated. Seeds ovate, not margined, disposed in one row. Radical trunt fleshy, horizontal, irregularly toothed. Scape erect, bearing the raceme at the top. Radical leaves none or few, on long stalks; cauline one stalked, placed on the middle of the scape, usually in threes, alternate, or in whorles, palmately or pinnately-cut. Pedicels filiform, bractless. Flowers white, cream-coloured or purplish.

§ 1. *Verticillàtæ. Stem leaves whorled. Style long. Valves terminating at the base of the style, hardly acuminated.*

1 D. polyphy'lla (Walds. et Kit. pl. rar. hung. 2. p. 174. t. 160.) leaves 3, in a whorl, or alternate, stalked, pinnate; segments 7 or 9, approximate, lanceolate, acuminated, serrated.

4. H. Native of Hungary in shady moist places of woods. Flowers large, cream-coloured.

Var. β, D. ochroleùca (Gaud. herb.) segments of leaves short, ciliated. Native of Switzerland and Piedmont.

Many-leaved Toothwort. Fl. May, June. Clt. 1817. Pl. 1 ft.

2 D. ENNEAPHY'LLA (Lin. spec. 912.) leaves 3, in a whorl, stalked, ternate; segments ovate-lanceolate, acuminated, serrated; stamens length of petals. 4. H. Native of mountain woods, particularly on the Carpathian mountains among the beech, and even at the height of 4600 feet among the Pinus Mughus, also in Styria, Hungary, Austria, Carniola, Piedmont, &c. Jacq. aust. t. 361. Cardámine enneaphýllos, Crantz. cruc. p. 27. Cardámine enneaphylla, R. Br. in hort. kew. ed. 2. vol. 4. p. 101.—Lob. icon. t. 687.—Morr. oxon. 2. p. 254. sect. 3. t. 10. f. 1. Flowers white, when dry cream-coloured. Herb acrid.

Nine-leaved Toothwort. Fl. April, June. Clt. 1659. Pl. 1 ft.

3 D. GLANDULÒSA (Waldst. et Kit. hung. 3. p. 302. t. 272.) leaves 3 in a whorl, stalked, ternate; segments oval-lanceolate, acuminated, serrated, bearing glands in the axillæ; stamens one-half shorter than the petals. 4. H. Native of Hungary in humid woods; in Transylvania on mount Gætzenberg. Petals purplish, much longer and larger than the calyx.

Glandular Toothwort. Fl. May, June. Clt. 1815. Pl. 1 foot.

4 D. LACINIA'TA (Muhl. cat. 60.) leaves 3 in a whorl, on short stalks, 3-parted; lobes or segments linear, entire or deeply serrated, or jagged. 4. H. Native of North America in mountain woods, from New England to Canada, particularly on the highest mountains of Carolina, also in Pennsylvania about West Chester. D. concatenàta, Michx. fl. bor. amer. 1. p. 30. Flowers large. Petals oblong, rose-coloured, or almost white.

Var. β, mìnor (D. C. syst. 2. p. 273.) plant smaller in all its parts, hardly 3 inches high.

Jagged-leaved Toothwort. Fl. April, June. Clt. 1823. Pl. 1 ft.

5 D. HETEROPHY'LLA (Nutt. gen. amer. 2. p. 66.) cauline leaves 2, opposite, stalked, ternate; segments lanceolate-linear, entire. 4. H. Native of western Pennsylvania under the shade of pine woods; on banks at Wishahikon Bay, not far from Philadelphia. This is the smallest of all the species. Flowers pale-purple, about the size of those of *Cardámine pratènsis*.

Variable-leaved Toothwort. Pl. ½ foot.

§ 2. *Palmatifòlia. Cauline leaves alternate, palmately-cut into 3 or 5 sections.*

6 D. TENE'LLA (Pursh. fl. amer. sept. 2. p. 439.) leaves 2, alternate, sessile, cut in 3 linear-elliptical entire segments. 4. H. Native of North America along the banks of the Columbia river. Flowers purple, about the size of those of *Cardámine praténsis*.

Slender Toothwort. Fl. April, June. Clt. 1826. Pl. ¾ foot.

7 D. DIPHY'LLA (Mich. fl. bor. amer. 2. p. 30.) cauline leaves 2, alternate, on short stalks, cut into 3 ovate-lanceolate grossly and unequally serrate-lobed segments. 4. H. Native of North America from Pennsylvania to Canada, on the higher mountains in shady beech woods. Sims, bot. mag. t. 1465. Dentària bifòlia, Stok. mat. med. 3. p. 443. Petals ovate, white on the inside, and purple on the outside (Sims), pale red, with a tinge of yellow (Pursh), yellowish (Mich.). The roots of this plant have a pungent mustard-like-taste, and are used by the natives in the mountains instead of mustard, where it is generally known by the name of *Pepper-root*.

Two-leaved Toothwort. Fl. May, June. Clt. 1810. Pl. ½ to 1 ft.

8 D. MA'XIMA (Nutt. gen. amer. 2. p. 66.) leaves many, alternate, stalked, cut into 3 broad oval deeply-toothed segments. 4. H. Native of the western parts of Pennsylvania, and in the fields about New York. Flowers pale-purple. Petals oblong-oval.

Largest Toothwort. Fl. May, June. Clt. 1823. Pl. 2 feet.

9 D. TRIFÒLIA (Waldst. et Kit. hung. 2. p. 148. t. 139.) leaves many, alternate, stalked, cut into 3 ovate-lanceolate remotely-toothed segments, bearing glands in the axillæ. 4. H. Native of Hungary in shady valleys. Petals white, obovate, spreading 3 times longer than the calyx.

Three-leaved Toothwort. Fl. May, June. Clt. 1824. Pl. 1 ft.

10 D. DIGITA'TA (Lam. dict. 2. p. 268.) cauline leaves many, alternate, stalked, palmately cut into 5 oblong-lanceolate, pointed, grossly serrated segments. 4. H. Native of France, Germany, Switzerland, upper Italy, and Carniola, &c. in shady mountain woods. Dentària pentaphýllos, Lin. spec. 912. var. β and γ, Scop. carn. no. 814. Sims, bot. mag. t. 2202. Cardámine pentaphýlla, R. Br. in hort. kew. ed. 2. vol. 4. p. 101. —Clus. hist. 2. p. 122. f. 1. Mor. oxon. 2. p. 255. no. 3. sect. 3. t. 10. f. 3.—Taber. icon. p. 323 and 324.—Garid. aix. prov. p. 152. t. 29. Flowers white or rather purplish.

Digitate-leaved Toothwort. Fl. My. Ju. Clt. 1659. Pl. to 1½ ft.

§ 3. *Pinnatifòlia. Cauline leaves pinnate, alternate.*

11 D. PINNA'TA (Lam. dict. 2. p. 268. ill. t. 562. f. 1.) cauline leaves alternate, stalked, pinnate; segments oblong, acuminated, serrate-toothed. 4. H. Native of France, Italy, and Switzerland, in shady mountain woods. Boiss. fl. europ. t. 449. Stok. mat. med. 3. p. 444. D. heptaphýllos, Vill. dauph. 3. p. 364. D. pentaphyllos β, Lam. fl. fr. 2. p. 498. Cardámine pinnàta, R. Br. in hort. kew. ed. 2. vol. 4. p. 101.—Garid. aix. prov. p. 152. t. 28. Swert, floril. 2. t. 23. This plant differs from *D. bulbífera*, to which it is nearly allied, by the superior leaves being never undivided, and also from its not bearing bulbs in the axillæ. Flowers white.

Pinnate-leaved Toothwort. Fl. May, Ju. Clt. 1683. Pl. 1 ft.

12 D. WALLI'CHII; leaflets 9-12, opposite, lanceolate, mucronate, deeply and bluntly serrated, pilose beneath, as well as the stem, which is simple; racemes many-flowered, pubescent. 4. H. Native of Gosaingsthan. Leaves a span in length; leaflets 3 inches in length. Flowers pale purple. This plant differs from *D. pinnàta* in the leaves being furnished with a greater number of leaflets. Cardámine polyphýlla, D. Don. prod. fl. nep. p. 202.

Wallich's Toothwort. Pl. 1½ foot.

13 D. QUINQUEFÒLIA (Bieb. fl. taur. 2. p. 109. suppl. 436.) cauline leaves 3, alternate or whorled, pinnate; segments 5 or 7, oblong-linear, grossly toothed, terminal one not confluent. 4. H. Native of Tauria and Caucasus, and in the Ukraine, and about the town of Lubni in Russia Minor, under trees and in woods. D. Caucásica, Willd. herb. D. pinnàta, Pall. ined. D. pentaphýllos, Guldenst. itin. 1. p. 194. 420. Very like *D. pinnàta Hypánica* and *bulbífera*. Flowers pale-purple? Deless. icon. sel. 2. t. 33.

Five-leaved Toothwort. Fl. April, Ju. Clt. 1823. Pl. 1 foot.

14 D. HYPA'NICA (Besser, in litt. D. C. syst. 2. p. 278.) cauline leaves 3, alternate or in a whorl, pinnate; segments 5-7, oblong-linear, toothed, terminal one confluent. 4. H. Native of Bessarabia and Podolia on the banks of the river Hypanis, sometimes called Bog river. Nearly allied to *D. quinquefòlia*, and easily confused with it; it is principally distinguished from it by the ultimate segment of the leaves being never cut down to the base, but confluent. Flowers pale-purple?

Hypan Toothwort. Fl. April, May. Pl. 1 foot.

15 D. BULBI'FERA (Lin. spec. 912.) cauline leaves alternate, pinnate, upper one undivided, for the most part bearing bulbs in the axillæ. 4. H. Native of Sweden, France, Switzerland, Italy, Germany, Greece, Transylvania, Carniola, Iberia, and

Caucasus, at the base of mountains in shady humid places. In England, near Mayfield, Sussex; in the old park-wood near Harefield, Middlesex, abundantly; in woods between Beaconsfield and Wickham, plentifully; on the north side of the high rocks at Tunbridge Wells, and elsewhere in that neighbourhood. Smith, eng. bot. t. 309. Fl. dan. t. 361. Schkuhr. handb. 2. t. 183. Tratt. arch. 4. t. 188. Stok. bot. mat. med. 3. p. 443. Flowers purple, but they are said to be sometimes white.

Var. β, *ptarmicæfòlia* (D. C. syst. 2. p. 279.) upper leaves more sharply-serrated.—Besl. hort. eyst. œst. ord. 7. t. 12. f. 2. —Mor. oxon. 2. p. 255. f. 6.

Bulb-bearing Toothwort. Fl. April, May. England. Pl. 1½ to 2 feet.

16 D. microphy'lla (Willd. spec. 3. p. 479.) cauline leaves 3, alternate or somewhat verticillate, all pinnate, segments 7-11, linear-lanceolate, entire or somewhat toothed. ♃. H. Native of Caucasus and Iberia, in woods. Bieb. fl. taur. 2. p. 108. Flowers purplish, almost like those of *D. pinnàta*.

Small-leaved Toothwort. Fl. April, May. Pl. ½ foot.

17 D. tenuifòlia (Lebeb. mem. acad. peters. 5. 1815. p. 547.) cauline leaves on short stalks, alternate, some of which are ternate, others pinnately-quinate; segments linear, acute, quite entire; root fibrous, bearing roundish tubers. ♃. H. Native of Siberia, on the banks of rivers, and in humid meadows; also of North America, on the banks of the Columbia. D. trífida, Lam. ill. t. 562. f. 2. D. tuberòsa, Patrin, ined.—Gmel. sib. 3. p. 272. no. 41. t. 65. Flowers rose-coloured or purple, size of those of *Cardámine praténsis*.

Var. β, *incìsa*; segments of leaves deeply notched. ♃. H. Native of the Ural Mountains, in Siberia.

Fine-leaved Toothwort. Fl. May, Jul. Clt. 1825. Pl. ½ foot.

Cult. These plants succeed best in a light sandy soil, in moist shady situations. They may be either increased by dividing the roots, or by seeds. The *D. bulbífera* may be encreased by the bulbs which grow in the axillæ of the leaves. They are all ornamental plants, and deserve to be cultivated.

XVI. PA'RRYA (in honour of Captain William Edward Parry, R. N. formerly commander of the expeditions sent in search of a North-West passage.) R. Br. in Parry's 1st. voy. app. p. 269. t. B. Hook. fl. bor amer. p. 46.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique broad-linear, with flat valves, which are more or less distinctly veined. Seeds disposed in something like 2-rows, edged with a broad wing. Umbilical cord adnate to the dissepiment above. Lobes of stigma approximate. Evergreen perennial herbs with lanceolate or oblong rather fleshy, toothed or entire leaves, and pale rose-coloured flower. Roots thick, woody, fusiform, covered with the vestiges of the old leaves at their neck.

1 P. macroca'rpa (R. Brown, in Parry's 1st. voy. app. p. 270. Hook. fl. bor. amer. p. 47. t. 15.) siliques broad-linear; anthers linear; leaves broad, lanceolate, deeply toothed. ♃. H. Native of North America, to the west of Mackenzie River, frequent on the shores of Kotzebue's Sound, and the adjacent coast, and the Island of St. Lawrence. Originally found in Siberia. Neurolòma arabiflòrum, D. C. prod. 1. p. 156. Hesperis arabiflòra, D. C. syst. 2. p. 454. Neurolòma nudicaúle, D. C. prod. 1. p. 156. A'rabis nudicaúle, D. C. syst. 2. p. 240. Cardámine articulàta, Pursh. fl. sept. amer. 2. p. 439? Cardámine nudicaúlis, Lin. spec. 913. Flowers in corymbs, large, of a purple rose-colour.

Var. α, *áspera* (Hook. l. c.) plant beset with glandular hairs. ♃. H. A'rabis caule nudo, Lin. amœn. acad. 2. p. 358. t. 4. f. 20. A'rabis grandiflòra, Willd. spec. pl. Neurolòma arabiflòrum β, D. C. l. c.

Var. β, *glàbra* (Hook. l. c.) plant quite smooth. Neurolòma arabiflòrum α, D. C.

Long-fruited Parrya. Fl. May, June. Clt. 1798. Pl. ½ foot.

2 P. a'rctica (R. Br. in Parry's 1st. voy. app. p. 269. t. B.) siliques linear oblong; anthers oval; leaves (almost all) quite entire; peduncles quite smooth. ♃. H. Native of North America in the Eastern Arctic Islands, and shores of the continent of Arctic America eastward of the Mackenzie river. Flowers in corymbs, of a pale purple-colour.

Arctic Parrya. Fl. May, June. Clt. 1820. Pl. ¼ foot.

3 P. exsca'pa (Ledeb. ex Hook. fl. bor. amer. p. 48.) pedicels appear to spring from the top of the root without any scape, and by the number and size of the flowers appear to conceal the leaves; siliques 4-inches long; seeds hardly margined; umbilical cord wholly fixed to the dissepiment. ♃. H. Native of the Altaian mountains. Flowers probably rose-coloured.

Scapeless Parrya. Pl. ¼ foot.

4 P. scapígera; pedicels length of calyx; petals rather emarginate; leaves almost all radical, stalked, lanceolate, fleshy, smooth as well as the stem. ♃. H. Native of Siberia, at the mouth of the river Lena, at Cape Bykofskoy, and also at the mouth of the river Volga. Neurolòma scapígerum, D. C. prod. 1. p. 156. Hésperis scapíger, D. C. syst. 2. p. 454. Cheiránthus scapíger, Adam, mem. soc. nat. mosc. 5. p. 112. no. 18. Flowers violet, about the size of those of *Hésperis matronàlis*, disposed in racemose corymbs. Leaves entire or toothed.

Scape-bearing Parrya. Pl. ½ foot.

5 P. intege'rrima; stem suffruticose at the base; radical leaves rather spatulate, quite entire; cauline ones few; racemes at first corymbose. ♄. H. Native of Siberia. Flower beautiful purple, about the size of those of *Cardámine praténsis*, Sweet, brit. fl. gard. icon. ined. but perhaps under a different name.

Very-entire-leaved Parrya. Fl. April, May. Clt. 1827. Pl. ½ foot.

Cult. The species of this genus are well adapted for ornamenting rock-work, but as they are very rare and apt to be killed in the winter, we therefore would recommend a plant or two of each to be planted in pots, and placed among other alpine plants. A mixture of sand, loam, and peat will answer them well; the pots which they are planted in should be well drained with potsherds. They may be increased by dividing the plants at the root, but more readily by seeds or by young cuttings.

Tribe II.

ALYSSI'NEÆ (plants agreeing with Alyssum in some important characters) or PLEURORHI'ZÆ (πλευρα, *pleura*, a side, ριζα, *rhiza*, a root; radicle at side of cotyledons: f. 46. *c.*) LATISE'PTÆ (*latus*, broad, and *septum*, a dissepiment.) D. C. syst. 2. p. 280. prod. 1. p. 156. Silicle opening longitudinally, with a broad oval membranous dissepiment, and flat or concave valves. Seed compressed, usually margined (f. 46. *g. h.*). Cotyledons flat, accumbent, parallel with the dissepiment (f. 46. *c.*; f. 45. *g.*).

XVII. LUNA'RIA (from *luna*, the moon; resemblance in broad silvery dissepiment.) Lin gen. no. 809. Gært. fruct. 2. p. 288. t. 124. Lam. ill. t. 561. D. C. syst. 2. p. 280. prod. 1. p. 156.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle stalked, elliptical or lanceolate, with flat valves. Funicles long, adhering to the dissepiment Calyx somewhat bisaccate. Petals nearly entire. Stamens not toothed. Large somewhat pilose herbs, with round, erect, branched stems, and cordate grossly toothed, alternate or opposite stalked leaves. Flowers large, elegant, lilac. Racemes terminal; pedicels filiform bractless. Dissepiments

permanent, silvery. The English name of the genus, *Honesty*, is given to it on account of the clear brilliant dissepiment.

1 L. REDIVÌVA (Lin. spec. 911.) pods lanceolate, narrowed at both ends. ♃. H. Native of France, Switzerland, Germany, Italy, Transylvania, &c. &c. in mountain woods. Lam. ill. t. 561. f. 1. L. odoràta, Lam. fl. fr. 2. p. 457. L. Ricòtia, Gært. fruct. 2. p. 289. t. 142. L. perénnis, Gmel. fl. bad. 3. p. 48. L. lanceolàta, Stok. bot. mat. med. 3. p. 442. Flowers sweet-scented, purplish.

Var. β, *purpùrea* (D. C. syst. 2. p. 281.) flowers purple.

Var. γ, *alpìna* (D. C. syst. 2. p. 281.) upper leaves less cordate; pods narrower. Tab. icon. 512. Lunària alpìna, Berg. phyt. 3. p. 115.

Perennial Honesty. Fl. May, June. Clt. 1596. Pl. 2 or 3 feet.

2 L. BIE'NNIS (Mœnch. meth. 261.) pods elliptical, blunt at both ends. ♂. H. Native of Sweden, Germany, France, Switzerland, &c. in mountain woods. L. ánnua, Lin. spec. 911. Lam. ill. t. 561. f. 2. Schkuhr. handb. 2. no. 1829. t. 182. L. inodòra, Lam. fl. fr. 2. p. 457. L. redivìva, Gært. fruct. 2. p. 288. t. 142. exclusive of the synonyms. L. ovàlis, Stok. bot. mat. med. 3. p. 441. Flowers violet-lilac, scentless.

In German this plant is named *Mondviole, Mondkraut, Silberblume, Silberblatt, Flittern, Atlasblume, Waldriegel.* In Dutch, *Maankruid, Penningkruid, Zilverbloeme.* In Danish, *Maaneviol, Manefioler.* In French, *La Lunaire, Satinee, Satin blanc, Passe Satin, Medaille, Herbe aux lunettes.*

Var. β, *albiflòra* (D. C. syst. 2. p. 282.) Flowers white.—Morr. oxon. 2. p. 246. no. 2.

Var. γ, *corcyræ'a* (D. C. syst. 2. p. 283.) pods almost orbicular. Native of the island of Corcyra. Perhaps a distinct species.

Biennial Honesty. Fl. May, June. Clt. 1595. Pl. 1½ to 3 ft.

Cult. The species of *Lunària* are large well-known ornamental plants. They thrive well in the open border, in common garden soil. The *L. biénnis* can only be increased by seeds, which should be sown in the border where the plants are intended to remain, or they may be transplanted. The *L. redivìva* may be either increased by dividing the plant at the root, or by seeds.

XVIII. RICO'TIA (Ricot, probably the name of some obscure botanist.) Lin. gen. no. 810. Lam. ill. t. 561. D. C. syst. 2. p. 284. prod. 1. p. 157.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle sessile, elliptical, when ripe losing its dissepiment and becoming 1-celled: valves flat. Funicles long, free. Seeds when young 4, when ripe, solitary and nearly central in the cell. Calyx with two protuberances at the base. Petals entire. Stamens toothless. Smooth, slender, branched, annual herbs, with variable pinnate-lobed, stalked leaves, and filiform bractless pedicels, which are disposed in elongated racemes, bearing pale lilac-coloured flowers about the size and appearance of those of *Cakìle.*

1 R. LUNA'RIA (D. C. syst. 2. p. 284.) leaves almost bipinnate; lobes oblong, sinuated, angular. ☉. H. Native of Syria not far from Saleyeh, also on Mount Carmel near Ptolemy. R. Ægyptìaca, Lin. spec. 912. Lam. ill. t. 561. Ker. bot. reg. 49. Cardámine Lunària, Lin. spec. ed. 1. p. 656. Lunària Ricòtia, Gært. fruct. 2. p. 289. t. 142.—Mill. icon. 2. p. 113. t. 169. Plant twisted, somewhat scandent. Petals lilac, with white claws. Pods ovate lanceolate.

Moon-podded Ricotia. Fl. Jun. Jul. Clt. 1757. Pl. ¾ foot.

2 R. TENUIFÒLIA (Smith. fl. græc. t. 630.) leaves somewhat bipinnatifid; lobes linear. ☉. H. Native of Caramania. Peltària Caramaniénsis, Sibth. in herb. Banks. Stem much branched, twiggy. Flowers lilac. Pods compressed, flat, obovate, blunt.

Fine-leaved Ricotia. Fl. Jun. Jul. Pl. ½ foot.

† *A species not sufficiently known.*

3 R. CANTONE'NSIS (Lour. coch. ed. Willd. 2. p. 482.) leaves oblong, pinnate-cut. Native of China about Canton. Lunària Ricòtia, Desv. journ. bot. 3. p. 174. Pods oblong, compressed, thin, nearly sessile, differing from *Ricòtia* in having yellow flowers and many-seeded pods.

Canton Ricotia. Pl. ¾ foot.

Cult. This genus of pretty annuals is well adapted for ornamenting rock-work, where the seed should be sown, or they may be sown in the open border. A light sandy soil suits them best.

XIX. FARSE'TIA (in honour of Philip Farseti, a noble Venetian botanist.) Turra fars. 1765. Desv. journ. bot. 3. p. 173. D. C. syst. 2. p. 286. prod. 1. p. 157.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle sessile ovate (f. 46. *g.*), or orbicular, with flat valves (f. 46. *g.*). Seed winged (f. 46. *g.*). Calyx bisaccate at the base. Petals entire. Branched, erect herbs or sub-shrubs, which are more or less hoary or downy. Leaves entire, oblong. Racemes terminal; pedicels filiform without bracteas, or furnished sometimes with leafy bracteas. Flowers yellow, or dirty whitish-purple.

SECT. I. FARSETIA'NA (D. C. prod. 1. p. 157. Farsètia, D. C. syst. 2. p. 287.) Petals oblong-linear, entire, whitish-purple. Stamens all toothless. Pods elliptical; dissepiment pierced at the base.

1 F. ÆGYPTI'ACA (Turr. diss. fars. 1765. 4to. p. 1. t. 1.) stems shrubby, erect; leaves linear, pressed, hoary. ♄. G. Native of Egypt, in the desert of Cairo, and about Aleppo; in Mauritania, at the bottom of mountains near Cafza. Cheiránthus Farsètia, Lin. mant. 94. Desf. atl. 2. p. 89. t. 160. Lunària scàbra, Forsk. ægyp. desc. 117. Farsètia cheiranthoìdes, R. Br. in hort. kew. ed. 2. vol. 4. p. 96. Stem much branched.

Egyptian Farsetia. Fl. Ju. July. Clt. 1788. Pl. 1 foot.

2 F. STYLÒSA (R. Br. in append to Denh. and Clapper. journ. p. 12.) plant much branched; silicle oblong, many-seeded; lobes of stigma spreading. ♄. G. Native about Tripoli. Leaves not seen.

Broad-*styled* Farsetia. Pl. 1 foot?

SECT. II. CYCLOCARPÆ'A (from κυκλος, *kyklos*, a circle, and καρπος, *karpos*, a fruit; orbicular pods.) D. C. syst. 2. p. 287. prod. 1. p. 157. Petals oblong, somewhat emarginate. Smaller stamens furnished with a tooth. Pods orbicular, smooth, with an entire dissepiment.

3 F. SUFFRUTICÒSA (D. C. syst. 2. p. 287.) stems at base somewhat shrubby, erect; leaves lanceolate, downy. ♄. G. Native of Persia, between Hamadan and Casbin, and at Mount Elwend. Lunària suffruticòsa, Vent. cels. t. 19. Flowers rather drooping, scentless, of a violet-lilac colour. Sepals velvety.

Suffruticose Farsetia. Fl. Apr. May. Clt. 1830. Pl. 1 foot.

SECT. III. FIBÍGIA (derivation unknown.) D. C. syst. 2. p. 288. Med. gen. 1. p. 90. t. 2. f. 23. D. C. prod. 1. p. 157. Laminæ of petals ovate or oval, yellow, entire, smaller stamens furnished each with a tooth. Pods elliptic: dissepiment entire, bounded by narrow linear areolæ. This section is considered by Mr. Brown sufficient to constitute a genus.

4 F. LUNARIOÌDES (R. Br. in hort. kew. ed. 2. vol. 4. p. 96.) stems suffruticose, ascendant; leaves oblong-obovate, stalked, and are as well as the pods downy-hoary. ♃. H. Native of the islands in the Archipelago. Lunària Græ'ca, Willd. enum.

2. p. 675. Lunària perénnis, Mill. dict. no. 4. Alyssum lunarioìdes, Willd. spec. 3. p. 461.—Tourn. itin. ed. gall. 1. p. 242. t. 30. Flowers yellow; limb of petals ovate; sepals whitish.

Lunaria-like Farsetia. Fl. Ju. July. Clt. 1731. Pl. 1 foot.

5 F. eriocá'rpa (D. C. syst. 2. p. 288.) stems erect, shrubby at the base; leaves oblong; pods densely clothed with silky-hairs. (f. 46. *g*.) ♄.G. Native of the island of Cyprus. Very like *F. clypeàta*, but differs in the pods being clothed with long, simple, crowded white hairs, not with short hairs. Deless. icon. sel. 2. t. 34. Flowers not seen.

Woolly-podded Farsetia. Pl. 1 foot.

6 F. clypea'ta (R. Br. in hort. kew. ed. 2. vol. 4. p. 96.) stems herbaceous, erect; leaves oblong, repand; pods velvety from short down; stigma capitate. ♂. H. Native of rocky hills and mountains in the south of Europe, on mounts Maronis and Lebanon in Sicily; frequent in Asia-Minor, Tauria, and in Iberia, about Tiflis, &c. Sweet, fl. gard. icon. Alýssum clypeàtum, Lin. spec. 909. Schkuhr. handb. 2. no. 1815. t. 181. Dràba clypeàta, Lam. dict. 2. p. 328. Lunària clypeàta, All. ped. 1. p. 245. no. 899. Lunària canéscens, Willd. enum. 2. p. 675.—Lob. icon. t. 323. f. 1. Petals yellow, oblong, bluntly truncate.

Var. α, *ebracteàta* (Bœrh. ined. alt. 2. 6. no. 7.) pedicels without bracteas.

Var. β, *bracteàta* (Bœrh. ined. alt. 2. 7. no. 10.) pedicels furnished with bracteas.

Buckler-podded Farsetia. Fl. Ju. Jul. Clt. 1596. Pl. 1 to 2 ft.

7 F. cheiranthifòlia (Desv. journ. 3. p. 173.) stem erect, herbaceous; leaves lanceolate, hairy, quite entire; pods velvety with short down; stigma bifid. ♂. H. Native of the Levant. Alýssum cheiranthifòlium, Willd. spec. 3. p. 468. Very like *F. clypeàta*, but the leaves are less hoary. Flowers yellow.

Wall-flower-leaved Farsetia. Pl. 1 foot.

8 F. triqué'tra (D. C. syst. 2. p. 290.) stems at base suffruticose; branches triquetrous, ascendant; leaves downy, radical ones obovate, stalked, cauline ones oblong-lanceolate; style long, deciduous; stigma simple. ♄. F. Native of Dalmatia, on rocks. Welden. icon. ined. t. 11. Pods elliptical. Flowers yellowish. Stamens toothless.

Triquetrous-branched Farsetia. Fl. April, May. Pl. ¼ decumbent.

Cult. The green-house kinds of this genus thrive well in a mixture of sandy loam and peat; and young cuttings strike root readily in the same kind of soil, under a hand-glass, or they may be raised from seeds, which sometimes ripen in abundance. The hardy perennial kinds are well adapted for rock-work or for the front of flower-borders; or they may be grown in small pots, in a mixture of loam and peat, and placed among other alpine plants, so as to be protected by a frame during severe weather; they are readily increased by seeds, or by cuttings planted under a hand-glass. The biennial species are also well adapted for rock-work, or the front of flower-borders; they should be sown where they are intended to remain, or they may be transplanted.

XX. KONI'GA (*Konig* of Adauson, and in honour of Charles Konig, F.R.S. F.L.S. superintendant of the natural history department in the British Museum.) R. Br. in append. Denh. and Clapp. exp. afr. p. 9.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle somewhat ovate, with flattish valves and 1 or many-seeded cells. Funicle adhering to the base of the dissepiment. Seeds usually margined. Calyx spreading. Petals quite entire. Glands 8, hypogynous. Filaments all toothless. Annual or perennial herbs white from appressed forked down. Leaves quite entire, almost linear. Racemes terminal, sometimes leafy at the base. Flowers white.

1 K. mari'tima (R. Br. l. c.) cells 1-seeded. ♄. G. ⊙. H. Native along the Mediterranean Sea, in the sand, and in other parts of the south of Europe. Alýssum halamifòlium, Lin. spec. 907. Curt. bot. mag. t. 101. A. mínimum, Lin. spec. 908. Clypèola marítima, Lin. mant. 426. A. marítimum, Lam. dict. 1. p. 98. Dràba marítima, Lam. fl. fr. 2. p. 461. Lepídium fràgrans, Willd. in Ust. bot. mag. 11. p. 37. Lobulària marítima, Desv. journ. bot. 3. p. 62.

Var. β, *Canariénsis*; stems longer; cells usually 2-seeded. ♄. G. Native of the Islands of Teneriffe and Grand Canary.

Var. γ, *variegàta*; leaves edged with white or yellow. ♄. G.

Sea-side Koniga. Fl. Jun. Nov. Britain. Pl. procumbent or erect.

2 K. Líbyca (R. Br. l. c.) cells many-seeded, usually six. ♄. F. or ⊙. H. Native of Africa near Tripoli. Lunaria Líbyca, Viv. fl. lib. spec. p. 34. t. 16. f. 1.

Libyan Koniga. Fl. Jun. Nov. Pl. erect.

Cult. These plants will grow freely if sown in the open border as other hardy annuals. The striped variety of *K. marítima* should be kept as a green-house shrub, and it should be increased by cuttings, which strike root readily if planted under a hand-glass.

XXI. BERTERO'A (in honour of Charles Joseph Bertero, a pupil of Balbis and friend of De Candolle, who speaks in high terms of his merit.) D. C. syst. 2. p. 290. prod. 1. p. 158.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle sessile, elliptical or obovate, with flat or concave valves. Calyx equal at the base. Petals 2-parted. Smaller stamens toothed. Seeds oval, flat, with narrow margins. Erect, branched herbs or sub-shrubs, hoary with branched hairs. Leaves oblong-linear, entire or somewhat sinuated. Racemes opposite the leaves and terminal, many-flowered, corymbose, at length becoming elongated; pedicels filiform, erect, bractless. Flowers small, white.

1 B. inca'na (D. C. syst. 2. p. 291.) pods pubescent, somewhat ventricose. ♂. H. Native of many parts of Europe among rubbish, sandy, and uncultivated places, exposed to the sun. Alýssum incànum, Lin. spec. 978. Horn. fl. dan. t. 1461. Dràba cheirifòlia, Berg. phyt. icon. Dràba cheiranthifòlia, Lam. dict. 2. p. 328. Mœnchia incàna, Roth. fl. germ. 1. p. 273. Farsètia incàna, R. Br. in hort. kew. ed. 2. vol. 4. p. 97. Stevènia incàna, Andrz. cruc. ined. Pods oval, oblong, with membranaceous convex valves which are, when ripe, smooth. The whole plant hoary with pressed stellate hairs, but in moist ground it becomes smooth. Flowers white.

Var. β, *prolífera* (D. C. syst. l. c.) each calyx bearing three flowers instead of one, the 2 lateral ones sessile, the middle one stalked. Native of Tauria.

Hoary Berteroa. Fl. May, Oct. Clt. 1640. Pl. 1 to 2 feet.

2 B. muta'bilis (D. C. syst. 2. p. 292.) pods compressed, flat, elliptical, smooth. ♃. H. Native of the island Corcyra. Alýssum mutábile, Vent. cels. t. 85. Farsètia mutábilis, R. Br. in hort. kew. ed. 2. vol. 4. p. 96. Dràba mutábilis, Desv. journ. 3. p. 172. Very nearly allied to *B. incàna*, but the stems are evidently shrubby at the base, and permanent, and the plants less hoary. Petals when young white, adult ones pale rose-coloured, with yellowish claws, bluntly bifid.

Changeable-flowered Berteroa. Fl. July, Aug. Clt. 1802. Pl. 1 to 2 feet.

3 B. obli'qua (D. C. syst. 2. p. 292.) pods flat, elliptical, pubescent. ♃. H. Native of Rome, Naples, Sicily, and Calabria, in fields. Alýssum oblìquum, Smith, fl. græc. t. 623. Farsètia oblìqua, Spreng. syst. 2. p. 870. An intermediate plant between the two preceding species, differing from *B. incàna* in the valves

of the silicles being flat, and from *B. mutábilis* in the silicles being downy. Flowers white; petals bifid.

Oblique Berteroa. Fl. July, Aug. Clt. 1824. Pl. 1 to 2 feet.

4 B. ORBICULA'TA (D. C. syst. 2. p. 293.) pods flat, obovately orbicular, pubescent. ♄. H. Native in the sand at Xerxis Channel. Alỳssum orbiculàtum, D. Urv. Farsètia orbiculàta, Spreng. syst. 2. p. 870. Leaves and stems hoary with stellate hairs. Flowers white; petals bifid.

Orbicular-podded Berteroa. Fl. Jul. Aug. Pl. 1 ft. decumbent.

5 B. PERUVIA'NA (D. C. syst. 2. p. 293.) pods ovate-oblong, scabrous with small hairs; pedicels bracteate. ♃. ♄. G. Native of Peru in the coldest places. Farsètia Peruviàna, Spreng. Petals obcordate, twice the length of the calyx. Leaves and stems scabrous with distant stellate hairs.

Cult. As the species of this genus ripen seed in abundance, it is the best method of increasing them. They only require to be sown in the open border, but, however, young cuttings of the shrubby sorts planted under a hand-glass will root freely. Not worth cultivating except in botanic gardens.

XXII. AUBRIE'TIA (in honour of M. Aubriet, a famous French botanical draughtsman.) Adams, fam. 2. p. 420. D. C. syst. 2. p. 293. prod. 1. p. 158.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle oblong, with convex valves. Seeds not margined. Calyx bisaccate at the base. Petals entire. Smaller stamens toothed. Small evergreen pilose herbs, with ovate or oblong entire, or angularly-toothed leaves, which are covered with simple and branched hairs. Racemes opposite the leaves and terminal, lax, few-flowered. Pedicels filiform, bractless. Flowers purplish, seldom white.

1 A. DELTOI'DEA (D. C. syst. 2. p. 294.) pedicels longer than the calyx. ♃. H. Native of Naples near Aversa, of Sicily on the Nebrodes and near Palermo, on mount Lebanon, and of Greece, &c. &c. on rocky mountains. Alýssum deltoìdeum, Lin. spec. 908. Curt. bot. mag. t. 126. Smith, fl. græc. t. 628. Farsètia deltoìdea, R. Br. in hort. kew. ed. 2. vol. 4. p. 97. Vesicària deltoìdea, Poir. dict. 8. p. 572. Stem prostrate, ascendant. Leaves with 1 or 2 large teeth on each side, therefore they are rhomboidal, not truly deltoid, scabrous, with short branchy stellate hairs. Petals twice the length of the calyx, with long claws, purplish.

Deltoid-leaved Aubrietia. Fl. March, May. Clt. 1710. Pl. prostrate.

2 A. PURPU'REA (D. C. syst. 2. p. 294.) pedicels shorter than the calyx. ♃. H. Native of Bithynia on the top of mount Olympus. A'rabis purpùrea, Smith, fl. græc. t. 643. Dràba hesperidifòlia, Lam. dict. 2. p. 328. A small tufted plant, with oblong entire or toothed leaves, which are hispid with stellate or branched down as well as the younger stems. Flowers about the size, colour, and form of *A. deltoìdea.*

Purple-flowered Aubrietia. Fl. March, May. Clt. 1821. Pl. 2 or 3 inches.

Cult. These very ornamental plants thrive well in a dry soil; they are well adapted for ornamenting rock-work or the front of flower-borders, where they will flower nearly all the season; they are readily increased by dividing the plants at the root, or cuttings planted under a hand-glass will root readily; seeds also ripen frequently, by which they may be raised in plenty.

XXIII. VESICA'RIA (from *vesica*, a blister or bladder; inflated pods.) Lam. ill. t. 559. D. C. syst. 2. p. 295. prod. 1. p. 159.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle globose, inflated, with hemispherical valves. Seeds many, generally beyond 8, usually margined. Petals entire. Stems shrubby at the base, branched, round. Leaves oblong or linear entire, or somewhat sinuated. Racemes terminal. Pedicels bractless, filiform. Flowers yellow.

SECT. I. VESICA'RIANA (D. C. syst. 2. p. 296. prod. 1. p. 159.) silicles globose, with membranous inflated valves.

1 V. UTRICULA'TA (Lam. ill. t. 559.) calyx bisaccate at the base; leaves oblong, quite entire, smooth; lower ones ciliated, somewhat spatulate. ♄. H. Native of Greece, Italy, France, Piedmont, &c. on calcareous rocks. Alýssum utriculàtum, Lin. mant. 92. Curt. bot. mag. t. 130. Waldst. et Kit. hung. 2. p. 215. t. 196. Alỳssum Oedèri β, Durand, fl. bourg. 1. p. 161. Myàgrum utriculàtum, Berg. phyt. univ. icon. Flowers yellow, almost like those of *Wall-flower.*

Bladder-podded Vesicaria. Fl. Ap. Ju. Clt. 1730. Pl. 1 ft.

2 V. RETICULA'TA (Lam. ill. t. 559. f. 2.) calyx? leaves oblong-linear, smooth, radical ones rosulate, toothed, cauline ones entire. ♃. H. Native of Armenia between Baitbout and Conac; of Syria near Damascus. Alỳssum vesicària, Lin. spec. 910. Flowers small, yellow, in short racemes. Root perpendicular.

Reticulated-podded Vesicaria. Fl. June. Clt.? Pl. ½ foot.

3 V. LUDOVICIA'NA (D. C. syst. 2. p. 297.) calyx equal at the base, somewhat spreading; leaves linear-spatulate, entire, hoary with stellate-tomentum; stem at the neck somewhat shrubby; pods globose, downy; style slender. ♃. H. Native of Louisiana on the banks of the river Missouri. Myàgrum argénteum, Pursh. Alỳssum Ludoviciànum, Nutt. gen. amer. 2. p. 63. Flowers yellow, a little larger than those of *Alýssum saxátile.*

Louisiana Vesicaria. Fl. May, June. Clt. 1825. Pl. ½ foot.

4 V. SINUA'TA (Poir. dict. 8. p. 570.) calyx equal at the base, somewhat spreading, and is velvety as well as the oblong, entire, or sinuately-toothed leaves; stem herbaceous. ♂. H. Native of Spain in cultivated places, and on the road-side to Castello; also by the sea-side in Istria and Illyria, &c. Alỳssum sinuàtum and Créticum, Lin. spec. 910. Schkuhr. handb. 2. no. 1816. t. 181. Petals yellow, emarginate, at length becoming white. Seeds 6 in each cell, while the rest have only 4.—Morr. oxon. 2. p. 247. sect. 3. t. 9. f. 6.

Sinuated-leaved Vesicaria. Fl. Ap. Ju. Clt. 1596. Pl. 1 foot.

5 V. GLOBO'SA (Desv. journ. bot. 3. p. 171 and 184.) leaves lanceolate, acute, entire, smoothish; pods spherical, somewhat villous. ♄.? H. Native of North America in arid places. Pods small, terminated by the filiform style; cells many-seeded. Flowers yellow.

Globose-podded Vesicaria. Pl. ½ foot.

6 V. FRUTICULÒSA (Desv. journ. bot. 3. p. 171 and 184.) leaves somewhat spatulate, quite entire, white with down; pods somewhat globose, inflated, smooth. ♄. H. Perhaps a native of some of the islands in the Archipelago. Flowers yellow.

Fruticulose Vesicaria. Pl. 1 foot.

7 V.? PHYSO'PHORA (Andrz. cruc. ined. in D. C. syst. 2. p. 300.) leaves oblong, blunt, crowded, downy; pods sub-globose, somewhat pubescent; style very short.—Native of?

Bladder-bearing Vesicaria. Pl. ¾ foot.

8 V. A'RCTICA (Richards. in Frankl. 1st journ. ed. 2. app. p. 26.) radical leaves obovately-spatulate, the rest somewhat linear, quite entire, hoary with starry tomentum; pods orbicular, inflated, smooth, longer than the thickish style; calyx equal; stem suffruticose. ♄. H. Native of Amanak in Greenland; also of North America, but mostly confined to the Arctic shores and islands eastward of the Mackenzie River. Alýssum árcticum, Horn. fl. dan. t. 1520. Flowers large, yellow.

Arctic Vesicaria. Fl. April, June. Pl. ½ foot.

9 V. arenòsa (Richards. l. c.) lower leaves somewhat rhomboidal, obsoletely sinuate-toothed, grey with stellate down; stem round, suffruticose at the base; pods globose, pubescent. ♄. H. Native of North America on hills and dry prairies on the Arctic shore, at Saskatchawan, and at Carlton House. V. árctica, Hook. in bot. mag. t. 2882. var. β. Hook. fl. bor. amer. p. 48. Flowers yellow, smaller than those of the preceding. Stems spreading or ascendant.

Sand Vesicaria. Fl. April, June. Pl. ½ foot?

10 V. didymoca'rpa (Hook. fl. bor. amer. t. 16.) plant beset with forked hairs; leaves spatulate, slightly toothed, or entire; stems decumbent; pods didymous, inflated about the length of the slender style, beset with forked hairs; root fusiform. ♃. H. Native of North America in the Arctic regions. Flowers yellow, disposed in racemose corymbs. Calyx equal at the base.

Twin-fruited Vesicaria. Pl. ½ foot.

11 V. cochlearioi'des (Spreng. syst. 2. p. 872.) herbaceous; leaves oblong, obtuse, sinuately-toothed, rather fleshy, smooth; calyx permanent, inflated when in fruit. ♃. H. Native of the East Indies. Alýssum cochlearioìdes, Roth.

Scurvy Grass-like Vesicaria. Pl. 1 foot.

Sect. II. Alyssoi'des (plants with the habit of Alýssum.) D. C. syst. 2. p. 298. prod. 1. p. 159. Silicles ovate, with concave stiffish valves.

12 V. Cre'tica (Poir. dict. 8. p. 570.) calyx deciduous; leaves oblong, entire or repand, waved, covered with hoary down. ♄. or ♃. H. Native of Crete. Alýssum Créticum, Lin. spec. 910? Willd. spec. 3. p. 460.—Alp. exot. p. 117 and 118. icon. Pods ovate-globose, hoary. Seeds girded by a membranous margin. Flowers yellow.

Cretan Vesicaria. Fl. May, Aug. Clt. 1739. Pl. ¾ foot.

13 V. vesti'ta (Desv. jour. bot. 3. p. 171 and 184.) calyx permanent; leaves linear, acute, downy, entire. ♄. H. Native of Persia near Hamadan. Flowers yellow. Seeds not margined. Deless. icon. sel. 2. t. 35.

Clothed Vesicaria. Pl. ¾ foot.

14 V. paniculata (Desv. jour. bot. 3. p. 171.) leaves obovate, entire, smooth; pods ovate, somewhat inflated. ♄. H. Native of Crete. Alýssum paniculàtum, Desf. cor. Tourn. p. 67. t. 50. Flowers unknown.

Panicled-flowered Vesicaria. Pl. ¾ foot.

Cult. The species of this genus are well adapted for ornamenting rock-work or the front of flower borders: young cuttings planted under a hand-glass will soon strike root; but the best and most general method of increasing them is by seed, which ripen in abundance. They thrive best in a dry situation, in any kind of soil. Some of the rarer kinds should be planted in pots, so that they may be protected by a frame during severe weather.

XXIV. SCHIWERE'CKIA (in honour of Andr. Schivereck, a famous Polish botanist, formerly a friend of Marschall Bieberstein's.) Andrz. Cruc. ined. in D. C. syst. 2. p. 300. prod. 1. p. 160.

Lin. syst. *Tetradynàmia Siliculòsa.* Silicle ovate, with convex valves, which are somewhat depressed lengthways in the middle. Seeds numerous, without margins. Calyx equal at the base. Petals entire. Larger stamens toothed. A little evergreen perennial herb, white from stellate down. Radical leaves rosulate, oval-oblong, toothed, cauline ones few, stem-clasping. Racemes terminal; pedicels filiform, bractless. Flowers white. Ovaries and siliques grey from short soft down.

1 S. Podo'lica (Andrz. et Bess. in litt. D. C. syst. l. c.) ♃. H. Native of Podolia, Volhynia, and the Ural mountains in Siberia. Deless. icon. sel. 2. t. 36. Sweet, brit. fl. gard. t. 77. Alýssum Podólicum, Bess. cat. hort. crim. 1816. p. 8.

Podolian Schiwereckia. Fl. May, July. Clt. 1817. Pl. ¼ foot.

Cult. This pretty little plant thrives well in rock-work, or to be grown in small pots in light sandy soil, and placed among other alpines. It may be either increased by seed or dividing the plant at the root.

XXV. ADYSE'TON (meaning unknown.) Scop. carn. 2. p. 13, Alýssum, sect. 1. Adysèton, D. C. syst. 2. p. 301. prod. 1. p. 160. Alýssum, spec. Lin.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicles obovate or elliptical, with flat valves. Seeds 1-2-4 in each cell, compressed, usually girded by a membranous wing. Calyx equal at the base. Petals entire. Stamens all or some of them toothed. Small evergreen herbs or sub-shrubs, grey from soft starry-hairs or down. Leaves oblong, linear, or obovate, entire. Racemes opposite the leaves or terminal, elongating as they grow old; pedicels filiform, bractless. Flowers yellow.—The authorities given for the species are under *Alýssum.*

Sect. I. Disodóntea (from δις, *dis*, double; οδους οδοντος, *odous odontos*, a tooth; stamens furnished with a tooth on each side.) Flowers yellow. Stamens all or the larger ones furnished with a tooth on each side. Seeds 1-2 in each cell.

1 A. saxa'tile (Lin. spec. 908.) stems suffruticose at the base, somewhat corymbose; leaves lanceolate, entire, clothed with hoary tomentum; pods obovate, orbicular, 2-seeded; seeds margined. ♄. H. Native of Russia at the falls of Boristhen, and in Podolia. Curt. bot. mag. t. 159. Aurìnia saxátilis, Desv. jour. bot. 3. p. 162. A very common plant in gardens. Called in France *Corbeille d'or.*

Rock Adyseton. Fl. April, May. Clt. 1710. Pl. 1 foot.

2 A. Gemone'nse (Lin. mant. 92.) stems suffruticose at the base, panicled; leaves lanceolate, entire, greyish-velvety from stellate down; pods nearly orbicular, 2-4-seeded; seeds margined. ♄. H. Native on walls about the town of Gemona in Italy, and in Austria, Carinthia, and Transylvania, on rocky mountains. Jacq. icon. rar. 3. t. 503. Alýssum saxátile, Crantz. austr. p. 16. Vesicària Gemonénsis, Poir. dict. 8. p. 571.

Gemona Adyseton. Fl. April, May. Clt. 1710. Pl. 1 foot.

3 A. orienta'le (Ard. specim. 2. p. 32. t. 15. f. 1.) stems suffruticose at the base, panicled; leaves lanceolate, repandly-toothed, waved, downy; pods almost orbicular, transversely-oval, 4-seeded; seeds margined. ♄. H. Native of Crete on the mountains; at the Euxine sea on the sandy shore near Fanar. On rocks in the island of Cois, and also in the south of Italy. Smith fl. græc. t. 625. Clypèola tomentòsa, Lin. mant. 92.

Oriental Adyseton. Fl. May, June. Clt. 1820. Pl. 1 foot.

4 A. spathula'tum (Steph. in Willd. spec. 3. p. 465.) stems suffruticose at the base; leaves spatulately-obovate, stalked, greyish-velvety; pods orbicular, a little longer than the style; seeds margined. ♄. H. Native of Siberia on mountains; also in cretaceous ground at the river Lena. Alỳssum cretàceum, Adams, soc. nat. mosc. 5. p. 109. Deless. icon. sel. 2. t. 37. Petals emarginate, double the length of calyx.

Spatulate-leaved Adyseton. Fl. Ap. May. Clt. 1821. Pl. ½ ft.

5 A. arge'nteum (Vitm. summ. 4. p. 30.) stems suffruticose at the base, hoary with stellate down; leaves oblong-spatulate, silvery on the under surface; pods ovate-orbiculate, compressed, velvety; seeds slightly margined. ♄. H. Native of the lower Alps of Piedmont, on rocks exposed to the sun. Lunària argéntea, All. ped. no. 901. t. 54. f. 3.

Silvery-leaved Adyseton. Fl. May, June. Clt. 1819. Pl. 1 ft.

6 A. Bertolònii (Desv. jour. bot. 3. p. 172 and 185.) stems

suffruticose at the base, grey with stellate down; leaves oblong-obovate, silvery on the under surface; pods elliptical, compressed, greyish; seeds not margined. ♄. H. Native of Italy on hills and rocks exposed to the sun, about Sarzena and elsewhere. A. argénteum, Bertol. amœn. ital. p. 34. exclusive of the synonyms. Savi. bot. etr. p. 185. no. 569. Very like *A. argénteum*.

Bertoloni's Adyseton. Fl. May, June. Clt. 1825. Pl. 1 foot.

7 A. MURA'LE (Waldst. et Kit. hung. 1. p. 5. t. 6.) stems suffruticose at the base, grey from stellate down; leaves oblong, acutish, under surface white; pods ovate, rather velvety; seeds not margined. ♄. H. Native of Transylvania on the old walls about Deva, and on mount Vulkany towards Abrudhanya. Very like the two preceding plants.

Wall Adyseton. Fl. July, Aug. Clt. 1801. Pl. 1 foot.

8 A. SAVRA'NICUM (Andrz. ex Spreng. syst. 2. p. 858.) stems diffuse, ascending; leaves spatulately-linear, clothed with starry pubescence, densely tomentose beneath; flowers minute; silicles hoary, with pubescence. ♄. H. Native of Podolia.

Savranic Adyseton. Fl. May, June. Shrub ½ foot.

9 A. OBTUSIFÒLIUM (Steven. in litt. D. C. syst. 2. p. 305.) stems suffruticose at the base, pubescent with stellate down; leaves obovate-spatulate, blunt, silvery on the under surface; pods ovate-orbicular, rather velvety; seeds not margined. ♄. H. Native of southern Tauria, and in Siberia. Deless. icon. sel. 2. t. 38. A. muràle, Bieb. fl. taur. 2. p. 103. but not of Kit.

Blunt-leaved Adyseton. Fl. June, Aug. Clt. 1812. Pl. ¾ foot.

10 A. ATLA'NTICUM (Desf. atl. 2. p. 71. t. 149.) stems suffruticose at the base, hoary, erect; leaves lanceolate, hoary and pilose; racemes simple; pods orbicular, hoary; valves rather convex in the middle. ♄. H. Native of Crete on rocks, and on the top of Mount Atlas, near Tlemsen.

Atlantic Adyseton. Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

11 A. SERPYLLIFÒLIUM (Desf. atl. 2. p. 70.) stems suffruticose, erect, hoary; leaves hoary, lower ones obovate, upper ones lanceolate; racemes corymbose; pods obovately-cuneated, hoary, with flat valves. ♄. H. Native of Algiers, near Tlemsen; also in Spain about Aranjuez.

Wild-thyme-leaved Adyseton. Fl. May, July. Clt. 1820. Pl. ½ to 1 foot.

12 A. RE'PENS (Baumg. fl. trans. 2. p. 237.) stems suffruticose at the base, younger ones decumbent, adult ones erect; leaves rather pilose, lower ones oblong-obovate, narrowed into the petiole; upper ones oblong; pedicels hispid; style rather hairy, longer than the 2-ovulate ovary. ♄. H. Native of Transylvania on calcareous rocks. Root creeping. Pods orbicular, 1-seeded.

Creeping-rooted Adyseton. Fl. April, June. Pl. ½ foot.

13 A. VERNA'LE (Horn. ex Schrank, hort. mon. t. 96.) stems ascendant; leaves lanceolate, narrowed downwards, almost entire, greyish from stellate down; petals emarginate; pods inflated, covered with stellate hairs. ♃. H. Very near to *A. rèpens*, but the pods are said to be inflated.

Vernal Adyseton. Fl. April, May. Clt. 1823. Pl. ¼ to ½ ft.

14 A. TORTUO'SUM (Waldst. et Kit. hung. 1. p. 94. t. 91.) stem suffruticulose at the base, twisted, diffuse, hoary; leaves hoary, somewhat lanceolate; racemes corymbose; pods elliptical, greyish-velvety, with flat valves. ♄. H. Native of Hungary on very dry sandy declivities of hills, also in Transylvania and southern Podolia.

Var. β, orientàle (D. C. syst. 2. p. 306.) stems more shrubby at the base, and the leaves more hoary. Native of Armenia and on calcareous hills in Tauria and Iberia about Tanaim. A. subalpìnum, Pall. ined. A. serpyllifòlium, Bieb. fl. taur. 2. p. 103. suppl. 432.

Twisted-stemmed Adyseton. Fl. Ju. Jul. Clt. 1804. Pl. ½ ft.

15 A. ALPE'STRE (Lin. mant. 92.) stems suffruticose at the base, diffuse, greyish; leaves obovate, hoary; racemes simple; pods obovate-oblong, greyish, with flat valves. ♄. H. Native of the Alps of Provence, Piedmont, Vallais, Portugal, France, Transylvania, Greece, &c. on rocks exposed to the sun. All. ped. no. 888. t. 18. f. 2. Smith, fl. græc. t. 624. A. minútulum, Schleich. pl. helv. A tufted plant.

Alp Adyseton. Fl. June, July. Clt. 1777. Pl. ¼ foot.

16 A. NEBRODE'NSE (Tineo, pug. pl. sicul. p. 12. no. 10.) stems suffruticulose, ascendant, canescent; leaves obovate, hoary; racemes corymbose; pods elliptical-obovate, hoary, with flat valves. ♄. H. Native of Sicily on the Nebrodes.

Nebrode Adyseton. Fl. June, July. Pl. ½ to 1 foot.

17 A. MARSCHALLIA'NUM (Andrz. cruc. in D. C. syst. 2. p. 308.) stems suffruticose, erect, and are as well leaves hoary; lower leaves obovate, upper ones oblong-linear; racemes simple; pods elliptical, grey, with somewhat convex valves. ♄. H. Native of Eastern Caucasus and Tauria among broken stones. A. alpéstre, Bieb. An intermediate plant betwen *A. Atlánticum* and *A. alpéstre*.

Marschall-Bieberstein's Adyseton. Fl. May, Jul. Clt. 1817. Pl. ½ foot.

18 A. LENE'NSE (Adams, mem. soc. nat. mosc. 5. p. 110.) stems somewhat herbaceous, diffuse, and are as well as the imbricated lanceolate leaves grey or hoary; racemes simple, short; pods ovate, emarginate, pubescent. ♃. H. Native of Siberia on the banks of the river Lena, about Yachutzk. A. imbricàtum, Schlecht. in herb. Willd. Petals obovate, emarginate.

Lena Adyseton. Pl. ½ foot.

19 A. LANI'GERUM (D. C. syst. 2. p. 308.) stems suffruticose at the base, tufted, and are as well as obovate leaves woolly; racemes corymbose; pods elliptical, velvety, nearly equal in length with the style. ♄. H. Native of Persia between Kermancha and Amadan. Flowers small; petals obovate.

Wool-bearing Adyseton. Pl. ½ foot.

20 A. MONTA'NUM (Lin. spec. 907.) stems rather herbaceous, diffuse, pubescent; leaves somewhat hoary, lower ones obovate, upper ones oblong; racemes simple; pods orbicular and somewhat emarginate, grey. ♃. H. Native nearly throughout all Europe on hills and low mountains in calcareous situations exposed to the sun. Jacq. vind. 358. Curt. bot. mag. t. 419. Jacq. fl. aust. t. 37. Clypèola montàna, Crantz. austr. 19. Petals twice the length of the calyx.

Var. β, albéscens (Schlecht. in herb. Willd.) A. montànum, Bieb. fl. taur. 2. p. 104. Plant larger and flowers smaller.

Var. γ, arenàrium (Lois. fl. gall. p. 401.) leaves rounder.

Mountain Adyseton. Fl. May, Sept. Clt. 1713. Pl. ⅛ ft.

21 A. CUNEIFO'LIUM (Ten. fl. nap. prod. p. 37. app. cat. neap. 1815. p. 58.) stems somewhat herbaceous, diffuse; pubescent; leaves rather hoary, obovately-cuneated; corymbs simple; pods ovate, somewhat emarginate, nearly equal in length with the style. ♃. H. Native of Abruzzo in Naples, on the tops of the mountains. Easily confounded with *A. montànum*.

Wedge-leaved Adyseton. Fl. May, Aug. Clt. 1820. Pl. ¼ ft.

22 A. DIFFU'SUM (Ten. app. hort. neap. 1815. p. 58.) stems somewhat herbaceous, diffuse, grey; leaves hoary, lower ones somewhat obovate, the rest linear-lanceolate, narrowed at both ends; racemes simple; pods ovate, somewhat emarginate, nearly equal in length with the style. ♃. H. Native of Naples with the preceding. Very like the preceding.

Diffuse Adyseton. Fl. May, Aug. Clt. 1825. Pl. ¼ foot.

23 A. WULFENIA'NUM (Willd. enum. suppl. 44.) stems somewhat herbaceous, diffuse, grey; leaves dotted, grey, narrowed at the base, lower ones obovate, upper ones lanceolate; racemes simple; pods elliptical, somewhat emarginate, twice the length of the style. ♃. H. Native of Carinthia on mountains. Differs

from *A. montànum*, to which species it is nearly allied in the pods being elliptical, not orbicular.

Wulfen's Adyseton. Fl. May, Sept. Clt. 1821. Pl. $\frac{1}{4}$ foot.

24 A. Sibi'ricum (Willd. spec. 3. p. 465.) stems herbaceous, ascendant, branched at the top, corymbose; leaves and pods obovate, blunt, dotted with stellate hairs; style 3-times shorter than the pod. ♃. H. Native of Siberia. Flowers small.

Siberian Adyseton. Pl. $\frac{1}{4}$ foot.

25 A. fischeria'num (D. C. syst. 2. p. 311.) stems herbaceous, ascendant, and are as well as the leaves grey, lower leaves obovate, upper ones oblong; racemes simple; pods orbicular, hoary, twice the length of the style. ♃. H. Native of Siberia about Nerschtinsky-savod. Petals double the length of the calyx.

Fischer's Adyseton. Pl. $\frac{1}{4}$ foot.

26 A. gnaphalo'des (D. C. syst. 2. p. 311.) stems suffruticose, dwarf; leaves elliptical, covered with velvety down, those of the branches linear; racemes simple; calyx closed, longer than the pedicel; pods elliptical, velvety, twice the length of the style. ♄. H. Native of Persia on Mount Elwend. Petals obovate, with filiform claws.

Woolly Adyseton. Fl. May, Oct. Pl. $\frac{1}{2}$ foot.

27 A. petalo'des (D. C. syst. 2. p. 312.) stems suffruticose, erectish, hairy; leaves oblong, narrowed at the base, hairy, lower ones toothed; racemes simple; calyx closed, longer than the pedicel; pods ovate, with a velvety margin. ♄. H. Native of Syria. Claws of petals longer than the calyx.

Long-clawed-*petalled* Adyseton. Fl. May, Aug. Pl. $\frac{1}{4}$ foot.

Sect. II. Odontoste'mon (from *οδους οδοντος, odous odontos*, a tooth; *στημων, stemon*, a stamen; each large stamen furnished with one tooth). Flowers white. Larger stamens furnished with a tooth. Stems herbaceous. This section may probably form a distinct genus.

28 A. hyperbo'reum (Lin. spec. 910.) stems herbaceous, tufted; leaves elliptical, grossly and acutely toothed, rather hairy; pods elliptical. ♃. H. Native of the western coast of North America among rocks. Dràba hyperbòrea, Desv. journ. bot. 3. p. 172. Krasch. nov. comm. acad. Petrop. 1. ann. 1750. p. 388. t. 15. f. 1. A tufted, somewhat glaucous plant with the habit of Neurolòma arabiflòrum. Petals white, with yellow claws. Seed kidney-shaped, margined, 3 in each cell.

Northern Adyseton. Fl. April, May. Pl. 2 inches.

† *Species not sufficiently known.*

29 A. obcorda'tum (D. C. syst. 2. p. 324.) leaves linear-lanceolate, toothed, woolly-pubescent; pods smooth, roundish-obcordate. Native? Aurìnia obcordàta, Desv. journ. 3. p. 162. & 174. Seeds girded with a broad membrane, only one in each cell.

Obcordate-podded Adyseton. Pl. $\frac{1}{2}$ foot.

30 A. denta'tum (Nutt. gen. amer. 2. t. 63.) radical leaves somewhat runcinately-toothed; cauline ones linear-lanceolate; pods elliptical, pubescent. ♃. H. Native of Virginia near Harper's Ferry, on declivities of slate rocks. Dràba arabìsans, Pursh, fl. amer. sept. 2. p. 434. but not of Mich. Flowers unknown.

Toothed-leaved Adyseton. Pl.?

31 A.? du'bium (Bory. ann. sc. phys. 3. p. 4.) stem shrubby, branched; leaves obovate-lanceolate, downy; pods ovate, acute, 1-seeded. ♄. H. Native of Spain among the rocks of Sierra Nevada. A. purpùreum, Lag. ann. 5. p. 275.

Doubtful Adyseton. Pl. 2 or 4 inches.

Cult. The whole of the species of *Adysèton* are very proper for ornamenting rock-work, or the front of flower-borders. Some of the rarer species may be kept in pots, and placed among other alpine plants. They may be increased by cuttings, planted under a hand-glass, or by dividing the plants at the roots as well as by seed. A dry light soil suits them best.

XXVI. ALY'SSUM (from α, priv. and λυσσα, *lyssa*, rage; the *Alỳssum* passed among the ancients as a plant possessed of properties of allaying anger). R. Br. in app. to Denh. and Clapp. trav. p. 6. Alyssum spec. Lin. D. C. syst. 2. p. 301. prod. 1. p. 162.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle roundish, with the valves convex in the disk, retuse at the apex; cells 2-seeded. Seeds girded by a membranous wing. Funicle adhering to the dissepiment, permanent. Petals emarginate. Stamens all or some of them toothed. Annual branched herbs, grey from stellate down. Racemes terminal. Flowers small, yellow.

1 A. umbella'tum (Desv. journ. bot. 3. p. 173. and 184.) stem diffuse, leaves linear, rather hairy; racemes somewhat umbellate; pods elliptical, pilose with stellate hairs. ⊙. H. Native of Tauria in gravelly places. A. brachystàchyum, Bieb. suppl. 434. Flowers small, sulphur-coloured.

Umbellate-racemed Madwort. Fl. Ju. Jul. Clt. 1817. Pl. $\frac{1}{4}$ ft.

2 A. rostra'tum (Stev. mem. acad. petersb. 3. p. 295. t. 15. f. 1.) stem erect; floriferous branches panicled; leaves lanceolate, rather hairy; pods orbicularly-elliptical, pilose, grey, hardly longer than the style, disposed in long racemes. ⊙. H. Native of Bessarabia, on the edges of fields about Bender; on the calcareous rocks at the river Tyra; about Odessa, and in the mountains of Tauria. Petals spatulate, dark yellow, twice the length of the calyx.

Var. β, A. vernàle; Kit. from Horn. hort. hafn. p. 601. leaves linear, about a line in breadth.

Beaked Madwort. Fl. May, Jul. Clt. 1818. Pl. $\frac{1}{2}$ to 1 ft.

3 A. micrope'talum (Fisch. in D. C. syst. 2. p. 313.) stem erect; leaves lanceolate, hairy; pods hairy, orbicular, twice as long as the style, disposed in long racemes. ⊙. H. Native of Iberia near Tiflis. Deless. icon. sel. 2. t. 39. A. parviflòra, Bieb. suppl. p. 434.

Var. β, procúmbens (Bieb. l. c.) stems diffuse, procumbent, and much smaller.

Small-petalled Madwort. Fl. May, Jul. Clt. 1820. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ ft.

4 A. hirsu'tum (Bieb. fl. taur. 2. p. 106.) stem erect; leaves lanceolate, hairy; pods orbicular, tuberculately-hairy, thrice as long as the style, disposed in long racemes. ⊙. H. Native of Tauria and Iberia in dry fields. A. Dràba, Willd. enum. p. 672. Very like *A. campéstre*. Deless. icon. sel. 2. t. 40.

Hairy Madwort. Fl. May, Jul. Clt. 1817. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

5 A. campe'stre (Lin. spec. 909.) stems diffuse; leaves lanceolate or somewhat linear, hairy; pods orbicular, tubercularly-hairy, six times longer than the style, disposed in long racemes. ⊙. H. Native of Spain, Tauria, south of France, Vallais, Italy, Transylvania, Greece, &c. in sandy fields. Smith, fl. græc. t. 626. Mœ'nchia campéstris, Roth. fl. germ. 1. p. 274. Petals longer than the calyx, somewhat emarginate.

Var. β, simplex (Rud. in Schrad. journ. 2. p. 291.).

Field Madwort. Fl. June, Aug. Clt. 1768. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

6 A. calyci'num (Lin. spec. 908.) stems diffuse; leaves linear-lanceolate, canescent; calyx permanent; pods orbicular, somewhat emarginate, downy, 4-times as long as the style. ⊙. H. Native in dry fields both in South and middle Europe. Jacq. vind. 114. fl. austr. t. 338. A. alyssoides, Gouan. hort. 321. A. campéstre, Hoffm. germ. 4. p. 43. Schkuhr. handb. 2. t. 181. Petals, when old, whitish.

Large-*calyxed* Madwort. Fl. June, Aug. Clt. 1740. Pl. $\frac{1}{2}$ ft.

7 A. minu'tum (Schlecht. in herb. Willd. from Steven. D. C. syst. 2. p. 316.) stems erectish, somewhat hispid; radical leaves oval, stalked, cauline ones oblong-linear; calyx pilose, slowly

deciduous; pods ovate-orbicular, smooth. ⊙. H. Native of Siberia on rocks. Flowers small; petals almost linear.

Minute Madwort. Fl. May, June. Clt. 1827. Pl. 1 inch.

8 A. mi'nimum (Willd. spec. 3. p. 464. exclusive of Lin. syn.) stems diffuse; leaves linear-lanceolate, hoary; pods orbicular, emarginate smooth. ⊙. H. Native in dry sandy fields and on hills about Vienna, also of Podolia, and Tauria, &c. Tratt. thes. p. 8. t. 35. Very like *A. calycìnum*, but the calyx is deciduous.

Smallest Madwort. Fl. April, May. Clt. 1791. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

9 A. glomera'tum (Burch. cat. geog. pl. afri. austr. extratrop. no. 1204.) stems ascendant; leaves lanceolate, blunt, villous; racemes crowded; calyx permanent; pods orbicular, smooth. ⊙. H. Native of the Cape of Good Hope in Rogeweld, near Riet river. Petals oblong, a little longer than the calyx.

Glomerate-racemed Madwort. Pl. $\frac{1}{4}$ foot.

10 A. densiflo'rum (Desf. cor. Tourn. p. 65. t. 48.) leaves narrow-lanceolate; flowers crowded into dense cylindrical racemes; pods orbicular, pubescent, 1-2-seeded. ⊙. H. Native of Armenia. Flowers small, white.

Dense-flowered Madwort. Pl. $\frac{3}{4}$ foot.

11 A. stri'ctum (Willd. spec. 3. p. 464.) leaves linear-lanceolate, downy; flowers crowded into dense cylindrical racemes; pods elliptical, downy. ⊙. H. Native of Armenia. Differing from *A. densiflòrum*, in the pods being elliptical and downy, not orbicular, and pubescent.

Upright Madwort. Pl. $\frac{1}{4}$ foot.

12 A. strigo'sum (Russ. in Schrad. journ. 1. p. 426.) stems herbaceous, hispid with starry hairs; leaves obovate, entire; calyx permanent. ⊙. H. Native about Aleppo.

Strigose-stemmed Madwort. Pl. $\frac{1}{4}$ foot.

13 A. fulvescens (Smith. prod. fl. græc. 2. p. 13.) stems ascendant; radical leaves stalked, obovate, grey, upper ones oblong; calyx permanent; pods ovate-globose, smooth. ⊙. H. Native of the Morea and in the islands of Cyprus and Scio. Petals obcordate, when dry brownish.

Brownish-petalled Madwort. Pl. $\frac{1}{4}$ foot.

Cult. Inconspicuous annual plants, the seed of which will grow under any circumstances and in any kind of soil.

XXVII. ANODO'NTEA (from *a, priv. οδους οδοντος, odous odontos*, a tooth; stamens without teeth). D. C. syst. 2. p. 317. prod. 1. p. 163. as a section of *Alýssum*.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle ovate, roundish or obovate, somewhat inflated, with convex valves, crowned by the permanent style; cells 1-2-seeded (f. 46. *h.*). Seeds girded by a membranous wing. Petals obovate, entire, or bifid. Stamens all toothless. Annual herbs or sub-shrubs, hoary from stellate down. Flowers yellow or white, racemose. The authorities given for the species are under *Alýssum*.

Sect. I. Vesica'ria (*vesica*, a bladder; inflated pods). Flowers yellow. Silicles somewhat inflated. Species intermediate between *Adysèton* and *Vesicària*. Annual or biennial plants.

1 A. ede'ntula (Waldst. et Kit. hung. 1. p. 95. t. 92.) stem erect; leaves oblong, somewhat sinuated, velvety, upper ones linear; calyx spreading; petals bifid; pods ovate, smooth. ♂. H. Native of Bosnia on calcareous rocks. Vesicària edéntula, Poir. dict. 8. p. 572. Petals twice as long as calyx, bifid at the top. Seeds 2 in each cell.

Toothless-stamened Anodontea. Fl. Ju. Jul. Clt. 1819. Pl. 1 ft.

2 A. dasyca'rpa (Steph. in Willd. spec. 3. p. 469.) stems erect; leaves oblong, canescent; pedicels shorter than the calyx; pods nearly double the length of the style. ⊙. H. Native of Siberia at the rivers Kuma and Volga, at lake Inderkoi, and also about Astracan. Vesicària dasycárpa, Poir. dict. 8. p. 571. A. Sibíricum, Trev. in ges. nat. fr. berl. mag. 1816. p. 151. t. 2. f. 14. et 17. but not of Willd. Flowers small, yellowish.

Thick-podded Anodontea. Fl. Jul. Clt. 1820. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

Sect. II. Lobula'ria (D. C. syst. 2. p. 318. prod. 1. p. 164.) Flowers white. Seeds usually solitary in the cells. Stems fruticulose, at least at the base.

3 A. rupe'stris (Tenore, fl. nap. t. 60.) stem suffruticose at the base, rather erect; radical leaves oblong-lanceolate, acute, silvery, cauline ones few, linear; pods obovate, flocculose, mucronated with a short style. ♄. H. Native of the south of Italy on rocks. Flowers larger than those of *Konìga marítima*.

Rock Anodontea. Fl. May, Sept. Clt. 1824. Pl. $\frac{1}{2}$ foot.

4 A. arena'ria (Presl. ex. Spreng. syst. app. p. 239. under Alyssum.) stem suffruticose, procumbent; leaves linear-lanceolate, acute, rather hoary; silicles elliptical, somewhat inflated, rather pilose, 1-seeded, mucronate by the short style. ♄. H. Native of Sicily.

Sand Anodontea. Fl. June, July. Pl. procumbent.

5 A. halimifo'lia (Willd. spec. 3. p. 460.) stems suffruticose, ascendant; leaves oblong, blunt, narrowed at the base, covered with scaly hairs; pods orbicular, smooth, twice as long as the style. ♄. H. Native of Italy, Piedmont, about Nice, &c. on rocky mountains exposed to the sun. Lunària halimifòlia. All. ped. no. 900. t. 54. f. 1.—Bocc. mus. 45. t. 39. Flowers like those of *A. spinòsum*.

Halimus-leaved Anodontea. Fl. Ju. Sept. Clt. 1820. Pl. $\frac{1}{2}$ ft.

6 A. spino'sa (Lin. spec. 907.) stem shrubby, old branches and peduncles spiny; leaves oblong-linear, silvery; pods orbicular, smooth, terminated by the short style. ♄. F. Native of Arragon and south of France on calcareous rocks exposed to the sun.—Barrel. icon. t. 808. Dràba spinòsa, Lam. fl. fr. 2. p. 461. Flowers a little larger than those of *Konìga marítima*. Seeds 2 in each cell. A little tufted shrub.

Spiny Anodontea. Fl. June, Aug. Clt. 1683. Pl. $\frac{1}{2}$ foot.

7 A. macroca'rpa (D. C. syst. 2. p. 321.) stem shrubby; branched, somewhat spiny; leaves oblong, blunt, silvery; pods obovate-orbicular, somewhat emarginate, smooth, pointed with the style, containing 8 ovula (f. 46. *h.*). ♄. H. Native of the south of France, especially in the Cevennes, on calcareous rocks. Very like *A. spinòsa halimifòlia* and *A. Pyrenaìca*, but different. Deless. icon. sel. 2. t. 41. Seeds 2 in each cell.

Large-podded Anodontea. Fl. Ju. Sept. Clt. 1828. Pl. $\frac{3}{4}$ ft.

8 A. Pyrena'ica (Lapeyr. abr. pyr. 371. suppl. 91.) stem shrubby, branched, not spiny; leaves obovate, narrowed at the base, hoary; pods elliptical, rather villous, pointed with the style. ♄. F. Native of the Eastern Pyrenees on rocks, particularly on Mount Conat, about Font de Combs. A. halimifòlium *β*, D. C. fl. fr. 5. p. 594.

Pyrenean Anodontea. Fl. June, Aug. Pl. $\frac{3}{4}$ foot.

9 A. cane'scens (D. C. syst. 2. p. 322.) stem shrubby, ascendant; leaves oblong-linear, hoary; pods elliptical, velvety, crowned with the long style. ♄. F. Native of Siberia, Tauria, Kamtschatka, on rocky mountains.

Var. a, abbreviàta (D. C. syst. l. c.) racemes short, corymbose. A. montànum and A. minùtum, Patrin. herb.

Var. β, elongàta (D. C. syst. l. c.) racemes more elongated. Leaves more hairy. A. Daùricum. Schlecht. in herb. Willd.

Canescent Anodontea. Fl. April, Sept. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

10 A. tenuifo'lia (Steph in Willd. spec. 3. p. 460.) stem fruticulose, erect; leaves linear, acute, clothed with starry villi; pods oval, hairy, crowned by the style. ♄. F. Native of Siberia about Doroninsk. Petals obovate, blunt, spreading, with filiform claws.

Slender-leaved Anodontea. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. The whole of the species of this genus are very proper

for ornamenting rock-work or the front of flower-borders; they are all very easily increased by seeds, which ripen in abundance. The shrubby kinds are also easily increased by dividing the plants at the root or by cuttings planted under a hand-glass, which root readily. The annual sorts should be sown in the open border or on rock-work.

XXVIII. DISCO'VIUM (from *δισκος, discos*, a disk; valves of pods keeled, in the disk?) Rafin. in journ. phyt. vol. 89. anno. 1819. p. 96. D. C. prod. 1. p. 236.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle lenticular with an entire dissepiment and keeled valves; cells many-seeded. Style permanent, crowned by a blunt stigma. Calyx closed. An annual, erect, simple slender herb, with distant sessile, oblong, obtuse, entire leaves. Petals yellow, entire, wedge-shaped, about equal in length with the calyx. An intermediate genus between *Alýssum* and *Thláspi.*

1 D. Ohiote'nse (Rafin. l. c.) ⊙. H. Native of North America, on the banks of the Ohio.

Ohio Discovium. Pl. $\frac{1}{2}$ foot.

Cult. An inconspicuous annual plant, the seed of which only require to be sown in the open border.

XXIX. MENIO'CUS (from *μηνη, mene*, the moon, and *οκκος, okkos*, an eye; shape of seeds?) Desv. journ. bot. 3. p. 173. D. C. syst. 2. p. 325. prod. 1. p. 165.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle sessile, elliptical, with flat valves. Seeds not margined, 6 or 8 in each cell. Calyx at the base equal. Petals entire. Larger stamens toothed. An annual herb, but nevertheless it is frutescent at the base; much branched, erect, greyish-velvety from stellate short hairs. Leaves linear, entire. Racemes terminal; pedicels filiform, bractless. Flowers small, white. This genus is hardly distinct from *Adysèton*, unless that there are never fewer than 6 seeds in each cell, not 2 or 4 as in that genus, and with smooth silicles.

1 M. linifòlius (D. C. syst. 2. p. 325.) leaves linear, bluntish, quite entire. ⊙. H. Native about Astracan among rubbish, and in cultivated land; in Tauria and Caucasus, near Tanaim; in Syria, between Aleppo and Mossul; in Podolia and Illyria; in Spain, in the province of Valentia, in several places, &c. Deless. icon. sel. 2. t. 42. Alýssum linifòlium, Steph. in Willd. spec. 3. p. 467. A. mínimum, Pall. itin. 3. p. 741. Meniòcus serpyllifòlius, Desv. l. c. A. Dràba, Bieb. from Desv. journ. l. c. A. Illýricum, Willd. enum. suppl. p. 44. A. linearifòlium, Lag. elench. hort. madr. 1815. p. 9. Farsètia linifòlia, Andrz. cruc. ined. Petals white, a little longer than the calyx.

Flax-leaved Meniocus: Fl. May, Jul. Clt. 1819. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

Cult. This little annual will answer well for rock-work, where the seeds should be sown.

XXX. CLYPE'OLA (from *clypeus*, a buckler; in allusion to the form of the silicles.) Gært. fruct. 2. p. 283. t. 141. f. 6. D. C. syst. 2. p. 326. prod. 1. p. 165. Clypèola spec. Lin. and Juss.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle orbicular, 1-celled, 1-seeded, with flat valves. Calyx equal at the base. Petals entire. Stamens toothed. Seeds compressed. Small annual herbs with the habit of *Alýssum* and *Biscutélla*, erect or diffuse, greyish from short stellate hairs. Leaves oblong-linear, entire. Racemes terminal, erect; pedicels filiform, short, bractless. Flowers small, yellow, or when old, whitish.

Sect. I. Ionthla'spi (from *ιον, ion*, a violet, and *θλαω, thlao*, to compress; that is to say, flat-seeded violet.) D. C. syst. 2. p. 326. prod. 1. p. 165. Silicles with ciliated margins, and smooth or pubescent disks.

1 C. Ionthla'spi (Lin. spec. 910.) stems diffuse, or ascendant. ⊙. H. Native of Spain; south of France; Avergne; Lower Vallais; Italy; Sicily; Arcadia; Iberia, near Tiflis; and in Persia, near Lenckeran, &c. &c.: growing on walls and in sandy places; also on gypsaceous and calcareous sterile hills. Cav. icon. 1. p. 22. t. 32. f. 2. Boiss. fl. europ. t. 455. Desv. journ. bot. 3. p. 161. t. 25. f. 7. Lam. ill. t. 560. f. 1. Fosselìnia ionthláspi, All. ped. no. 901. Clypèola monospérma, Lam. fl. fr. 2. p. 462 and 484. Alýssum ionthláspi, Clairv. herb. val. 216. Flowers small, yellow. Ovary 1-seeded.

Flat-seeded Violet, or Common Treacle-Mustard. Fl. May, Jul. Clt. 1710. Pl. 2 or 3 inches.

Sect. II. O'rium (from *ora*, a brim or margin; silicles toothed on the margins.) D. C. syst. 2. p. 327. prod. 1. p. 165. Silicles with toothed margins, and clothed with long, soft hairs.

2 C. erióphora (Cav. from Lag. in litt. D. C. syst. 2. p. 327.) stem erect, almost simple; calyx permanent. ⊙. H. Native of Spain, on hills, at Aranjuez. O'rium lanuginòsum, Desv. journ. bot. 3. p. 162. t. 25. f. 10. Alýssum erióphorum, Pourr. in Willd. enum. 2. p. 671. Vesicària lanuginòsa, Poir. dict. 8. p. 572. Flowers small, when dry, whitish. Petals spreading, permanent, hardly longer than the calyx.

Wool-bearing-Treacle-Mustard. Fl. May, Jul. Clt. 1820. Pl. $\frac{1}{2}$ foot.

Sect. III. bergere'tia (John Pyramus Bergeret, who wrote a Flora of the Pyrenees.) D. C. syst. 2. p. 328. prod. 1. p. 165. Silicles with toothed margins, and echinated disks.

3 C. echina'ta (D. C. syst. 2. p. 328.) stem erect; calyx deciduous. ⊙. H. Native of the Levant. Clypèola lasiocárpa, Pers. ench. 2. p. 193. Bergerètia echinàta, Desv. journ. bot. 3. p. 161. t. 25. f. 9. Flowers small, yellow. Pods 1-seeded.

Var. β, ramosissima (D. C. l. c.) stem much branched; leaves oblong, covered with short stellate hairs.

Echinated-podded Treacle-Mustard. Fl. May, Jul. Pl. $\frac{1}{4}$ foot.

Cult. These are pretty little curious annual plants; well adapted for rock-work, or the front of flower borders. They only require to be sown where they are intended to remain.

XXXI. PELTA'RIA (from *πελτη, pelte*, a small buckler; in allusion to the form of the silicles.) Lin. gen. no. 1083. Gært. fruct. 2. p. 383. t. 141. Desv. journ. bot. 3. p. 161. t. 24. D. C. syst. 2. p. 328. prod. 1. p. 166. Bohátschia, Crantz, aust. p. 5. t. 1. f. 1.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle orbicular, 1-celled, 1-(f. 46. *i.*) 4-seeded, with flat valves. Calyx equal at the base. Petals entire. Stamens toothless. Seeds pendulous, and often solitary from abortion. Smooth, erect, perennial herbs, with stalked, ovate, entire, radical leaves, and sessile sagittate stem-clasping, cauline ones. Racemes many, almost disposed in corymbs; pedicels bractless, filiform, erect, at the time of flowering, and when in fruit spreading or somewhat recurved. Flowers small, white.

1 P. allia'cea (Lin. spec. 910.) stem-leaves sagittate, stem-clasping; pods flat, smooth. ♃. H. Native of Austria, Croatia, Transylvania, and Piedmont about Fenestrelles, &c. in shady places. Jacq. fl. aust. t. 123. Boiss. fl. eur. t. 446. Clypèola alliàcea, Lam. dict. 2. p. 55. Clypèola perénnis, Ard. spec. 26. t. 6. The whole plant when bruised smells strongly of garlic.

Garlic-scented Peltaria. Fl. May, Jul. Clt. 1601. Pl. 1 to 2 ft.

2 P. angustifòlia (D. C. syst. 2. p. 329.) lower stem-leaves

stalked, upper ones linear; pods flat, short. ♃. H. Native about Damascus, on a mountain called Dgebel-cher. Pods ovate-orbicular, compressed, 2-ovulate, 1-seeded from abortion.

Narrow-leaved Peltaria. Fl. May, July. Pl. 1 foot.

3 P. GLASTIFÒLIA (D. C. syst. 2. p. 330.) cauline leaves sagittate, stem-clasping; pods flattish, rather rough, leathery. 1-seeded (f. 46. *i.*). ⊙.? H. Native of Syria, between Aleppo and Mossul.

Woad-leaved Peltaria. Fl. Jun. Jul. Clt. 1823. Pl. 1 foot.

Cult. The species of this genus will thrive well in any common garden soil; they are readily increased by seeds.

XXXII. PETROCA'LLIS (from *πετρον*, *petron*, a rock, and *καλος*, *kalos*, beautiful; in allusion to the plant growing on the rocks, which it enlivens with the beautiful tufts of rose-coloured blossoms.) R. Br. in hort. kew. ed. 2. vol. 4. p. 93. D. C. syst. 2. p. 330. prod. 1. p. 166.

LIN. SYST. *Tetradynàmia*, *Siliculòsa*. Silicle sessile, oval, with flattish valves. Seeds not margined, 2 in each cell. Funicles adhering to the dissepiment. Cotyledons oval, obliquely accumbent. A small ever-green, branched, tufted herb. Leaves cuneated at the base, but cleft at the apex into 3-5 divisions. Racemes short, somewhat corymbose, few-flowered, bractless. Flowers rose-coloured. Plant having the appearance of a species of *Saxífraga* when not in flower.

1 P. PYRENA'ICA (R. Br. l. c.) ♃. H. Native of the Pyrenees, Provence, Piedmont, Switzerland, Austria, Transylvania, Carniola, and many other parts of the south of Europe, on rocks, between stones, in places exposed to the sun at the height of 2100 and 4100 feet. Lod. bot. cat. t. 635. Sweet, brit. fl. gard. icon. Dràba Pyrenàica, Lin. spec. 896. Jacq. fl. aust. t. 228. Curt. bot. mag. t. 713. Flowers elegant rose-coloured. Leaves cuneate, 3 or 5, cleft at top.

Pyrenean Petrocallis. Fl. May, June. Clt. 1759. Pl. ¼ foot.

Cult. This pretty little plant is well adapted for ornamenting rock-work, or it may be grown in little pots, in a mixture of peat, loam, and sand, and placed among other alpine plants. It is easily increased by seeds, or dividing the plant at the root.

XXXIII. DRA'BA (from *δραβη*, *drabe*, acrid, biting, according to Linnæus; taste of leaves. It is to be suspected that the name *Dràba* was not originally given to this genus.) D. C. syst. 2. p. 331. prod. 1. p. 166. Draba, spec. Lin. Juss. R. Br.

LIN. SYST. *Tetradynàmia*, *Siliculòsa*. Silicle sessile, oval or oblong (f. 46. *j.*), with flat or convex valves (f. 46. *j.*). Seeds many, not margined (f. 46. *j.*). Calyx equal at the base. Petals entire. Stamens all toothless. Perennial or annual branched herbs, which are sometimes tufted, sometimes elongated, smooth or pilose, or usually velvety from soft branched hairs. The leaves are either linear, oblong or ovate, entire or toothed. Racemes terminal; pedicels filiform, bractless. Flowers yellow or white.

SECT. I. AIZÒPSIS (from *αει*, *aei*, always, *ζωος*, *zoos*, *alive*, and *οψις*, *opsis*, resemblance; plants always green, like *D. Aizoon*.) D. C. syst. 2. p. 332. prod. 1. p. 166. Little evergreen, tufted, perennial plants with naked scapes, and ciliated stiff leaves. Flowers yellow, with filiform styles, which vary in length. (A proper genus, according to Andrz. in litt.)

1 D. AIZOÌDES (Lin. mant. 91.) scapes naked, smooth; leaves lanceolate-linear, keeled, ciliated; stamens about the length of the petals; style almost as broad as the pod. ♃. H. Native on walls, rocks, and gravelly places of mountains, in France, Germany, Switzerland, North of Italy, Carpathian Mountains, Transylvania, and Britain in South Wales; near Whormshead, 16 miles west of Swansea; about Pennard Castle, near Swansea, abundantly, in inaccessible spots. Jacq. fl. aust. t. 192. Smith, eng. bot. t. 1271. Dràba alpìna, Crantz, aust. 1. p. 13. Alýssum ciliàtum, Lam. fl. fr. 2. p. 479. Dràba montàna, Berg. phyt. univ. icon. Mœ'nchia aizoìdes, Roth. germ. I. p. 273.

Var. β, mìnor (D. C. syst. 2. p. 333.) distinguished by its smaller stature, very short leaves, and smooth pods. Dràba ciliàris, D. C. fl. fr. ed. 3. vol. 4. p. 697.

Var. γ, diffùsa (D. C. l. c.) stems elongated, diffuse. Dràba ciliàris, Lin. mant. 91.—Ger. gallopr. p. 344. t. 13. f. 1.

Aizoon-like or Sea-Green Whitlow-Grass. Fl. March, April. Wales. Pl. 2 or 3 inches.

2 D. BRACHYSTE'MON (D. C. syst. 2. p. 334.) scapes naked, smooth; leaves elongated, linear, keeled, ciliated; stamens hardly equal in length with the calyx. ♃. H. Native of.....? Dràba aizoìdes, Curt. bot. mag. t. 170.—Mill. icon. 1 p. 14. t. 20. f. 2. Dràba ciliàris, Lin. mant. p. 91?

Short-stamened Whitlow-Grass. Fl. March, April. Clt.? Pl. 2 or 3 inches.

3 D. AIZÒON (Wahlenb. fl. carp. p. 193. in a note.) scapes naked, smooth; leaves linear, acutish, keeled, stiff, ciliated; style as broad as the hairy pod, but one half shorter. ♃. H. Native of Bavaria, Austria, Hungary, Transylvania, and Carpathian mountains, particularly on Mount Chocsz; on rocks on the lower mountains. Dràba ciliàris, Schrank. bav. 2. p. 177. Pods the length of pedicels, always hispid with short hairs.

Aizoon or Evergreen Whitlow-Grass. Fl. April, May. Clt. 1819. Pl. ¼ foot.

4 D. CUSPIDA'TA (Bieb. suppl. 424.) scapes naked, villous; leaves linear, acutish, keeled, ciliated; pods lanceolate, hispid, a little longer than the style. ♃. H. Native of Tauria, Apennines, Spain, &c. on mountains, on rocks in places exposed to the sun. Dràba aizoìdes, Pall. ined taur. Bieb. fl. taur. 2. p. 92. but not of Lin. Dràba áspera, Bertol. amœn. ital. p. 92. but not of Adams. D. alpìna, Cav.

Pointed-leaved Whitlow-Grass. Fl. April, May. Clt. 1821. Pl. ¼ foot.

5 D. RI'GIDA (Willd. spec. 3. p. 423.) scape naked, smooth, leaves oblong, stiff, blunt, keeled, sparingly ciliated, older ones reflexed; petals length of calyx; style not equalling the breadth of the smooth pod. ♃. H. Native of Iberia, on rocks. Petals roundish, nearly the length of the calyx.

Rigid-leaved Whitlow-Grass. Fl. April, May. Pl. ¼ foot.

6 D. BRYOÌDES (D. C. syst. 2. p. 335.) scapes naked, smooth; leaves oblong, small, keeled, sparingly ciliated, much crowded; petals and stamens twice the length of the calyx; style hardly equalling the breadth of the smooth pod. ♃. H. Native of Caucasus and Iberia, in alpine, rocky situations. Dràba rígida, Bieb. fl. taur. 2. p. 93. suppl. 426. Dràba cæspitòsa, Hoffm. hort. mosc. 1808. no. 1225. not of Willd. Petals oblong, twice the length of the calyx. Plant emulating *Saxífraga bryoìdes*.

Green-Moss-like Whitlow-Grass. Fl. March, May. Clt. 1821. Pl. 2 inches.

7 D. OLY'MPICA (Sibth. in herb. Banks. D. C. syst. 2. p. 336.) scapes naked, velvety; leaves linear, keeled, much crowded, ciliated; pods ovate, hoary-villous; style very short. ♃. H. Native on Mount Olympus. Dràba Aizoìdes, Smith, prod. fl. græc. 2. p. 4. but not of Lin. Pods ovate, scarcely compressed.

Olympus Whitlow-Grass. Fl. April, May. Pl. 2 or 3 inches.

8 D. BRUNIÆFÒLIA (Stev. in mem. sc. nat. mosc. 3. p. 268.) scapes naked, pubescent; leaves linear, somewhat keeled, ciliated, acute, loosely rosulate; petals twice the length of the calyx and stamens; pods oval, pubescent; style very short. ♃. H. Native of Eastern Caucasus, on Mount Schahdagh. Petals twice the length of the calyx. Plant loosely tufted.

Brunia-leaved Whitlow-Grass. Fl. Jun. Clt. 1825. Pl. ¼ ft.

9 D. ERICÆFÒLIA (Stev. mem. sc. nat. mosc. 3. p. 268.) scapes

naked, smooth; leaves linear, somewhat keeled, ciliated? acute, loosely rosulate; petals twice the length of the calyx and stamens; pods oblong-elliptical, smooth; style very short. ♃. H. Native of Caucasus, on Mount Schadagh, among stones near the limits of snow. Very like *D. bruniæfòlia*.

Heath-leaved Whitlow-Grass. Fl. June. Clt. 1823. Pl. ¼ foot.

10 D. PILÒSA (Adams, from Fisch. in litt. D. C. syst. 2. p. 337.) scape naked, smooth, 2 or 3-flowered; leaves linear, keeled, loosely rosulate, ciliated; calyx pilose; petals twice the length of the calyx and stamens; pods roundish-ovate, smooth. ♃. H. Native of the north of Siberia, at the river Lena.

Pilose-calyxed Whitlow-Grass. Fl. May, June. Clt. 1825. Pl. ¼ foot.

11 D. A'SPERA (Adams, from Fisch. in litt. D. C. syst. 2. p. 337.) scapes naked, smooth; leaves linear, keeled, stiff, ciliated; calyx smooth; stamens hardly the length of the calyx; pods oblong; style very short. ♃. H. Native of the most northern part of Siberia, at the mouth of the river Lena. Habit of *D. aizoìdes*.

Rough-leaved Whitlow-Grass. Fl. May, June. Pl. 2 inches.

12 D. SAUTE'RI (Hopp. ex. Spreng. syst. app. 240.) leaves spatulate, stiff, ciliated; scape smooth; stamens shorter than the corolla; silicle ovate, smooth, crowned by the short style. ♃.H. Native of Switzerland on the Alps.

Sauter's Whitlow-Grass. Pl. ¼ foot.

SECT. II. CHRYSODRA'BA (from χρυσος, *chrysos*, gold, and *Dràba*; that is to say golden Drabas; flowers yellow.) D. C. syst. 2. p. 337. prod. 1. p. 167. Small perennial tufted plants with the leaves neither stiff nor keeled. Flowers yellow, with scarcely any, or very short styles. Silicles oval-oblong.

13 D. A'LGIDA (Adams, from Fisch. in litt. D. C. syst. 2. p. 337.) scapes naked, pilose; leaves oblong, flat, and are pilose with simple hairs, as well as calyxes; pods oblong; style very short; stigma 2-lobed. ♃. H. Native of the north of Siberia; on the shores of the Icy-Sea towards the mouth of the river Lena, and the Bay of St. Laurence. Habit of *Dràba alpìna*, but from it, as well as all the rest of the *Chrysodrabas*, it differs in the hairs being simple, not branched; it is also sometimes smooth.

Var. β, subcarinàta (D. C. syst. l. c.) middle nerve of leaves rather prominent on the under surface.

Var. γ, brachycárpa (D. C. l. c.) pods ovate, shorter.

Algid Whitlow-Grass. Pl. ¼ foot.

14 D. ALPI'NA (Lin. spec. 896. exclusive of the synonyms.) scapes naked, pubescent; leaves lanceolate, flat, pilose with branched hairs; pods oblong; style very short. ♃. H. Native of Lapland, on dry rocks in the Alps, and of Norway in the Alps about Dover; also of North-America, in the Bay of St. Laurence, and the island of St. Laurence. Wahl. fl. lapp. p. 173. no. 316. t. 11. f. 4. Œder. fl. dan. t. 56. Flowers golden yellow, a little smaller than those of *Dràba aizoìdes*. The middle nerve of the leaf in the American plant runs even to its apex, with one tooth on each side, which is not the case in the European plant. Perhaps a distinct species.

Alpine Whitlow-Grass. Fl. April, May. Clt. 1816. Pl. 3 inch.

15 D. GLACIA'LIS (Adams, mem. soc. nat. mosc. 5. p. 106.) scapes naked, covered with starry pubescence; leaves linear-lanceolate, entire, hispid with stellate hairs; pods ovate, smooth; stigma almost sessile. ♃. H. Native of Siberia, at the shore of the Icy Sea, at the promontory called Bykofskoy-mys, and at the river Lena, not far from a place called Shigansk. Differing from *D. a'lgida*, to which it is nearly allied, by the leaves being narrower, pods ovate, and the calyx more villous.

Icy Whitlow-Grass. Fl. May, June. Clt. 1825. Pl. 2 inches.

16 D. RE'PENS (Bieb. fl. taur. 2. p. 93. exclusive of the synonyms of Gmelin. suppl. p. 427.) scapes naked, smoothish; leaves lanceolate, entire, pilose with 2-parted appressed hairs; runners creeping; pods oblong, smooth. ♃. H. Native of Iberia in meadows, between the towns Kasbeck and Koby, also on the Caucasian Alps. Petals obovate, blunt, twice the length of the smooth calyx.

Creeping Whitlow-Grass. Fl. May, Ju. Clt. 1825. Pl. ¼ foot.

17 D. GMELI'NI (Adams in mem. soc. nat. mosq. 5. p. 107.) scapes naked, somewhat hispid; leaves lanceolate, hispid, pilose with stellate hairs; runners not creeping; pods oblong, smooth. ♃. H. Native of Siberia, from the river Yenessei to the eastern sea even to the banks of the river Lena about Shigansk; also on the Ural mountains.—Gmel. sib. 3. p. 255. t. 56. This species is very like *D. repens*, and is sometimes confused with it.

Var, β, porrécta (Trin.) runners very long, but not rooting.

Var. γ, cæspitòsa (Willd. herb.) runners shorter, but the scapes are longer.

Gmelin's Whitlow-Grass. Fl. May, June. Clt. 1823. Pl. ¼ foot.

18 D. TRIDENTA'TA (D. C. syst. 2. p. 339.) scapes naked, smooth; leaves obovate, narrowed at the base into the petiole, 3-toothed at the apex, hairy; pods oblong, smooth. ♃. H. Native of the Alps of Caucasus. D. híspida, Bieb. fl. taur. 2. p. 94. exclusive of the synonyms, suppl. p. 428. About the height of *D. rèpens*, but it is destitute of runners. Differing from *D. híspida* by its larger stature and flowers, and longer pods.

Three-toothed-leaved Whitlow-Grass. Pl. ¼ foot.

19 D. HÍSPIDA (Willd. spec. 3. p. 426.) scapes naked; leaves obovate, somewhat toothed, hispid from bifid hairs; pods oval. ♃. H. Native of Cappadocia. Petals yellow, twice the length of the calyx. Style very short. Plant with the habit of *Erópphila vérna*.

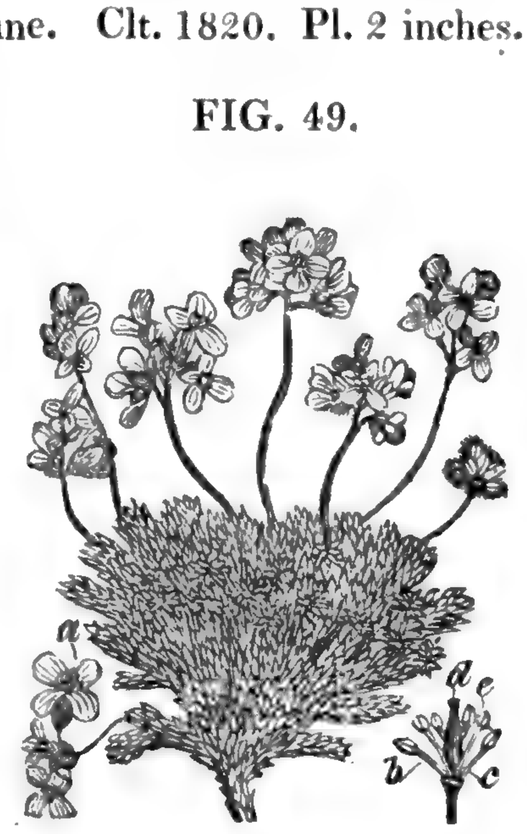
Hispid Whitlow-Grass. Pl. 2 inches.

20 D. INCO'MPTA (Stev. in mem. soc. mosc. 3. p. 268.) scapes velvety, 3-times longer than the leaves; leaves oblong, greyish-velvety from starry-hairs; pedicels shorter than the flowers. ♃. H. Native of the Eastern Caucasus on rocks on Mount Tyfendagh. Habit of *Arètia Vitaliàna*. Flowers yellow. Petals twice the length of the velvety calyx. Deless. icon. sel. 2. t. 44.

Undecked Whitlow-Grass. Fl. June. Clt. 1820. Pl. 2 inches.

21 D. MOLLI'SSIMA (Stev. in mem. soc. nat. mosc. 3. p. 268.) scapes smooth, naked, much longer than the leaves; leaves imbricate, oblong, hoary-velvety with stellate hairs; pedicels longer than the flowers. ♃. H. Native of Eastern Caucasus on Alp. Schadagh. Deless. icon. sel. 2. t. 45. Flowers yellow, about the size of those of *D. aizoìdes*. (f. 49.)

FIG. 49.



Softest Whitlow-Grass. Fl. Ju. Pl. 1 to 2 inches.

22 D. JORULLE'NSIS (H. B. et Kth. nov. spec. amer. 5. p. 78.) stem leafy, villous; radical leaves oblong-elliptical, stalked, somewhat velvety; pods elliptical, pubescent. ♃. F. Native of Mexico on the burning mount Jorullo. Petals obovate, hardly longer than the calyx.

Jorullo Whitlow-Grass. Pl. ¼ to ½ foot.

23 D. TOLUCCE'NSIS (H. B. et Kth. nov. spec. amer. 5. p. 78.) stems leafy, smoothish; radical leaves oblong, somewhat hoary; pods elliptical, smooth. ♃. F. Native of colder parts of Mexico, particularly near the town of Tolucco at the height

of 2140 feet. Very like *D. Jorullénsis.* Flowers unknown. Pods elliptical, pointed by the short style. Trunk of root woody.

Tolucco Whitlow-Grass. Pl. $\frac{1}{4}$ foot.

Sect. III. Leucodra'ba (from λευκος, *leucos*, white, and *Draba*, that is to say, *Draba* with white flowers.) D. C. syst. 2. p. 342. prod. 1. p. 168. Small perennial tufted plants, with white flowers, and blunt or emarginate petals; leaves flaccid, not stiff.

24 D. borea'lis (D. C. syst. 2. p. 342.) scape hairy, bearing 1 ovate leaf, the rest of the leaves are oblong and narrowed at the base, entire, velvety with branched hairs; pods ovate. ♃. H. Native of the island of St. Paul. Petals white, oblong-cuneated, twice the length of the calyx.

Northern Whitlow Grass. Pl. $\frac{1}{4}$ foot.

25 D. oblonga'ta (R. Br. in Ross's voy. append.) scapes naked, somewhat hairy with floccose down; leaves rosulate, oblong-linear, entire, ciliated and velvety; pods oblong-elliptical, velvety. ♃. H. Native of North America in the polar regions, particularly at Baffin's Bay. Style very short.

Oblong-podded Whitlow-Grass. Fl. May, June. Clt. 1820. Pl. $\frac{1}{4}$ foot.

26 D. corymbòsa (R. Br. in Ross's voy. append.) scapes naked, rather hispid; leaves densely rosulate, oblong, narrowed at the base, ciliated, and somewhat hispid; pods elliptical, corymbose, rather hispid. ♃. H. Native of the polar regions of North America, particularly at Baffin's Bay. Pods elliptical; Style very short, and terminated by the somewhat capitate stigma.

Corymbose Whitlow-Grass. Fl. May, June. Clt. 1820. Pl. $\frac{1}{4}$ ft.

27 D. Wormskio'ldii (Fisch. ex Spreng. syst. 2. p. 874.) leaves oblong, with one tooth on each side; scape 1-leaved, and is, as well as the leaves, beset with branched pili; flowers in corymbs; silicles oblong, smooth. ♃. H. Native in the extreme eastern parts of Siberia. Flowers white.

Wormskiold's Whitlow-Grass. Pl. $\frac{1}{4}$ foot.

28 D. murice'lla (Wahl. fl. lapp. 178. no. 318. t. 11. f. 2.) scape naked, velvety; leaves oblong, entire, greyish-velvety with stellate hairs; pods oblong-lanceolate, smooth. ♃. H. Native of Norway, Lapland, on dry hills, and perhaps on the western coast of North America and Labrador. D. hírta, Oeder. fl. dan. t. 214. D. Liljeblàdii of Wallm. D. nivàlis, Liljebl. nov. act. ups. 6. p. 47. t. 2. f. 2. Flowers small, whitish. Pods oblong-lanceolate, acute at both ends, and very smooth.

Var. β, *cæ'sia* (Adams, in mem. soc. nat. mosc. 5. p. 268.) differing from the species in the flowers being sulphur-coloured, not whitish, and with the leaves rarely toothed. ♃. H. Native of the north of Siberia at the mouth of the river Lena, at the promontory called Bykofskoy-mys.

Little-hispid Whitlow-Grass. Fl. May, Ju. Clt. 1825. Pl. $\frac{1}{4}$ ft.

29 D. hi'rta (Lin. spec. 897.) scapes puberulous, bearing 2 dentate leaves; radical leaves oblong, nearly entire, puberulous; pods oblong, and are, as well as the pedicels, smooth. ♃. H. Native of Lapland, Norway, and Greenland, on dry shaded rock in the lower mountains. Wahl. fl. lapp. p. 175. no. 319. t. 11. f. 3. A very polymorphous plant, which is often confused with *D. rupéstris.*

Var. β, *apícola* (Wahl. l. c. t. 11. f. 1.) more stiff and dwarfer habit, and the hairs are more stellate than in the other varieties. ♃. H. Native on the higher mountains of the above mentioned countries.

Var. γ, *Norvégica* (Gunn. fl. norv. 2. p. 106. no. 846.) radical leaves larger, somewhat cuneated, acute, toothed, crowded. ♃. H. Draba Pyrenàica, Oed. fl. dan. t. 143. but not of Lin. Native of the Alps of Norway, especially near Port Olaus.

Var. δ, *siliquòsa* (Cham. et Schlecht. Linnæa. 1. p. 23.) plant with a more lose habit; siliques longer. ♂. H. Native of Unalaschka. Leaves broader and more toothed. Sepals beset with simple and forked hairs towards the apex. Siliques 9-lines long.

Hairy Whitlow-Grass. Fl. May, July. Clt. 1817. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ and even $\frac{3}{4}$ foot.

30 D. rupe'stris (R. Br. in hort. kew. ed. 2. vol. 4. p. 91.) scapes puberulous, naked or bearing one leaf; leaves lanceolate, pilose, almost entire; pods lanceolate, and are, as well as the pedicels, pubescent. ♃. H. Native on rocks near the summit of Ben Lawers in Scotland, also on rocks in the mountains of Norway; North America, in the Bay of St. Lawrence, also in the islands of Unalaschka and St. Lawrence. Dràba hírta, Smith, fl. brit. 2. p. 677. engl. bot. t. 1338. but not of Lin. Dràba stellàta, With. fl. brit. 565. Pods lanceolate, hairy-pubescent with very short simple or forked hairs, sometimes but very rarely smooth.

Rock Whitlow-Grass. Fl. May, June. Scotland. Pl. 2 or 3 in.

31 D. niva'lis (Willd. spec. 3. p. 427.) scapes naked or one leaved, smooth; leaves oblong-linear, ciliated, and somewhat pilose; pods elliptic-oblong, and are, as well as pedicels, smooth. ♃. H. Native of Lapland, Norway, Switzerland, Savoy, and Dauphiny, in rocky places on the higher alps. D. stellàta, Oed. fl. dan. t. 142. Pods elliptical-oblong, quite smooth.

Snow Whitlow-Grass. Fl. April, Ju. Clt. 1820. Pl. 1 or 2 in.

32 D. Lappo'nica (Willd. herb. from Stev. obs. ined. D. C. syst. 2. p. 344.) scapes naked, very smooth; leaves lanceolate, quite entire, rather pilose; pods elliptical-oblong, and are as well as the pedicels very smooth. ♃. H. Native on rocks in the Alps of Lapland and Greenland; North America in the Bay of St. Lawrence. D. Androsàcea, Wahl. fl. lapp. 174. no. 317. t. 11. f. 5. exclusive of the synonyms. D. Wahlenbérgii, Hartm. More loose in habit than *D. nivàlis.*

Lapland Whitlow-Grass. Fl. May, Ju. Clt. 1824. Pl. 2 or 3 in.

33 D. Helve'tica (Schleich. pl. dr. Switz. D. C. syst. 2. p. 345.) scapes naked, very smooth; leaves lanceolate, ciliated; pods oval, and are, as well as pedicels, very smooth. ♃. H. Native of Switzerland near the limits of snow on the rocky top of Wendigletscher about Engelberg. D. ciliàris, Wahl. helv. p. 122. no. 671. but not of Lin.

Swiss Whitlow-Grass. Fl. May, July. Clt. 1819. Pl. 1 inch.

34 D. Fladnize'nsis (Wulf. in Jacq. misc. 1. p. 147. t. 17. f. 1.) scapes 2 or 3-leaved, smooth; leaves oblong-linear, stiffly-ciliated; pods oblong, and are, as well as the pedicels, very smooth. ♃. H. Native of Croatia, Carniolia, and Carinthia, on rocks in the higher mountains above Fladniz; also in Transylvania. D. Androsàcea, Willd. spec. 3. p. 428. D. ciliàta, Scop. carn. no. 787. t. 33. D. ciliàris, Hort. syn. 354. Flowers few, approximate; sepals green, oval.

Fladniz Whitlow-Grass. Fl. July. Clt. 1819. Pl. 1 inch.

35 D. tomentòsa (Clairv. herb. val. p. 217? Wahl. fl. helv. p. 123. no. 672. t. 3.) scape 1 or 2-leaved, velvety; leaves oval-oblong, downy with short stellate-tomentum; pedicels pubescent; pods oval, ciliated. ♃. H. Native throughout the higher Alps of Switzerland in the chinks of dry rocks on Gemmy and Stockhorm; central Pyrenees at Valley d'Aure, on the mountain called Penne-blanque; also on the tops of the Carpathian mountains at the height of 6200 feet. D. dùbia, Sut. Petals white, 3 times longer than the calyx. Pods pointed by the punctiform stigma. D. hírta, Towns. itin. hung. 490.

Tomentose Whitlow-Grass. Fl. May, Jul. Clt. 1819. Pl. 1-2 in.

36 D. chamissòni; scapes 2-3-leaved, clothed with stiff short tomentum, as well as the leaves; leaves oval-oblong; pedicels usually exceeding the length of the silicle; silicles pubescent, acute; stigma evidently 2-lobed. ♃. H. Native of North America in the island of Unalaschka and the Bay of St. Lawrence. D. stellàta, Cham. et Schlecht. Linnæa. 1. p. 22. This plant

has a much more loose habit than *D. stellàta*, with longer pedicels and longer styles.

Chamisso's Whitlow-Grass. Pl. 3 to 4 inches.

37 D. stella'ta (Jacq. vind. 113. obs. no. 54. t. 4. f. 3.) scapes 1-leaved, pubescent; leaves oval-oblong, downy with stellate short hairs; pedicels puberulous; pods oblong (f. 46. *j*.) ♃. H. Native in fissures of rocks in very high places exposed to the sun, in the Pyrenees; also in the same sort of places in the Alps of Provence, Dauphiny, Piedmont, Savoy, Switzerland, Austria, Salzburg, Styria, Transylvania, &c. &c. Deless. icon. sel. 2. t. 46. f. B. D. hírta, Jacq. austr. t. 432. D. Austrìaca, Crantz. austr. p. 12. t. 1. f. 4. Flowers very small and white. Pods oblong, usually very smooth.

Var. β, hebecárpa (D. C. syst. 2. p. 346.) pods velvety with down.

Stellate-haired Whitlow-Grass. Fl. May, July. Clt. 1819. Pl. 1 to 3 inches.

38 D. læ'vipes (D. C. syst. 2. p. 346.) scapes naked, or bearing 1 leaf, pubescent; leaves ovate, downy with short stellate hairs; pods elongated, linear, and are as well as the pedicels very smooth. ♃. H. Native of the Pyrenees on rocks. Deless. icon. sel. 2. t. 46. f. A. Very like the two preceding plants.

Smooth-pedicelled Whitlow-Grass. Fl. May. Pl. 2 inches.

39 D. siliquòsa (Bieb. fl. taur. 2. p. 94. suppl. p. 428.) scapes 2-leaved, somewhat pubescent; leaves linear-lanceolate, somewhat toothed, villous with branched hairs; pods linear, and are as well as pedicels smooth. ♃. H. Native of the Alps of Caucasus. Petals white, oblong, hardly emarginate. Pods linear.

Long-podded Whitlow-Grass. Fl. May, July. Pl. 2 inches.

40 D. la'ctea (Adams, mem. soc. nat. mosc. 5. p. 194.) scapes naked, smooth; leaves oblong-linear, acute, very entire, pilose; pods oblong-elliptic, pointed by the short style, and are as well as the pedicels smooth. ♃. H. Native of the north of Siberia on the shores of the Arctic sea, about the mouth of the river Lena. Petals cream-coloured, with short claws.

Milk-coloured-flowered Whitlow-Grass. Fl. July. Pl. 2 inch.

41 D. calyci'na (Desv. jour. bot. 3. p. 185.) scapes naked, smoothish, 1-flowered; leaves oblong, narrowed at the base, pilose, entire; pods linear, smooth. ♃. G. Native of Peru. Petals white, oblong, a little longer than the calyx. Root long, perpendicular.

Large-*calyxed* Whitlow-Grass. Pl. 2 or 3 inches.

Sect. IV. Hola'rges (meaning unknown.) D. C. syst. 2. p. 348. prod. 1. p. 170. Plants annual or biennial. Style short. Flowers white, very rarely yellow.

42 D. inca'na (Lin. spec. 897. Cham. et Schlecht. Linnæa. 1. p. 23.) stems numerous from the root, naked or clothed with the vestiges of the leaves of the preceding year, usually branched emulating stolons, terminated in a tuft of leaves at the top, from which the floriferous branches emerge; leaves elliptical, quite entire, rarely toothed, tapering into the petiole; cauline leaves ovate, acute, toothed; pods elliptical, acute at both ends, beset with simple or branched hairs. ♃. H. Native of the islands of Kamtschatka, Unalaschka, and St. Paul. Flowers white, with emarginate petals, at first corymbose, but at length racemose. Plant pubescent, when young tomentose, but when in fruit it is smooth.

Var. β, Kamtschática; plant more pubescent with starry down, mixed with larger simple hairs. ♃. H. Native of Kamtschatka. Plant more slender and more tufted. Pods narrower. Seeds elliptical, not acute.

Var. γ, Redowskiàna; plant slender, clothed with dense cinereous pubescence; siliques densely-pubescent, twisted; peduncles length of pods; stigma 2-lobed.

Hoary Whitlow-Grass. Pl. $\frac{1}{8}$ foot.

43 D. conto'rta (Ehrh. beitr. 7. p. 155.) stem leafy, branched, velvety with stellate down; leaves ovate, toothed, hoary; pods oblong, smooth, somewhat twisted. ♂. H. Native of Britain on Alpine limestone rocks, particularly on the summits of mountains in Wales, Westmoreland, and Scotland; upon the top of Ingleborough, Yorkshire; upon Ben Lawers, Loch-na-gair, and Cairn-gorm, Scotland; on heaths on the east coast of Sunderland near Wilk-house; also in the Pyrenees, Caucasus, Greenland, Unalaschka, and Labrador. D. incàna, Smith, engl. bot. t. 388. Flowers white; petals bluntly emarginate. D. incàna β, Willd. spec. 3. p. 430.

Var. β, linearifòlia (D. C. syst. 2. p. 348.) stem much branched; leaves linear, hardly toothed; pods a little longer than those of the species. ♂. H. Native of Greenland. Perhaps a proper species.

Twisted-podded Whitlow-Grass. Fl. May, June. Britain. Pl. $\frac{1}{4}$ to 1 foot.

44 D. confu'sa (Ehrh. beitr. 7. p. 155.) stem leafy, somewhat branched, velvety with short stellate down; leaves oblong, somewhat toothed, hoary; pods oblong, pubescent, longer than the pedicels. ♂. H. Native of Norway, Finmark, Sweden, Vallais, also on the Caucasian Alp called Schahdagh, and on the Altaian mountains, in dry fields and on hills. D. incàna, Fl. dan. t. 130. Differing from *D. contórta*, in the pods being terminated by a longer style, pubescent, rarely twisted.

Var. β, paucifòlia (D. C. syst. 2. p. 348.) leaves fewer on the stem. ♂. H. Native of Kamtschatka and Labrador.

Confused Whitlow-Grass. Fl. May, July. Clt.? Pl. $\frac{1}{4}$ to 1 ft.

45 D. cine'rea (Adams, mem. soc. nat. mosc. 5. p. 103.) stem simple, leafy, somewhat pubescent; leaves oblong-linear, entire; pods oblong, pubescent, shorter than the pedicels. ♂. H. Native of sterile mountainous places in the north of Siberia, at the mouth of the river Dschulamda in the Lena, near the town called Schigansk or Sayansk. Very like *D. confùsa*, but differing in the stem being more lax and weaker, and less leafy. Stem leaves 5 or 6 entire, scattered.

Cinereous Whitlow-Grass. Fl. Ju. July. Clt. 1820. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

46 D. Magella'nica (Lam. dict. 2. p. 328.) stem simple, leafy, velvety; leaves oblong, entire; pods oblong, velvety, longer than the pedicels. ♂. H. Native of the Straits of Magellan at the edges of mountain woods. Nearly allied to *D. confùsa*, but differing in the stem being simple, not branched, and in the leaves being entire, not toothed. Flowers white.

Magellan Whitlow-Grass. Fl. Aug. Dec. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

47 D. arabi'sans (Mich. fl. bor. amer. 2. p. 28.) stem leafy, somewhat branched, and rather pubescent; leaves lanceolate, acute, toothed; pods linear, smooth, longer than the pedicels. ♂. H. Native of North America on rocks by river sides. In New England and at lake Champlain. Dràba A'rabis, Pers. Habit of *A'rabis*. Pods erect, twisted, pointed by the style, about 5 lines long. A tufted plant, with short sterile stems, and elongated, flowering ones. Flowers white.

Arabis-like Whitlow-Grass. Fl. May, June. Pl. $\frac{1}{4}$ foot.

48 D. Dau'rica (D. C. syst. 2. p. 350.) stem leafy, branched, somewhat pubescent; leaves ovate, toothed, pubescent; pods oblong, smooth, longer than the pedicels. ♂. H. Native of Dauria in the mountains, called Yablonoi Chrebet. Petals white, somewhat emarginate, narrowed at the base, twice the length of the calyx. Stigma capitellate.

Daurian Whitlow-Grass. Fl. May, Ju. Clt. 1824. Pl. $\frac{1}{2}$ foot.

49 D. Unalaschkia'na (D. C. syst. 2. p. 350.) stem leafy, simple, pubescent; leaves ovate-oblong, entire, pubescent; pods oblong, hairy. ♂. H. Native of the island of Unalaschka. Petals obovate, emarginate, twice the length of the calyx. Flowers 4 or 6, disposed in a racemose-corymb. Stems rather decumbent.

Unalaschka Whitlow-Grass. Fl. May, Ju. Pl. ¼ to ½ foot.

50 D. au'rea (Vahl. from Horn. fl. œcon. ed. 2. p. 599. fl. dan. t. 1460.) stem leafy, somewhat branched, velvety; leaves oblong-linear, acute, entire, pubescent; pods linear, puberulous, twice or thrice the length of the pedicels. ♂. H. Native of Greenland. Hook. bot. mag. 2924. This is the only species in this section with yellow flowers, the rest being all white. Petals obovate, blunt, clawed.

Golden-flowered Whitlow-Grass. Fl. May, June. Clt. 1824. Pl. ½ foot.

Sect. V. Drabe'lla (a diminutive of Draba.) D. C. syst. 2. p. 351. prod. 1. p. 171. Annual or biennial plants. Style none. Flowers small, yellow, or white.

51 D. lu'tea (Gilib. fl. lith. in Ust. del. op. 2. p. 357.) stem branched, leafy, pubescent; leaves oval, denticulated, pubescent; pods elliptical-oblong, smooth, containing from 20 to 40 seeds. ⊙. H. Flowers racemose, small, yellow. Petals blunt, almost elliptical, longer than the calyx.

Var. α, brévipes (D. C. syst. 2. p. 351.) pedicels hardly twice the length of the pods. ⊙. H. Native of Armenia or Cappadocia. Dràba Póntica, Desf. cor. Tourn. p. 67. t. 51. ann. du. mus. 11. p. 381. t. 38.

Var. β, lóngipes (D. C. l. c.) pedicels three or four times longer than the pod. ⊙. H. Native of the north of Caucasus in grassy places and on hills; about Grodno, Dorpath, Moscow, Petersburgh; also in the Ural mountains and Dauria. D. lùtea, Gilib. l. c. D. muràlis, Steph. fl. mosc. p. 29. Bieb. fl. taur. no. 1246. suppl. p. 428.

Yellow-flowered Whitlow-Grass. Fl. May, Aug. Clt. 1825. Pl ½ foot.

52 D. nemora'lis (Lin. spec. ed. 1. p. 643. Houtt. pfl. syst. 4. t. 60. f. 1.) stem branched, leafy, pubescent; leaves ovate, tooths, pubescent; pods elliptical-oblong, containing from 32 to 36 seeds, velvety with small hairs. ⊙. H. Native of Japan by way-sides; in Russia in groves; in Tauria and Caucasus in fields; in Transylvania in shady mountains; in the Carpathian mountains and the Pyrenees. It is said also to grow in Sweden and North America. Dràba muràlis, Thunb. fl. jap. 259. Flowers yellow, differing but little from *D. lùtea*, unless that the pods are pubescent, not smooth.

Grove Whitlow-Grass. Fl. May, June. Clt. 1759. Pl. ½ foot.

53 D. mura'lis (Lin. spec. ed. 1. p. 643.) stem branched, leafy, pubescent; leaves ovate, toothed, somewhat cordate, stem-clasping, rather hairy; pods elliptical-oblong, smooth, containing 12-16 seeds. ⊙. H. Native of England on the shady sides of limestone mountains, but rare. In several parts of Craven, Yorkshire, about Malham Cove; at old Malton on walls, on the Wardon hills, Bedfordshire, on dry banks at Emborough, Somersetshire, naturalised on the walls of Chelsea Botanic Garden, as likewise about the old Botanic Garden, Edinburgh. It is also to be found throughout the whole of Europe on the shady sides of walls, rocks, and mountains. Smith, engl. bot. t. 912. Lam. ill. t. 556. f. 2. Hook, fl. lond. t. 64. D. nemoròsa, All. ped. no. 897. D. ramòsa, Gater. fl. montaub. 114. D. nemoràlis, Delarb. fl. auv. ed. 2. vol. 1. p. 371. Flowers small, white; petals obovate, entire.

Wall Whitlow-Grass. Fl. April, May. Engl. Pl. ½ to 1 ft.

54 D. Carolinia'na (Walt. fl. carol. 174.) stem leafy at the base and hispid, smooth at the top and naked; leaves ovate-roundish, entire, hispid; pods linear, smooth, longer than the pedicels. ⊙. H. Native of North America in sandy fields from Pennsylvania to Carolina, and on the banks of the river Missouri, Virginia, New York, &c. &c. Dràba hispídula, Mich. fl. bor. amer. 2. p. 28. Flowers small, white.

Carolinian Whitlow-Grass. Fl. March, April. Pl. 1 or 2 in.

† *Species, the generic characters of which are doubtful, or not sufficiently known.*

55 D. pumi'lio (R. Br. in D. C. syst. 2. p. 353.) scapes naked, 1-flowered; radical leaves ovate, entire, stalked; pods ovate. ⊙. H. Native of Van Diemen's Land. Flowers small, white. Calyx spreading. Root perpendicular.

Dwarf Whitlow-Grass. Plant hardly 1 inch.

56 D. vesica'ria (Desv. journ. bot. 3. p. 186.) scapes naked, covered with stellate hairs; leaves crowded, oblong, velvety with stellate down, and ciliated with simple hairs; pods ovate, inflated, hairy. ♃. H. Native of Palestine on rocks and mountains, and of Syria on Mount Lebanon. A little tufted plant with yellow flowers.

Bladder-podded Whitlow-Grass. Pl. 1 inch.

57 D. pulche'lla (Willd. herb. from Stev. obs. ined. D. C. syst. 2. p. 354.) scapes naked; leaves lanceolate, quite entire, covered with stellate down on both surfaces; pods ovate, smooth. Native of Persia on the alps in the province of Ghilan.

Pretty Whitlow-Grass. Pl. 1 inch.

58 D. aretioi'des (H. B. et Kth. nov. spec. amer. 5. p. 77. t. 435.) scapes naked; leaves oblong, blunt, villous, imbricated; pods ovate, villous. ♃. G. Native of South America on the Andes of Quito, in the valleys of Mount Antisana at the height of 3400 feet. Arètia càna, Willd. herb. from Kunth. Androsàce càna, Rœm. et Schult. syst. 5. p. 786. Flowers small, yellow.

Aretia-like Whitlow-Grass. Pl. 1 inch.

59 D. viola'cea (D. C. syst. 2. p. 354.) stem suffruticose, branched, diffuse; leaves opposite, ovate, downy; pods oblong. ♄. G. Native of South America in very cold snowy places on Mount Assuay in Quito at the height of 3740 feet. Dràba Bonplandiàna, H. B. et Kth. nov. spec. amer. 5. p. 78. Petals ovate, violet.

Violet-flowered Whitlow-Grass. Fl.? Pl. ½ to 1 foot.

60 D. alyssoi'des (H. B. et Kth. nov. spec. amer. 5. p. 79.) stem shrubby, branched, and is tomentose as well as ovate-oblong, scattered, serrated leaves; pods ovate-lanceolate, tomentose. ♃. G. Native of South America in the province of Pasto near Zapayes Guachucal and Quarchu at the height of 2500 or 2800 feet. Hook, bot. misc. 2. p. 126. t. 32. A frutescent herb with white flowers.

Alyssum-like Whitlow-Grass. Pl. 1 or 2 feet.

61 D. ramosi'ssima (Desv. jour. bot. 3. p. 186.) stem branched, trailing, smooth; leaves spatulate, remotely toothed, smooth. ♃. H. Native of North America. Pods smooth, compressed, not margined, often oblique, bearing a long style.

Much-branched Whitlow-Grass. Pl. trailing.

62 D. glabe'lla (Pursh, fl. amer. sept. 2. p. 434.) scape erect, generally bearing 2 leaves; leaves spatulate-lanceolate, smoothish; racemes crowded with flowers; pods ovate-lanceolate, acute. ⊙. H. Native of North America at Hudson's Bay. Flowers probably white.

Bald Whitlow-Grass. Pl. 1 inch.

63 D.? læviga'ta (Cham. et Schlecht. Linnæa. 1. p. 25.) stem leafy, simple, smooth, straight; radical leaves and lower cauline ones stalked, ovate, tapering to the base, rather fleshy, with obsoletely ciliated margins; pods oblong-lanceolate, smooth, 4 or 6-times longer than the pedicel. ♃. H. Native of the island of St. Lawrence. A plant of peculiar habit from being deficient of the tufts of leaves. Root thick, descending. Flowers white, at first corymbose, but at length racemose. Petals unguiculate, obovate.

Smoothed Whitlow-Grass. Fl. June. Pl. ½ foot.

Cult. The whole of the species of this genus are pretty little plants, particularly the species contained in the two first sections; they are well adapted for ornamenting rock-work, but as

many of them are apt to damp off in the winter in this kind of situation, unless taken great care of, therefore the safest way to preserve them is to keep a plant or two of each of the perennial kinds in small pots among other alpine plants; they thrive best in a mixture of sand, loam, and peat, and the pots should be well drained with potsherds; they are easily increased by dividing the plants at the roots, or by seed. The annual and biennial kinds, having rather a weedy appearance, are only fit for botanic gardens; they should be sown in the open border or on rock-work. *D. nemoràlis* and *D. muràlis* require to be sown in a shady situation.

XXXIV. ERO'PHILA (from ερ, *er*, the spring, and φιλεω, *phileo*, to love; in allusion to the time of flowering). D. C. syst. 2. p. 356. prod. 1. p. 172.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle oval or oblong, with flat valves. Seeds many, not margined. Calyx equal at the base. Petals 2-parted. Stamens not toothed. Small annual vernal plants, with oval or oblong leaves, which are rosulate at the neck, and naked, erect scapes. Pedicels bractless, often elongated. Flowers small, white. Hairs on leaves few, simple, or sometimes branched.

1 E. America'na (D. C. syst. 2. p. 356.) pods oblong, shorter than the pedicels; scapes 5 or 10-flowered. ⊙. H. Native of North America in fields and among rubbish in places exposed to the sun. Dràba vérna Americàna, Pers. ench. 2. p. 190. Dràba Caroliniàna, var. Bart. fl. phil. 2. p. 58. Differing from *Eróphila vulgàris* in the pods being oblong, not elliptical, nearly 3-times as long as broad.

American Whitlow-Cress. Fl. March, April. Clt. 1820. Pl. 1 to 3 inches.

2 E. vulga'ris (D. C. syst. 2. p. 356.) pods elliptical, shorter than the pedicels; scapes 5-15-flowered. ⊙. H. Native throughout the whole of Europe, on walls, banks, and dry waste ground, abundant in Britain. Dràba vérna, Lin. syst. 896. Smith, engl. bot. t. 586. Schkuhr. handb. 2. no. 1764. t. 179. Fl. dan. t. 983. Leaves either entire or notched.

Common Whitlow-Cress. Fl. Mar. Ap. Britain. Pl. 1 to 3 in.

3 E. præ'cox (D. C. syst. 2. p. 357.) pods somewhat orbicular, hardly shorter than the pedicels; scapes 3-5-flowered. ⊙. H. Native of the Eastern Caucasus near Gandsha. Dràba præ'cox, Stev. mem. soc. nat. mosc. 3. p. 269. Dràba vérna, var. Bieb. suppl. 428.

Early Whitlow-Cress. Fl. Feb. Apr. Clt. 1827. Pl. 1 inch.

4 F. minuti'ssima (D. C. syst. 2. p. 357.) pods?; scape naked, generally 3-flowered; leaves elliptical, stalked. ⊙. H. Native near Constantinople. Dràba minutíssima, Willd. herb. from Stev. obs. ined.

Minutest Whitlow-Cress. Fl. Mar. April. Pl. $\frac{1}{2}$ to 1 inch.

5 E. musco'sa (D. C. syst. 2. p. 358.) pods elliptical, a little longer than the pedicels; scapes 3 or 4-flowered. ⊙. H. Native of Peru among moss and small herbs. Petals semibifid, longer than the calyx. Plant having the appearance of a moss.

Moss-like Whitlow-Cress. Pl. 1 inch.

Cult. These pretty little annual plants should be sown in the autumn in the sunny parts of rock-work, where they should be allowed afterwards to scatter themselves. Being very early flowering plants, therefore very desirable.

XXXV. COCHLEA'RIA (from *cochlear*, a spoon; the leaves of most of the species are hollowed like the bowl of a spoon). Tourn. inst. 215. t. 101. Lin. gen. no. 803. Lam. illust. t. 558. D. C. syst. 2. p. 358. prod. 1. p. 172.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicles sessile, ovate-globose or oblong, with ventricose valves. Seeds many, not margined. Calyx equal at the base, spreading. Petals entire. Stamens toothless. Annual or perennial herbs, usually smooth and fleshy, but sometimes they are puberulous, with scattered, short, simple, or 3-forked hairs. Form of leaves very variable; radical ones usually stalked; cauline ones often auriculately-sagittate. Racemes terminal; pedicels bractless, spreading, filiform, or somewhat angular. Flowers white, except in one species which is lilac. The sections of this genus may constitute as many distinct genera.

Sect. I. Kerne'ra (from κερνος, *kernos*, an earthen vessel; shape of leaves?). D. C. syst. 2. p. 359. prod. 1. p. 172. Silicles globose, somewhat 4-sided at the base, with rather stiff valves. Dissepiment bounded by narrow linear areolæ. Filaments 4, jointed at their middle. Style short; stigma 2-lobed. This section is considered of sufficient importance by Mr. Brown to constitute a distinct genus.

1 C. saxa'tilis (Lam. fl. fr. 2. p. 471.) pods pea-formed, smooth; radical leaves oblong, toothed, pilose, cauline ones linear-oblong. ♃. H. Native of France, Switzerland, Italy, Transylvania, and the Carpathian mountains, on calcareous rocks and in rugged places. Myàgrum saxátile, Lin. spec. 894. Jacq. austr. t. 128. Vind. t. 257. Nastúrtium saxátile, Crantz. austr. 1. p. 14. t. 1. f. 2. Alýssum alpìnum, Scop. carn. ed. 2. no. 793. Alýssum myagroìdes, All. ped. no. 887. Kernèra myagroìdes, Medik. in Ust. new. ann. 2. p. 42. Camelìna saxátilis, Pers. ench. 2. p. 191. Alýssum rupéstre, Willd. enum. 2. p. 612. but not of Tenore. Camelìna myagroìdes, Moretti in giorn. fis. pav. 1820. bim. 1. Flowers white.

Var. β, *incìsa* (D. C. syst. 2. p. 360.) leaves lyrate or pinnatifid.—Mor. hist. 2. p. 293. no. 11. sect. 3. t. 17. fig. ult. Myàgrum saxátile β. D. C. suppl. 597.

Rock Scurvy-Grass. Fl. May, July. Clt. 1775. Pl. $\frac{1}{2}$ ft.

2 C. auricula'ta (Lam. dict. 2. p. 165.) pods pea-formed, smooth; radical leaves oblong, toothed, pilose; cauline ones cordate-sagittate. ♃. H. Native on the mountains of Auvergne, Savoy, Cevennes, and the Pyrenees; on calcareous rocks. Myàgrum montànum, Berg. phyt. 3. p. 140. icon. Myàgrum saxátile β, Willd. spec. 3. p. 410. M. alpìnum, Lapeyr. abr. p. 362. Cheiránthus auriculàtus, Lapeyr. abr. 362. Myàgrum auriculàtum, D. C. suppl. 597. Differing from *Cochl. saxátilis* in the cauline leaves being cordate-sagittate at base, with acute auricles, not sessile. Flowers white.

Eared-leaved Scurvy-Grass. Fl. May, Ju. Clt. 1820. Pl. $\frac{1}{2}$ ft.

3 C.? alyssoi'des (D. C. prod. 1. p. 172.) pods globose, inflated with the calyx; leaves oblong, blunt, sinuately-toothed, thickish, radical ones stalked, upper ones half-stem-clasping. Native of the East Indies. Alýssum cochlearioìdes, Roth. nov. pl. spec. 322. Perhaps a species of *Vesicària*.

Alyssum-like Scurvy-Grass. Pl. 1 foot.

Sect. II. Armora'cia (a name of Celtic origin, from *ar*, near, *mor*, the sea, *rich*, against, that is to say, a plant growing near the sea). D. C. syst. 2. p. 360. prod. 1. p. 172. Silicle elliptical or oblong. Style short, filiform; stigma capitate, nearly disciform. Leaves large, oblong. Flowers white.

4 C. armora'cia (Lin. spec. 904.) pods ellipsoid; radical leaves large, oblong, crenated, cauline ones elongated, lanceolate, toothed, or cut; root large, fleshy. ♃. H. Native of Europe in watery mountainous places. In England about Alnwick, and elsewhere in Northumberland; in several parts of Craven in Yorkshire. Common in waste ground, about orchards and farmyards from the refuse of gardens. In France in Dauphiny, at a place called Roxans; also in Switzerland, Germany, and Transylvania, Woodv. med. bot. 3. p. 406. t. 150. Smith, engl. bot. t. 2223. Schkuhr. handb. 2. p. 229. t. 181. Cochl. rusticàna, Lam. fl. fr. 2. p. 471. Armoràcia lapathifòlia, Gilib. fl. lith. in Ust. del. op. 2. p. 359. Flowers with a spreading calyx. The *horse-radish* is

called upon the Continent *Cran*, *Cran de Bretagne*, *Le Grand Raifort*, (Fr.) *Reeredyck*, (Germ.) *Ramolaccio*, (Ital.) The root of this plant has a pungent smell, and a penetrating acrid taste; and it also contains a sweet juice, which sometimes exudes upon the surface. Einhoff has discovered that the acrimony of *horse-rádish* is owing to a volatile oil of a pale yellow colour, and which has the consistence of oil of cinnamon. The liquid obtained from the root gave traces of sulphur by distillation. The tincture deposits crystals of sulphur, which are of a yellow colour, and when exposed to flame exhale a peculiar sulphuric flavour; this is no doubt the case with all cruciferous plants. Both water and alcohol extract its virtues by infusion. By drying it loses all its acrimony, becoming first sweetish, and afterwards almost insipid; if kept in a cool place, such as a shed or cellar, covered with sand or dry earth, it retains its pungency for a considerable time. It is an extremely penetrating stimulus. It excites the solids, and promotes the fluid secretions. It has frequently been of service in some kinds of scurvy and other chronic disorders, and is sometimes recommended in dropsies, particularly those which sometimes follow intermittent fevers. It is said also to excite appetite when the stomach is weakened or relaxed. Taken in considerable quantities, it provokes vomiting. Thomas Bertholini extols its virtues in the stone from experience: he affirms the juice of *horse-radish* dissolved a calculus of stony concretion that was taken out of a human body. An infusion of it in cold milk makes one of the safest and best cosmetics. The root scraped into shreds is a well-known accompaniment of English roast beef.

Two excellent modes of cultivating the *horse-radish* have lately been described in the Horticultural Society's Transactions by Knight and Judd. Both agree in trenching the soil to a considerable depth, and putting the manure at the bottom of the trench; but Knight plants the sets on the surface, and calculates on the root that strikes down to the dung for produce. Judd, on the other hand, makes holes quite to the bottom of his trenched soil, and in each drops a set, filling up the hole with wood-ashes, rotten tan, or sand, calculating for produce on the shoots made from the set at the bottom of the hole up through the sand or ashes to the surface. Either mode will do extremely well.

The following excellent instruction is given by J. Knight in Hort. Trans. 1. p. 207.

"Horse-radish thrives best in deep, soft, sandy loam, that is not very dry in summer nor inundated in winter; the situation must be open. During winter trench the ground three feet deep, and in the following February procure the sets, in the choice of which take the strongest crowns or leading buds, cutting them about two inches long. Mark out the ground, four feet beds, and one foot alleys, then take from the first bed nine inches of the top soil, laying it upon the adjoining bed, after which take out an opening at one end of the bed, in the common way of trenching, 15 inches deep from the present surface, then level the bottom, upon which plant a row of sets across the bed at nine inches apart each way, with their crowns upright; afterwards dig the next trench the same width and depth, turning the earth into the first trench over the row of sets, thus proceeding trench after trench to the end for as many beds as are wanted. The plants must be kept clear of weeds during summer, and as soon as the leaves decay in autumn, let them be carefully raked off with a wooden-toothed rake; in the following February 18 inches of the earth of the unplanted bed must be laid as light as possible and equally over the beds that are planted, then trench and plant the vacant beds as before directed. The following autumn the first planted *horse-radish* may be taken up by opening a trench at one end of the bed to the bottom of the roots, so that the sticks or roots of *horse-radish* may be taken up entire and sound, which for size and quality will be such as have not been seen. The following February the one year old crop will require additional earth as before directed, which must of course be taken from those beds which are now vacant, which when done, if the ground appears poor or unlikely to produce another vigorous crop, they must have a coat of manure." "Upon every alternate bed, which is not planted, a dwarf annual crop may be grown, such as *spinach* or *radishes*." A moist soil increases its bitter and alkaline flavour.

Common *Horse-radish*. Fl. May, June. Britain. Pl. 2 feet.

5 C. macroca'rpa (Waldst. et Kit. hung. 2. p. 101. t. 184.) pods ellipsoid; radical leaves large, oblong, crenated, cauline ones lanceolate-toothed; teeth cartilaginous; root fleshy; sepals erect. ♃. H. Native of Hungary and Transylvania in humid meadows or marshes. Armoràcia macrocárpa, Baumg. fl. transyl. 2. p. 240. Cochl. crassifòlia, Willd. herb. Flowers and fruit a little larger than those of *Cochl. armoràcia*, and the taste of the root is less acrid. It may be used in the same manner.

Large-podded Horse-radish. Fl. May, July. Clt. 1806. Pl. 2 ft.

6 C. microca'rpa (D. C. syst. 2. p. 362.) pods globose; leaves oblong, auriculately-stem-clasping at the base, toothed. ♃. H. Native of Siberia at Krivoluka. C. armoràcia? Pall. herb. C. Altàica, Schlecht. in herb. Willd. from Stev. obs. ined. Habit of *Myàgrum Austrìacum* or *Lepídium Dràba*. Stem branched. Pods small.

Small-podded Horse-radish. Pl. 1 foot.

Sect. III. Co'chlear (for derivation see genus; form of leaves). D. C. syst. 2. p. 362. prod. 1. p. 176. Silicles of various forms, but never emarginate at the top. Style very short or wanting altogether. Spreading plants, with usually kidney-shaped hollow leaves. Flowers white or tinged with purple.

7 C. glastifo'lia (Lin. spec. 904.) silicles somewhat globose; cauline leaves cordately-sagittate, stem-clasping, acuminated, entire. ♂. H. Native about Ratisbon, in Dauphiny in fields, in the gardens of Corsica, in Portugal on the banks of Douro. Schkuhr. handb. 2. no. 1804. t. 181.—Lob. icon. t. 321. f. 2.—Mor. oxon. 2. p. 312. sect. 3. t. 21. f. 3. A smooth, branched, glaucous herb.

Woad-leaved Scurvy-Grass. Fl. May, July. Clt. 1648. Pl. 1 to 3 feet.

8 C. oblongifo'lia (D. C. syst. 2. p. 363.) pods roundish one-half shorter than the pedicels; cauline leaves oblong, entire, sessile, upper ones with very short auricles. ♃. H. Petals twice the length of the calyx.

Var. α, Dràba cochlearioìdes (Langsdorf, from Fisch. in litt.) Native of the islands of St. Paul, St. Laurence, and Unalaschka.

Var. β, Cochleària A'nglica e Kamtschátka (Pall. in herb. Willd.) Cochl. Kamtschática, Schlecht. in herb. Willd. Native of Kamtschatka. A smooth, branching, fleshy herb. Leaves more narrowed towards the base. Flowers smaller.

Oblong-leaved Scurvy-Grass. Fl. April, May. Pl. ¼ foot.

9 C. A'nglica (Lin. spec. 903.) pods ovate, sub-globose, netted with veins, twice as short as the pedicels; radical leaves stalked, ovate, entire, cauline ones oblong, toothed. ⊙. H. Native of Britain, Norway, Lapland, &c. on the muddy sea-shore, and about the mouths of large rivers. Oed. fl. dan. t. 329. Smith, eng. bot. 552. Cochl. Groenlándica, Gun. norv. no. 196. Cochl. ovalifòlia, Stok. bot. mat. med. 3. p. 436.

English Scurvy-Grass. Fl. May. Britain. Plant variable in size.

10 C. officina'lis (Lin. spec. 903.) pods ovate-globose, twice as short as the pedicels; radical leaves stalked, cordate, cauline ones ovate, toothed, angular. ♂. H. Native on the sea-coast, in stony or muddy situations, abundantly throughout North Europe; plentiful in Britain. Oed. fl. dan. t. 135. Woodv. med. bot. 1. p. 86. t. 29. Smith, eng. bot. t. 551.

Savi, mat. med. tosc. p. 25. t. 18. Tratt. arch. 5. t. 236. C. renifòlia, Stok. bot. mat. med. 3. p. 435.

Var. β, mìnor (Smith, fl. brit. 2. p. 688.) C. Dánica, Gun. norv. no. 197. from Vahl. Many of the stem leaves have long stalks, which are also more cordate than those of the species. Native on the tops of the Scotch and Welsh mountains, in watery places.

Var. γ, rotundifòlia (Smith, l. c.) C. Groenlándica, With. brit. but not of Lin. Leaves rounder than those of the species. Native on the tops of the Scottish and Welsh mountains.

A branched plant, varying much in size. It is called in France, *Cranson officinal;* in Germany, *Löffelkraut.* The Common *Scurvy-Grass* when fresh has a peculiar smell, especially when bruised, and a kind of acrid bitter taste, which it loses completely by drying, but which it imparts by distillation to water or alcohol. It also furnishes an essential oil, with sulphuretted hydrogen, the smell of which is extremely pungent. The fresh plant is a gentle stimulant and diuretic, and is chiefly used for the cure of sea scurvy. It may be eaten in substance, in any quantity, like the water-cress, or the juice may be expressed from it, or it may be infused in wine, beer or water, or its virtues may be extracted by distillation. The juice is recommended as a gargle in scorbutic affections of the gums and mouth. The whole of this section *Cochlear* possess more or less of the above virtues. When this plant is to be cultivated for use, sow the seeds in July, in drills eight inches apart, and when the plants are up thin them to six inches apart; those thinned out may be planted into new beds. In the following spring the succulent leaves will be fit for use.

Officinal or Common Scurvy-Grass. Fl. May, June. Britain. Pl. 2 inches to 1 foot.

11 C. Pyrena'ica (D. C. syst. 2. p. 365.) pods obovate; somewhat globose, length of pedicels; radical leaves cordately reniform, entire, cauline ones few, ovate, toothed. ♂. H. Native along the sides of rivulets, on the upper valleys of the Central Pyrenees. Deless. icon. sel. 2. t. 48. C. officinàlis, Lapeyr. abr. pyr. p. 368. Intermediate between *C. officinàlis* and *C. Groenlándica.*

Pyrenean Scurvy-Grass. Fl. Jul. Aug. Clt.? Pl. ¼ to ½ foot.

12 C. Groenla'ndica (Lin. spec. 904.) pods ovate, length of pedicels; radical leaves stalked, kidney-shaped, entire; cauline ones almost wanting. ♂. H. Native of Greenland, Norway, and Iceland. In Scotland, on the hills of Clova, Angusshire, and at Loch-na-Gare. Lod. bot. cab. 1. t. 45. Smith, eng. bot. t. 2403. Plant very small in its place of natural growth. Flowers white, tinged with purple.

Greenland Scurvy-Grass. Fl. July, Aug. Scotland. Pl. 1 to 3 inches.

13 C. Da'nica (Lin. spec. 903.) pods elliptical, netted with veins, length of pedicels; leaves all stalked, and triangular. ⊙. H. Native throughout the north of Europe, also in Kamtschatka, on the coast, in a muddy soil. In England but rare. In Walney Island, Lancashire; Anglesea; at Wells, Norfolk; on several parts of the south coast from Portland to the Land's end. Oed. fl. dan. t. 100. Smith, eng. bot. t. 696. Stems spreading or prostrate. Flowers pure white.

Var. β, integrifòlia (D. C. syst. 2. p. 366.) cauline leaves very few, radical ones kidney-shaped, entire. Native of Ireland, on the Giant's Causeway.

Danish Scurvy-Grass. Fl. May, June. England and Ireland. Pl. ¼ foot.

14 C. Lene'nsis (Adams, from Fisch. in litt.) pods ovate; 3-times shorter than the pedicels; radical leaves stalked, somewhat kidney-shaped, blunt, cauline ones oblong, almost entire. ♂. H. Native of Siberia, at the river Lena. *C. Groenlándica,* Willd. herb. from Stev. obser. ined. Flowers small.

Lena Scurvy-Grass. Fl. May, June. Pl. ¼ foot.

15 C. A'rctica (Schlecht. in herb. Willd. from Stev. obs. ined.) pods ovate-oblong, a little shorter than the pedicels; radical leaves stalked, ovate, somewhat toothed; cauline ones sessile, furnished with one tooth on each side. ♂. H. Native of the north of Siberia, and Kamtschatka.

Arctic Scurvy-Grass. Pl. ½ foot.

16 C. tridactyli'tes (Banks, herb. D. C. syst. 2. p. 367.) pods ovate-globose; cauline leaves somewhat 3-lobed from a deep tooth on each side. ♂. H. Native of Labrador. Like *C. Lenénsis* and *C. A'rctica.* Pods the size of those of *C. officinàlis.*

Three-fingered-leaved Scurvy-Grass. Pl. ¼ foot.

17 C. fenestra'ta (R. Br. in app. voy. Ross.) pods elliptical, twice as short as pedicel, with an elongated, perforated dissepiment; radical leaves stalked, ovate; cauline ones oblong. ♃. H. Native of North America, in the Polar regions, on the Western Coast, at Baffin's Bay, and near Possession Bay. C. alpìna, Hook.

Windowed Scurvy-Grass. Fl. April, June. Clt. 1819. Pl. ¼ to ½ foot.

18 C. sisymbrioi'des (D. C. syst. 2. p. 368.) pods oblong, twice as short as pedicels; petals oblong; lower leaves pinnatifid, superior ones ovate-lanceolate, entire, or toothed, clasping the stem at the base. ♃. H. Native of Siberia, on the shores of the Icy Sea, and at the river Lena. C. heterophýlla, Schlecht. D. C. prod. 1. p. 375. Flowers largish, white, with oblong sepals, which are membranous at their margin. Gmel. fl. sib. 3. t. 57.

Sisymbrium-like Scurvy-Grass. Pl. 1 foot.

19 C. grandiflòra (D. C. syst. 2. p. 368.) pods oblong; petals large, obovate; cauline leaves ovate-lanceolate, bluntish, grossly toothed, and bluntly auricled at the base.—Native of Siberia, at Nertchinsky-Sawod. Flowers white, larger than those of any of the other species. Leaves large, membranous.

Great-flowered Scurvy-Grass. Pl. 1 foot.

20 C. integrifòlia (D. C. syst. 2. p. 369.) pods oblong; petals obovate-oblong; cauline leaves entire, lower ones stalked, ovate, upper ones nearly sessile, lanceolate.—Native of the Altaian mountains. Very like the two preceding plants. Flowers white, smaller than those of *Cochl. Sisymbrioides.*

Entire-leaved Scurvy-Grass. Pl. 1 foot.

21 C. sa'lsa (Schlecht. in. herb. Willd. from Stev. obs. ined.) pods lanceolate, terminated by the conical style, one half shorter than the pedicel; cauline leaves oblong-lanceolate, cordate, stem-clasping, and are, as well as the stem, pubescent.—Native of Siberia? in salt marshes. Dràba sálsa, Spreng. syst. 2. p. 876. Flowers white, size of those of *C. A'nglica.*

Salt Scurvy-Grass. Pl. ½ foot.

22 C. spathula'ta (Schlecht. in Willd. herb. from Stev. obs. ined. D. C. syst. 2. p. 369.) stem branched, leafy, puberulous; pods lanceolate, pointed, with the short style, a little shorter than the pedicels; leaves spatulate, deeply-toothed, pubescent. ⊙. H. Native of the Aleutian islands of St. Paul and St. George, between Kamtschatka and America. *C. septentrionàlis,* Schlecht. in Willd. herb. from Stev. obs. ined. D. C. prod. 1. p. 174. Deless. icon. sel. 2. t. 47. Dràba spathulàta, Spreng. syst. 2. p. 876. Dràba grándis, Langsdorff, from Fisch. in litt. Very near to *C. árctica,* but easily distinguished from it by the hairs being 3-forked. Flowers cream-coloured. Silicles inflated.

Spatulate-leaved Scurvy-Grass. Pl. ¼ foot.

23 C.? siliquòsa (Schlecht. in herb. Willd. from Stev. obs. ined. and D. C. syst. 2. p. 369.) pods oblong-lanceolate, pointed with the style, one half shorter than the pedicels; leaves oblong, entire. pubescent, narrowed at the base. ♃. H. Native of

Unalaschka, on the highest rocks. Flowers when dry yellowish.

Long-podded Scurvy-Grass. Pl. ½ foot.

24 C.? vèlutìna (D. C. syst. 2. p. 370.) pods elliptical, one half shorter than the pedicels; leaves velvety with branched down, radical ones pinnate-parted, cauline ones sagittate. ⊙. H. Native of Syria, between Aleppo and Mossul. Flowers like those of *C. saxátilis*. Petals broad, obovate. Deless. icon. sel. 2. t. 49. A very distinct species which, perhaps with the following, may constitute a separate genus.

Velvety Scurvy-Grass. Pl. 1 to 3 inches.

25 C. saxifragæfòlia (D. C. syst. 2. p. 370.) pods ovate-oblong; leaves smooth, radical ones stalked, kidney-shaped, palmately and deeply-toothed, cauline ones ovate, 3-lobed, uppermost ones linear. ♃. H. Native of Persia. Flowers very like those of the preceding plant, Deless. icon. sel. 2. t. 50.

Saxifrage-leaved Scurvy-Grass. Pl. ¼ to ½ foot.

Sect. IV. Ionopsi'dium (from *ιον*, *ion*, a violet, *οψις*, *opsis*, resemblance, *ειδος*, *eidos*, similar; like a violet.) D. C. syst. 2. p. 371. prod. 1. p. 174. Silicle roundish, compressed, emarginate at the top. Flowers lilac. An intermediate section between *Cochleària* and *Thláspi*.

26 C. acau'lis (Desf. fl. atl. 2. p. 69.) pods roundish, emarginate, pedicels rising from the root; petioles long; leaves ovate-roundish, entire. ♃. H. Native of Portugal, frequent on the basaltic hills near Lisbon, but rarer in the calcareous hills of Estremadura. Said also to grow in Morocco. C. pusílla, Brot. phyt. p. 100. no. 45. t. 21. f. 2 and 3. Jacq. eclog. t. 132. C. Olyssiponénsis, Brot. fl. lusit. 1. p. 571. Lepídium violifórme, D. C. mem. soc. hist. nat. paris. an. VII. p. 145. Leaves and pedicels rising from the root. Pedicels 1-flowered, and 1½ inch long.

Stemless Scurvy-Grass. Fl. March, May. Clt. 1823. Pl. 1½ in.

† *Species not sufficiently known.*

27 C. sagittæfòlia (Desv. journ. bot. 3. p. 182.) ⊙. H. Native of .....? Flowers small white; pods oblong, entire, tumid, few-seeded; radical leaves oblong, slightly toothed.

Arrow-leaved Scurvy-Grass Pl. ½ foot.

28 C. lyra'ta (Sibth. and Smith, fl. græc. t. 619.) ⊙. H. Native of Sicily. Leaves toothed, smooth; radical ones lyrate, cauline ones oblong, sagittate, stem-clasping.

Lyre-leaved Scurvy-Grass. Pl. ½ foot.

29 C. repa'nda (Med in Ust. new. ann. 2. p. 42.) Native? Lower leaves stalked, waved, pubescent, superior ones repand, stem-clasping, sagittate, hollowed in the form of a spoon.

Repand-leaved Scurvy-Grass.

30 C. longifòlia (Med. in Ust. new. ann. 2. p. 41.)—Native of? Lower leaves on long foot-stalks, upper ones sessile, for the most part entire.

Long-leaved Scurvy-Grass. Pl.?

Cult. The common horse-radish should be planted in February or October in the way recommended under that species, in a deep rich soil. The smaller perennial sorts do best in pots, placed among other alpine plants, but the larger ones should be planted in a shady, rather moist situation, in the open border. The biennial and annual kinds only require to be sown in the open border, the greater part of them grow best in a damp situation, the seeds should be sown directly after they have ripened, or they may be allowed to sow themselves. They are all easily increased by seeds except *Cochleària armoràcia* and *macrocárpa*, which do best by slips from the root, and some others of the perennial species which do not seed freely may be increased by dividing the plants at the root.

Tribe III.

THLASPI'DEÆ (plants agreeing in some important character with Thláspi.) or PLEURORHI'ZÆ (from *πλευρα*, *pleura*, a side, and *ριζα*, *rhiza*, a root; radicle at side of cotyledons; (f. 46. *c.* f. 45. *g. d.*) ANGUSTISEPTÆ (from *angustus*, narrow, and *septum*, a dissepiment.) D. C. syst. 2. p. 372. prod. 1. p. 175. Silicle opening, with a very narrow dissepiment (f. 46. *k. l.*), and keeled navicular valves (f. 46. *k. l. m.* and *n.*). Seeds oval (f. 46. *l.*) sometimes margined (f. 46. *n.*). Cotyledons flat, accumbent, contrary to the dissepiment (f. 46. *k.* f. 45. *a. d.*). A very distinct tribe, and can only be confounded with *Lepidíneæ*, but from which it is easily distinguished by the much compressed seeds and accumbent cotyledons.

* *Cells of silicles from 2 to many-seeded.*

XXXVI. THLA'SPI (from *θλαω*, *thlao*, to compress; seeds compressed.) Dill. fl. giss. gen. nov. p. 123. t. 6. Vent. tabl. 3. p. 110. Thlaspi spec. Lin. Juss. Lam.

Lin. syst. *Tetradynàmia*, *Siliculòsa*. Silicle emarginate at the apex, (f. 46. *k. l.*) with navicular valves which are winged at the back (f. 46. *k.*). Cells 2 or many-seeded (f. 46. *l.*) Petals equal. Calyx equal at the base. Perennial or annual branched, erect, smooth herbs with entire or toothed leaves, radical ones usually stalked, cauline ones stem-clasping. Racemes terminal; pedicels bractless. Flowers of all white.

Sect. I. Pachyphra'gma (from *παχυς*, *pachys*, thick, *φραγμα*, *phragma*, a dissepiment.) D. C. syst. 2. p. 373. prod. 1. p. 175. Silicle broad, emarginate. Style none. Dissepiment thick, double, furnished with 3 longitudinal plaits. Seeds 4, not striated (f. 46. *k.*).

1 T. latifòlium (Bieb. fl. taur. 2. p. 99. supp. p. 430.) radical leaves on long footstalks, cordate, repand-toothed, cauline ones ovate-cordate, on short foot-stalks. ♃. H. Native of Iberia, in woods, also in the north of Caucasus. T. macrophýllum, Hoffm. comm. soc. phys. med. mosc. 1. p. 7. Lèpia latifòlia, Desv. journ. bot. 3. p. 166. Pterolòbium Bieberstèinii, Andrz. cruc. ined. Flowers largish. Petals cuneated, blunt, 3-times longer than the calyx. Deless. icon. sel. 2. p. 51. (f. 46. *k.*).

Broad-leaved Bastard-Cress. Fl. March, April. Clt. 1822. Pl. ½ to 1 foot.

Sect. II. Carpóceras (from *καρπος*, *karpos*, a fruit, and *κερας*, *keras*, a horn; valves horned.) D. C. syst. 2. p. 374. prod. 1. p. 175. Valves expanded at end into a wing resembling a horn. Seeds 4, striated. Dissepiment membranous, oblong.

2 T. ceratoca'rpon (Murr. comm. goett. 1774. p. 26. t. 1.) radical leaves somewhat stalked, obovate-oblong, cauline ones hastate, stem-clasping, with acute auricles. ⊙. H. Native of Siberia, in salt fields, in plenty between the Belokamenskoi station and Fort Seven-Palace. Capséllа cornígera, Medik. in Ust. new. ann. 2. p. 46. Th. cornùtum, Clairv. herb. val. 214. Lepídium ceratocárpon, Pall. Flowers small white. Fructiferous pedicels, filiform.

Horned-podded Bastard-Cress. Fl. May, July. Clt. 1779. Pl. 1 to 1½ foot.

Sect. III. Nomísma (from *νομισμα*, *nomisma*, a piece of money; in allusion to the form of the silicles as well as the names of *Th. arvénsis*, money-wort, monnoyere, Fr.) D. C. syst. 2. p. 375. prod. 1. p. 175. Valves with a wing along the whole back. Seeds numerous, striated.

3 T. ARVE'NSE (Lin. spec. 901.) leaves oblong, toothed, stems erect; pods obovately-orbicular, shorter than the pedicels. ⊙. H. Native throughout Europe, in cultivated or waste fields, and probably has been introduced to many countries with wheat. In England, but not common, particularly in Essex, Suffolk, and Staffordshire. Fl. dan. t. 793. Curt. fl. lond. 6. t. 43. Smith, eng. bot. t. 1659. Schkuhr. hanb. 2. no. 1789. t. 180. Boiss. fl. europ. t. 440. f. 2. Stok. bot. mat. med. 3. p. 438. Flowers small, white. Odour of plant when bruised somewhat alliaceous.

Corn-field Penny-Cress. Fl. May, July. England. Pl. ½ to 1 foot.

4 T. BAICALE'NSE (D. C. syst. 2. p. 376.) leaves oblong, grossly toothed; stems erect; pods orbicular, longer than the pedicels. ⊙. H. Native of Siberia, beyond the Baical, and on the shores of the Baical lake. This is perhaps only a variety of *Th. arvénse.*

Baical Bastard Penny-Cress. Fl. May, Jul. Pl. ½ to ¾ foot.

5 T. COLLI'NUM (Bieb. fl. taur. 2. p. 99.) leaves oblong, toothed, cauline ones linear-sagittate, upright; stems diffuse, somewhat ascendant; pods almost orbicular, ⊙. H. Native of Armenia and Iberia on Mount Alwar, about the metal mines. Th. nemoròsum, Adàmi, Hoffm. cat. hort. mosc. 1808. no. 3249. Very near *Th. arvénse.*

Hill Penny-Cress. Fl. May, July. Clt. 1818. Pl. ½ to ¾ foot.

SECT. IV. NEURO'TROPIS (from *νευρον, neuron,* a nerve, and *τροπις, tropis,* a keel; wings of pod circumscribed by a nerve.) D. C. syst. 2. p. 377. prod. 1. p. 176. Silicle orbicular, emarginate, with a narrow recess. Back of valves expanded into a broad wing, which is circumscribed by a nerve. Seeds numerous, not striated.

6 T. ORBICULA'TUM (Stev. in litt. and D. C. syst. 2. p. 377.) superior leaves quite entire, stem-clasping; pods orbicular. ⊙. H. Native of Iberia. Seeds oblong, compressed, rufous.

Orbicular-podded Bastard-Cress. Fl. May, July. Clt. 1820. Pl. ½ to ¾ foot.

7 T. UMBELLA'TUM (Stev. in D. C. syst. 2. p. 377.) leaves ovate, toothed; radical ones somewhat stalked, cauline ones half stem-clasping; pods obcordate. ⊙. H. Native of Persia, in the province of Ghilan.

Umbellate-flowered Bastard-Cress. Pl. ¼ foot.

8 T. PROCU'MBENS (Lapeyr. abr. 366.) leaves sinuately pinnatifid, or almost entire; petals hardly larger than the calyx; pods 10-12-seeded, blunt at both extremities; stigma sessile. ⊙. H. Native among rubbish on the sea-side, as well as on the sides of roads, or paths about salt pans or pits, or any place where salt is made in Spain, South of France, Piedmont, Tauria, Island of Cyprus, &c. Lepídium procúmbens, Lin. spec. 898. Hil. veg. syst. 11. t. 42. f. 1. Lepídium pusíllum, *var. α,* Lam. fl. fr. 2. p. 468. Hutchínsia procúmbens, Desv. journ. bot. 3. p. 168. Stem procumbent. This is evidently a true Lepídium.

Var. β, erectiúscula (D. C. syst. 2. p. 391.) stems erectish. Native of Syria.

Var. γ, integrifòlia (D. C. l. c.) leaves entire, or sparingly cut. Native of Marseilles.

Procumbent-stemmed Bastard-Cress. Fl. March, May. Clt. 1819. Pl. procumbent

SECT. V. PTERO'TROPIS (from *πτερον, pteron,* a wing, and *τροπις, tropis,* a keel; valves of pods furnished with winged keels.) D. C. syst. 2. p. 377. prod. 1. p. 176. Silicle somewhat obovate, emarginate or truncate. Valves furnished with a wing the whole length on the back (f. 46. *l.*), but the wings are not margined with a nerve as in the preceding section. Seeds not striated.

9 T. ALLIA'CEUM (Lin. spec. 901.) leaves oblong, blunt, somewhat toothed, lower ones stalked, upper ones sagittate, stem-clasping, with acute auricles; pods obovate, ventricose; stigma almost sessile. ⊙. H. Native throughout middle and south Europe, in cultivated fields. Jacq. icon. rar. 1. t. 121. Flowers a little smaller than those of *Th. arvénse,* and the pods are almost one half smaller. Th. arvénse, *β* mìnor, Lam. fl. fr. 2. p. 464. Plant when bruised smelling of garlic.

Garlic-scented Bastard-Cress. Fl. June, July. Clt. 1714. Pl. ½ to ¾ foot.

10 T. PERFOLIA'TUM (Lin. spec. 902.) leaves somewhat toothed, radical ones stalked; cauline ones cordate, stem-clasping; stem branched; petals equal in length with the calyx; pods obcordate, 8-seeded; stigma almost sessile. ⊙. H. Native of Portugal, Spain, France, Switzerland, Germany, Italy, Podolia, Greece, &c. in cultivated fields, especially on a chalky soil; in England, abundant among stone-pits, about Burford, Oxfordshire, but it is not known to be found any where else in Britain. Jacq. aust. t. 337. Smith, eng. bot. t. 2354. Th. alpéstre, Huds. angl, 282.

Var. β, simplicíssimum (D. C. syst. 2. p. 379.) stems simple, strict, striated from the base. ⊙. H. Native of the north of Persia, about Lenckeran.

Perfoliate-leaved Bastard-Cress. Fl. April, July. England. Pl. ½ foot.

11 T. MONTA'NUM (Lin. spec. 902.) leaves somewhat fleshy, entire, radical ones obovate, stalked; cauline ones oblong, sagittate, stem-clasping; petals larger than the calyx; pods obcordate, 4-seeded; style filiform. ♃. H. Native of Europe from Spain to Podolia, and from Sicily to Holland, on mountains. Jacq. aust. t. 237. Bois. fl. eur. t. 441. f. 1. Schkuhr. handb. 2. no. 1794. t. 180. Lepídium thlaspidioìdes, Pall. itin. 3. p. 161. Th. spatulàtum, Gater. fl. montanb. 115.

Var. β, præ'cox (Wulf. in Jacq. coll. 2. p. 124. t. 9.) differing from the species by the plant being a little more glaucous, and with the radical leaves crenated at the top. Dràba cárnica, Scop.

Var. γ, alpìnum (Jacq. aust. 3. t. 238.) style longer, exceeding the ovary, and almost equalling the length of the pod.

Mountain Bastard-Cress. Fl. May, July. Clt. 1808. Pl. ½ to ¾ foot.

12 T. ALPE'STRE (Lin. spec. 903.) leaves entire, radical ones ovate, stalked, cauline ones sagittate, stem-clasping; petals nearly as long as the calyx; pods obcordate, 8 to 12-seeded; style filiform. ♃. H. Native of the Pyrenees, Cevennes, Carpathian mountains, France, Spain, &c. in mountain pastures and meadows; in the north of England, among lime-stone rocks and lead mines; about Settle and Malham, Yorkshire. At Matlock Bath, Derbyshire. Smith, eng. bot. t. 81. Th. cæruléscens, Presl. fl. cech. p. ? Th. montànum, Huds. angl. 282. Th. præ'cox, Schleich. pl. helv.

Alpine Bastard-Cress. Fl. Ju. Jul. England. Pl. ½ foot.

13 T. HETEROPHY'LLUM (D. C. fl. fr. ed. 3. vol. 4. p. 712.) radical leaves stalked, spreading, entire, toothed, or lyrate, cauline ones erect, cordately-sagittate; petals almost equal with the calyx. ♃. H. Native of the Pyrenees, on the borders of Spain. Flowers a little smaller than those of *Th. alpéstre.*

Variable-leaved Bastard-Cress. Fl. June, July. Pl. ¼ foot.

14 T. MAGELLA'NICUM (Pers. ench. 2. p. 189.) radical leaves oval, stalked, almost entire, cauline ones oblong-sessile; petals nearly equal with the calyx; pods oblong, truncately-emarginate, 8-seeded; style short. ♃. ? H. Native of the rocks of Magellan at the places called by French travellers Baie Duclos, and Baie Boucaut. Flowers small, white. Seeds oval-oblong, rufous, compressed, not striated.

Magellan Bastard-Cress. Pl. ¼ foot.

15 T. COCHLEARIFO'RME (D. C. syst. 2. p. 381.) leaves

somewhat fleshy, radical ones stalked, ovate, somewhat toothed, cauline ones cordate, stem-clasping; petals larger than the calyx; pods oblong, somewhat emarginate, 8-seeded (f. 46. *l.*); style short, filiform. ♃. H. Native of Siberia and Dauria, on the tops of the mountains. Deless. icon. sel. 2. t. 52. Flowers very like those of *Th. montànum*.

Scurvy-grass-like Bastard-Cress. Fl. Jul. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

† *Species not sufficiently known.*

16 Th.? samolifo'lium (D. C. syst. 2. p. 382.) leaves ovate, blunt, quite entire, lower ones on short foot-stalks; petals emarginate. Native of Cappadocia. Alýssum samolifòlium, Desf. choix. cor. p. 66. t. 49. Flowers white, about the size of those of *Berteròa incàna*. Very like *Th. montànum*.

Samolus-leaved Bastard-Cress. Pl. 1 to $1\frac{1}{2}$ feet.

17 T. tubero'sum (Nutt. gen. amer. 2. p. 65.) leaves rhomboid-ovate, obsoletely toothed, sessile, radical ones on long footstalks; stem pubescent; root tuberous. ♃. H. Native on the western side of Pennsylvania. Flowers largish, rose-coloured. Pods orbicular, short.

Tuberous-rooted Bastard-Cress. Fl. Apr. May. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

18 T. Schra'nckii (Schult. fl. aust. p. 83.) leaves somewhat hispid, entire, radical ones stalked, cauline ones stem-clasping; calyx shorter than the petals; pods obcordate. Native of Austria on walls along with the *Capsélla Bursa-pastoris*.

Schranck's Bastard-Cress. Fl. May, July. Pl. $\frac{1}{2}$ to 1 foot.

19 T. scapiflo'rum (Viv. fl. cors. app. in Schlecht. Linnæa. 1. p. 503.) leaves all radical, on long stalks, roundish-oblong, quite entire, smoothish; silicles elliptical, slightly emarginated; style elongated. ♃? H. Native of Corsica. Flowers white?

Scape-flowered Bastard-Cress. Pl. 1 inch.

Cult. The species of this genus are hardly worth cultivating except in general collections, as in botanical gardens. The perennial species may be grown on rock-work or in borders; they are readily increased by seeds. The biennial and annual sorts may be either sown on rock-work or in open borders. All the species succeed best in a light sandy soil.

XXXVII. HUTCHI'NSIA (in honour of Miss Hutchins of Belfast, to whom Sir James Smith was indebted for many communications on submarine plants, during the progress of "English Botany"). R. Br. in hort. kew. ed. 1812. vol. 4. p. 82. but not of Agardh. D. C. syst. 2. p. 384. prod. 1. p. 177.

Lin. syst. *Tetradynàmia Siliculòsa*. Silicle elliptical, with navicular wingless valves. Cells 2-seeded, rarely many-seeded. Calyx equal at the base. Petals equal. Herbs small, perennial, rarely annual, many-stemmed, those with entire leaves have purplish flowers, those with pinnate-lobed leaves have small white flowers. Racemes terminal, erect; pedicels filiform, bractless, spreading. Flowers never yellow. Lower leaves opposite.

Sect. I. Iberide'lla (a diminutive of *Ibèris*; like). D. C. syst. 2. p. 385. prod. 1. p. 177. Style filiform. Leaves entire or toothed. Flowers purplish, resembling those of *Ibèris*.

1 H. rotundifo'lia (R. Br. in hort. kew. ed. 2. vol. 4. p. 82.) leaves somewhat fleshy, quite entire; lower ones stalked, obovate; cauline ones ovate-oblong, somewhat stem-clasping; stamens, petals, and style one-half shorter than the pod. ♃. H. Native of Provence, Dauphiny, Piedmont, Switzerland, Germany, Carniola, Carinthia, Transylvania, near the snow among stones and in the fissures of rocks in the Alps. Ibèris rotundifòlia, Lin. spec. 905. Scop. carn. no. 805. t. 37.—All. ped. spec. 27. t. 4. f. 1. Ibèris rèpens, Lam. fl. fr. 2. p. 674. Lepídium rotundifòlium, All. pedm. flor. 1. p. 252. t. 55. f. 2. Noccæ'a rotundifòlia, Mœnch. suppl. 89. Stems many, weak, prostrate, or ascendant. Flower from white to purplish. Seeds 2 or 3 in each cell, alternate, pendulous.

Round-leaved Hutchinsia. Fl. April, Aug. Clt. 1759. Pl. 2 to 3 inches.

2 H. Cepeæfo'lia (D. C. syst. 2. p. 386.) leaves somewhat fleshy, lower ones stalked, oblong-obovate, denticulated at the apex, cauline ones oblong; stamens shorter than the corolla; style 3-times shorter than the pod. ♃. H. Native of Carinthia in the valley called Rabl, also in the Apennines, where it flowers immediately on the melting of the snow. Ibèris cepeæfòlia, Wulf. in Jacq. misc. 2. p. 28. t. 1. Very like *H. rotundifòlia* both in habit and character. Flowers pink or purplish.

Cepæa-leaved Hutchinsia. Fl. April, May. Clt. 1821. Pl. 2 to 4 inches.

3 H. pygmæ'a (Viv. fl. cors. app. in Schlecht. Linnæa. 1. p. 503.) plant smooth; leaves fleshy; radical ones coarsely and obsoletely toothed or quite entire, tapering into the petiole, cauline ones sessile, half-stem-clasping; silicle elliptical, truncate, bluntly emarginate; style very short, permanent. ♃. H. Native of Corsica. Flowers white or purplish.

Pygmy Hutchinsia. Pl. 1 inch.

4 H. pu'mila (D. C. syst. 2. p. 386.) leaves somewhat fleshy, lower ones on long foot-stalks, oval, entire, cauline ones oblong, acutely-sagittate at the base; stamens, corolla, and style much shorter than the pod. ♃. H. Native of Eastern Caucasus on Alp Schadagh. Ibèris pùmila, Stev. mem. soc. nat. mosc. 3. p. 269. Pods narrowed at both ends. Stems many, prostrate, or ascendant.

Dwarf Hutchinsia. Fl. April, June. Clt. 1821. Pl. 1 to 2 in.

5 H. stylo'sa (D. C. syst. 2. p. 387.) leaves somewhat fleshy, lower ones stalked, obovate-oblong, almost entire, cauline ones oblong; stamens, petals, and style about the length of the pod. ♂. H. Native of Naples on the higher mountains, especially in Abruzzo. Ibèris stylòsa, Tenore, prod. fl. neap. 37. Thláspi mínimum, Arduin, specim. 2. p. 37. t. 15. f. 1.? Flowers white, corymbose. Stems many, erect.

Long-*styled* Hutchinsia. Fl. May, July. Clt. 1821. Pl. 1 in.

6 H. brevi'stula (D. C. syst. 2. p. 387.) leaves somewhat fleshy, stalked, obovate, somewhat toothed; pods oblong, truncately-emarginate; style very short. ♃. H. Native of the mountains of Syria. Flowers small, white. Petals oblong-cuneated, blunt, almost truncate. Pods obovately-cuneated, truncately-emarginate at the top; seeds 4 in each cell. A tufted plant, with rather woody roots.

Short-styled Hutchinsia. Fl. April, Ju. Clt. 1825. Pl. 1 in.

7 H. trine'rvia (D. C. syst. 2. p. 387.) leaves quite entire, 3-nerved, oval-oblong, sessile, somewhat cordate, stem-clasping at the base. ♄. ♃. H. Native of Persia on Mount Elwend. Flowers from white to purplish. Valves keeled. A plant with a woody root and many erect stems, which are somewhat shrubby at the base. Deless. icon. sel. 2. t. 53.

Three-nerved-leaved Hutchinsia. Pl. $\frac{1}{2}$ to 1 foot.

8 H. hastula'ta (D. C. syst. 2. p. 388.) leaves cordately-hastulate at the base, ovate-oblong, somewhat denticulated and half-stem-clasping; pods elongated, truncate at the top. ♃. H. Native of Hyrcania and of the north of Persia in the province of Ghilan near Lenckeran. Thláspi hastulàtum, Stev. in litt.—Gmel. sib. 254. t. 56. f. 1. A smooth, somewhat glaucous herb, with erectish stems. Flowers white, suffused with red. Size and habit of *H. rotundifòlia*.

Hastulate-leaved Hutchinsia. Pl. $\frac{1}{2}$ to 1 foot long.

Sect. II. Nasturtio'lum (D. C. syst. 2. p. 388. prod. 1. p. 178.) Leaves pinnate-lobed. Flowers small, white. Like *Dràba* and *Teesdàlia*.

9 H. calyci'na (Desv. journ. bot. 3. p. 168.) leaves pinnate-

parted, and are as well as erect stems pubescent; calyx permanent; pods oblong, narrowed at both ends, and pointed by the style. ♃. H. Native of Siberia on the Altaian mountains, and of North America. Hook, fl. bor. amer. t. 17. B. Lepídium calycìnum, Steph. in Willd. spec. 3. p. 433. Petals white, oblong, twice the length of the calyx, rarely deciduous.

Calycine Hutchinsia. Fl. May, June. Clt. 1819. Pl. 2 or 3 in.

10 H. alpi'na (B. Br. in hort. kew. ed. 2. vol. 4. p. 82.) leaves pinnate-parted, smooth; petals twice the length of deciduous calyx; pods acute at both ends; style very short, exserted. ♃. H. Native of the Pyrenees, Apennines, Mount Baldo, Carpathian mountains, &c. on rather moist rocks. Lepídium alpìnum, Lin. amœn. 4. p. 321. Jacq. aust. 2. t. 137. Schrank, fl. mon. 3. t. 216. Lepídium Hallèri, Crantz. austr. 1. p. 8. t. 1. f. 3. Dràba nasturtiòlum, Scop. carn. ed. 2. no. 791. Dràba alpìna, Baumg. fl. transylv. 2. p. 232. but not of Lin. Seeds 2 in each cell. Flowers white.

Alpine Hutchinsia. Fl. April, Ju. Clt. 1775. Pl. 2 or 3 in.

11 H. petræ'a (R. Br. in hort. kew. ed. 2. vol. 4. p. 82.) leaves pinnate parted, smooth; petals hardly longer than the calyx; pods 4-seeded, blunt at both ends; stigma sessile. ⊙. ♂. H. Native of rocky places from Spain to Sweden, and from England to Laconia and Arcadia, also in the south of Tauria. In England on limestone rocks and walls, particularly on the rocks about Goram's chair, and on St. Vincent's Rocks, near Bristol; at Uphill, Somersetshire; on a limestone wall 2 miles from Pembroke, and in various other parts of Wales, and of the mountainous limestone districts of Yorkshire. Hook, fl. lond. t. 31. Lepídium petræ'um, Lin. spec. 899. Jacq. austr. 2. t. 131. Smith. engl. bot. t. 111. Bois. fl. eur. t. 440. f. 1. Lepídium Linnæ'i. Crantz. austr. 9. t. 2. f. 4. & 5. Lepídium pusíllum. Var. β. Lam. fl. fr. 3. p. 468. Stems erect or tufted, or somewhat decumbent. Flowers white very minute.

Rock Hutchinsia. Fl. Mar. Apr. Engl. Pl. 2 or 3 inches.

12 H. brevicau'lis (Spreng. syst. 2. p. 863.) leaves lyrately-pinnate; leaflets obovate; petals larger than the deciduous calyx; silicles obovate-oblong, obtuse, destitute of the style. ♃. H. Native of the Alps of Carinthia. Lepídium brevicaúle, Hoppe. Flowers white?

Short-stemmed Hutchinsia. Pl. ¼ foot.

Cult. These pretty little plants are well adapted for rock-work or to be grown in small pots (well drained with potsherds) and placed among other alpine plants. The annual and biennial species should all be sown on rock-work or in a dry situation in autumn or early in spring, or they may be allowed to scatter themselves, which is the best mode. The perennial kinds, which are recommended to be grown in pots, or on rock-work, do best in a mixture of loam, sand, and peat. They may be either increased by dividing the plants at the root or by seeds, which ripen in plenty, or cuttings will root freely, planted under a hand-glass.

XXXVIII. TEESDA'LIA (named after Robert Teesdale, author of a catalogue of plants growing about Castle Howard, published in the Linnæan Transactions, vol. 2.) R. Br. in hort. kew. ed. 2. vol. 4. p. 83. Smith in Lin. soc. trans. II. p. 283. D. C. syst. 2. p. 391. prod. 1. p. 178. Guepìnia, Bast. suppl. 35.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle oval, emarginate at the top, with navicular valves. Cells 2-seeded. Stamens each furnished with a scale on the inside at the base. Small, annual, smooth herbs with rosulate, expanded, stalked, pinnate-lobed radical leaves, and with many leafless simple scapes rising from the neck. Racemes terminal, at time of flowering corymbose, afterwards elongated; pedicels filiform, bractless, spreading. Flowers small, white.

1 T. ibe'ris (D. C. syst. 2. p. 392.) petals unequal, outer ones largest. ⊙. H. Native of dry, barren, gravelly fields in many parts of Europe, especially in the Morea, France, Germany, Denmark, and Sweden. In England about London, Norwich, and Bury, in Worcestershire and Cumberland, near Sheffield. In corn-fields near Easinwold, Yorkshire, in several parts of the Lowlands of Scotland. Abundant in Anglesea. Teesdàlia nudicaúlis, R. Br. l. c. Ibèris nudicaúlis, Lin. spec. 907. Oed. fl. dan. 323. Smith, engl. bot. t. 327. Sturn. fl. germ. icon. Schkuhr. handb. 2. no. 1774. t. 179. Ibèris bursifòlia, Berg. phyt. icon. Thláspi nudicaúlis, D. C. fl. fr. ed. 3. vol. 4. p. 708.

Iberis-like or Irregular-flowered Teesdalia. Fl. May. Britain. Pl. 1 to 2 inches.

2 T. lepi'dium (D. C. syst. 2. p. 392.) petals equal. ⊙. H. Native of sandy, sterile, somewhat wooded places throughout the south of Europe, especially in Portugal and Spain in elevated fields about Madrid, above the monastery of St. Bernard. About Montpelier and in Lower Dauphiny, also in Mauritania. Lepídium nudicaúle, Lin. spec. 898. Thláspi nudicaúle, Desf. atl. 2. p. 67. Teesdàlia regulàris, Smith in Lin. trans. II. p. 283.—Magn. monsp. 186 and 187. icon. Stamens usually 4, rarely 6.

Var. β, *integrifòlia* (D. C. syst. 2. p. 393.) leaves entire, not pinnate. Native of Spain and Sardinia.

Var. γ, *acutíloba* (D. C. l. c.) leaves more oblong, with 3 or 4 acute lateral lobes or teeth, and an elongated, acuminate terminal one. Native of the island of Scio.

Lepidium-like or Regular-flowered Teesdalia. Fl. Feb. May. Clt. 1818. Pl. 1 to 2 inches.

Cult. These pretty little annuals should be sown on rock-work or in a dry sandy situation, and the seeds may afterwards be allowed to scatter themselves.

XXXIX. PLATYSPE'RMUM (from πλατυς, *platys*, broad, and σπερμα, *sperma*, a seed; seeds broad). Hook. fl. bor. amer. t. 18. B.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle elliptical, with navicular valves, terminated by a short, blunt stigma; cells 4-5-seeded; seeds nearly orbicular, flat, cordate at the base, edged with a broad wing. A small annual plant with radical runcinate leaves, and 1-flowered radical pedicels. Stamens naked. Petals and sepals about equal in length.

1 P. scapi'gerum (Hook. l. c.). ⊙. H. Native of North America on the western coast.

Scape-bearing Platyspermum. Pl. 2-3 inches.

Cult. A trifling little plant of easy culture, well adapted for rock-work, where the seeds may be sown.

* * *Cells of silicle* 1-*seeded.*

XL. IBE'RIS (from the country called *Iberia*, now Spain; most of the species grow in such climates). Lin. gen. no. 804. Gært. fruct. 2. p. 279. D. C. syst. 2. p. 398. prod. 1. p. 178.

Lin. syst. *Tetradynàmia, Siliculòsa.* Petals 4, 2 outer ones largest. Silicle much compressed, truncately emarginate. Seeds ovate, pendulous. Herbs or sub-shrubs. Stems round, usually smooth, sometimes fleshy. Leaves alternate, linear, or obovate, entire, toothed, or pinnatifid, sometimes thickish. Racemes sometimes elongated, sometimes corymbose when in flower, afterwards elongated, and sometimes, even after flowering, corymbosely-umbellate; pedicels bractless. Flowers either white or purplish, never yellow; the outer flowers of the corymb are much more irregular than the inner ones.

Sect. I. Iberi'dium (altered from *Ibèris*). D. C. prod. 1. p. 179. Radicle descending. Seed not margined. Dissepiment simple.

§ 1. *Suffruticòso-corymbòsa. Fructiferous pedicels corymbose. Stems suffruticose. Evergreen plants.*

1 I. CONTRA'CTA (Pers. ench. 2. p. 186.) frutescent, smooth; stem erect, elongated; leaves linear, somewhat cuneated, toothed; pods crowded, umbellate. ♄. H. Native of Spain and Portugal. Fructiferous corymbs very much contracted. Flowers white.

Var. β, ciliolàta (D. C. syst. 2. p. 405.). I. fruticòsa, foliis oblongis, crassis, &c. Ant. Juss. in herb. Juss. Leaves evidently ciliated at the base. Perhaps a proper species. D. C. l. c.

Contracted-corymbed Candy-Tuft. Fl. April, June. Clt. 1824. Pl. 1 to 1½ foot.

2 I. PRUI'TI (Tineo. pug. sic. 1. p. 11. no. IX.) stems suffruticose at the base, smooth; leaves obovate-spatulate, entire, or somewhat toothed; pods emarginate, somewhat corymbose. ♃. ♄. H. Native of Sicily on the Nebrode mountains. Very like *Ibèris Tenoreàna*, but differing in the leaves being very smooth, not ciliated, and the flowers pure white; silicles disposed in very short, much-crowded racemes.

Pruitian Candy-Tuft. Pl. ½ foot.

3 I. TENOREA'NA (D. C. syst. 2. p. 404.) stems suffrutescent at the base; leaves somewhat fleshy, crenated, lower ones obovate, narrowed at the base and ciliated, upper ones oblong-linear; pods emarginate, somewhat corymbose. ♄. H. Native of Naples near St. Angelo and on Mount Vellino in Abruzzo. Sweet, brit. fl. gard. t. 88. bot. mag. t. I. cepeæfòlia, Tenore, prod. fl. nap. p. 37. but not of Lin. Flowers purplish or whitish, umbellate. Stems ascendant. A beautiful plant.

Tenore's Candy-Tuft. Fl. May, July. Clt. 1822. Pl. ½ ft.

§ 2. *Herbàceo-corymbòsa. Fructiferous pedicels corymbose. Stems herbaceous. Annual or biennial plants.*

4 I. SPATULA'TA (Berg. phyt. icon. D. C. fl. fr. 4. p. 716.) herbaceous, smooth; leaves spatulate, entire, rather fleshy; pods corymbose, emarginate, with an acute, narrow notch. ⊙. H. Native of the Pyrenees in calcareous stony places, irrigated at certain seasons from the melting of snow. Ibèris cepeæfòlia, Pourr. act. toul. 3. p. 321. but not of Wulf. Ibèris rotundifòlia, Lam. dict. 3. p. 221. but not of Lin. Ibèris carnòsa, Willd. spec. 3. p. 455. Flowers purplish. Seed thick, rufous-brown.

Spatulate-leaved Candy-Tuft. Fl. Ju. Jul. Clt. 1820. Pl. ½ ft.

5 I. NA'NA (All. auct. p. 15. t. 2. f. 1.) herbaceous, smooth; leaves roundish-spatulate, entire, somewhat fleshy; pods corymbose, emarginate, with a broadish blunt notch. ♂. H. Native on rocky mountains in Piedmont, Dauphiny, Provence, &c. Ibèris Aurósica, Vill. delph. 1. p. 349. 3. p. 289. Flowers purple. Petioles never ciliated as in the preceding plant.

Dwarf Candy-Tuft. Fl. June, Aug. Clt. 1822. Pl. ¼ foot.

6 I. VIOLA'CEA (R. Br. in hort. kew. ed. 2. vol. 4. p. 85.) herbaceous, smoothish; leaves stalked, spatulate, blunt, toothed, or quite entire, ciliated; corymbs somewhat umbellate; calyx hairy on the back. ⊙. H. Native of? Flowers violet.

Violet-coloured Candy-Tuft. Fl. Ju. Jul. Clt. 1782. Pl. ¼ ft.

7 I. TAU'RICA (D. C. syst. 2. p. 402.) herbaceous, smoothish; leaves ciliated, somewhat fleshy, lower ones spatulate, somewhat bidentate at the apex, upper ones linear; pods corymbose, emarginate; lobules of pod blunt, shorter than the style. ♂. H. Native of Tauria and Caucasus on stony hills. Ibèris ciliàta, Willd. spec. 3. p. 445. but not of All. Ibèris símplex, D. C. fl. fr. suppl. p. 597. Thláspi saxátile, Habl. taur. p. 157. Very like *Ibèris amàra* and *I. ciliàta*. Flowers white. Leaves ciliated.

Taurian Candy-Tuft. Fl. May, Jul. Clt. 1802. Pl. ½ to ¾ ft.

8 I. CILIA'TA (All. auct. p. 15. but not of Willd.) herbaceous, smoothish; leaves linear, entire, ciliated at the base; pods corymbose, emarginate, lobules blunt, equal in length with the style. ♂. H. Native of Nice and Provence, on rocks. Ibèris Molinèrii, Balb. cat. hort. taur. 1813. p. 43. Flowers nearly like those of *Ibèris pinnàta*, white.

Ciliated-leaved Candy-Tuft. Fl. Ju. Jul. Clt. 1802. Pl. ½ to 1 ft.

9 I. LINIFO'LIA (Lin. spec. 905.) herbaceous, smooth; leaves linear, quite entire, somewhat toothed; pods corymbose, bidentate. ♂. H. Native of Nice, Provence, Dauphiny, Sicily, and Spain, &c. I. tenuifòlia, Presl. ex Spreng.—Garid. aix. 459. t. 105. Very like *Ibèris umbellàta*. Flowers purplish.

Var. β. albiflòra (Desf. in herb. mus. Paris). Flowers white.

Flax-leaved Candy-Tuft. Fl. June, Aug. Clt. 1759. Pl. 1-2 ft.

10 I. UMBELLA'TA (Lin. spec. 906.) herbaceous, smooth; leaves lanceolate, acuminated, lower ones serrated, upper ones quite entire; pods umbellate, very acutely 2-lobed. ⊙. H. Native of Italy, about Genoa, Sarzena, and Pisa; in the island of Crete, and in Spain; on stony hills in sunny places. Curt. bot. mag. t. 106. Thláspi umbellàtum, Crantz. aust. 25. Ibèris corymbòsa, Mœnch. meth. 269. Flowers purplish.

Umbellate or Purple Candy-Tuft. Fl. June, Aug. Pl. ½ to 1 ft.

11 I. LAGASCA'NA (D. C. syst. 2. p. 400.) herbaceous, pilosely-pubescent; leaves oblong, somewhat spatulate, toothed at the top; pods somewhat corymbose, acutely 2-lobed. ⊙. H. Native of Spain in mountainous places in the province of Valentia, and in the vicinity of Hellin in the province of Murcia. Ibèris spatulàta, Lag. fl. hisp. ined. but not of Berg. Flowers white?

Lagasca's Candy-Tuft. Fl. Ju. Aug. Clt. 1822. Pl. ¼ foot.

§ 3. *Herbàceo-racemòsa. Fructiferous pedicels racemose. Stems herbaceous. Annual or biennial plants.*

12 I. ODORA'TA (Lin. spec. 906.) herbaceous, smooth; leaves linear, toothed, ciliated at the base, dilated at the top; pods roundish, emarginate, lobes acute, spreading, shorter than the style. ⊙. H. Native of Crete. Sweet, br. fl. gard. t. 50.—Clus. hist. 2. p. 132. f. 1. Like *Ibèris pinnàta*. Flowers white, sweet-scented.

Sweet-*scented* Candy-Tuft. Fl. Ju. Aug. Clt. 1806. Pl. ½ to 1 ft.

13 I. PINNA'TA (Gouan. hort. monsp. 319.) herbaceous, smooth; leaves pinnatifid; racemes corymbose, but after flowering a little elongated. ⊙. H. Native of Spain, south of France, and Italy, in corn-fields.—Lob. icon. t. 217. f. 2.—Dalech. lugd. 652. f. 2. Flowers white, sweet-scented, corymbose. Calyx a little violaceous.

Var. β, crenàta (Lam. dict. 3. p. 213.) leaves deeply-crenated.

Pinnate-leaved Candy-Tuft. Fl. June, Aug. Clt. 1596. Pl. ¾ ft.

14 I. INTERME'DIA (Guersent, in bull. philom. no. 82. t. 21.) herbaceous; leaves lanceolate, smooth, blunt, entire, or the radical ones are a little toothed; flowers finally racemose; pods ovate, truncate, or very broadly emarginated. ♂. H. Native on calcareous rocks along the Seine between Rouen and Duclair. Intermediate between *I. amàra* and *I. umbellàta*. Flowers white.

Intermediate Candy-Tuft. Fl. Ju. Jul. Clt. 1823. Pl. ½ to 1 ft.

15 I. AMA'RA (Lin. spec. 906.) herbaceous; leaves lanceolate, acute, somewhat toothed; flowers corymbose, finally racemose; pods orbicular, narrowly emarginate. ⊙. H. Native of Europe, from Portugal to Germany, and from England to Italy, frequent among corn; in England about Henley and other places in Oxfordshire; about Wallingford, Berkshire, undoubtedly wild. Smith, engl. bot. t. 52. Flowers white; sepals with membranous margins. The whole plant has a nauseous bitter taste.

Var. β, ruficaúlis (Lejeun. fl. spa. 2. p. 58.) leaves narrower, ciliated. Habit smaller. Stem villous with rufous down.

Bitter Candy-Tuft. Fl. June, July. England. Pl. ½ to 1 foot.

§ 4. *Frutescénti-racemòsa. Fructiferous pedicels racemose. Stems frutescent. Evergreen plants.*

16 I. CONFE'RTA (Lag. varied. 2. no. 22. 1805. p. 213.) stem suffrutescent, dwarf; leaves subradical much crowded, somewhat linear, acute, smooth; scape naked, racemiferous. ♄. H. Native of Spain in the mountains of Leone, and among bushes near Arva. Flowers white, younger ones corymbose, afterwards becoming racemose. Stems diffuse, procumbent, glaucous, as well as younger leaves. Deless. icon. sel. 2. t. 54.

Crowded-leaved Candy-Tuft. Fl. Ju. Jul. Clt. 1824. Pl. ¼ foot.

17 I. GARREXIA'NA (All. ped. no. 920. t. 40. f. 3. and t. 54. f. 2.) frutescent; leaves oblong, narrowed at the base, blunt, quite entire, smooth; flowers corymbose. ♄. H. Native of sunny mountainous stony places in Piedmont about Garrexius and Tenda, in the Apennines and in the eastern and central Pyrenees. Ibèris sempervìrens β, Willd. spec. 3. p. 453. Ibèris sempervìrens, Lapeyr, abr. p. 370.—Barrel. icon. t. 734.—Mor. oxon. 2. p. 297. sect. 3. t. 18. f. 26. Flowers white. Intermediate between *I. sempervìrens* and *I. saxátilis*, with the character of the first, but assuming the habit of the latter. Stems branched.

Garrexian Candy-Tuft. Fl. Ju. Jul. Clt. 1820. Pl. ½ to ¾ ft.

18 I. SEMPERVI'RENS (Lin. spec. 905.) frutescent; leaves oblong, blunt, narrowed at the base, smooth; flowers in long racemes; pods emarginate, with a narrow notch. ♄. H. Native of Crete on rocks. Smith. fl. græc. t. 620. Ib. sempervìrens var. β, Lam. dict. 3. p. 220. var. γ, Willd. spec. 3. p. 453.—Barrel. icon. t. 214. Flowers white.

Evergreen Candy-Tuft. Fl. Ap. Ju. Clt. 1731. Pl. ¾ to 1 ft.

19 I. SUBVELUTI'NA (D. C. syst. 2. p. 397.) frutescent; leaves linear, acute, quite entire, somewhat velvety on both surfaces from short hairs; flowers becoming racemose. ♄. H. Native of Spain in dry mountainous places about the town of Aranjuez and elsewhere. Ibèris sempervìrens, Lag. elench. hort. madr. p. 19. no. 253. Like *I. saxátilis* and *I. Garrexiàna*. Stems much branched. Flowers white.

Velvety Candy-Tuft. Fl. April, June. Pl. ½ to 1 foot.

20 I. PUBE'SCENS (Willd. enum. suppl. p. 43.) frutescent; leaves ciliated, blunt, linear-spatulate, lower ones toothed at the top; flowers corymbose, afterwards becoming somewhat racemose. ♄. H. Native of? Flowers shewy, pale-violet. Stems many, rising from the root, procumbent.

Pubescent Candy-Tuft. Fl. Ap. June. Clt. 1821. Pl. ½ foot.

21 I. SAXA'TILIS (Lin. amœn. 4. p. 321.) frutescent; leaves linear, quite entire, somewhat fleshy, acute, ciliated; flowers corymbose. ♄. H. Native of the south of Europe on hills in places exposed to the sun, particularly in the Pyrenees, Provence, and Sicily, &c. Gouan. fl. monsp. p. 177. f. 1. Ibèris Garrexiàna, Scop. del. ins. 1. p. 16. t. 7.—Mor. oxon. 2. p. 298. sect. 3. t. 18. f. 31.—Garid. aix. p. 466. t. 101. Stems ascendant. Flowers white.

Rock Candy-Tuft. Fl. Ap. Ju. Clt. 1739. Pl. ¼ to ½ foot.

22 I. CORIFO'LIA (Sweet. hort. brit. p. 22.) frutescent; leaves linear, very entire, somewhat fleshy, blunt, smooth; flowers corymbose. ♄. H. Native of Sicily on mount Ventosa. Ibèris saxátilis β, corifòlia, Sims, bot. mag. t. 1642. D. C. syst. 2. p. 396.—Clus. hist. 2. p. 132. icone, Ibèris saxátilis, Lin. herb. Stems decumbent. Flowers white.

Coris-leaved Candy-Tuft. Fl. Ap. Ju. Clt. 1739. Pl. ¼ to ½ ft.

23 I. VERMICULA'TA (Willd. spec. 3. p. 454.) frutescent; leaves linear, quite entire, somewhat fleshy, blunt, somewhat ciliated; flowers corymbose; lobes of pod bluntish and somewhat dilated. ♄. H. Native of Tauria. Ibèris saxátilis, Pall. Ibèris saxátilis γ, vermiculàta, D. C. syst. 2. p. 396. Stems ascendant. Flowers white.

Vermiculate-leaved Candy-Tuft. Fl. Ap. June. Pl. ¼ to ½ ft.

24 I. CAPPADO'CICA (Willd. spec. 3. p. 452.) frutescent; leaves strigose, lower ones spatulate, upper ones linear acute; flowers corymbose. ♄. H. Native of Cappadocia. Petals obovate, white. Flowers at first corymbose.

Cappadocian Candy-Tuft. Pl. ½ foot.

25 I. GIBRALTA'RICA (Lin. spec. 905.) frutescent; leaves wedge-shaped, blunt, somewhat toothed at the top, rather ciliated; flowers corymbose. ♄. G. Native of Gibraltar. Curt. bot. mag. t. 124. Ibèris dentàta, Mœnch. suppl. 88. Very like *I. semperflòrens*. Leaves 2 inches long. Flowers white, with a few of them suffused with red.

Gibraltar Candy-Tuft. Fl. May, June. Clt. 1732. Pl. ½ to ¾ ft.

SECT. II. IBERIDA'STRUM (altered from *Ibèris*.) D. C. prod. 1. p. 181. Radicle horizontal: Seeds somewhat margined. Dissepiment almost double. Seed nearly as in *Biscutélla*, and therefore perhaps a proper genus (Andrz.) but from its habit it is retained with *Ibèris*.

26 I. SEMPERFLO'RENS (Lin. spec. 904.) frutescent; leaves cuneated or spatulate, rather fleshy, blunt, quite entire, smooth; flowers corymbose; pods truncate, and somewhat emarginate at the top, with obsolete lobules. ♄. G. Native of Sicily on rocks about Palermo, &c., and flowering throughout the year in its place of natural growth. I. cuneàta, Mœnch. meth. 269. I. hùmilis, Presl. ex Spreng.—Weinm. phyt. t. 973. f. c.—Seba. thes. 1. p. 2. t. 13. f. 4.—Bocc. sic. 55. t. 29. f. a. j.—Mor. oxon. 2. t. 25. f. 5. Flowers white, sweet-scented.

Ever-flowering Candy-Tuft. Fl. Jan. Dec. Clt. 1679. Pl. 1 or 2 ft.

† *Species not sufficiently known.*

27 I.? LINEARIFO'LIA (D. C. syst. 2. p. 405.) smooth; stem erect; leaves linear, quite entire; pods bifid, racemose.—Native of New Holland at Swan River Lépia linifòlia, Desv. jour. bot. 3. p. 166 and 181. Flower white?

Linear-leaved Candy-Tuft. Pl. 1 foot?

28 I. PYRENA'ICA (Lapeyr. abr. pyr. 370.) herbaceous, smooth; leaves elliptical, quite entire, lower ones opposite; pods broadly emarginate, racemose. ☉. H. Native of the Pyrenees in the valley Gistain, near Sin. Flowers numerous, naked, white, racemose. Stem reddish, branched, erect.

Pyrenean Candy-Tuft. Fl. June, July. Pl. ¾ to 1 foot.

Cult. The whole of the species of this genus are very ornamental, and deserve to be cultivated in every garden. The annual and biennial sorts may be all sown in open flower-borders, where they will flower and ripen their seed: if sown at several different times through the summer a succession of flowers may be kept up, until the frost destroys them. Many of the species will continue to bloom throughout a mild winter, if the seeds are sown in August. The shrubby species are well adapted for ornamenting rock-work, or the front of flower-borders, as they flower profusely. Cuttings of these will root freely if planted under a hand-glass in common garden mould, or they may be increased by seeds. The two green-house species *I. Gibraltárica* and *I. semperflòrens*, grow freely in any light rich soil, and young cuttings planted in the same sort of soil under a hand-glass will root freely.

XLI. THYSANO'CARPUS (from θυσανος, *thysanos*, a fringe, and καρπος, *karpos*, a fruit; broad fringed pods.) Hook fl. bor. amer. t. 18. f. A.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle obovate, emarginate at the apex, with a thick style in the recess, 1-2-celled; cells 1-seeded, with navicular keeled valves. Seeds not margined. Stamens naked. Petals much shorter than the sepals. —A small annual plant, with narrow, obtuse, runcinate, rosulate, radical leaves, and a few linear-lanceolate entire, rather stem-clasping cauline ones, one under each branch or raceme. Racemes elongated.

1 T. runcina'tus (Hook. l. c.) ⊙. H. Native of North America, probably on the Rocky Mountains.

Runcinate-leaved Thysanocarpus. Pl. 1 foot.

Cult. An insignificant plant of easy culture; the seeds only require to be sown in the open border early in spring.

XLII. BISCUTE'LLA (from *bis*, double, and *scutella*, a saucer; in allusion to the form of its silicles.) Lin. gen. no. 808. Gært. fruct. 2. p. 278. t. 141. D. C. syst. 2. p. 406. prod. 1. p. 181.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle flat, biscutate, (f. 46. *m.*) with orbicular 1-seeded cells, which are laterally united to the axis. Style long, permanent (f. 46. *m.*). Seed compressed. Embryo inverted. Perennial or annual herbs, usually hispid, but sometimes downy or smoothish, with oblong entire, toothed or pinnatifid, somewhat radical or cauline leaves, and round erect stems, which are usually somewhat corymbosely branched at the top by racemes, which when in flower are short, but when in fruit elongated; pedicels filiform, bractless. Flowers yellow, scentless.

Sect. I. Iondra'ba (from *ιον, ion*, a violet, and *Dràba*, Whitlow-Grass.) D. C. syst. 2. p. 407. prod. 1. p. 181.—Med. gen. nov. t. 1. f. 14. in Ust. new. ann. 2. p. 37. Calyx 2-spurred at the base. Glands on the torus, very prominent.

1 B. auricula'ta (Lin. spec. 911.) calyxes bluntly 2-spurred; pods smooth, rough in the centre from elevated dots, with the lobes meeting over the style at the top. ⊙. H. Native of Portugal, Spain, south of France, southern parts of Germany, Sicily, and Mauritania, in cultivated fields. D. C. diss. no. 1. t. 1. f. 2. Schkuhr. handb. 2. no. 1821. t. 182. Berg. phyt. 3. p. 55. icon. Clypèola auriculàta, Crantz. cruc. p. 93. B. auriculàta *β*, Lam. dict. 3. p. 617. illust. t. 570. f. 2. Flowers pale yellow.

Eared-calyxed Buckler-Mustard. Fl. June, July. Clt. 1683. Pl. 1 to 2 feet.

2 B. erigerifo'lia (D. C. diss. no. 3. t. 1. f. 1.) calyxes acutely 2-spurred; pods smooth, almost meeting over the style at the top (f. 46. *m.*). ⊙. H. Native of Spain, frequent in cornfields. Deless. icon. sel. 2. t. 55. B. auriculàta var. *α*, Lam. dict. 2. p. 617. exclusive of the synonyms. B. Orcelitàna, Lag. fl. hisp. ined. Like *B. auriculàta*, but differing in the spurs of calyx being acute, not blunt.

Erigeron-leaved Buckler-Mustard. Fl. June, July. Clt. 1819. Pl. 1 foot.

3 B. hi'spida (D. C. diss. no. 3. t. 1. f. 1.) calyxes acutely 2-spurred; pods smooth, rough in the disk from elevated dots, not overhanging the style at the top; stem hispid. ⊙. H. Native of Provence, Piedmont, and probably throughout Italy, on mountains in places exposed to the sun. Sims, bot. mag. 2444. B. macrocárpa, Hort.—Barrel. icon. 230 and 1219.—Col. ecphr. 2. p. 49. t. 61.—Mor. oxon. 2. p. 247. sect. 3. t. 9. f. 7. Plant hispid with crowded hairs.

Hispid Buckler-Mustard. Fl. June, July. Clt. 1818. Pl. 1 to 1½ foot.

4 B. cichoriifo'lia (Lois. add. p. 167.) calyxes rather acutely 2-spurred; pods smooth, rough in the centre from elevated dots, not overhanging the style at the top; stem villous. ♃. H. Native of stony places exposed to the sun, at the bottom of the central Pyrenees, not far from the Bagneres de Luchon. D. C. diss. no. 4. t. 2. B. picridifòlia var. Lapeyr. abr. pyr. 373. Stems branched, rather reddish. Leaves runcinately-pinnatifid. Flowers large.

Succory-leaved Buckler-Mustard. Fl. May, July. Clt. 1820. Pl. 1 to 2 feet.

Sect. II. Thlaspi'dium (from *thlaspi*, and *ειδος, eidos*, like.) D. C. syst. 2. p. 409. prod. 1. p. 181. Med. gen. nov. t. 1. f. 5. from Ust. new. ann. 2. p. 38. Calyxes equal at the base. Glands on the receptacle, hardly elevated.

§ 1. *Annuæ. Plants annual.*

5 B. lyra'ta (Lin. mant. 354.) pods pilose, hispid in their disks; radical leaves lyrate. ⊙. H. Native of Portugal, Spain, Calabria, Sicily near Palermo, north of Africa near Tangiers, &c.—Bocc. sic. 45. t. 23. A very polymorphous species.

Lyre-leaved Buckler-Mustard. Fl. June, July. Clt. 1799. Pl. 1 to 1½ foot.

6 B. raphanifo'lia (Poir. voy. har. 2. p. 198.) pods even, glabrous; radical leaves lyrate. ⊙. H. Native of Sicily near Palermo, and in Mauritania. B. laxiflòra, Presl. ex Spreng. Differing from *B. lyràta* in the pods being very smooth, not hispid, and perhaps the leaves are less cut.

Radish-leaved Buckler-Mustard. Fl. June, July. Clt. 1819. Pl. 1 to 2 feet.

7 B. margina'ta (Tenore, fl. nap. p. 38,) silicles scabrous on both surfaces, with brownish margins; stem almost naked; leaves pilose, lyrate; lobes blunt, with the terminal one very large, bidentate. ⊙? H. Native of Naples.

Marginate-podded Buckler-Mustard. Fl. June, July. Clt. 1820. Pl. ¾ foot.

8 B. mari'tima (Tenore, prod. fl. nap. p. 38. fl. nap. t. 61.) pods smooth, with ciliated margins; radical leaves lyrate. ⊙. H. Native of Goat's Island and about Fondi in Naples, by the sea-side. Very like the two preceding species, but nevertheless it differs in the pods being not smooth all over, nor pilosely-hispid, but smooth in their disks, and ciliated along their margins in a longitudinal line.

Sea-side Buckler-Mustard. Fl. June, July. Clt. 1824. Pl. 1 to 1½ foot.

9 B. cilia'ta (D. C. diss. no. 9. syst. 2. p. 410.) pods smooth in the disk, but ciliated on the margins; stem erect, elongated, leafy; leaves sessile, oblong, remotely toothed. ⊙. H. Native of Italy and Spain. B. coronopifòlia, Willd. spec. 3. p. 474. D. C. icon. gall. rar. 1. p. 12. t. 39. but not of Linnæus. B. A'pula, Lam. dict. 3. p. 618. exclusive of the synonyms. B. dídyma, Willd. enum. 2. p. 673.

Ciliated-podded Buckler-Mustard. Fl. June, July. Clt. 1790. Pl. 1 foot.

10 B. depre'ssa (Willd. enum. 2. p. 673.) pods smooth in the disk, but ciliated at the margins; stem dwarf, somewhat diffuse; leaves oblong-obovate, cuneated at the base, remotely toothed. ⊙. H. Native of Egypt in the deserts of Alexandria. D. C. diss. no. 10. B. pùmila, Balb. cat. hort. taur. Pods constantly ciliated at their margins along the sutural line. Perhaps only a variety of *B. ciliàta*.

Depressed Buckler-Mustard. Fl. Ju. Jul. Clt. 1818. Pl. ½ ft.

11 B. microca'rpa (D. C. diss. no. 11. syst. 2. p. 411.) pods with hispid disks and ciliated margins; stem almost naked, much branched; leaves almost all radical oblong, sinuately-toothed. ⊙. H. Native of Andalusia on the rock of Gibraltar about St. Roch. B. tumídula, Lag. fl. hisp. ined. Flowers small, in long racemes.

Small-fruited Buckler-Mustard. Fl. Ju. Jul. Clt. 1819. Pl. 1½ ft.

12 B. erioca'rpa (D. C. diss. no. 12. t. 9. f. 2. syst. 2. p. 411.) pods pilosely-hispid in the disk; stem erect, simple; leaves oblong-cuneated, somewhat toothed. ⊙. H. Gathered beyond Spain on a journey to Mogodor by Broussonet. Pods the size of those of *B. A'pula*.

Woolly-fruited Buckler-Mustard. Fl. Ju. Jul. Clt. 1820. Pl. ½ ft.

13 B. Colu'mnæ (Tenore, prod. fl. nap. p. 38.) pods scabrous on the disks and margins with short hairs; radical leaves obovately-cuneated, acute, toothed; stem almost naked, hispid at

the base. ⊙. H. Native of Apulia or Puglia and Lucania. B. dídyma β. Lin. spec. 911.—Col. ecphr. 1. p. 283. t. 284. f. 1.—Mor. oxon. 2. p. 249. sect. 3. t. 9. f. 12. Very like *B. eriocárpa* and *B. A'pula*, but differing in the pods being twice the size. There is a variety of this with sinuately-lyrate leaves.

Columna's Buckler-Mustard. Fl. Ju. July. Clt. 1819. Pl. 1 ft.

14 B. A'pula (Lin. mant. 254.) pods rough in the disks and margins with small hairs; leaves lanceolate, serrated; stem leafy, branched, hairy. ⊙. H. Native of the mountains of Italy, Naples, and Greece. Lam. ill. t. 560. f. 1. but not of his dict. Schkuhr. handb. 2. no. 1824. t. 182. Smith, fl. græc. t. 629. Flowers small. Pods approximate. D. C. diss. no. 15. syst. 2. p. 412.

Apulian Buckler-Mustard. Fl. Ju. July. Clt. 1710. Pl. 1 ft.

15 B. leiocá'rpa (D. C. diss. no. 16. syst. 2. p. 413.) pods smooth; leaves lanceolate, serrated; stem leafy, hairy, branched. ⊙. H. Native of the Levant. B. A'pula, Gært. fruct. 2. p. 279. t. 141. Very like *B. A'pula*, but differing in the fruit being very smooth, not rough, &c. This plant was formerly cultivated in the jardin des plantes, Paris, under the name of *B. orientàlis*.

Smooth-podded Buckler-Mustard. Fl. Jun. Jul. Clt. 1816. Pl. 1 foot.

16 B. obova'ta (Hort. par. D. C. diss. no. 18. syst. 2. p. 413.) pods smooth; leaves sub-radical obovate, grossly toothed, and narrowed into the petiole, smoothish. ⊙. H. Native of? Very like *B. montàna*, but differing in the root being annual, not perennial.

Obovate-leaved Buckler-Mustard. Fl. June, July. Clt 1818. Pl. 1 foot.

§. 2 *Perénnes. Plants perennial.*

17 B. monta'na (Cav. icon. 2. p. 50. t. 177.) pods smooth, even; leaves nearly all radical obovate-cuneated, toothed, downy. ♃. H. Native of Spain, in Valentia, on rocks. D. C. diss. no. 17. Stems many from the same root.

Mountain Buckler-Mustard. Fl. March, May. Clt. 1820. Pl. ½ to ¾ foot.

18 B. læviga'ta (Lin. mant. 225.) pods smooth, even; leaves nearly all radical, pilose, scabrous, oblong, somewhat toothed or entire, cauline ones linear, few, quite entire. ♃. H. Native of mountains in places exposed to the sun, in the Alps of Europe, particularly in the Pyrenees, Jura, &c. Jacq. aust. t. 339. icon. rar. p. 11. t. 38. Schrank. fl. mon. 1. t. 94. Bois. fl. eur. t. 447. B. dídyma, Scop. carn. no. 804. Clypèola dídyma, Crantz. aust. p. 20.

Var. β, *B. alpéstris;* Waldst. ex. Kit. pl. rar. hung. 3. p. 253. t. 228. Native of Hungary.

Var. γ, *B. glàbra* (Clairv. herb. val. 216.) a very common plant, easily distinguished from the rest.

Smoothed Buckler-Mustard. Fl. Mar. My. Clt. 1790. Pl. 1 ft.

19 B. lu'cida (D. C. diss. no. 20. t. 7. syst. 2. p. 414.) pods smooth, even; leaves smooth, for the most part radical. ♃. H. Native of Abruzzo, in Naples, on mountains. Plant easily distinguished from the rest by its smooth shining leaves.

Var. α, *dentàta;* lower leaves toothed. B. lùcida, Balb. hort. taur.

Var. β, *integrifòlia;* lower leaves entire. B. spatulàta, Lam. dict. 3. p. 620.—Barrel. icon. t. 254.

Shining-leaved Buckler-Mustard. Fl. Jun, Jul. Clt.? Pl. 1 ft.

20 B. coronopifo'lia (All. ped. no. 907.) pods smooth, even; leaves pilosely-scabrous, for the most part radical, pinnatifid, with 2 or 3 remote lobes on each side. ♃. H. Native of Spain, south of France, and Piedmont, in sterile places of mountains exposed to the sun. Sisýmbrium Valentìnum, Lin. spec. 920.? exclusive of the synonyms. B. dídyma, var. χ. Gouan. ill. p. 41.—D. C. diss. no. 22. t. 18.

Buckhorn-leaved Buckler-Mustard. Fl. Jun. July. Clt. 1790. Pl. ½ to ¾ foot.

21 B. ambí'gua (D. C. diss. no. 23. t. 11. f. 1. syst. 2. p. 415.) pods smooth, even; leaves pilosely-scabrous, radical ones sinuately-toothed, narrowed at the base, cauline ones very few, somewhat cordate at the base and half stem-clasping. ♃. H. Native of Nice, south of France, and Spain, in sterile places exposed to the sun.

Var. α, *revolùta;* leaves with the recesses of the teeth revolute. B. coronopifòlia, Lin. mant. 255.?

Var. β, *plàna;* leaves with the recesses of the teeth flat.

Ambiguous Buckler-Mustard. Fl. June, July. Clt. 1819. Pl. ½ to ¾ foot.

22 B. saxa'tilis (Schleich. cent. exsic. no. 69.) pods smooth, rough with elevated dots on the disk; leaves rough with hairs, generally radical, oblong. ♃. H. Native of the south of Europe, in barren mountainous places, particularly in Transylvania, Italy, south of France, and Spain. D. C. diss. no. 24. t. 10.

Var. α, *B. longifòlia* (Vill. dauph. 3. p. 305.) leaves entire.

Var. β, *B. móllis* (Lois. not. p. 168.) leaves deeply-toothed or sinuately-pinnatifid.

Var. γ, *B. intermèdia* (Gouan. ill. p. 42.) leaves toothed, stem very dwarf. B. depréssa, Thom. pl. exsic. A very variable species, and only can be distinguished by the pods being rough on the disk from elevated dots.

Rock Buckler-Mustard. Fl. Jun. Aug. Clt. 1819. Pl. ½ to ¾ ft.

23 B. sempervi'rens (Lin. mant. 255.) pods smooth, rough on the disk with elevated dots; leaves generally radical, erect; linear-lanceolate, hoary, almost entire. ♃. H. Native of Spain, in the province of Valentia; also in Portugal in Estremadura. B. anchusæfòlia, Turr. giorn. venez. t. 1. from Vittm. sumn. 4. p. 33.—Barrel. icon. t. 841.—Bocc. mus. 2. p. 167. t. 122.

Evergreen Buckler-Mustard. Fl. June, July. Clt. 1784. Pl. ½ to ¾ foot.

24 B. tomento'sa (Lag. in litt. D. C. syst. 2. p. 416.) pods finely pubescent and rough with dots; leaves oblong, narrowed at the base, repand-toothed, soft, downy; those on the branches stem-clasping. ♃. H. Native of Spain, on mountains, growing in chinks of rocks. Stems woody at the base.

Tomentose Buckler-Mustard. Fl. Jun. July. Pl. ¾ to 1 foot.

25 B. stenophy'lla (Duf. in ann. gen. 7. p. 299.) pods rough on the disk with dots, smooth; petals furnished with 2-auricles; radical leaves hispid with rigid hairs, lanceolate-linear, remotely toothed, or rather somewhat pinnatifid; stems almost naked and rather simple. ♃. H. Native of Spain, in Valentia. Perhaps sufficiently distinct from *B. coronopifòlia* and *B. saxátilis*.

Narrow-petalled Buckler-Mustard. Fl. June, July. Clt. 1821. Pl. ¾ to 1 foot.

† *Species hardly known.*

26 B. ma'jor (Schkuhr. handb. 2. no. 1822.) calyx laterally gibbous; pods smooth, veiny.

Larger Buckler-Mustard. Fl.? Pl. 2 feet?

27 B. angustifo'lia (Schkuhr. handb. 2. no. 1823.) calyxes laterally gibbous; pods warted, rough.

Narrow-leaved Buckler-Mustard. Pl. 1 foot.

Cult. These are pretty plants with yellow flowers. The perennial species are well adapted for ornamenting rock-work, or the front of flower-borders; they prefer a dry sunny situation. The annual kinds should be sown in the open borders, and if sown at different times throughout the season a succession of flowers may be kept up. A light sandy soil suits them all best, and as they all produce seeds in abundance they are therefore easily increased.

XLIII. MEGACARPÆ'A (from *μεγας*, *megas*, great, and *καρπος*, *karpos*, a fruit; pods large). D. C. syst. 2. p. 417. prod. 1. p. 183.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle flat, biscutate, emarginate at each end. Cells much compressed, 1-seeded, winged on the margin and united laterally to the axis. Style none. Radicle, ascendant. Perennial herbs, with a scaly neck and multifid leaves. Flowers in panicles small, perhaps yellow. Pods large.

1 M. LACINIA'TA (D. C. syst. 2. p. 417.) leaves villous; radical ones stalked, pinnate-parted, with deeply toothed or cut lobes. ♃. H. Native of Siberia, in the Kirghisian-steppe, and on the gypsaceous hills in the desert called Arsagar, beyond the river Volga. Biscutélla megalocárpa, Fisch. in litt. D. C. diss. bisc. no. 5. t. 3. Flowers small, but not sufficiently known. Stem furnished at the neck with the vestiges of the petioles of preceding year.

Jagged-leaved Megacarpæa. Fl. June, July. Clt. 1818. Pl. ½ to 1 foot.

† *Species not sufficiently known.*

2 M. ANGULA'TA (D. C. syst. 2. p. 418.) leaves smooth, entire, or repand-toothed. ♃. ? H. ? Native of Siberia. The description of this plant has been taken from a very incomplete specimen, by De Candolle, but from it, it is evident, that it is a species of *Megacarpæ'a*, and very distinct from *M. laciniàta.*

Angular-leaved Megacarpæa. Pl. 1 foot.

Cult. These plants are well adapted for rock-work. They can only be increased by seeds.

XLIV. CREMO'LOBUS (from *κρεμαω*, *kremao*, to suspend, and *λωβος*, *lobos*, a pod; cells hanging from the axis.) D. C. syst. 2. p. 418. prod. 1. p. 184.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle stalked, flat; biscutate. Cells marginate, hanging from the top or end of the axis. Style somewhat pyramidal. Seed solitary in each cell. Radicle ascending. Smooth herbs or sub-shrubs with round stems, and ovate or oblong, serrated, or somewhat entire cauline leaves, and many-flowered elongated racemes, with bractless filiform pedicels and yellow flowers.

1 C. PERUVIA'NUS (D. C. syst. 2. p. 419.) stems suffrutescent; leaves ovate, serrated; style shorter than the pedicel of the fruit. ♄. G. Native of Guayaquil, and Chili. Biscutélla, Lam. dict. 3. p. 620. D. C. diss. bisc. no. 6. t. 4. Leaves 2 or 3 inches long.

Peruvian Cremolobus. Pl. 1 or 2 feet.

2 C. SUFFRUTICO'SUS (D. C. syst. 2. p. 419.) stem suffrutescent; leaves oval-oblong, serrated; style longer than the pedicel of the fruit. ♄. G. Native of Peru. Biscutélla suffruticòsa, D. C. diss. bisc. no. 7. t. 5. Easily distinguished from *C. Chilénsis* in the stems being frutescent, not herbaceous, as well as in having broader, more serrated leaves.

Shrubby Cremolobus. Pl. 1 to 2 feet.

3 C. CHILE'NSIS (D. C. syst. 2. p. 419.) stem herbaceous; leaves oblong, almost entire; style somewhat longer than the pedicel of the fruit. ⊙. H. Native of Chili. Biscutélla, Lag. in litt. D. C. diss. bisc. no. 8. t. 6. Biscutélla cuneàta, Lag. in hort. madr. 1815. p. 20.

Chili Cremolobus. Fl. Ju. July. Clt. 1820. Pl. ½ foot.

Cult. The genus *Cremólobus* is scarcely worth cultivating except in botanic gardens. A mixture of loam, peat, and sand, will suit the two green-house species well. The hardy annual kind should be sown in front of a south wall in the common earth, about the middle of April. The only way of increasing this genus is by seeds; however young cuttings of the two green-house species, when procured, may be tried under a hand-glass.

XLV. MENONVI'LLEA (in honour of N. C. Thiery de Menonville, who introduced into Spanish America the *Cactus Coccinellifera* as well as the *Cochineal.*) D. C. syst. 2. p. 419. prod. 1. p. 184.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle somewhat stipitate, biscutate (f. 46. *n.*). Cells with the margin expanded into a wing, and as if it were finishing the parallel disk (f. 46. *n.*). An herb with a thick root and radical linear leaves, and terminal racemes with bractless pedicels and dark or sad-coloured flowers.

1 M. LINEARIS (D. C. syst. 2. p. 420.) ♃. G. Native of Peru and Chili. Radical leaves linear, entire, but sometimes, although rarely, grossly and irregularly toothed towards the top. Petals linear, twice the length of the calyx. Deless. icon. sel. 2. p. 56. The colours of the flowers are nearly like those of *Hésperis tristis.*

Linear-leaved Menonvillea. Fl. May, July. Pl. 1 foot.

Cult. *Menonvíllea* is not worth cultivating except in botanical gardens. A mixture of sand, loam, and peat will answer it well; and it should be increased by seeds.

Tribe IV.

EUCLIDIE'Æ (plants agreeing in important characters with *Euclídium,*) or PLEURORHI'ZEÆ (See Sub-Order I.) NUCAMENTA'CEÆ (from *nucamentum*, a catkin; pods.) D. C. syst. 2. p. 420. prod. 1. p. 184. Silicle indehiscent, with concave, indistinct (f. 46. *d.*), or not separating valves, and sometimes with hardly any trace of a dissepiment. Seeds oval, very few. Cotyledons flat, accumbent, parallel with the dissepiment (f. 45. *g. h.*) when there is any.

XLVI. EUCLI'DIUM (from *ευ*, *eu*, well, and *κλειδοω*, *kleidoo*, to shut up; because of the well-closed seed-pods.) R. Br. in hort. kew. ed. 2. vol. 4. p. 74. D. C. syst. 2. p. 421. prod. 1. p. 184.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle ovate, drupaceous, with manifest sutures. Style subulate (f. 46. *d.*). Cells 1-seeded. Annual herbs with slender roots and round branched stems, and pinnate-lobed, stalked, radical leaves, and oblong or linear, entire or toothed stem ones, with somewhat spicate erect racemes, which are opposite the leaves, and small white bractless flowers.

1 E. SYRÌACUM (R. Br. in hort. kew. ed. 2. vol. 4. p. 74.) pods scabrous; style subulate, permanent (f. 46. *d.*); cauline leaves stalked, lanceolate. ⊙. H. Native of Syria, Tauria, Iberia, Podolia, Moldavia, Transylvania, and Austria, among rubbish, and in sandy cultivated places. Bùnias Syrìaca, Gært. fruct. 2. p. 290. t. 141. f. 11. Anastática Syrìaca, Lin. spec. 895. Jacq. austr. 1. p. 7. t. 6. Anastática Hierochuntìna, Crantz. aust. p. 7. not of Lin. Myàgrum rostràtum, Scop. carn. ed. 2. no. 797. t. 35. Myàgrum Syrìacum, Lam. dict. 1. p. 570. no. 9. Myàgrum rígidum, Pall. itin. 3. append. no. 104. t. L. l. f. 1. and t. M. m. f. 2. ed. gall. append. no. 343. t. 65. and t. 105. f. 1. Hierochóntis Carniólica, Medik, in Ust. ann. new. 2. p. 40. Bùnias rostràta, Lher. cak. diss. ined. p. 9. Sòria Syrìaca, Desv. jour. bot. 3. p. 168, exclusive of synonyms of Lam. Flowers distant, disposed in spikes.

Syrian Euclidium. Fl. Jul. Aug. Clt. 1778. Pl. ½ to 1 foot.

2 E. TATA'RICUM (D. C. syst. 2. p. 422.) pods smooth; style becoming deciduous; cauline leaves linear, sessile. ⊙. H. Native on hills about the Jaik, and in the deserts about Astracan. Vélla tenuíssima, Pall. itin. ed. gall. append. no. 344. t. 77. f. 2. Bùnias Tatárica, Willd. spec. 3. p. 413. Myàgrum Tatáricum, Poir. suppl. 2. p. 48. Flowers small, scarcely pedicelled.

Tartarian Euclidium. Fl. April, June. Clt. 1820. Pl. ¼ foot.

Cult. This genus is not worth cultivating except in botanic

gardens. The species only require to be sown in the open border. A light sandy soil suits them best.

XLVII. OCHTHO'DIUM (from *οχθωδης, ochthodes*, warted; in allusion to the warted surface of the pods.) D. C. syst. 2. p. 423. prod. 1. p. 184.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicles coriaceous, somewhat globose. Stigma sessile. Dissepiment thick. Cells 1-seeded. Cotyledons flat, oval-oblong, obliquely accumbent. An annual, erect, branched herb, with pinnatifidly-lyrate lower leaves, somewhat similar to those of *Rape*, and rather entire upper ones; with the stems pilose at base, and with elongated racemes, bractless short pedicels and yellow flowers.

1 O. Ægyptìacum D. C. syst. 2. p. 423.) ⊙. H. Native of Egypt and Syria. Bùnias Ægyptìaca, Lin. syst. nat. 3. p. 231. Gmel. in Act. petrop. 12. p. 509. t. 9. Jacq. hort. vind. t. 145. Myàgrum verrucòsum, Lam. dict. 1. p. 570. no. 11. Rapístrum Ægyptìacum, R. Br. in hort. kew. ed. 2. vol. 4. p. 74. Euclídium Ægyptìacum, Andrz. cruc. ined. Radical leaves stalked. Petals larger than the calyx.

Egyptian Ochthodium, Fl. Ju. July. Clt. 1787. Pl. ¾ foot.

Cult. This plant is scarcely worth cultivating except in botanic gardens. It only requires to be sown in the open border. A light sandy soil suits it best.

XLVIII. PUGIO'NUM (from *pugio*, a dagger; resemblance in point of pods.) Gært. fruct. 2. p. 291. t. 142. D. C. syst. 2. p. 424. prod. 1. p. 185.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle coriaceous, transversely oval, echinated on all sides, and ending in a long, dagger-like point, 1-celled and 1-seeded from abortion. A smooth herb with linear, entire, half stem-clasping leaves, and loose racemes of small white flowers.

1 P. cornu'tum (Gært. l. c.) ⊙.? H. Native of the Levant and Siberia, in the desert of the Kalmucks, at the Caspian Sea. Búnias cornùta, Lin. spec. 935. Myàgrum cornùtum, Lam. dict. 1. p. 571. Flowers hardly larger than those of *Eróphila vérna.* Petals narrow, quite entire. Leaves linear, somewhat tongue-shaped, glaucous.

Horned-podded Pugionum. Fl. Jun. July. Pl. ½ foot?

Cult. This plant is hardly worth cultivating except in botanic gardens. It only requires to be sown in the open border, in a warm dry situation. A light sandy soil will suit it best.

Tribe V.

ANASTATI'CEÆ (plants agreeing in important characters with *Anastática.*) or PLEURORHI'ZEÆ (See Sub-Order I.) SEPTULA'TÆ (a dim. of *septum*, a dissepiment; dissepiment small.) D. C. syst. 2. p. 424. prod. 1. p. 185. Silicle opening longitudinally (f. 46. *f.*), with concave valves, bearing internally transverse, horizontal dissepiments, which separate the seeds (f. 46. *f.*). Seeds not margined. Cotyledons flat, accumbent, parallel with the dissepiment (f. 45. *g. h.*).

XLIX. ANASTA'TICA (from *αναστασις, anastasis*, resurrection; plant recovering its original form however dry it may be, on immersion in water.) Gært. fruct. 2. p. 286. t. 141. D. C. syst. 2. p. 425. prod. 1. p. 185.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle ventricose (f. 46. *e.*), with the valves bearing each an appendage on the outside at the end (f. 46. *f.*). Petals obovate. A small annual herb, branching from the neck. The younger plants are herbaceous, villous and expanded. The adult plants become hard, ligneous, and smooth, with the branches crowded lattice-wise into a globular form. The leaves are oblong, and entire, the racemes are short, and placed opposite the leaves. The flowers are small, sessile, and white.

1 A. Hierochunti'na (Lin. spec. 895.). ⊙. F. Native of arid wastes in Egypt near Caira; Palestine, and Barbary; on roofs of houses and among rubbish in Syria; of Arabia in sandy deserts on the coasts of the Red Sea. Jacq. vind. t. 58. Lam. ill. t. 555. Schkuhr. handb. 2. no. 1760. t. 179. good figure. A. littoràlis, Sal. prod. 266.—Lob. icon. 2. p. 203.—Moris. hist. 2. p. 228. sect. 5. t. 25. f. 2 & 3.—Weinm. phyt. t. 914. f. c. Stem much branched, somewhat dichotomous, dwarf. Leaves oblong or ovate, narrowed at the base into the petiole. Pods somewhat pubescent. The leaves fall off from the plant after flowering, and the branches and branchlets become dry, hard, and ligneous, and rise upwards and bend inwards at their points, hence they become contracted into a globular form, and in this state the plant is easily withdrawn from the sand by the wind and blown from the desert into the sea, and as soon as it comes in contact with the water, the branches gradually expand, and the pods open and relieve the seeds, which are thrown again upon the shore by the tide, and scattered with the sand through the desert by the wind. If this plant is taken up before it is withered, and kept entire in a dry room, it may be long preserved, and after being many years in this situation, if the root is placed in a glass of water a few hours, the buds of flowers will swell, open, and appear as if newly taken out of the ground, or it will recover its original form in the same manner if wholly immersed in water. The common people in Palestine believe that if you put this plant in water at the time when a woman first experiences the pains of child-birth, it will expand at the precise moment when the infant is brought into the world. The plant is called *Kaf Maryam* or *Mary's Flower* in Palestine, because it is supposed that the flower opened at the instant our Saviour was born.

Rose of Jericho or *Holy Rose.* Fl. Ju. Jul. Clt. 1597. Pl. ½ ft.

Cult. The seeds of this plant rarely ripen in England, unless they be sown in a hot-bed early in the spring, and the plants afterwards put into pots which should be plunged again into the hot-bed to bring them forward; for although the seeds will come up in the open ground, where the soil is dry, yet the plants rarely rise to any size, nor do they perfect seeds unless the summer is very hot and dry; but if the plants are kept in a frame, giving them free air in warm weather, they will flower in June and ripen their seeds in September. This plant is only grown in the gardens of the curious for its singularity.

L. MORE'TTIA (in honour. of J. L. Moretti, an Italian botanist). D. C. syst. 2. p. 426. prod. 1. p. 185.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle ovate, with the valves not appendiculated at the end. Petals linear. A branched herb, beset with fascicled-stellate grey hairs. Leaves obovate, cuneated at their base, and grossly toothed at their apices. Racemes erect, with short pedicels in the axillæ of the bracteas, which are leafy and longer than the flowers.

1 M. philæa'na (D. C. syst. 2. p. 426.) ♄. ⊙.? H. Native of Nubia near the island of Phila. Sinàpis Philæàna, Delil. fl. ægyp. p. 99. t. 33. f. 3. Tucnéxia Philæàna, D. C. syst. 2. p. 426. Stems suffruticose at the base, about the thickness of a pigeon's quill. Leaves alternate, almost sessile. Flowers distant, small, probably white. Pods oblong, velvety on the outside.

Phila Morettia. Fl. June, July. Pl. ½ to ¾ foot.

Cult. As this plant possesses no beauty, it is only worth cultivating in botanical gardens. It should be sown in a dry warm situation in the open border, where the seeds will ripen.

Tribe VI.

CAKILI'NEÆ (plants agreeing with *Cakìle* in important characters) or PLEURORHI'ZEÆ (see Suborder I.) LOMENTA'CEÆ (*lomentum*, a loment; pods). D. C. syst. 2. p. 427. prod. 1. p. 185. Silique or silicle separating across into 1-2-celled, 1-2-seeded joints (f. 46. *o.*). Seeds not margined. Cotyledons flat, accumbent, parallel with the dissepiment, when there is any (f. 45. *g. h.* f. 46. *c.*).

LI. CAKI'LE (an Arabic word employed by Serapio for this plant). Tourn. inst. 49. t. 483. Gært. fruct. 2. p. 287. t. 141. D. C. syst. 2. p. 427. prod. 1. p. 185.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique 2-jointed, compressed (f. 46. *o.*), upper joint ensiform or ovate. Seeds solitary in the cells, the one in the upper cell erect, the one in the lower cell pendulous. Smooth, fleshy, glaucous, annual, branched herbs. Leaves pinnatifid or toothed. Racemes opposite the leaves and terminal, erect; pedicels filiform, bractless. Flowers white or purplish.

1 C. mari'tima (Scop. fl. carn. no. 844.) upper joint of pod ensiform; leaves pinnate-parted. ⊙. H. Native of Europe in the sand along the sea-coast from Sweden and Lapland to Gibraltar; on both shores of the Mediterranean and along the Euxine Sea in Tauria. In Britain frequent on the sea-coast. Lam. ill. t. 554. f. 1. Hook. fl. lond. t. 160. Bùnias Cakìle, Lin. spec. 936. Smith engl. bot. t. 231. Fl. dan. 1168. Isàtis pinnàta, Forsk. ægyp. descr. 121. Rapístrum marítimum, Berg. phyt. 3. p. 173. icon. Cakìle Serapiònis, Gært. fruct. 2. p. 287. t. 141. f. 12. Cakìle pinnatífida, Stok. bot. mat. med. 3. p. 485. A spreading plant with pinnate-parted leaves, with the lobes somewhat distant, entire or toothed. Flowers of a bright lilac-colour, disposed in dense corymbs. This plant is asserted to be an active cathartic by Anquillara.

Sea-Rocket. Fl. June, Sept. Britain. Pl. 1 foot.

2 C. Ægypti'aca (Willd. spec. 3. p. 417.) upper joint of pod ensiform; leaves entire or dentately-sinuated, blunt. ⊙. H. Native of Italy, Barbary, and Egypt in the sand along the sea-coast. Horn. fl. dan. t. 1583. Isàtis Ægyptìaca, Forsk. ægyp. descr. 121. but not of Lin. Bùnias Cakìle, var. β, Vahl. symb. 2. p. 78. Rapístrum Cakìle of Berg. phyt. 3. p. 163. icon. Cakìle marítima, var. α., Desf. atl. 2. p. 77. Cakìle Serapiònis, var. β, Lher. cak. diss. ined. p. 5. Cakìle latifòlia, Poir. suppl. 2. p. 88. Cakìle sinuatifòlia, Stok. bot. mat. med. 3. p. 485. Cakìle marítima β, sinuatifòlia, D. C. syst. 2. p. 429. Leaves broader than those of *Cakìle marítima*, never pinnate-cut. Flowers lilac, in dense corymbs.

Egyptian Sea-Rocket. Fl. June, Sept. Clt.? Pl. 1 foot.

3 C. America'na (Nut. gen. amer. 2. p. 62.) upper joint of pod ovate, acute. ⊙. H. Native of North America along the sea-coast and on the shores of Lake St. Laurent, also on the shores of the Caribbee Islands, particularly St. Domingo. Bùnias edéntula, Bigel. fl. bost. no. 43. Cakìle Ægyptìaca, Tuss. ant. 1. f. 17. Leaves oblong, blunt, sometimes cuneated, sometimes almost linear, bluntish. A spreading herb with lilac flowers.

Var. β, *Cubénsis* (H. B. et Kth. nov. gen. & spec. amer. 5. p. 75.) leaves entire or scarcely sinuate-toothed, never pinnatifid. Flowers lilac, smaller than those of *C. marítima*.

American Sea-Rocket. Fl. June, Sept. Clt.? Pl. 1 foot.

4 C. æqua'lis (Lher. herb. & diss. cak. ined. p. 1. with a figure) upper joint of pod somewhat 4-sided at the base and furnished with a long beak at the end (f. 46. *o.*). ⊙. H. Native of Martinique on the sea-shore. Stems diffuse, straggling. Leaves light green, entire and cuneated at the base, toothed at the top. Flowers white. Pod linear, almost uniform. Seeds oblong, of a bay colour. Deless. icon. sel. 2. t. 57.

Equal-podded Sea-Rocket. Fl. June, Sept. Pl. 1½ foot.

Cult. These are rather pretty annual plants, and only require to be sown in open ground early in the spring or autumn, and treated as other hardy annuals.

LII. CORDYLOCA'RPUS (from κορδυλος, *cordylos*, a club, and καρπος, *carpos*, a fruit; upper joint of pod). Desf. atl. 2. p. 79. t. 152. D. C. syst. 2. p. 434. prod. 1. p. 186. but not of Smith.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique roundish, torose, with many joints, upper joint thick, globose, echinated. Seeds all pendulous. An annual, branched, erect, smooth (or rarely furnished with scattered hairs) herb. Lower leaves somewhat lyrate, upper ones lanceolate. Racemes erect; pedicels bractless, filiform, thicker than the fruct, not elongated. Flowers cream-coloured.

1 C. murica'tus (Desf. atl. 2. p. 79. t. 152.) ⊙. H. Native of Algiers on the edges of fields near Mayenne. Lower leaves ovate-oblong, running along the petiole. Petals pale-yellow. Pods spreading.

Muricated-podded Cordylocarpus. Fl. June, July. Clt. 1823. Pl. ½ foot.

Cult. Hardly worth cultivating, except in botanic gardens. It only requires to be sown in the open ground, and treated as other hardy annuals.

LIII. CHORI'SPORA (from χωρις, *choris*, separately; σπορα, *spora*, a seed; in allusion to each seed being inclosed separately in the pod.) D. C. syst. 2. p. 435. prod. 1. p. 186.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique roundish, with many equal joints. Seeds all pendulous. Annual branched, slender, smooth, or puberulous herbs. Leaves either pinnatifid or nearly entire. Racemes opposite the leaves, erect, elongated; pedicels filiform, bractless. Flowers violaceous or yellow.

§ 1. *Purpurascéntes. Flowers purplish; petals entire.*

1 C. tene'lla (D. C. syst. 2. p. 435.) pods and leaves smooth, upper leaves lanceolate, toothed, lower ones pinnatifid. ⊙. H. Native of Tauria among rubbish; in the Caspian desert; in craggy and nitrous places; plentiful on the banks of the river Volga; also in the Kirghisian steppe, and at Tanais, even to the Ukraine. Ráphanus tenéllus, Pall. itin. 3. app. no. 105. t. L. f. 3. ed. gall. 8vo. app. no. 356. t. 102. f. 2. Schkuhr. handb. 2. no. 1913. t. 202. Ráphanus Tatáricus, Falck. itin. 2. p. 218. no. 786. t. 13. Hésperis láxa, Lam. dict. 3. p. 325? Chorispérmum tenéllum, R. Br. in hort. kew. ed. 2. vol. 4. p. 129. Flowers purple. Stems erect.

Var. β, *taraxicifòlia* (D. C. syst. l. c.) ⊙. H. Cheiránthus taraxicifòlius, Schrank. mem. soc. Ratisb. 1818. p. 164. Leaves smooth or somewhat pubescent on the under surface, some of them are furnished at the tops of the lobes with ciliæ. Flowers purple, almost like those of *Malcòmia marítima* or *A'rabis vérna*.

Var. γ, *arcuàta* (D. C. syst. l. c.) ⊙. H. Hésperis arcuàta, Nocca. pl. sel. hort. Ticin. 1. p. 3. t. 2. Ráphanus arcuàtus, Willd. spec. 3. p. 562. Chorispérmum arcuàtum, Andrz. cruc. ined. Flower purple. Pods arched, not straight, as in the two preceding varieties.

Pliant Chorispora. Fl. June, July. Clt. 1780. Pl. ¼ to ½ foot.

2 C. stri'cta (D. C. syst. 2. p. 436.) pods, stem, and lower leaves hispid; pods erect; leaves linear, toothed. ⊙. H. Native at Lake Inderskoe in the Kirghisian steppe, but rare. Ráphanus stríctus, Fisch. in litt. Bieb. suppl. fl. taur. p. 452. Herb erect. Flowers like those of preceding plant. Seeds oval, compressed, girded by a membranous wing, by which it differs from the rest of the genus.

Straight-podded Chorispora. Fl. May, July. Clt. 1820. Pl. ¼ to ½ foot.

§ 2. *Flaviflorœ. Flowers yellow; petals emarginate.*

3 C. Sibi'rica (D. C. syst. 2. p. 437.) pods and leaves smoothish; leaves all sinuately-pinnatifid. ⊙. H. Native of Siberia and Altaia on the banks of the river Oby; frequent in the upper region of the river Yenissei. Ráphanus Sibíricus, Lin. spec. 925. Murr. comm. gœtt. 1775. p. 48. t. 11. Chorispérmum Sibíricum, Andrz. cruc. ined. Flowers yellow, nearly the size of those of *Bùnias erucàgo*. Seeds oval, brown, compressed. Plant very variable in height.

Siberian Chorispora. Fl. June, July. Clt. 1822. Pl. from 1 inch to 2 feet.

4 C. Ibe'rica (D. C. syst. 2. p. 437.) pods hairy, hardly longer than the style; leaves linear, runcinately-toothed. ⊙. H. Native of Iberia in stony places about Chinalug, in eastern Caucasus. Ráphanus Ibéricus, Bieb. fl. taur. 2. p. 129. suppl. p. 451. Chorispérmum Ibéricum, Andrz. cruc. ined. Flowers like those of *Chorispora tenélla*, but yellow. The whole plant possesses a very powerful nauseous odour, when bruised.

Iberian Chorispora. Fl. Ju. July. Clt. 1822. Pl. ¼ to ½ foot.

Cult. This is a genus of rather pretty annual plants; they only require to be sown in the open ground, and treated as other hardy annuals.

Sub-order II. NOTORHI'ZEÆ (from *νωτος, notos*, the back, and *ριζα, rhiza*, a root; radicle at the back of the cotyledons, f. 45. j. e.) D. C. syst. 2. p. 438. prod. 1. p. 186. Cotyledons flat, incumbent (f. 45. *i.*). Radicle dorsal (f. 45. *i. e.*). Seeds not margined.

Tribe VII.

SISY'MBREÆ (plants agreeing with *Sisymbrium* in many important characters,) or NOTORHI'ZEÆ (see Sub-order II.) SILIQUO'SÆ, (siliqua a long pod; pods long.) Silique 2-celled, opening longitudinally (f. 46. *p.*) with concave (f. 46. *p.*) or keeled valves. Seeds ovate or oblong, not margined. Cotyledons flat, incumbent, contrary to the dissepiment (f. 45. *i.*). A very distinct tribe from the characters of the seeds, but with the habit nearly of *Arabídeæ*.

LIV. MALCO'MIA (named after a William Malcolm, F.L.S. a celebrated cultivator.) R. Br. in hort. kew. ed. 2. vol. 4. p. 121. D. C. syst. 2. p. 438. prod. 1. p. 186.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique roundish. Stigma simple, much pointed. Annual or perennial herbs, usually scabrous or velvety from stellate hairs. Leaves oblong or oval entire, toothed or sinuately-pinnatifid; pedicels bractless, disposed in racemes. Flowers either purplish or white, sometimes very small, never becoming double in gardens.

1 M. Africa'na (R. Br. in hort. kew. ed. 2. vol. 4. p. 121.) stem branched, diffuse; leaves lanceolate, somewhat toothed, beset with 2 or 4-parted hairs; pedicels shorter than the permanent calyx; pods scabrous. ⊙. H. Native of vineyards and sandy places in the north of Africa, Sicily, Spain, south of France, Iberia about Gandsha. Hésperis Africàna, Lin. spec. 928. Hésperis diffùsa, Lam. fl. fran. 2. p. 504. Cheiránthus scàber, Mœnch. meth. 254. Hésperis híspida, Roth. cat. bot. 1. p. 78.—Buxb. cent. 4. p. 26. t. 44.—Bocc. sic. 77. t. 42. f. 1. Flowers small, purplish. Seeds oblong-ovate, rufous.

African Malcomia. Fl. May, July. Clt. 1747. Pl. ¼ to ½ ft.

2 M. taraxacifo'lia (D. C. syst. 2. p. 439.) stem erect, simple; leaves oblong, deeply-toothed; hairs 3-parted; pedicels shorter than the deciduous calyx; pods smooth, somewhat 4-sided. ⊙. H. Native —? Cheiránthus taraxacifòlius, Balb. cat. hort. taur. app. 1814. p. 10. Flowers small, purplish.

Dandelion-leaved Malcomia. Fl. Ju. Jul. Clt. 1795. Pl. ¼ to ½ ft.

3 M. la'xa (D. C. syst. 2. p. 440.) stem branched, somewhat pilose at the base; leaves ovate, acute, angularly-toothed, and are as well as the pods smooth; pedicels shorter than the calyx. ⊙. H. Native of Siberia. Hésperis láxa, Lam. dict. 3. p. 325. Flowers small, purplish. Seeds small, oblong-ovate, rufous.

Loose-branched Malcomia. Fl. Ju. Jul. Clt. 1818. Pl. 1 to 2 ft.

4 M. Chi'a (D. C. syst. 2. p. 440.) stem erect, branched; hairs 2-parted, appressed; leaves obovate, entire; pedicels length of the calyx; pods roundish, pubescent; style very short. ⊙. H. Native of the island of Chio in rocky places, and probably of Crete, Spain, and Russia. Cheiránthus Chìus, Lin. spec. 924. Cheiránthus subulàtus, Mœnch. meth. 254. Hésperis Chìa, Lam. dict. 3. p. 324.—Herm. parad. 194. t. 61.—Dill. elth. 180. t. 147. f. 178. Flowers purplish, one-half smaller than those of *Malcòmia marítima*. Plant downy.

Chio, or Dwarf-branching Malcomia. Fl. May, July. Clt. 1732. Pl. ½ to 1 foot.

5 M. mari'tima (R. Br. in hort. kew. ed. 2. vol. 4. p. 121.) stems erect, branched; leaves elliptical, blunt, entire, narrowed at the base; hairs appressed, 2 or 4-parted; pedicels somewhat shorter than the calyx; pods pubescent, furnished with a long acumen at the apex. ⊙. H. Native of the south of Europe in the sand by the sea-shore, particularly France, in the fields of Narbonne, Balearic islands, Mauritania, Greece, and all the islands in the Archipelago. Cheiránthus marítimus, Lin. amœn. 4. p. 280. spec. 924. Curt. bot. mag. t. 166. Cheiránthus littòreus, All. ped. 1. p. 273. but not of Lin. Hésperis marítima, Lam. dict. 3. p. 324.—Barrel. icon. t. 1127.—Mor. oxon. 2. p. 235. sect. 3. t. 7. f. 6. Flowers pale, violet or lilac. Pods roundish. An elegant diffuse plant, commonly cultivated in gardens as a border annual. Plant downy.

Sea-side Malcomia, or Branching Annual Stock. Fl. May, July. Clt. 1713. Pl. ½ to 1 foot.

6 M. incrassa'ta (D. C. syst. 2. p. 441.) stems many, somewhat diffuse; leaves oval, stalked, upper ones oblong; hairs appressed, 2-parted; pedicels shorter than the calyx, which becomes thickened after flowering; pods pubescent. ⊙. H. Native of the islands in the Archipelago on rocks by the sea-side; particularly in Scio and Tenedos. Deless. icon. sel. 2. t. 59. Flowers purplish, a little larger, as well as the pods being two or three times thicker, than those of *Malcòmia marítima*. An elegant downy plant.

Thickened-pedicelled Malcomia. Fl. June, July. Clt. 1820. Pl. 2 inches to ½ foot.

7 M. arena'ria (D. C. syst. 2. p. 442.) stem erect, branched; leaves lanceolate, acute, lower ones toothed, sessile; hairs stellate; pedicels very short; pods torulose, subulate. ⊙. H. Native of Mauritania in the sand on the sea-shore near Arzeau. Hésperis arenària, Desf. atl. 2. p. 91. t. 162. Flowers violaceous, about the size of those of *Malcòmia marítima*. An elegant downy plant.

Sand Malcomia. Fl. June, July. Clt. 1804. Pl. ¼ to ½ foot.

8 M. parvifl'ora (D. C. syst. 2. p. 442.) stem erect, branched; leaves oblong, blunt, almost entire; hairs soft, starry; pedicels at last the length of calyx; pods pubescent. ⊙. H. Native in sand on the sea-shore in Corsica, France, Provence, Italy about Pisa, also in Calabria, &c. &c. Cheiránthus làcerus, Gouan. ill. p. 44? Hésperis parviflòra, D. C. fl. fr. ed. 3. vol. 4. p. 654. icon. gall. rar. p. 11. t. 35. Hésperis pùmila, Poir. suppl. 3. p. 194. Flowers small, lilac. Plant downy.

Small-flowered Malcomia. Fl. Ju. Jul. Clt. 1816. Pl. ¼ to ½ ft.

9 M. lyra'ta (D. C. syst. 2. p. 443.) stem erect, branched; lower leaves lyrate, blunt, stalked; hairs appressed, 2-parted; pedicels length of calyx; pods pubescent. ⊙. H. Native of the island of Cyprus. Cheiránthus lyràtus, Smith. fl. græc. t. 635. Flowers purplish like those of *Malcòmia parviflòra*.

Lyrate-headed Malcomia. Fl. June, July. Clt. 1820. Pl. ½ ft.

10 M. litto'rea (R. Br. in hort. kew. ed. 2. vol. 4. p. 121.) stems many, erect; leaves lanceolate-linear, almost entire, hoary with short down; pedicels length of calyx; pods hoary. ♂. H. Native of France, Italy, Spain, Portugal, and along the Mediterranean sea, in the sand. Cheiránthus littòreus, Lin. spec. 925. Hésperis littòrea, Lam. dict. 3. p. 322.—Clus. hist. 1. p. 298. f. 2.—Park. theatr. 623. icon.—Lob. icon. t. 331. f. 1. Flowers whitish-yellow. Seeds ovate, not margined.

Sea-shore Malcomia. Fl. Ju. Nov. Clt.1683. Pl. ½ to 1 foot.

11 M. alyssoi'des (D. C. syst. 2. p. 444.) stem erect, branched; leaves imbricate, obovate, blunt, almost entire; hairs stellate, grey, soft; pedicels very short. ♃. H. Native of Portugal. Hésperis alyssoìdes, Pers. ench. 2. p. 203.—Barrel. icon. t. 804. Flowers purplish, somewhat sessile, 2 or 3 together at the tops of the branches. Stem somewhat woody at the base. Plant tomentose.

Alyssum-like Malcomia. Fl. May, July. Pl. ¼ to ½ foot.

12 M. pa'tula (D. C. syst. 2. p. 444.) stem branched, diffuse; leaves linear, nearly entire; hairs short, stellate, grey, soft; pedicels hardly shorter than the calyx; pods slender, pubescent, terminated by the long style. ♃. H. Native of Spain in Castile and elsewhere, especially about Madrid, in sandy places. Hésperis arenària, Lag. cat. hort. madr. 1814. p. 20. not of Desf. Flowers purplish, like those of *M. littòrea*. Plant tomentose.

Spreading Malcomia. Fl. May, June. Pl. ¼ to ¾ foot.

13 M. Broussone'tii (D. C. syst. 2. p. 445.) stem erect, branched; leaves oblong, blunt, sinuated; hairs stellate, grey, soft; pedicels shorter than the calyx; pods pubescent, torulose, terminated by the long style. ⊙. H. Native about Mogodor in fields. Deless. icon. sel. 2. t. 60. Cheiránthus trílobus, Lin. spec. 925? Flowers like those of *Malcòmia littòrea*, but rather larger. Plant tomentose.

Broussonet's Malcomia. Pl. ¼ to ½ foot.

14 M. la'cera (D. C. syst. 2. p. 445.) stem branched, diffuse; leaves oblong, bluntly-pinnatifid; hairs stellate, somewhat downy; pedicels at last equal in length with the calyx; pods pubescent, torulose, terminated by the long style. ⊙. H. Native of Portugal, Spain, Morocco, and the Levant, in the sand on the sea-shore. Cheiránthus làcerus, Lin. spec. 926. but not of his syst. veg. Hésperis làcera, Lam. dict. 3. p. 322? Hésperis pinnatífida, Desf. cor. Tourn. p. 63. t. 47. Ann. mus. 11. p. 377. t. 34. but not of Michx. M. tríloba, Spreng. syst. 2. p. 899. Flowers the colour and size of those of *M. littòrea*.

Jagged-lobed Malcomia. Fl. June, July. Clt. 1718. Pl. ½ ft.

† *A species not sufficiently known.*

15 M. ero'sa (D. C. syst. 2. p. 446.) ⊙. H. Native of Portugal and Spain, in sandy places. Hésperis eròsa, Lag. cat. hort. madr. 1814. p. 20. Pubescent. Leaves linear-oblong, sinuately-pinnatifid. Pods stalked, rather filiform, acute.

Gnawn Malcomia. Fl. June, July. Clt. 1818. Pl. ¼ to ½ foot.

Cult. The greater part of the species of *Malcòmia* being hardy annuals, they only require to be sown in the open ground, and if sown at various times throughout the summer and autumn, a succession of flowering plants may be kept up, until the frost kills them. *Malcòmia Chìa, marítima, incrassàta*, and *arenària*, are the most elegant of the annual kinds; the other annual kinds possess no beauty, and therefore are only fit to be preserved in botanic gardens. The perennial species, *Malcòmia, alyssoìdes*, and *pátula*, can only be increased by seeds; they are very well adapted for ornamenting rock-work. All the species of this genus thrive best in a light dry sandy soil.

LV. HE'SPERIS (from ἑσπερος, *hesperos*, the evening; because the flowers of most of the species are sweet-scented in the evening.) Lin. gen. no. 817. D. C. syst. 2. p. 446. prod. 1. p. 188.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique roundish or somewhat 4-sided (f. 46. *p.*). Stigmas 2, erect, connivent. Calyx bisaccate at the base. Seeds oblong, somewhat triquetrous (f. 46. *p.*). Stamens all toothless. Annual, biennial or perennial herbs, with fibrous roots, and erect or diffuse stems. Leaves ovate-lanceolate or oblong, toothed or lyrately-runcinate. The plants are for the most part furnished with simple or branched lymphatic hairs, and others are furnished, especially at the top, with glandular hairs, and from thence as if it were bituminous or clammy. Racemes terminal, bractless, erect; pedicels filiform, never thickening after flowering. Flowers white or purplish, often party-coloured, usually sweet-scented, particularly towards evening.

Sect. I. Hesperi'dium (for derivation see genus; the flowers of the plants belonging to this section smell only in the evening and at night, never throughout the day time.) D. C. syst. 2. p. 447. prod. 1. p. 188. Limb of petals linear. Pods 2-edged, with keeled valves, and a spongy dissepiment. Flowers of a dark dreary colour, sweet-scented in the evening and throughout the night.

1 H. alyssifo'lia (D. C. syst. 2. p. 447.) pedicels villous, hardly longer than the very villous calyx; petals oblong, waved; leaves oblong, quite entire, velvety with stellate down.—Native of Persia. Deless. icon. sel. 2. t. 61. Petals oblong-linear, acute, of a dark dirty-purplish colour.

Alyssum-leaved Rocket. Pl. ½ to 1 foot.

2 H. tri'stis (Lin. spec. 927.) pedicels very long, spreading, rigid, equalling the pod in breadth; pods 2-edged, thickened on the margin; petals oblong, oblique. ♂. H. Native of Austria, Hungary, Transylvania, Tauria, south of Russia, and of Naples, about the edges of fields and woods. Curt. bot. mag. t. 730. Jacq. vind. 118. Jacq. austr. 2. p. 1. t. 102. Schkuhr. handb. 2. no. 1847. t. 184. Cheiránthus lanceolàtus, Willd. spec. 3. p. 515. Stems much branched at the top, sometimes almost smooth, sometimes more or less hispid, with long spreading hairs. Radical leaves stalked, upper ones sessile, ovate, acute, entire or grossly toothed, smooth or pubescent, 2 or 4 inches long; hairs short, somewhat glandular. Flowers of a dirty white or cream-colour, brownish-red or dirty dark-purple; smelling in the night.

Sad-coloured-flowered or Night-smelling Rocket. Fl. April, June. Clt. 1629. Pl. 1 to 2 feet.

3 H. fra'grans (Fisch. in litt. Sweet, brit. fl. gard. t. 61.) pedicels villous, much shorter than the very villous calyx; petals oblong, wavy, lower leaves stalked, lanceolate, runcinate, bluntish, upper leaves almost sessile, ovate, acuminated, coarsely-toothed at the base. ♂. H. Native of Siberia? Flower purplish.

Fragrant Rocket. Fl. June, July. Clt. 1821. Pl. ¾ foot.

Sect. II. Deilo'sma (from δειλη, *deile*, the day, and οσμη, *osme*, a smell. The flowers of the plants belonging to this section smell in the day time as well as at night.) D. C. syst. 2. p. 448. prod. 1. p. 188. Limb of petals obovate. Siliques roundish, or somewhat 4-edged, with a membranous dissepiment. Funicle winged.

4 H. lacinia'ta (All. ped. no. 985. t. 82. f. 1.) pedicels shorter than the calyx; petals obovate-oblong; leaves obovate, deeply-toothed; stem hispid. ♂. H. Native on rocks exposed to the sun in Piedmont, Provence, and the south of Dauphiny. Hésperis hieracifòlia, Vill. dauph. 3. p. 317. Cheiránthus laciniàtus, Poir. suppl. 2. p. 780. Leaves covered with glandular pubescence. Flowers sometimes purplish or lilac, and sometimes yellowish.

Jagged-leaved Rocket or Dame's Violet. Fl. May, June. Clt. 1816. Pl. 1½ foot.

5 H. villo'sa (D. C. syst. 2. p. 449.) pedicels shorter than the calyx; petals obovate-oblong; leaves oblong, pointed, deeply-toothed, and are villous as well as the simple stem. ♂ ? H. Native of Apulia or Puglia. Cheiránthus villòsus, Spreng. in litt. Very nearly allied to *Hésperis laciniàta*, but the hairs of the stems are not glandular, nor the down on the leaves. Flowers purplish or lilac.

Villous-Rocket or Dame's Violet. Fl. May, June. Pl. 1½ ft.

6 H. runcina'ta (Waldst. et Kit. pl. rar. hung. 2. p. 220. t. 200.) pedicels longer than the calyx; petals obovate, somewhat mucronate; leaves pubescent, lower ones lyrately-runcinate, upper ones lanceolate, acuminated; stem erect, panicled at the top. ♂. H. Native of Hungary in coppices. The whole plant is covered with somewhat clammy short hairs. With the habit of *H. matronàlis*.

Var. β H. bituminòsa (Savi. hort. Pis. ann. 1808. perhaps also of Willd. enum. suppl. 45.) Deilósma suavèolens, Andrz. cruc. ined. Plant clammy. Pods somewhat incurved. Flowers of both varieties from white to purple or lilac, about the size of those of *Hésperis matronàlis*.

Runcinate-leaved Rocket or Dame's Violet. Fl. May, July. Clt. 1804. Pl. 1 to 2 or 3 feet.

7 H. matrona'lis (Lam. dict. 3. p. 321. ill. t. 564. f. 1.) pedicels length of calyx; petals obovate; pods erect, torose, smooth, not thickened at the edge; leaves ovate-lanceolate, toothed. ♃. H. Native of coppices and hedges nearly throughout the whole of Europe.

Var. α, horténsis (D. C. syst. 2. p. 450.) stem firm, straight; flowers usually sweet-scented; petals frequently emarginate and mucronate; leaves ovate-lanceolate, never cordate. ♃. H. Hésperis matronàlis, Lin. spec. 927.—Mor. hist. 2. p. 251. sect. 3. t. 10. f. 1.—Lob. icon. t. 323. f. 2. The ladies of Germany have pots of this plant placed in their apartments, whence it has obtained the name of *Dames' Violet*. Parkinson calls the plants *Queen's Gilloflowers*, and Gerarde *Damask Violets*.

1 *albiflòra* (D. C. l. l. c.) flowers single, white.—Tab. kraut. p. 692. f. 1.—Dalech. lugd. 804. f. 1. Besl. eyst. vern. ord. 8. t. 3. f. 2.

2 *albo-plena* (D. C. l. c.). Flowers double white.

3 *purpùrea* (D. C. l. c.) flowers single, purple.—Tab. kraut. p. 692. f. 2. Dalech. lugd. 804. f. 2. Besl. eyst. vern. ord. 8. t. 3. f. 3.—Weinm. phyt. t. 572. f. b.

4 *purpùreo-plena* (D. C. l. c.) flowers double purple.—Weinm. phyt. t. 572. f. c.

5 *variegàta* (D. C. l. c.) flowers double, variegated with white and purple.—Munt. phyt. cur. t. 186.

6 *foliiflòra* (D. C. l. c. p. 451.) flowers double, green. Moris. oxon. 2. p. 251. no. 2. Weinm. phyt. t. 572. f. a.

Var. β, sylvéstris (D. C. syst. 2. p. 451.) habit much more loose than var. α. Lower leaves only at the base more or less cordate, and often coarsely toothed; flowers always purplish or lilac, rarely sweet-scented; limb of petals blunt. Hésperis inodòra, Lin. spec. 927. Jacq. aust. t. 347. Fl. dan. t. 934. Smith engl. bot. t. 731. Hésperis sylvéstris, Crantz. austr. p. 32. Hésperis Sibírica, Vill. dauph. 3. p. 316. Native of many places in the north of Europe. In Britain in hilly pastures near rivulets but rare.

Var. γ, H. Sibírica (Lin. spec. 927.) leaves narrower, oblong-lanceolate, acuminated. Hésperis obtùsa, Mœnch. suppl. 86. Native of Tauria and Siberia. Flowers purple or lilac.

This is a very variable plant, as may be seen from its numerous varieties.

Common Rocket or *Dames'* Violet. Fl. May, Aug. Clt. var. α and its varieties since 1597. β. Native of Britain. γ. Since 1800. Pl. 1 to 4 feet.

8 H. heterophy'lla (Tenore, fl. nap. prod. p. 39.) pedicels length of calyx; petals obovate; stem branched, diffuse, and is as well as leaves covered with short pubescence; leaves ovate-lanceolate, toothed. ♃. H. Native of Naples in shady fields and in woods. Habit of plant very like the branched diffuse varieties of *Hésperis matronàlis*. Flowers purplish or lilac.

Variable-leaved Rocket. Fl. May, Jul. Clt. 1825. Pl. 2 to 3 ft.

9 H. ela'ta (Horn. hort. hafn. suppl. 74.) petals blunt, very entire and notched at the top; leaves lanceolate-acuminated, remotely toothed; stems simple, erect. ♂. H. Native?

Tall Rocket or Dames' Violet. Fl. May, Aug. Clt. 1824. Pl. 3 or 5 feet.

10 H. grandiflo'ra (Sims, bot. mag. t. 2683.) pedicels longer than the calyx; petals obovate; racemes many-flowered, crowded; radical leaves oblong-ovate, obtuse, cauline ones lanceolate, sessile. ♂. H. Native of Siberia? or Hungary? Flowers dark lilac. Stem simple.

Great-flowered Dames' Violet or Rocket. Fl. June, July. Clt. 1817. Pl. 3 feet.

11 H. Stevenia'na (D. C. syst. 2. p. 452.) pedicels longer than the calyx; petals obovate; stem and pods hispid; radical leaves stalked, runcinate, upper ones ovate-lanceolate, deeply-toothed. ♃. ♂. H. Native of the south of Tauria. Claws of petals longer than the calyx. Flowers purplish. This plant is very like *Hésperis matronàlis, β sylvéstris*.

Steven's Rocket or Dames' Violet. Fl. May, July. Pl. 1 ft.

12 H. apri'ca (Poir. suppl. 3. p. 194.) pedicels beset with glandular pili, length of calyx; petals obovate; leaves oblong, blunt, and are as well as the simple stems hispid. ♃. H. Native of exposed fields in Siberia and Dauria. Cheiránthus aprìcus, Steph. in Willd. spec. 3. p. 518. Hésperis Cheiránthus, Pers. ench. 2. p. 203. Cheiránthus hírtus, Schlecht. ex Stev. obs. in herb. Willd.—Deless. icon. sel. 2. t. 62. Flowers purple or lilac, size of those of *H. matronàlis*.

Var. β, dentàta; leaves grossly toothed. Perhaps a proper species.

Exposed Rocket or Dames' Violet. Fl. May, June. Clt. 1821. Pl. ¼ to ½ foot.

13 H. bicuspida'ta (Poir. suppl. 3. p. 194.) pedicels length of calyx; petals blunt; leaves lanceolate, acute, rather toothed, and are as well as simple stem covered with stellate grey down. ♃.? ♂.? H. Native of Armenia. Cheiránthus bicuspidàtus, Willd. spec. 3. p. 519. Flowers purple or lilac?

Var. β, Cappadòcica (plant a little smaller, and with the pods and flowers more spreading than in the species.) ♂. ♃. H. Native of Cappadocia. Both plants are rather woody at the base.

Two-pointed-podded-Rocket. Fl. May, June. Pl. 1½ foot.

14 H. ramosi'ssima (Desf. atl. 2. p. 91. t. 161.) pedicels rather shorter than the calyx; petals elliptical-oblong; pods scabrous, torulose; leaves oblong, velvety; stem much branched. ⊙. H. Native of Algiers near Arzeau, in the sand on the shore, and in Egypt, near the Saqqarah Pyramids, also in Galatia. Flowers small, violet or lilac.

Much-branched Rocket. Fl. Ju. Jul. Clt. 1819. Pl. ½ to ¾ ft.

15 H. pygmæ'a (Dilil. ill. fl. ægyp. p. 19. no. 596.) pedicels longer than the calyx; petals elliptical; pods very slender, smooth; leaves sinuated, scabrous from stellate hairs; stem branched. ⊙. H. Native of Syria and near Alexandria. Flowers small, purplish.

Pygmy Rocket. Fl. May, Jul. Clt. 1828. Pl. 2 or 3 inches.

16 H. pulche'lla (D. C. syst. 2. p. 455.) pedicels longer than the calyx; petals obovate; leaves almost all radical, bluntly pinnatifid, smoothish; scapes numerous, scarcely longer than the leaves. ⊙. H. Native of the Levant (Greece or Syria).

With the habit of *Malcòmia làcera*, but with the stigma of *Hésperis*. Flowers rose-coloured, a little smaller than those of *Malcòmia marítima*, otherwise similar.

Pretty Rocket. Fl. May, July. Pl. 2 or 3 inches.

17 H. CRENULA'TA (D. C. syst. 2. p. 456.) pedicels shorter than the calyx; petals obovate; leaves oblong, smooth; blunt, crenated; stem branched. ⊙. H. Native in the Levant between Aleppo and Mossul. Flowers purplish; claws of petals length of calyx.

Crenulated-leaved Rocket. Pl. $\frac{1}{4}$ foot.

† *Species, the generic characters of which are very doubtful.*

18 H.? PINNATI'FIDA (Mich. fl. bor. amer. 2. p. 31.) pedicels at last longer than the calyx; petals obovate; lower leaves pinnatifidly-lyrate, upper ones unequally serrated. ♃. H. Native of humid woods in Tennessee and Kentucky, and not by any means rare along the banks of the river Ohio below Le Tarts rapids. Herb very smooth. Stems simple or branched, angularly-sulcate. Flowers small, pale-purple or lilac.

Pinnatifid-leaved Rocket. Fl. Ju. Jul. Pl. 2 or 3 ft. high.

19 H.? PE'NDULA (D. C. syst. 2. p. 457.) pedicels deflexed, hispid; leaves covered with bristles, lower ones somewhat lyrate, upper ones ovate, toothed; stem branched, hispid. ⊙? ♃? H. Native of Syria. Flowers unknown.

Pendulous-flowered Rocket. Pl. $1\frac{1}{2}$ foot.

20 H.? ANGUSTIFO'LIA (D. C. syst. 2. p. 457.) pedicels very short, thick; petals oblong; leaves linear, grossly-toothed, smoothish; stem hispid. ⊙. H. Native of Syria between Aleppo and Mossul. Flowers small, white. Stem branched, erect.

Narrow-leaved Rocket. Pl. 3 or 4 inches.

† *Species not sufficiently known.*

21 H. NI'VEA (Baumg. fl. trans. 2. p. 278.). ♃. H. Native of Transylvania on mountains. Herb very hairy, branched. Leaves alternate, stalked, upper ones sessile, stem-clasping, ovate-lanceolate, toothed. Flowers stalked, corymbosely-racemose, white, sweet-scented; petals oval, blunt, entire.

Snow Rocket. Fl. Aug. Sept. Pl. 1 foot.

22 H. REPA'NDA (Lag. cat. hort. madr. 1814. p. 20.) ♃. H. Native of Spain on the Mariana mountains. Stems erect, somewhat angular. Spikes of flowers terminal, elongated. Calyx dark-purple. Corolla violet. Petals oblong, truncate, longer than the calyx. The whole plant is covered with short, white, reflexed, appressed hairs.

Repand-leaved Rocket. Fl. Ju. Jul. Clt. 1820. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ ft.

Cult. The perennial species of this genus thrive best in a light rich soil, and they require to be frequently transplanted and divided, otherwise they will not long exist, particularly the double varieties of *Hésperis matronàlis*; the best time to do this, is after they are done flowering and are again beginning to spring afresh from the root. The biennial and annual sorts do well in any common garden-soil, requiring the same treatment as other hardy annuals and biennials.

LVI. ANDREO'SKIA (in honour of Antonio Andrzejowski, a Russian botanist, who has studied cruciferous plants particularly). D. C. prod. 1. p. 190. Sisýmbrium, section VII. Hesperidópsis, D. C. syst. 2. p. 484. Dontostèmon, Andrz. in litt.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique sessile, roundish, 2-celled, with somewhat concave valves and a membranous dissepiment. Style short, slender. Seeds ovate, disposed in one row. Cotyledons flattish, incumbent. Herbs villose, glandular. Leaves linear, entire, or pectinately pinnate-lobed. Flowers white, or purplish. Calyx almost erect, deciduous, equal at the base. Petals unguiculate, entire. Two lateral stamens free, not toothed; the four larger ones are sometimes joined by pairs, and sometimes furnished with a tooth on the inside, at the top.

1 A. INTEGRIFO'LIA (D. C. prod. 1. p. 190.) leaves linear, quite entire; branches and pedicels glandular and pilose as well as the pods. ⊙. H. Native in sandy places of mountains in Siberia from Yenissei to the regions beyond the Baical, and at the river Lena. In arid fields of Dauria near Tschita and about Doroninsk. Sisýmbrium integrifòlium, Lin. spec. 922. Hésperis glandulòsa, Pers. ench. 2. p. 203. Cheiránthus muricàtus, Weinm. cat. hort. Dorp. 1810. p. 41. Flowers white, varying to purple.

Entire-leaved Andreoskia. Fl. Ju. Jul. Clt. 1819. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

2 A. EGLANDULO'SA (D. C. prod. 1. p. 190.) leaves linear, quite entire, and are as well as stem villous, without glands. ⊙. H. Native of Siberia. Sisýmbrium eglandulòsum. D. C. syst. 2. p. 485. Sisýmbrium Sieversiànum, Redowsk. from Fisch. in litt. Differing from *A. integrifòlia* in the stems and leaves being villous, but not glandular. Flowers always white.

Glandless Andreoskia. Fl. Ju. Jul. Clt. 1824. Pl. $\frac{1}{2}$ foot.

3 A. PECTINA'TA (D. C. prod. 1. p. 190.) leaves pectinately-pinnate-lobed; lobes linear, acute, and are as well as stem pilose, interspersed with muricated glands. ♂. H. Sisýmbrium pectinàtum, D. C. syst. 2. p. 485. Flowers the same as those of *A. integrifòlia* but a little larger. H. punctàta and pilòsa, Poir.

Var. α, *pinnàta*; stem dwarf; flowers white. Hésperis pinnàta, Pers. ench. 2. p. 203. Native of Siberia on the Lake Baical near Penolsk.

Var. β, *pectinàta*; stem elongated; flowers white. Sisýmbrium pectinàtum, Fisch. in litt. Native of Dauria at the river Ighitou and about Doroninsk.

Var. γ, *pinnatífida*; stems elongated; flowers reddish. Cheiránthus pinnatífidus, Willd. spec. 3. p. 523. Native of Siberia.

Pectinated-leaved Andreoskia. Fl. May, July. Clt. 1825. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. These plants are scarcely worth cultivating, except in botanic gardens. They only require to be sown in the open ground, and treated like other hardy annuals. A light sandy soil will suit them best.

LVII. SISY'MBRIUM (Σισυμβριον was the Greek name of some aquatic plant. It appears to have had an agreeable smell. Ovid advises that Venus should be propitiated with garlands of myrtle, of roses, and of sisymbrium. It is, however, more probably derived from σισιβος, *sisibos*, a fringe, as some of the species have fringed roots). All. ped. 1. p. 274. D. C. syst. 2. p. 458. prod. 1. p. 190. Sisýmbrium, spec. Lin. Juss. &c.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique roundish, sessile upon the torus. Stigmas 2, somewhat distinct, or connate into a head. Calyx equal at the base. Seeds ovate or oblong. Cotyledons flat, incumbent, sometimes oblique. Stamens not toothed. Herbs annual or perennial, rarely suffrutescent. Leaves very variable on the same plant. Racemes elongated after flowering; pedicels bractless or furnished with a leafy bractea, filiform erect. Flowers yellow or white.

Sect. I. Vela'rum (*velar*, the Arabic name of the cress). D. C. syst. 2. p. 459. prod. 1. p. 191. Silique awl-shaped, broadest at the base, ending in the very short style at the top, appressed to the axis, standing on very short pedicels, which thicken after flowering. Flowers yellow.

1 S. OFFICINA'RUM (Scop. carn. ed. 2. no. 824.) leaves runcinate, pilose; stem pilose; pods subulate, pressed to the rachis. ⊙. H. Native throughout the whole of Europe in waste land and among rubbish, very common along the sides of walls, hedges, and roads; plentiful in Britain, also in the north of

Africa. Erýsimum officinàle, Lin. spec. 922. Fl. dan. t. 560. Curt. fl. lond. 5. t. 50. Woodv. med. bot. 4. p. 14. t. 244. Smith engl. bot. t. 725. Schkuhr. handb. 2. no. 1833. t. 183. Klùtia officinàlis, Andrz. cruc. ined. Flowers small, yellow. Pods erect and pressed to the stem.

Var. β, leiocárpum (D. C. syst. 460.) pods smooth. Native of South Carolina and Teneriffe. Erýsimum officinàle, Pursh, fl. amer. sept. 2. p. 436.

This plant is warm and acrid to the taste, and when cultivated is used as a spring pot-herb. Birds are fond of the seed. Sheep and goats eat the herb. Cows, horses, and swine refuse it. It is celebrated in medicine even to this day, and is used as a diuretic, and as an expectorant in asthma, chronical coughs, and hoarseness, and hence its name in France *Herbe au chantre*. Rondeletius informs us that the last-mentioned complaint, occasioned by loud speaking, was cured by the juice of this plant in three days. Other testimonies of its good effects in this disorder are recorded by writers on the Materia Medica, of whom we may mention Dr. Cullen, who for this purpose recommends the juice to be mixed with an equal quantity of honey or sugar. In this way also it is said to be an useful remedy in ulcerations of the mouth and throat. The seeds being most pungent, should be preferred to its leaves. This, as well as some other cruciferous plants, are apt to come up among the ashes where charcoal has been made, or where there has been any considerable fire. In Germany the plant is called *der Hederich, Wegesenf, Wildersenf, falcher Wassersenf, das Gelbe Eisenkraut, Kreuzkraut*, &c. In Danish *Vild senep, Veysenep*. In Swedish *Vaggkrassa*. In France, *Le velar, La Tortelle*. In Italian *Erisamo*. In Spanish *Jaramago, hierba de san Alberto, Irion*. In Russia *Corczyca polna, Pszonak ziele*.

Common Hedge Mustard or *Officinal* Sisymbrium. Fl. May, July. Britain. Pl. 1 or 2 feet.

2 S. corniculà'tum (Cav. præl. no. 3. from Lag. in litt.) lower leaves sinuately-runcinate; upper ones lanceolate, toothed; pods compressed, subulate, somewhat pilose; pedicels thick, very short. ⊙. H. Native of Spain about Madrid at a place called La Real casa del Campo. Flowers small, yellow. Pods straight, erect, appressed to the axis. A very distinct species, but not sufficiently known, and perhaps will form a separate genus.

Horned-podded Hedge-Mustard. Fl. June, July. Clt. 1818. Pl. 1 to 1½ foot.

Sect. II. Norta (meaning unknown). D. C. syst. 2. p. 461. prod. 1. p. 191. Silique round. Calyx spreading. Seeds oblong. Flowers yellow. Racemes bractless.

3 S. stricti'ssimum (Lin. spec. 922.) leaves lanceolate, stalked, toothed, pubescent. ♃. H. Native throughout middle Europe, France, Italy, Germany, &c. &c. on mountains in rugged places. Jacq. vind. 122. fl. austr. t. 194. Flowers intensely yellow. Pods 2 inches long, straight, very smooth. Stems erect, branching at the top.

Very-straight-podded Hedge-Mustard. Fl. June, Aug. Clt. 1658. Pl. 3 to 5 feet.

4 S. ju'nceum (Bieb. fl. taur. 2. p. 114.) leaves smooth, glaucous, lower ones stalked, runcinately-pinnatifid, upper ones linear-lanceolate, entire. ♃. H. Native of dry meadows in Hungary, of salt meadows in Transylvania, Tauria at the river Volga about Zarizyn and the colony Sarepta; in the deserts of Siberia between Oby and Irtish, and between Barnaoul and Zmeof. Pods strictly erect, parallel with the axis. Flowers yellow.

Var. α, Brássica polymórpha (Murr. comm. goett. 1776. p. 35. t. 6.? Waldst. et Kit. hung. 1. p. 93. t. 90.)

Var. β, Cheiránthus júnceus (Waldst. et Kit. hung. 3. p. 259. t. 234. Erýsimum júnceum. Willd. spec. 3. p. 513. Sisýmbrium júnceum, Bieb. l. c.)

Rush-like Hedge-Mustard. Fl. May, Jul. Clt. 1804. Pl. 1 foot.

Sect. III. Psilo'stylum (from ψιλος, *psilos*, slender, and στυλος, *stylos*, a column or style; styles long and slender). D. C. syst. 2. p. 463. prod. 1. p. 191. Siliques round, terminated by the long slender style. Calyx closed. Seeds oblong. Flowers yellow.

5 S. exacoi'des (D. C. syst. 2. p. 463.) leaves oval-oblong, almost entire, smooth, glaucous; racemes 1 or 4-flowered. ⊙. H. Native of Lebanon at a place called Zaale. Mathìola exacoìdes, Spreng. syst. 2. p. 899. Petals yellow, elliptical, small; claws of petals linear, longer than the calyx. Deless. icon. sel. 2. t. 63. Perhaps a proper genus. Habit of plant referable to *Exácum pusíllum*.

Exacum-like Hedge-Mustard. Fl. May, June. Pl. 1 to 2 in.

Sect. IV. Irio (from ερυω, *eruo*, to cure; see *Erýsimum*.) D. C. syst. 2. p. 463. prod. 1. p. 191. Siliques round. Seeds ovate, somewhat triquetrous. Flowers yellow. Pedicels bractless.

§. 1. *Leaves toothed or entire.*

6 S. Hispa'nicum (Jacq. coll. 1. p. 69. icon. rar. 1. t. 124.) leaves lanceolate, toothed, sessile, smooth; stems branched, divaricate; pods erect, roundish, smooth. ♂. H. Native of Spain, and perhaps of the south of France. Pods erect, appressed. A very smooth rather glaucous herb, with branches rising from the axillæ of the leaves.

Spanish Hedge-Mustard. Fl. May, June. Clt. 1818. Pl. 1½ ft.

7 S. linea're (D. C. syst. 2. p. 464.) leaves linear, entire, rather hispid; stem hispid; pods smooth, very slender. Native of Siberia. Cheiránthus leptophýllus, Willd. herb. from Stev. obs. ined.—Gmel. sib. 3. p. 271. t. 62. Flowers small. Pods slender, smooth. Seeds small. Stems branched at the top.

Linear-leaved Sisýmbrium. Fl. Ju. July. Clt. 1820. Pl. 1 ft.

8 S. pu'milum (Steph. in. Willd. spec. 3. p. 507.) radical leaves sinuately-toothed, cauline ones sagittate, stem-clasping, toothed; pods rough from branched hairs. ⊙. H. Native of the north of Persia, in the plains adjacent to Caucasus, about Kitzjar, and about Astracan; also in Iberia. Flowers small. Plant very variable in height.

Dwarf Hedge-Mustard. Fl. April, May. Clt. 1818. Pl. from ¼ to 1½ foot.

9 S. Palla'sii (Spreng. syst. 2. p. 901.) stem branched; leaves all linear, quite entire, smooth, lower ones blunt, superior ones narrowed, acute; calyx pilose; siliques slender, erectly-spreading. ⊙.? H. Native of Siberia. S. tenuifòlium, Pall. in Willd. herb.

Pallas's Hedge-Mustard. Pl. 1 foot.

10 S. Kahi'kir (Mart. ex. Spreng. syst. 2. p. 901.) stem slender, ascending, naked above; leaves oblong-linear, acute, tapering to the base, almost quite entire, hairy; racemiferous branches elongated; calyx hispid; petals linear; siliques slender, elongated, smooth. ⊙.? H. Native of?

Kahikir Hedge-Mustard. Pl. ½ foot.

11 S. atrovi'rens (Horn. ex. Spreng. syst. 2. p. 901.) stem diffusely branched; leaves oblong, toothletted, auricled at the base, smooth; petioles dilated at the base and stem-clasping; siliques somewhat arched, smooth. ⊙.? H. Native of China.

Dark-green Hedge-Mustard. Pl. 1 foot.

12 S. nitídulum (Lag. ex. Spreng. syst. 2. p. 901.) stem ascending, rather simple, smooth, and leafless above; leaves oblong, deeply toothed, stalked; racemes loose; siliques on long stalks, smooth. ⊙.? H. Native of Spain.

Glistering Hedge-Mustard. Pl. 1 foot.

§. 2. *Leaves pinnately-lobed; lobes entire or toothed.*

13 S. OBTUSA'NGULUM (Schleich. cat. p. 48.) leaves pinnate-parted; lobes oval-oblong, blunt, sinuately-toothed, recesses roundish; stems hispid at the base with reflexed hairs. ⊙. H. Native of Spain, France, Switzerland, and Piedmont, in sandy cultivated land, and among rubbish. Sinàpis nasturtiifòlia, Lam. dict. 4. p. 346. Sisýmbrium jacobeæfòlium, Berg. phyton. icon. Sinàpis Hispánica, Lam. fl. fr. 4. p. 645. Erysimum obtusángulum, Clairv. herb. val. 219. Erùca inodòra, Bauh. hist. 2. p. 862. f. 3. Chabr. sciagr. 276. f. 6. Moris. oxon. 2. p. 229. sect. 3. t. 5. f. 10. Plant very variable in size and hairiness. Stem hispid at the base, with reflexed bristles, the rest pubescent or smooth.

Var. β, S. lævigàtum (Willd. spec. 3. p. 500.) stems smoothish at base, not hispid.

Blunt-angled-leaved Sisýmbrium. Fl. May, Aug. Clt. 1823. Pl. 1 to 1½ foot.

14 S. ACUTA'NGULUM (D. C. fl. fr. 4. p. 670.) stem and leaves smooth; radical ones runcinate, cauline ones pinnatifid, lobes and recesses acute; calyx much spreading; pods rough. ♂. H. Native of Piedmont, and also of the hills in the south of France and Liguria; of the Pyrenees, Dauphiny, and Savoy, in rugged exposed places of valleys, and on low mountains. Erýsimum Pyrenàicum, Vill. prosp. p. 39. t. 21. f. 2. Sinàpis Pyrenàica, Lin. spec. 934. Jacq. vind. 3. p. 50. t. 97. All. ped. no. 960. t. 55. f. 1. Sisýmbrium Pyrenàicum, Vill. dauph. 3. p. 341. t. 38. not of Lin. S. sinapioìdes, R. Br. in hort. kew. ed. 1812. vol. 4. p. 112. Stems sometimes rather pubescent; sparingly branched at the top. Pods slender, an inch long.

Acute-angled-leaved Sisýmbrium. Fl. June, Aug. Clt. 1791. Pl. 1 to 1½ foot.

15 S. TARAXACIFÒLIUM (D.C. fl. fr. ed. 3. vol. 4. p. 670. icon. rar. gall. p. 11. t. 37.) leaves runcinately-pinnate-lobed; lobes and recesses acute; pods declinate, smooth; calyx erectish. ♂. H. Native of the Mountains of Provence. Flowers very small, but the petals are, nevertheless, longer than the calyx. Pods usually declinate.

Var. β, S. contórtum (Cav. from Willd. enum. 678.) differing from the species in the stems being much more hispid at the base; radical leaves hispid, and the cauline ones less strictly erect.

Var. γ, S. affìne (Willd. enum. suppl. p. 44.) calyx more spreading, with the leaves of *S. taraxacifòlium* and the calyx of *S. Austrìacum*.

Dandelion-leaved Sisýmbrium. Fl. May, June. Clt. 1817. Pl. 1 to 1½ foot.

16 S. AUSTRI'ACUM (Jacq. aust. 3. t. 262.) stem, pods, and leaves smooth; radical leaves runcinate, cauline ones cut or pinnatifid; lobes and recesses acute; calyx spreading. ♂. H. Native of rugged exposed places, and among rubbish on hills, and in valleys in the south of France, Piedmont, Switzerland and Germany. S. multisiliquòsum, Hoffm. germ. 4. p. 50. S. compréssum, Mœnch. suppl. 83.

Var. β, S. Eckartsbergénse (Willd. spec. 3. p. 502.) pods deflexed, spreading.

Var. γ, S. erysimifòlium (Pourr. act. toul. 3. p. 329.) pods erect.

Var. δ, S. Tillièri (Bell. ined. Willd. spec. 3. p. 497.) Perhaps differing from all, in the pods being longer, the radical leaves more crowded, and fewer stem ones.

Austrian Hedge-Mustard. Fl. May, July. Clt. 1799. Pl. 1½ to 2 feet.

17 S. I'RIO (Lin. amœn. 4. p. 270.) stem and leaves smooth; leaves runcinately-pinnatifid; lobes toothed, terminal lobe elongated; calyx and pods spreading, erect. ⊙. H. Native of waste grounds, or on banks and heaps of rubbish: plentiful in the neighbourhood of London. At Faulkbourn, Essex, and on the walls of Berwick-upon-Tweed. It covered the ground in the spring, after the great fire of London. Haller records the same tendency in Sisýmbrium Officinàrum (Smith). From Greece to Tauria, and from Spain and Sicily to Sweden. Jacq. aust. t. 322. Curt. fl. lond. 5. t. 48. Smith, engl. bot. t. 1631. S. glàbrum, Willd. enum. suppl. 44. S. erysimástrum *a*, Lam. fl. fr. 2. p. 521. Herb with the hot flavour of mustard.

Var. β, S. glàbrum (Jacq. hort. vind. from Schrad. spec, sicc.) lower leaves lyrate, with the terminal lobe rounder than in *var. a*.

Var. γ, S. pinnatífidum (Forsk. fl. arab. CXVI.) pods and pedicels one-half shorter than in the species. Native of Arabia Felix, in the mountains of Hadio.

Var. δ, S. Gállicum (Willd. enum, 678.) stem pubescent at the base.

Irio, London-Rocket, or Broad-leaved Hedge-Mustard. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

18 S. NI'TIDUM (Zea. in Desf. cat. hort. paris, 1815. p. 153.) smooth; lower leaves lyrate, repand-toothed, upper ones hastate, angular, running into the foot-stalk at the base; pods sessile, filiform, spreading, rather incurved. ⊙. H. Native of Spain. S. Zeæ, Spreng. syst. 2. p. 904. Flowers small, yellow, not white. Seeds small, pale, oval, compressed. Very like *S. Irio*.

Shining Hedge-Mustard. Fl. Jul. Aug. Clt. 1818. Pl. ¾ to 1 ft.

19 S. SUBHASTA'TUM (Willd. enum. 679.) smooth, somewhat glaucous; radical leaves runcinate; cauline leaves lanceolate, hastate at the base from two acute auricles; pods spreading, rigid; pedicels thick, very short. ⊙. H. Native of the islands in the Archipelago. Brássica subhastàta, Willd. spec. 3. p. 550. Stems branched.

Subhastate-leaved Hedge-Mustard. Fl. April, Jul. Clt. 1817. Pl. 2 feet.

20 S. COLU'MNÆ (Jacq. aust. t. 323.) stem villous, somewhat hoary; leaves runcinate, pubescent; lobes toothed or entire, acute; pods erectish; calyx loose. ⊙. H. Native of waste ground, among rubbish, by way sides, and in gardens in the south of Europe, particularly in the south of France, Alsace, Germany, south of Italy, Transylvania, and Greece; also in Tauria and Armenia. Plant very variable in height.

Var. a, altíssimum (D. C. syst. 2. p. 469.) pods smooth, lobes of leaves almost entire. S. altíssimum, Lin. spec. 920. S. Walthèri, Crantz. aust. p. 91.—Buxb. cent. 5. p. 26. t. 51.

Var. β, leiocárpum (D. C. l. c.) pods smooth; lobes of leaves toothed. S. Colúmnæ, Jacq. aust. t. 323.—Column. ecphr. 1. p. 266. t. 268. S. villòsum, Mœnch. meth. 251. Native of France.

Var. γ, villosíssimum (D. C. l. c.) pods pubescent; stem and leaves very villous; lobes of leaves toothed. S. erysimástrum *β*, Lam. fl. fr. 2. p. 521. S. Loesèlii, Thuil. fl. paris, ed. 2. vol. 1. p. 335. Native of France, about Paris.

Var. δ, tenuisíliquum (D. C. l. c.) pods pubescent, very slender; stem and petioles pubescent; lobes of leaves almost entire. S. Colúmnæ, Bieb. fl. taur. 2. p. 114. *var. a*. Native of Tauria.

Var. ε, orientàle (D. C. l. c.) pods puberulous; the lower part of the herb is downy-villous, upper part smooth; lobes of leaves toothed. S. orientàle, Lin. amœn. 4. p. 322. spec. 921. S. Colúmnæ, *var. β*, Bieb. fl. taur. 2. p. 114. Native of Tauria.

Columna's Hedge-Mustard. Fl. May, Sept. Clt. 1796. Pl. from 1 to 3 feet.

21 S. PANNÓNICUM (Jacq. coll. 1. p. 70. icon. rar. 1. t. 123.) lower leaves runcinate, hispid, with toothed lobes; upper leaves pinnate, smooth, with very entire linear lobes; pods spreading. ⊙. H. Native in sterile and rugged fields and vine-yards. In the valleys of Anivie and Iserable in Switzerland. In Alsace, Hungary,

Tauria, Caucasus, and Transylvania, &c. This plant covered the ground in and about Moscow, after the great fire of 1812. (Goldb.) S. Sinàpios, Retz. obs. 3. p. 37. S. sinapístrum, Crantz. aust. p. 52. S. altíssimum, Pall. ined. taur. Habl. taur. p. 158. from Bieb. S. tenuifòlium, Gener, scep. el. no. 613. ? Flowers pale yellow, almost cream-coloured. Pods spreading. Stems solitary, sometimes beset with long hairs.

Hungarian Hedge-Mustard. Fl. May, June. Clt. 1787. Pl. 2 feet.

22 S. SEPTULA'TUM (D. C. syst. 2. p. 471.) leaves smooth, pinnate-parted; lobes linear, somewhat toothed in front, acute; pods somewhat spreading; dissepiment bearing impressed seeds in the cells. Native of Syria, about Aleppo. Perhaps a proper genus, allied to *Moréttia*. Stem whitish.

Septulate Hedge-Mustard. Pl. 1 to 2 feet.

23 S. CARTILAGÍNEUM (Pall. herb. from Fisch. in litt.) leaves scabrous, pinnate-parted; lobes linear, entire or somewhat toothed, thickish; upper leaves undivided. ♃. ? ♂. ? H. Native on cretaceous mountains in Tauria and Iberia. Pods elongate, narrowed at the base. Perhaps a species of *Diplotáxis* or *Stanlèya*. Stem erect, smooth, nearly simple.

Cartilaginous-leaved Hedge-Mustard. Fl. ? Pl. 1 foot.

24 S. LYRA'TUM (Burm. fl. cap. 17.) lower leaves pilose, lyrately-runcinate, lobes toothed; upper leaves oblong, smooth, toothed; pods somewhat spreading, smooth. ♃. G. Native of the Cape of Good Hope. S. sylvéstre, Burm. herb. Seeds ovate, compressed, small, rufous. Deless. icon. sel. 2. t. 64.

Lyrate-leaved Hedge-Mustard. Pl. 1½ foot.

25 S. BURCHE'LLII (D. C. syst. 2. p. 472.) leaves pinnate, pilose; lobes oblong, bluntly sinuate-angular; pods spreading, scabrous; pedicels short, thick; stem hispid with spreading hairs. ⊙. H. Native of the Cape of Good Hope, beyond the colonial territory, near the rivulet called Sack-river. Sisýmbrium, no. 1496, Burch. cat. geogr. pl. afr. austr. Pods nearly the same as those of *S. ásperum*. Stems sparingly branched.

Burchell's Hedge-Mustard. Pl. ½ to 1 foot.

26 S. GARIEPI'NUM (Burch. in D. C. syst. 2. p. 472.) leaves pinnate-parted; lobes toothed, acutish, scabrous with branched hairs; pods scabrous, erectish; stems covered with appressed down. ⊙. H. Native of the Cape beyond the Orange river, in open places, *var. β*, in groves, at the fountain called Kosi. Pods round, scabrous from small starry hairs. Stem branched.

Var. α, aprìcum; Burch. cat. geogr. no. 2080.

Var. β, nemoròsum; Burch. l. c. no. 2558.

Gariep Hedge-Mustard. Pl. 1½ foot.

27 S. A'SPERUM (Lin. spec. 920.) leaves smooth, pinnate-parted, with oblong, blunt, toothed, lobes; pedicels very short; pods scabrous, pointed with the short style. ♂. H. Native of the south of France, Dauphiny, &c. Spain, Portugal at the Tagus, in humid sandy or gravelly places.—J. Bauh. hist. 2. p. 858. f. 3. Chabr. sciagr. 275. f. 2. Stems many, from the same root.

Rough Hedge-Mustard. Fl. May, Aug. Clt. 1778. Pl. ¼ to ¾ ft.

§ 3. *Sòphiæ. Cauline leaves bipinnate, with cut pinnatifid or multifid lobes. Flowers small, yellow.*

28 S. SOPHI'A (Lin. spec. 922.) leaves bipinnate; lobes cut, oblong-linear; pedicels 4-times longer than the calyx; petals smaller than the calyx. ⊙. H. Native among rubbish, dry banks, waste ground, and dung-hills, very frequent in Britain and many other parts of Europe, from Portugal to Ingria, and from England to the Morea, also of Eschscholz Bay on the west-coast of America. Smith, engl. bot. t. 963. Mart. fl. rust. t. 57. S. parviflòrum, Lam. fl. fr. 2. p. 519. Sophìa Chirurgiòrum, Lob. icon. 738. f. 1. Blackw. herb. t. 440. et seriphium Weinm. phyton. t. 941. f. a. "The wisdom of surgeons," or Flix-weed, is so named, from the quality attributed to it of curing immoderate laxity of the bowels. According to Linnæus sheep and kine eat the plants, horses and goats are not fond of it, and swine refuse it. The force of gun-powder is said to be augmented by mixing a tenth part of the seeds with the other ingredients. The plant formerly was prescribed in dysenteries and hysterical cases, and the seed was given to destroy worms, but none of these virtues and qualities have been well ascertained. Flowers small, greenish-yellow, somewhat corymbose. Pods erect, linear, smooth. A large branching downy plant.

Fine-leaved Hedge Mustard or *Flix-weed*. Fl. July, Aug. Britain. Pl. 2 or 4 feet.

29 S. PE'RSICUM (Spreng. nov. prov. p. 39. no. 88.) leaves bipinnate; lobules linear; pedicels twice the length of the calyx; petals a little longer than the calyx. ⊙. H. Native of Persia. Flowers very small. Pods almost parallel with the axis. A slender branched plant, very like *S. Sophìa*. Stems pubescent with minute 3-parted hairs. Leaves smoothish.

Persian Flix-weed or Hedge-Mustard. Fl. July, Aug. Clt. 1819. Pl. 1 to 2 feet.

30 S. CANE'SCENS (Nutt. gen. amer. 2. p. 68.) leaves bipinnate, canescent; lobules blunt, toothed; petals equal in length with the calyx; pods clavate, shorter than the pedicels. ⊙. H. Native of North America, from Virginia to Georgia. S. Sophìa, Pursh. fl. amer. sept. 2. p. 440? Very like *S. Sophìa*, but much smaller. Petals obovate, pale yellow.

Grey Flix-weed or Hedge-Mustard. Fl. July, Aug. Clt. 1827. Pl. 1 to 1½ foot.

31 S. BRACHYCA'RPUM (Richards. in Frankl. narr. journ. p. 744.) leaves bipinnate; lobes blunt, entire or sparingly cut; petals larger than the calyx; pods linear, somewhat 4-sided, shorter than the pedicels. ⊙. H. Native of the Arctic region between 54° and 64° degrees of north latitude. Very like *S. Sophìa*, but the pods are one-half shorter than in that species.

Short-podded Flix-weed or Hedge-Mustard. Fl. June, July. Clt. 1827. Pl. ½ to 1 foot.

32 S. TRIPINNA'TUM (D. C. syst. 2. p. 475.) leaves tripinnate, velvety with starry down; lobules oblong-linear, somewhat toothed; pods slender, elongated, smooth. ⊙. H. Native of the Cape of Good Hope in dry places at the river Gaurits. Sinàpis? tripinnàta, Burch. cat. geogr. afr. aust. no. 1640. trav. 1. p. 318. An intermediate species between *S. Sophìa* and *S. millefòlium*.

Tripinnate-leaved Flix-weed or Hedge-Mustard. Pl. 2 feet.

33 S. MILLEFO'LIUM (Ait. hort. kew. ed. 1. vol. 2. p. 391.) leaves somewhat tripinnate, hoary; lobules blunt, small; stem suffruticose; petals larger than the calyx. ♄. G. Native of Teneriffe on rocks in the lower parts of the island. Sinăpis millefòlia, Jacq. icon. rar. t. 27. Flowers crowded-corymbous. A small branched shrub.

Millefoil-leaved Flix-weed or Hedge-Mustard. Fl. May, Sept. Shrub 1 to 1½ foot.

34 S. TANACETIFO'LIUM (Lin. spec. 916.) leaves pinnate; segments lanceolate, deeply-serrated, outer ones confluent; petals larger than the calyx; pods shorter than the pedicels. ♃. H. Native of exposed cold situations in Piedmont, Switzerland, Savoy, Dauphiny, Provence, and the Pyrenees. Erýsimum tanacetifòlium, Clairv. herb. val. 219.—Zann. hist. 86. t. 33.—Mor. hist. 2. p. 231. sect. 3. t. 6. f. 19. Stems erect, simple, corymbose at the top. Leaves crowded, soft, with short starry down. Seeds small.

Tansy-leaved Flix-weed or Hedge-Mustard. Fl. June, July. Clt. 1731. Pl. 1 foot.

35 S. MULTI'FIDUM (Willd. herb. ex Spreng. syst. 2. p. 904.) stem erect, smooth; lower leaves hairy, pinnate; leaflets lanceolate-linear, toothed, lower ones reflexed; leaflets of the upper

leaves filiform, smooth; flowers panicled; siliques very long, flexuous, slender, crowned by the thick stigma. ⊙ ? H. Native of?

Multifid-leaved Flix-weed or Hedge-Mustard. Pl. 2 feet.

36 S. MYRIOPHY'LLUM (H. B. et Kth. in D. C. syst. 2. p. 477.) leaves bipinnate; segments blunt; petals larger than the calyx; pods lanceolate.—Native of Quito at the bottom of Mount Cotopaxi among stones at the height of 4550 feet. Nastúrtium myriophýllum, Spreng. syst. 2. p. 883. A very branching plant. Flowers pedicelled. Seeds ovate, minute.

Myriad-leaved Flix-weed or Hedge-Mustard. Pl. 2 or 3 feet.

SECT. V. KIBE'RA (meaning unknown.) D. C. syst. 2. p. 477. prod. 1. p. 194. Pedicels bracteate at the base. Style short, thick, retuse. Flowers small, yellow or white, rarely purple.

37 PERUVIA'NUM (D. C. syst. 2. p. 477.) pedicels axillary, smooth, longer than the calyx; pods hispid, spreading; leaves oblong, deeply-serrated.—Native of Peru. An erect, herbaceous, branched plant. Bracteas violaceous, oblong-linear, toothed, longer than the pedicels, but sometimes they are abortive at the top of the raceme. Flowers small, probably yellow.

Peruvian Hedge-Mustard. Pl. 1 to 2 feet.

38 S. SUPI'NUM (Lin. spec. 917.) pedicels axillary, very short, solitary; pods erect, puberulous; leaves sinuately-pinnatifid; stems covered with reflexed pubescence. ⊙. H. Native of sandy humid places, and on the margins of fields along the banks of the Seine about Paris, in Switzerland, also in Spain, &c. A'rabis supìna, Lam. fl. fr. 2. p. 512.—Isnard in act. acad. paris, 1724. t. 18. Stems either decumbent or erect, simple or branched. Flowers small, white.

Supine Hedge-Mustard. Fl. Ju. Jul. Clt. 1788. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

39 S. RUNCINA'TUM (Lag. fl. hisp. ined. D. C. syst. 2. p. 478.) pedicels axillary, very short, solitary; pods incurved, and are as well as the stem smooth; leaves oblong, runcinately-toothed. ⊙. H. Native of Spain about Orcelis among rubbish. Stems branched from the base, diffuse. Floral leaves sessile. Flowers small, probably white.

Runcinate-leaved Hedge-Mustard. Fl. June, July. Pl. $\frac{1}{2}$ ft.

40 S. HIRSU'TUM (Lag. from Dufr. in litt. D. C. syst. 2. p. 478.) pedicels axillary, very short, solitary; bracteas oblong-linear, almost entire; pods erect, and are as well as stem pubescent. ⊙. H. Native of Spain about Madrid. Flowers small.

Hairy Hedge-Mustard. Fl. May, July. Clt. 1820. Pl. $\frac{1}{2}$ ft.

41 S. POLYCERA'TIUM (Lin. spec. 3. p. 918.) pedicels in threes, axillary, very short; pods erect, smooth; leaves sinuately-runcinate; lobes acute, toothed, lower ones largest. ⊙. H. Native throughout the south of Europe on humid walls and in fissures of rocks. It also grows about Bury in Suffolk, but it certainly has been introduced there. Jacq. vind. t. 79. S. corniculàtum, Lam. fl. fr. 2. p. 520. A fetid somewhat erect herb, with small yellow flowers, which are sessile in the axillæ of the leaves.

Many-podded Hedge-Mustard. Fl. June, July. Clt. 1633. Pl. $\frac{1}{2}$ to 1 foot.

42 S. RI'GIDUM (Bieb. suppl. p. 439.) pedicels very short, axillary or naked; pods and erect stems hispid; leaves smoothish, oblong, acutely runcinately-pectinate. ⊙. H. Native of the south of Tauria. Erýsimum polyceràtium, Pall. itin. 3. p. 741. app. no. 103. t. Mm. f. 1. ed. gall. 8vo. app. p. 346. no. 351. t. 107. Hésperis rígida, Steven from cat. hort. gor. 1808. p. 82. Bristles on stems long. Petals oblong-linear, white.

Rigid-bristled Hedge-Mustard. Fl. June, July. Clt. 1816. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

SECT. VI. ARABIDO'PSIS (from *Arabis* and *οψις, opsis*, resemblance; plants resembling the genus *A'rabis*.) D. C. syst. 2. p. 480. prod. 1. p. 195. Siliques linear, compressed. Stigma sessile, truncate. Flowers white, on very short bractless pedicels.

43 S. BURSIFO'LIUM (Lin. amœn. 4. p. 322.) leaves lyrately-pinnatifid, smooth; stem erect, leafy; pedicels thick, shorter than the calyx. ⊙. H. Native of Sicily. A'rabis bursifòlia, Lam. fl. fr. 2. p. 511.—Dill. elth. 179. t. 148. f. 177. Hésperis dentàta, Lin. spec. 928. Flowers small, white.

Shepherd's-purse-leaved Hedge-Mustard. Fl. June, July. Clt. 1733. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

44 S. PINNATI'FIDUM (D. C. fl. fr. 4. p. 667. syst. 2. p. 481.) radical leaves lyrate, cauline ones pinnate-parted; lobes linear, entire, terminal one largest; pedicels very slender, somewhat shorter than the calyx. ♃. H. Native of rocky and stony pastures in the mountains of Europe, particularly in the Pyrenees, the mountains of Auvergne, France, Switzerland, and Piedmont. Cardámine runcinàta, Pourr. act. tol. 3. p. 310. Sisýmbrium bursifòlium, Gouan. ill. p. 42. Sisýmbrium dentàtum, All. ped. no. 1001. t. 57. f. 3. A'rabis pinnatífida, Lam. dict. 1. p. 221. ill. t. 563. f. 3. A'rabis dentàta, Clairv. herb. val. 223. Root perennial, suffruticose, much divided at the neck.

Pinnatifid-leaved Hedge-Mustard. Fl. May, Aug. Clt. 1820. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

45 S. ERYSIMOI'DES (Desf. atl. 2. p. 84. t. 158.) leaves lyrately-pinnatifid, lobes unequally toothed, terminal one largest; pedicels very short; pods rectangular spreading. ⊙. H. Native of Tunis in sandy places near Kervan, and in the island of Teneriffe. About the divisions of fields in dry places of Spain in Murcia and Granada. S. rigídulum, Lag. gen. et spec. pl. p. 20. A smooth herb with very small white flowers.

Erysimum-like Hedge-Mustard. Fl. Jan. April. Clt. 1825. Pl. 1 to 2 feet.

46 S. RAMULO'SUM (Del. ægypt. ill. 19.) lower leaves pinnate-lobed; lobes few, acute, entire, with the terminal one oblong; cauline leaves oblong-linear, almost entire; pedicels longer than the calyx. ⊙. H. Native of Egypt, near Minyet and Beny-Soueyf. Flowers small, probably white.

Branched Hedge-Mustard. Fl. June, July. Pl. $\frac{1}{2}$ foot.

47 S. ? CINE'REUM (Desf. atl. 2. p. 83. t. 157.) leaves pubescent, somewhat fleshy, pinnate-parted; lobes linear-filiform, entire; pedicels longer than the calyx. ⊙. H. Native of Mauritania near Cafsa in sandy places. Petals pale violet, twice the length of the calyx. Seeds small, but their structure is unknown, and therefore the genus to which it should belong is doubtful. Perhaps a species of *Hésperis* or *A'rabis*.

Cinereous Hedge-Mustard. Fl. in winter. Pl. $\frac{1}{2}$ to 1 foot.

48 S. TORULÒSUM (Desf. atl. 2. p. 84. t. 159.) leaves oblong; radical ones somewhat pinnatifid, cauline ones coarsely toothed; pedicels very short; pods hispid, straight. ⊙. H. Native of Tunis, in waste land near Sbiba, and in the island of Cyprus. Smith fl. græc. t. 632. Stems 2 or 3. Flowers white.

Torulose Hedge-Mustard. Fl. Apr. May. Clt. 1824. Pl. $\frac{1}{2}$ ft.

49 S. CONTORTUPLICA'TUM (D. C. syst. 2. p. 483.) leaves oblong, radical ones pinnatifid, cauline ones toothed or entire; pedicels length of calyx; pods hispid, usually twisted. ⊙. H. Native of the desert of Cumana, also about Kitzliar and Astracan, especially in sandy places. Cheiránthus contortuplicàtus, Steph. in Willd, spec. 3. p. 521. Hésperis contortuplicàta, Bieb. fl. taur. 2. p. 124. Flowers from white to purplish.

Var. β, *rectisíliquum* (Fisch. in litt.) siliques straight, or hardly curved.

Twisted-folded-podded Hedge-Mustard. Fl. June, Aug. Clt. 1819. Pl. $\frac{1}{2}$ foot.

50 S. SETO'SUM (Ledeb. ex Spreng. syst. 2. p. 902.) stem simple, erect, smooth above; radical leaves lyrate, sharply-toothed, hispid, cauline ones few, small, lanceolate, sessile. ⊙. H. Native of the north of Persia. Flowers probably white.

Bristly Hedge-Mustard. Pl. 1 foot.

† *Species, the generic characters of which are doubtful.*

51 S.? A'LBUM (Pall. itin. 3. app. no. 102. t. U. ed gall. 8vo. vol. 8. app. no. 349. p. 344. t. 96.) leaves white from pubescence, pinnate-parted; lobes oblong, bluntish, and are as well as stem without glands. ♃. H. Native of Siberia at lake Baikal. Nastúrtium álbum, Spreng. syst. 2. p. 883. Root frutescent, with many stems rising from the same neck. Racemes when in flower corymbose, afterwards elongating. Flowers white. Stamens all toothless. Pods scarcely the length of pedicel. Perhaps a species of *Nastúrtium*, from its short pods, and it may probably form a separate genus with *Nastúrtium sagittàtum*.

White-flowered Hedge-Mustard. Fl. Ju. Jul. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ ft.

52 S.? NA'NUM (D. C. syst. 2. p. 486.) leaves oblong, sinuately-pinnatifid, velvety with starry down; pods torulose. ⊙. H. Native of eastern Siberia. Cheiránthus nànus, Merk. ined. Mathìola nàna, Spreng. syst. 2. p. 897. Two or three stems, rising from the same root. Petals oblong, purplish. Seeds not sufficiently known. Habit of *Malcòmia*.

Dwarf Hedge-Mustard. Fl. April, June. Pl. $\frac{1}{4}$ foot.

† *Species not sufficiently known.*

53 S. SINA'PIS (Burm. fl. ind. 140. exclusive of the synonyms of Barrelier, which are referable to A'rabis Thaliàna). Native of Java. Leaves sublyrate, toothed. Flowers very small, white. Stature and appearance of *Sinàpis arvénsis*.

Sinapis-like Hedge-Mustard. Fl. Ju. Jul. Pl. 1 to $1\frac{1}{2}$ ft.

54 S. PA'TENS (Mœnch. meth. 251.). ⊙. H. Native? Leaves runcinate, extreme segment sagittate; upper leaves lanceolate. Petals pale yellow, entire. Pods round, smooth, bifariously pilose. Perhaps a species of *Brássica*.

Spreading-branched Hedge-Mustard. Pl. 2 feet?

55 S. CAPE'NSE (Thunb. prod. 109.). Native of the Cape of Good Hope. Stem panicled, smooth. Pods linear, smooth.

Cape Hedge-Mustard. Pl. 1 foot.

56 S. SERRA'TUM (Thunb. prod. 109.) Native of the Cape of Good Hope. Stem somewhat 3-sided. Leaves elliptical, sharply-toothed, or serrated, smooth.

Saw-leaved Hedge-Mustard. Pl. 1 foot.

57 S. CRASSIFO'LIUM (Cav. præl. p. 437. no. 977. Lag. in hort. madr. ined. t. 24.) ♃. H. Native of Spain in waste places about Madrid. Radical leaves sinuately-runcinate, somewhat fleshy, upper ones linear, quite entire. Spikes nodding at the top. Flowers pale sulphur-coloured. Siliques filiform, curved. Perhaps a species of *Diplotáxis*.

Thick-leaved Hedge-Mustard. Fl. May, July. Clt. 1819. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

58 S. FU'GAX (Lag. elench. hort. madr. 1805 and 1815. p. 20.) ♃. H. Native of Spain. Plant smooth. Leaves lyrate; lobes oblong-lanceolate, acute. Pods filiform, at length twisted.

Fugacious Hedge-Mustard. Fl. Ju. Jul. Clt. 1820. Pl. $\frac{3}{4}$ to 1 ft.

59 S. LEPTOPHY'LLUM (Raf. fl. lud. p. 84. no. 268.). Native of Louisiana near water. Leaves pinnate; segments lobed, smooth, terminal one largest. Flowers small, yellowish. Petals shorter than the stamens and calyx. Stigma sessile. Pods long, round.

Slender-leaved Hedge-Mustard. Fl. Feb. Mar. Pl. 1 foot.

Cult. The greater part of the species of this genus are not worth cultivating, except in botanic gardens. They grow well in any kind of soil, and are all easily increased by seeds, or the perennial kinds may be increased by dividing the plants at the root. *Sisýmbrium millefòlium* and *strictíssimum* are the only species worth general cultivation. The first is a greenhouse shrubby species from Teneriffe, it grows freely in a rich light soil, and young cuttings will root readily under a hand-glass, if planted in a pot and placed in a sheltered situation: the last is a hardy perennial, fit for shrubberies, and is easily increased by dividing the plants at the root.

LVIII. ALLIA'RIA (from *Allium*, Garlic; plants smelling like garlic when bruised). Adans. fam. 2. p. 418. D. C. syst. 2. p. 488. prod. 1. p. 196.

LYN. SYST. *Tetradynàmia, Siliquòsa.* Silique roundish, somewhat four-sided, with prominent nerves. Calyx loose. Seeds somewhat cylindrical. Cotyledons linear-oblong, flat. Perennial erect herbs. Leaves large, stalked, toothed, cordate or orbiculate. Racemes terminal, at time of flowering corymbose, afterwards elongated; pedicels bractless. Flowers white.

1 A. OFFICINA'LIS (Andrz. cruc. from Bieb. fl. taur. suppl. p. 445.) leaves cordate; pods prismatic, much longer than the pedicels. ♃. H. Native throughout Europe under hedges, coppices, and in ditches; also in Persia about Lenkeran. Erýsimum Alliària, Lin. spec. 922. Fl. dan. 935. Bull. herb. 338. Smith, engl. bot. 796. Schkuhr. handb. 2. no. 1835. t. 183. Hésperis Alliària, Lam. fl. fr. 2. p. 503. Sisýmbrium Alliària, Scop. carn. ed. 2. no. 825. Erýsimum cordifòlium, Pall. ined. taur. Stok. bot. mat. med. 3. p. 458.

Var. β; leaves more deeply cut. Mich. hort. flor. p. 49. no. 4.

This plant having a strong smell and taste of garlic, it was formerly used by country people in sauces; with bread and butter, salted meat, and in salads, hence one of its common names *sauce alone*, and from growing by hedge sides it is called *Jack by the hedge*. In Germany it is called *das Knoblauchkraut, der Knoblauchhederich, Lauchel, Waldknoblauch, Ramfen, Ramschelwurzel, Gernsel, Salsekraut, Saskraut.* In Danish *Hvidlögsurt, Gaflekaal.* In Swedish *Hvitlöksort.* In French *L'Alliare, l'herbe des aux, l'herbe aux aillets.* In Spanish and Portuguese *Alliaria.* The whole plant, as the generic name imports, scents strongly of *garlic.* It is occasionally used as a salad, boiled as a pot-herb, or introduced in sauces. Mr. Neill observes that "when gathered as it approaches the flowering state, boiled separately, and then eaten to boiled mutton, it certainly forms a most desirable pot-herb; and to any kind of salted meat an excellent green." According to Linnæus's observation, horses, sheep, and swine refuse it, but kine and goats eat it. If eaten by cows it gives a strong disagreeable taste to the milk. When it grows in poultry-yards the fowls eat it, and it gives an intolerable rank taste to their flesh. The seeds excite sneezing. The leaves were formerly recommended internally as sudorific and deobstuent, of the nature of garlic, but much milder; externally as antiseptic, in gangrenous and cancerous ulcers.

Officinal Jack-by-the-hedge or Sauce alone. Fl. May, June. Britain. Pl. 1 to 3 feet.

2 A. BRACHYCA'RPA (Bieb. fl. taur. suppl. 445.) leaves ovate-orbicular; pods lanceolate, length of pedicel. ♃. H. Native of Iberia. Ráphanus Taúricus, Adam. Ráphanus rotundifòlius, Bieb. fl. taur. 2. p. 130. Stems either procumbent or erect.

Short-podded Jack-by-the-hedge. Fl. May, June. Clt. 1824. Pl. $\frac{3}{4}$ foot.

Cult. These plants are not worth cultivating except in general collections; they are easily increased by seeds.

LIX. ERY'SIMUM (from ερυω, *eryo*, to draw, to cure; on account of its supposed salutary effects in medicine. It is even now reckoned a powerful cure for a sore throat; it is also said to draw and produce blisters). Gærtn. fruct. 2. p. 297. t. 143. D. C. syst. 2. p. 490. prod. 1. p. 196. Erýsimum et Brássica, Lin.

LIN. SYST. *Tetradynàmia, Siliquòsa.* Silique 4-sided. (f. 46. *q*.)

Calyx closed. Cotyledons flat, oblong. Herbs biennial or perennial, rarely suffrutescent at the base, usually branched, sometimes smooth, sometimes pubescent or hairy. Leaves variable, usually oblong-linear, entire, or toothed, stalked, sessile, or as in *Corìngia*, cordate, stem-clasping. Racemes elongated, terminal, many-flowered; pedicels filiform, bractless. Flowers yellow, rarely cream-coloured or whitish.

Sect. I. Stylonema (from *στυλος*, *stylos*, a column or style, *νημα*, *nema*, a thread; style filiform). D. C. syst. 2. p. 491. prod. 1. p. 196. Style long, filiform; stigmas 2, spreading (f. 46. *q*.). Calyx almost permanent. Flowers nearly sessile.

1 E. siliculo'sum (D. C. syst. 3. p. 491.) pods shorter than the style, younger pods covered with the permanent calyx; flowers on short pedicels; leaves linear, quite entire. ♂. H. Native of the desert of Cumana in Tauria and about Astracan. Cheiránthus siliculòsus, Bieb. fl. taur. 2. p. 121. suppl. 443. Syrènia siliculòsa, Andrz. cruc. ined. Deless. icon. sel. 2. t. 65. Flowers yellow. Siliques hoary. Plant canescent.

Silicled Treacle-Mustard. Fl. May, June. Pl. 1 to 2 feet.

2 E. Si'culum (Spreng. new. entd. 3. p. 51.) pods shorter than the style, prismatic, hoary, also the adult ones are covered with the permanent calyx; flowers on short pedicels; leaves linear, smoothish. ♂. H. Native of Sicily. Flowers yellow.

Sicilian Treacle-Mustard. Fl. Ju. Jul. Clt. 1824. Pl. 1 ft.

3 E. sessiliflo'rum (R. Br. in hort. kew. ed. 2. vol. 4. p. 116.) pods length of style, younger ones covered by the permanent calyx; flowers sessile; leaves linear, entire. ♃. H. Native of the salt deserts and mountains of Siberia, and of Tauria, also of Caucasus. Cheiránthus quadrangulàris, Lher. stirp. 1. p. 91. t. 44. Cheiránthus montànus, Pall. itin. 1. p. 496. no. 115. Cheir. cornùtus, Lam. dict. 2. p. 717. Erysimum cornùtum, Pers. ench. 2. p. 200. Cheir. angulàtus, Schultz. obs. p. 129. Syrènia Lamárckii, Andrz. cruc. ined. Stems at base suffrutescent. Flowers sulphur-coloured, sweet-scented. The stems, younger leaves, and calyx are whitish-grey.

Sessile-flowered Treacle-Mustard. Fl. Ju. July. Clt. 1794. Pl. 1 to 2 feet.

4 E. angustifo'lium (Ehrh. beitr. 7. p. 155.) pods much longer than the style, younger ones covered with the permanent calyx; flowers almost sessile; leaves linear, entire. ♂. H. Native of Hungary and Transylvania in dry sandy plains. Walds. et Kit. hung. 1. p. 101. t. 98. Cheiránthus virgàtus, Poir. suppl. 2. p. 781. Syrènia Ehrárti, Andrz. cruc. ined. Cheirínia angustifòlia, Link. enum. 2. p. 170. Flowers very like those of *E. sessiliflòrum*, but a little smaller. Plant canescent.

Narrow-leaved Treacle-Mustard. Fl. June, Aug. Clt. 1800. Pl. ½ to 2 feet.

Sect. II. Cuspida'ria (from *cuspis*, a point; style). D. C. syst. 2. p. 493. prod. 1. p. 197. Style filiform, short. Silique tetragonal, 2-edged. Calyx falling off with the petals. Flowers on short but distinct pedicels.

5 E. cuspida'tum (D. C. syst. 2. p. 493.) pods thrice the length of the style, 2-edged, naked; flowers on short pedicels; leaves oblong-lanceolate, sinuately toothed. ♂. H. Native of Bithynia, Moldavia, Sicily, Tauria, Caucasus, and in Iberia near Tiflis. Cheiránthus cuspidàtus, Bieb. fl. taur. 2. p. 120. suppl. 443. Cheiránthus Bithýnicus, Pers. ench. 2. p. 200. Syrènia Biebersteìnii, Andrz. cruc. ined.—Buxb. cent. 2. p. 23. t. 33. f. 1. E. glàbrum, Presl. ex Spreng. Sinàpis tetraèdra, Presl. The cultivated plants are almost smooth, while the spontaneous ones are rather grey, especially on the stem, with appressed hairs, which are fixed by the centre, hence they are 2-parted. Flowers yellow. Seed ovate, obliquely truncate at the top on both sides.

Cuspidate-podded Treacle-Mustard. Fl. May, June. Clt. 1800. Pl. 1 to 2 feet.

6 E. rupe'stre (D. C. syst. 2. p. 494.) leaves somewhat toothed, radical ones spatulate, cauline ones oblong, all pubescent with 2 or 3-parted hairs; stem suffruticose; length of the style exceeding the breadth of the pod. ♃. ♄. H. Native of Bithynia on Mount Olympus. Cheiránthus rupéstris. Smith, fl. græc. t. 633. A tufted suffruticose, branched plant. Flowers yellow, few, size of those of *E. cuspidàta*.

Rock Treacle-Mustard. Fl. May, June. Pl. 1 foot.

Sect. III. Erysima'strum (altered from Erýsimum). D. C. syst. 2. p. 494. prod. 1. p. 197. Style short, or scarcely any. Siliques 4-sided. (f. 46. *q*.) Calyx deciduous. Leaves not cordate, nor stem-clasping. Flowers distinctly pedicelled.

7 E. leptóstylum (D. C. syst. 2. p. 494.) leaves lanceolate, remotely toothed, pubescent with 3 or 4-parted hairs; branches few, rather upright; petals somewhat orbicular; pods erect; style filiform. ♂. H. Native on the bank of the Lower Tanais, about Charkovia, and on the sides of a mountain called Beschtau, in Caucasus. Cheiránthus grandiflòrus, Bieb. fl. taur. 2. p. 117. suppl. p. 441, but not of Desf. Stem erect, sparingly branched. Flowers yellow. Plant hoary.

Slender-styled Treacle-Mustard. Fl. May, July. Clt. 1827. Pl. 1½ foot.

8 E. exalta'tum (Andrz. in Bess. enum cont. 2. no. 1554.) canescent, scabrous; leaves linear-lanceolate, narrowed at each end, spreading, remotely denticulated; pods erectly spreading; outer glands of receptacle 2-horned. ♂. H. Native of Podolia. Very like *E. leptóstylum*. Flowers yellow.

Exalted Treacle-Mustard. Fl. May, June. Clt. 1824. Pl. 2 ft.

9 E. suffruticòsum (Spreng. nov. prov. p. 17. no. 36.) stem suffruticose at the base; leaves lanceolate, entire, pubescent from 2-parted hairs; pods erect; length of style exceeding the breadth a little. ♄. H. Native —? Cheiránthus fruticòsus, Lher. herb. Stem branching much from the base. Flowers at first corymbose, about a quarter the size of those of *Cheiránthus Cheìri*, pale yellow, or almost citron coloured. Plant very like *Cheiránthus Cheìri*.

Suffruticose Treacle-Mustard. Fl. April, May. Clt. 1822. Pl. 1 to 1½ foot.

10 S. odora'tum (Ehrh. beitr. 7. p. 157.) stem branched; leaves lanceolate, deeply toothed, scabrous, with 3-parted hairs; claws of petals about equal in length to the calyx; siliques straight, elongated, crowned by a 2-lobed stigma. ♂. H. Native of Hungary and Volhynia. S. stríctum, *var*. *β*, odoràtum, D. C. prod. 1. p. 197. Flowers yellow, sweet scented.

Sweet-scented Treacle-Mustard. Fl. July. Clt. 1795. Pl. 1 to 2 feet.

11 E. robu'stum (D. Don, prod. fl. nep. 202.) leaves lanceolate, mucronulate, toothed, tapering to the base, silky on both surfaces; siliques ascendant, puberulous, 5-times longer than the pedicel; stem angular, silky, branched. ♂. H. Native of Gosaingsthan. Stem stiff, heptagonal. Pedicels tetragonal. Flowers yellow. Stigma broad. Siliques tetragonal.

Robust Treacle-Mustard. Pl. 2 feet.

12 E. stríctum (Gært. fl. wetter. 2. p. 451. no. 836.) leaves lanceolate, toothed, pubescent from 3-parted hairs; stem upright; pods erect; style very short, stigma 2-lobed. ♂. H. Native of Volhynia, Transylvania, Austria, and Dauphiny, in gravelly fields. E. Pannónicum, Crantz. aust. 28. E. hieracifòlium, Jacq. aust. t. 73. E. odoratum, Willd. spec. 3. p. 512. Cheirínia strícta, Link, enum. 2. p. 170. Stems 1 or 2 from the same root. Flowers yellow.

Straight-stemmed Treacle-Mustard. Fl. Jun. Aug. Clt. 1795. Pl. 1 to 2 feet.

13 E. virga'tum (Roth. cat. bot. 75.) leaves oblong-lanceolate, somewhat toothed, pubescent from 3-parted hairs; stem straight, round; pods erect; length of style rather exceeding the breadth of pod. ♂. H. Native of gravelly places in the Alps, of Jura, and by way-sides in Holland, &c. E. hieracifòlium, Oed. fl. dan. 923.? Flower yellow, hardly sweet-scented.

Var. β, *Cheiránthus firmus*; Willd. enum. suppl. 45.

Twiggy Treacle-Mustard. Fl. June, Jul. Clt. 1807. Pl. 1 to 2 feet.

14 E. longisiliquòsum (Willd. enum. 680.) leaves oblong-lanceolate, entire, somewhat pubescent from 3-parted hairs; stem straight, round; pods erect, terminated by the very short style. ♂. H. Native of Vallais, and about Geneva, in gravelly places. E. virgàtum, Schleich. pl. helv. D. C. icon. gall. rar. t. 36. Stems erect, sparingly branched. Flowers pale yellow; claws of petals length of calyx.

Long-podded Treacle-Mustard. Fl. June, July. Clt. 1819. Pl. 2 feet.

15 E. cæspitòsum (D. C. syst. 2. p. 497.) leaves somewhat linear, quite entire, pubescent from 2-parted hairs; stems tufted, suffruticose; pods erect; length of style twice the breadth of the pod. ♃. ♄. H. Native of Persia, on the mountains in the province of Ghilan or Guylan. Stems branched, tufted. Flowers yellow; petals obovate.

Tufted Treacle-Mustard. Fl. July, Aug. Clt. 1828. Pl. ½ ft.

16 E. hieracifòlium (Lin. spec. 923.) leaves lanceolate, narrowed at the base, remotely and sharply sinuately-toothed, stem straight, a little branched, round; pods erect. ♂. H. Native of Hercynia, about Neustad, on mountains; in Sweden; about Moscow, but rare: on Mount Hæmus. E. strictíssimum, Fl. vetter. 2. p. 451, from Gmel. E. Marschallianum, Andrz. cruc. ined. ?—J. Bauh. hist. 2. p. 873. f. 2.—Besl. eyst. ord. 2. t. 15. f. 2. Flowers pale-yellow, scentless. Allied on the one side to *E. repándum*, and on the other to *E. odoràtum*.

Var. β, *pàtulum* (D. C. syst. 2. p. 497.) pods spreading.

Hawkweed-leaved Treacle-Mustard. Fl. May, Jun. Clt. 1820. Pl. 1 to 2 feet.

17 S. crepidifòlium (Rchb. ex. Spreng. syst. 2. p. 906.) stem branched; leaves linear, dilated at the apex, sinuate-toothed, scabrous with 3-parted hairs; claws of petals exceeding the calyx; siliques very long, spreading, crowned by the almost sessile stigma. ♂. H. Native of Germany. Flowers yellow.

Crepis-leaved Treacle-Mustard. Fl. May, June. Clt. 1829. Pl. 1 foot.

18 E. au'reum (Bieb. fl. taur. 2. p. 117. suppl. p. 440.) leaves lanceolate, pointed, toothed, pubescent, green; branches and pods spreading; stigma thick, 2-lobed, somewhat pedicelled. ♂. H. Native of thickets at Cape Caucasus, between Mosdok and Kisljar, at the river Terek, and also at the river Kuma. Plant green. Stems branched at the top. Leaves somewhat scabrous with 3-parted hairs. Flowers golden, Deless. icon. sel. 2. t. 66.

Golden-flowered Treacle-Mustard. Fl. May, June. Clt. 1820. Pl. 2 or 3 feet.

19 E. Ibe'ricum (D. C. syst. 2. p. 498.) lower leaves runcinate, toothed, upper ones lanceolate, undivided; floriferous branches and pods compressed, 4-sided, erectly-spreading. ♂. H. Native of Caucasus on Alp Kaischaur, towards the snowy region, in the mountains about the Kuban, at the falls in Jucharibasch. On Mount Ararat, in Armenia, where it flowers in August and September. Plant green, at first sight smooth, but is scabrous, with 3-parted, reversed hairs. Stems erect, simple or branched. Flowers yellow. Cheiránthus Armenìacus, Sims, bot. mag. t. 835. A beautiful plant.

Iberian Treacle-Mustard. Fl. May, June. Clt. 1803. Pl. 1 ft.

20 E. cheiranthoìdes (Lin. spec. 923.) leaves lanceolate, somewhat denticulated, green, and somewhat scabrous; pods erectly-spreading, twice the length of the pedicels; stigma small, almost sessile. ⊙. H. Native throughout the whole of Europe, from France and Italy to Lapland and Siberia; also in Virginia and Louisiana; plentiful in Britain, in turnip fields, gardens, osier-holts, hedges, and the margins of fields. Jacq. aust. t. 23. fl. dan. 731. Smith, engl. bot. t. 942. Gært. fruct. 2. p. 297. t. 143. Schkuhr. handb. 2. no. 1837. t. 183. Cheiránthus erysimoìdes, Huds. angl. 287. E. turrìtum, *var.* β, Lam. fl. fr. 2. p. 514. Cheiránthus turritoìdes, Lam. dict. 2. p. 716. E. cheiranthifòlium, Gilib. fl. lith. in Ust. del. opus. 2. p. 361. E. parviflòrum, Pers. ench. 2. p. 199. Nutt. gen. amer. 2. p. 18. Stem erect, branched, rough, with small close, deflexed, mostly simple bristles. Leaves and pods clothed with minute forked bristles. Flowers small yellow.

Var. β, *Cheiránthus scapígerus* (Willd. prod. no. 663. t. 5. f. 10.) stems almost leafless, bearing scape-like racemes.

Var. γ, *Cheiránthus aquáticus* (Lejeune, fl. spa. 2. p. 68.) stem diffuse; leaves ovate lanceolate, blunt; pods spreading an inch long, seated on pedicels 4 lines long. Native of rivulets in Holland.

Worm-seed or *Wall-flower-like* Treacle-Mustard. Fl. July. Britain. Pl. 1 to 3 feet.

21 E. repa'ndum (Lin. amœn. 3. p. 415.) leaves linear-lanceolate, repand-toothed, somewhat pubescent with forked hairs; pods spreading, hardly thicker than the short pedicels, torulose; stigma sessile. ⊙. H. Native of corn-fields in the more temperate parts of Europe, particularly in Spain, Piedmont, Etruria, Thuringia, Austria, Bohemia, Transylvania, Greece, Tauria, and Iberia. Jacq. aust. t. 22. E. ramosíssimum, Crantz. aust. p. 29. Cheiránthus ramosíssimus, Lam. dict. 2. p. 717. Stem much branched at the top. Flowers yellow. Seeds rufous, oblong.

Var. β, *símplex* (D. C. syst. 2. p. 500.) stem simple, not branched, Mich. hort. fl. p. 49. no. 9. Pl. ⅓ foot.

Repand-toothed-leaved Treacle-Mustard. Fl. May, June. Clt. 1772. Pl. 1 to 2 feet.

22 E.? tene'llum (D. C. syst. 2. p. 500.) leaves linear, repandly-toothed, stem almost simple; pods spreading? roundish; stigma 2-lobed, pedicelled. ⊙. H. Native of the Levant, between Aleppo and Mossul. Very like *E. repándum*, *var.* β, but the flowers are much larger. Flowers yellow.

Pliant Treacle-Mustard. Fl.? Pl. ¼ foot.

23 E. Helve'ticum (D. C. fl. fr. 4. p. 658.) leaves linear, entire, grey with appressed forked hairs; stem erect, hardly branched; pods erectish: stigmas pedicelled, emarginate. ♂. H. Native of Switzerland in dry exposed places in valleys about Lenk, at the bottom of Mount Cramont. In Piedmont; in Carpathian mountains, near the termination of the range of Firs; also in Sicily. Cheiránthus Helvéticus, Jacq. vind. t. 9. E. linearifòlium, Mœnch. meth. 85. Cheiránthus pàllens, Hall, fille. E. pàllens, Pers. ench. 2. p. 200. E. Bonnanianum, Presl. ex. Spreng. Petals obovate, pale yellow.

Swiss Treacle-Mustard. Fl. May, Jul. Clt. 1793. Pl. 1½ foot.

24 E. cane'scens (Roth. cat. bot. 1. p. 76.) leaves linear, entire, or somewhat toothed, greyish with forked hairs; petals obovate-oblong; claws of the petals longer than the calyx; pods erect, 5-times longer than the pedicels; stigma almost sessile. ♂. H. Native on hills throughout the south of Europe, in dry and exposed places, Spain, south of France, Italy, Carniola, Vallais, Austria, about Vienna; also of Sicily. Cheiránthus alpìnus, Lin. mant. 93? Jacq. aust. 1. p. 48. t. 75. E. sylvéstre, Scop. carn. ed. 2. no. 630. E. diffùsum, Ehr. beit. 7. p. 157. Cheiránthus Boccòni, All. ped. no. 988. t. 58. f. 2? E. crassístylum, Presl. ex. Spreng. A very *polymorphous* plant with the stems sometimes solitary, sometimes diffuse, branched. Flowers yellow, scentless.

Greyish Treacle-Mustard. Fl. May, July. Clt. 1731. Pl. ½ to ¾ foot.

25 E. Andrzejoskia'num (Bess. in litt. and D. C. syst. 2. p. 502.) leaves linear, channelled, somewhat toothed, greyish with forked appressed hairs; petals obovate; claws of petals a little longer than the calyx; pods erect, twice the length of the pedicel; stigma almost sessile. ♂. H. Native of Tauria and Caucasus, in dry exposed fields. E. diffûsum, Bieb. fl. taur. 2. p. 116. Very like *E. canéscens.* Floriferous branches panicled. Flowers yellow. Plant hoary.

Andrzejoski's Treacle-Mustard. Fl. May, July. Clt. 1818. Pl. 1½ foot.

26 E. colli'num (Andrz. in litt. D. C. prod. 1. p. 198.) lower leaves stalked, spatulate, angularly-toothed, upper ones linear-lanceolate, entire, clothed with 3-parted hairs; stem erect, somewhat branched; pods rough, erect. ♂. H. Native of grassy hills at the river Terek, near the little town of the Cossacs called Galuga. Cheiránthus collìnus, Bieb. fl. taur. 2. p. 119. Flowers yellow, about the size of those of *E. repándum.*

Hill Treacle-Mustard. Fl. June. Clt. 1823. Pl. 2 feet.

27 E. leptophy'llum (Andrz. in litt. D. C. prod. 1. p. 198.) leaves all linear-lanceolate, quite entire, hoary, scabrous; stem branched, hoary; pods spreading, hoary. ♂. H. Native of dry hills in Iberia, and in rather shaded woody mountains near the Aragwi. Cheiránthus leptophýllus, Bieb. fl. taur. 2. p. 119. D. C. syst. 2. p. 182. Habit of *E. diffûsum.* Stems erect, branched. Flowers yellow.

Slender-leaved Treacle-Mustard. Fl. May, July. Clt. 1820. Pl. 1 foot.

28 E. Maclovia'num (Gay ex. Spreng. syst. app. p. 243.) leaves lanceolate, denticulated, glaucous, bearded at the apex; calyx deciduous; siliques very smooth, much longer than the style. ♂. H. Native of the Falkland Islands. Brássica Magellánica, Gaud. Brássica. Macloviàna, d'Urv.

Maclove's Treacle-Mustard. Pl. 1 foot.

29 E. versi'color (Andrz. in litt. D. C. prod. 1. p. 198.) leaves hoary, lower ones runcinate, upper ones linear, very entire; branches spreading; pods hoary, straight. ♂. H. Native of the north of Persia, in arid fields adjacent to Caucasus, also at the river Terek, about Kisljar and Mosdok, and in the desert of Cumana. Cheiránthus versícolor, Bieb. fl. taur. 2. p. 119. suppl. p. 442. D. C. syst. 2. p. 182. Cheiránthus leucánthemus, Steph. in Willd. spec. 3. p. 521. Habit of *E. leptophýllum.* Stems clothed with forked hairs, and the leaves with 3-parted hairs. Flowers of various colours, particularly white, cream, sulphur-yellow, or deep yellow.

Various-coloured-flowered Treacle-Mustard. Fl. May, June. Clt. 1821. Pl. 1 foot.

30 E. lanceolatum (R. Br. in hort. kew. ed. 2. vol. 4. p. 116.) lower leaves lanceolate, toothed, upper ones almost linear, entire; petals orbiculately-obovate; claws of petals longer than the calyx; pods erect; stigma almost sessile. ♂. H. Native on dry rocks, fields, and walls, nearly throughout the whole of Europe, exclusive of Britain and Ireland. From Spain to Caucasus, and from Sicily to Sweden; also of the north-west coast of America. Flowers larger than those of *E. canéscens.*

Var. α, màjor (D. C. syst. 2. p. 502.) stem simple or branched, rigid, about a foot high. Cheiránthus erysimoìdes, Lin. spec. 923. Jacq. aust. t. 74. Erýsimum cheiranthoìdes, Crantz. aust. p. 28. E. Hésperis, Scop. carn. ed. 2. no. 829. Erýsimum, muràle. Desf. cat. ed. 1. p. 129. Pers. ench. 2. p. 199. Cheiránthus fírmus, Schleich. pl. helv. E. Cheiránthus, Pers. ench. 2. p. 199. Perhaps many species are here joined. Flowers yellow.

Var. β, minor (D. C. syst. l. c.) stem simple, sometimes branched, somewhat ascending. Cheiránthus alpìnus, Lin. mant. 93? E. ochroleùcum *β*, D. C. fl. fr. ed. 3. vol. 4. p. 658. E. alpìnum, Pers. ench. 2. p. 200. Flowers pale yellow.

Lance-leaved Treacle-Mustard. Fl. May, July. Clt. 1597. Pl. ½ to 1½ foot.

31 E. Rhæ'ticum (D. C. syst. 2. p. 503.) leaves linear-lanceolate, entire, or toothed; stems somewhat ascendant; claws of petals longer than the calyx; petals obovate; pods erectish, very long; style longish. ♂. H. Native of Rhætia. Cheiránthus Rhæ'ticus, Schleich. pl. helv. Horn. hort. hafn. p. 613. Stems clothed with forked hairs. Flowers yellow, like those of *E. lanceolàtum.*

Rhætian Treacle-Mustard. Fl. May, Jul. Clt. 1819. Pl. 1 ft.

32 E. du'bium (D. C. syst. 2. p. 504.) leaves lanceolate, toothed, narrowed at the base; petals obovate-oblong; pods spreading; style scarcely any. ♂. H. Native of? Cheiránthus dùbius, Horn. hort. hafn. suppl. p. 73. Stems covered with forked hairs. Leaves smooth, or hardly pubescent. Flowers yellow, not so large as those of *E. canéscens.*

Doubtful Treacle-Mustard. Fl. May, June. Clt. 1820. Pl. 1 to 1½ foot.

33 E. longifo'lium (D. C. syst. 2. p. 504.) leaves linear-lanceolate, elongated, a little toothed: petals obovate-oblong; pods erect, pubescent; style longish. ♃. H. Native of Algiers in the fissures of rocks. E. grandiflòrum, Desf. atl. 2. p. 88. Leaves 4 or 6 inches long. Flower large, yellow.

Long-leaved Treacle-Mustard. Fl. May, Jul. Clt. 1822. Pl. ½ to 1 foot.

34 E. gra'cile (D. C. syst. 2. p. 504.) leaves linear-lanceolate, toothed, pointed; petals obovate-oblong; pods erect, rather rough from stellate hairs; style hardly any. ♂. H. Native of the north of Caucasus and in Iberia about Tiflis. Stem covered with forked hairs, sparingly branched at the top, and covered with 2 or 3-parted hairs. Flowers yellow, about the size of those of *E. canéscens;* claws of petals length of calyx.

Slender Treacle-Mustard. Fl. May, July. Clt. 1824. Pl. 1 to 1½ foot.

35 E. ri'gidum (D. C. syst. 2. p. 505.) leaves linear-lanceolate, acutely toothed; pods spreading, smooth, stiff; style hardly any. (f. 46. *q.*) Native of the Levant. Stem much branched, covered with appressed 2-parted down. Flowers yellow. Deless. icon. sel. 2. t. 67.

Rigid-podded Treacle-Mustard. Pl. 2 feet.

36 E. sca'brum (D. C. syst. 2. p. 505.) leaves linear-lanceolate, lower ones blunt, somewhat toothed; racemes short; pods erect, tuberculately scabrous; style conical-filiform. Native of Mount Lebanon. Stems and leaves grey from appressed forked hairs. Flowers unknown.

Scabrous-podded Treacle-Mustard. Pl. ½ foot.

37 E. a'sperum (D. C. syst. 2. p. 505.) leaves linear-oblong, lower ones dentately-runcinate, pubescent, scabrous; pods spreading; style very short. ♂. H. Native of North America in fields about the river Missouri. Cheiránthus ásper, Nutt. gen. amer. 2. p. 436. Stem and leaves greyish, with forked appressed hairs. Pods 3 inches long, pubescent. Petals yellow, with white claws. E. lanceolàtum, Pursh. fl. amer. sept. 2. p. 436.

Rough Treacle-Mustard. Fl. Ju. Jul. Clt. 1824. Pl. ¾ ft.

38 E. strigo'sum (D. C. syst. 2. p. 506.) strigose; leaves oblong-lanceolate, quite entire or denticulated; pods erect; stigma 2-parted, sessile. ♂. H. Native of Siberia. Cheiránthus strigòsus, Ledeb. in mem. acad. petersb. 5. ann. 1815. p. 549. The whole plant is strigose. Flowers erect, yellow. Stems solitary, furrowed.

Strigose Treacle-Mustard. Fl. June, July. Clt. 1816. Pl. ¾ ft.

39 E. Redo'wski (Weinm. cat. hort. dorp. 1810. p. 65.) leaves all linear, channelled, quite entire, greyish; stem branched, angular; petals emarginate; pods erectly spreading, obtuse-

angled. ♂. H. Native of Siberia. The whole plant is covered with appressed white hairs. Flowers pale-yellow, large. Petals obcordate.

Redowski's Treacle-Mustard. Fl. June, Aug. Clt. 1821. Pl. 1½ to 2 feet.

Sect. IV. Cori'ngia (from *cor*, the heart; shape of leaves.) D. C. syst. 2. p. 507. prod. 1. p. 199. Style hardly any. Petals erectish. Flowers pale-yellow or white, seldom purple. Leaves cordate, and stem-clasping at the base.

40 E. alpinum (Baumg. fl. trans. 2. p. 263.) leaves membranous, smooth, cauline ones cordate-sagittate, stem-clasping, oblong, radical ones stalked, ovate. ♃. H. Native of Spain, Cevennes, Alps of Alsace, Hercynia, Nassau about Jena, Transylvania, and the Apennines, in stony woody places of mountains. Brássica alpìna, Lin. mant. 95. Vill. dauph. 3. p. 330. t. 36. Turrìtis pauciflòra, Grim. Turrìtis Brássica, Liers. fl. herb. no. 518. Turrìtis sagittàta, Schrank. mon. t. 99? A'rabis brassicæfórmis, Wallr. sched. 359. Root hard, twisted. Younger plant with a few scattered hairs, the rest smooth, hardly glaucous. Stem simple. Flowers white, almost like those of *A'rabis*.

Alpine Treacle-Mustard. Fl. Ju. Aug. Clt. 1793. Pl. 1 to 1½ ft.

41 E. perfolia'tum (Crantz. austr. 27.) radical leaves obovate, cauline ones cordate, stem-clasping, all blunt, smooth, and glaucous; pods 4-sided. ⊙. H. Native of the temperate parts of Europe and Asia, particularly Spain, France, Germany, Italy, Tauria, Japan; in England in Essex, but rare, near Harwich on the cliffs, as also at Bawdsey, and near Oxford; in Suffolk; in fields near Godstone and Marshfield, Sussex. Brássica orientàlis, Lin. spec. p. 931. Jacq. austr. t. 282. Smith, engl. bot. t. 1804. Schkuhr. handb. 2. no. 1862. t. 186. E. campéstre, Scop. carn. ed. 2. no. 827. Brássica turrìta, Weig. obs. 32. Brássica campéstris, Mat. sil. no. 500. Brássica perfoliàta, Lam. dict. 1. p. 748. Brássica álba, Gilib. fl. lith. in ust. del. op. 2. p. 361. E. orientàle, R. Br. in hort. kew. ed. 2. vol. 4. p. 117. Coríngia orientàlis, Andrz. cruc. ined. Herb very smooth, glaucous. Stem simple, seldom branched. Flowers white or cream-coloured. This plant is cultivated in Japan for the seeds.

Perfoliate-leaved Treacle-Mustard. Fl. June. Britain. Pl. 1 to 1½ foot.

42 E. viola'ceum (D. Don, prod. fl. nep. 202.) leaves lanceolate, acute, pilose, denticulated, sagittate at the base, half-stem-clasping; stem straight, quite simple, pilose; racemes short, crowded; petals quite entire, much longer than the calyx. ♃. H. Native of Gosaingsthan, where it is called *Outch*. Flowers of a violet-purple colour. Siliques spreading.

Violaceous-flowered Treacle-Mustard. Pl. 2 to 3 feet.

43 E. Austrìacum (Baumg. fl. trans. 2. p. 263.) radical leaves obovate, cauline ones cordate-stem-clasping, all blunt, smooth, and glaucous; pods 4-sided, and striated with elevated nerves. ⊙. H. Native of Spain, very common in wheat fields, Austria, Transylvania, and Iberia. Brássica Austrìaca, Jacq. austr. p. 45. t. 283, Brássica lùtea, Gilib. fl. lith. in Ust. del. op. 2. p. 361. Brássica perfoliàta var. β, Lam. dict. 1. p. 748. Brássica orientàlis β, Pers. ench. 2. p. 206. Crántzia ochroleùca, Lag. fl. hisp. ined. Gorínkia Austrìaca, Presl. fl. cech. p. 141. Very like *E. perfoliàtum*, and is often confused with it, but it differs in the flowers being a little smaller, yellow, or cream-coloured, not white, and in the pods being more erect.

Austrian Treacle-Mustard, or Hares-ear. Fl. May, June. Clt. 1806. Pl. 1 to 1½ foot.

† *Species not sufficiently known, but probably all referable to Sect. III. Erysimástrum.*

44 E. alti'ssimum (Lejeune, fl. spa. 2. p. 70.) ♂. H. Native in mountain woods between Verviers and Limbourg. Leaves linear-lanceolate, channelled, quite entire. Petals pale-yellow, obcordate. Pods 4-sided, terminated by a two-lobed stigma. Stem erect, much branched, greyish-white from appressed hairs, as well as the leaves. Flowers yellow.

Tallest Treacle-Mustard. Fl. Ju. July. Clt. 1818. Pl. 3 feet.

45 E. bi'color (D. C. syst. 2. p. 509.) ♂. H. Native of Switzerland. Cheiránthus bícolor, Horn. hafn. 2. p. 613. Leaves lanceolate, lower ones remotely-toothed, upper ones quite entire. Pods spreading, 4-sided. Flowers yellow.

Two-coloured Treacle-Mustard. Fl. June, July. Clt. 1819. Pl. 1 to 1½ foot.

46 E. pu'milum (Horn. hort. hafn. 2. p. 613.) ♂. H. Native of Switzerland. Leaves somewhat toothed, lower ones spatulately-ovate; upper ones linear; pods much spreading, 4-sided. Cheiránthus pùmilus, Horn. &c. Flowers yellow.

Dwarf Treacle-Mustard. Fl. June, July. Clt. 1823. Pl. ½ to ¾ feet.

47 E. pa'tulum (Horn. hort. hafn. suppl. 73.) ♂. H. Native of —? Leaves lyrately-pinnatifid, rather scabrous, upper ones sinuated. Pods spreading. Flowers yellow.

Spreading-podded Treacle-Mustard. Fl. Ju. Jul. Clt. 1824. Pl.?

48 E. sylva'ticum (Bieb. fl. taur. suppl. p. 441.) ♂. H. Native of the Ukraine in woods. Leaves lanceolate, remotely toothed. Branches spreading. Corolla paler and rather larger than in *E. cheiranthoìdes*. Pods spreading.

Wood Treacle-Mustard. Fl. June, July. Pl. 1 to 2 feet.

49 E. Marschallia'num (Andrz. in Bieb. fl. taur. suppl. p. 441.) ♂. H. Native of South Podolia. Very near to *E. hieracifòlium*, but differing in the leaves and pods being more upright and one-half shorter. Flowers yellow.

Marschall-Bieberstein's Treacle-Mustard. Fl. Ju. Jul. Pl. 1 ft.

Cult. The perennial herbaceous and sub-shrubby species of this genus answer well for the flower-border in any common garden soil; some of the smaller kind do well for ornamenting rock-work, or to be grown in pots, and placed among other alpine plants; they may be either increased by cuttings planted under a hand-glass, by seeds or by dividing the plants at the root. The biennial and annual kinds may all be sown in the open ground, and treated as other hardy annuals and biennials.

LX. LEPTA'LEUM (from λεπταλεος, *leptaleos*, slender; leaves slender and filiform.) D. C. syst. 2. p. 510. prod. 1. p. 200.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique roundish, sessile; stigmas 2, connivent. Calyx equal at the base. Stamens 4 or 6. Seeds numerous, in one row. Small smooth annual herbs. Leaves glaucous, filiform, sometimes entire, sometimes sparingly toothed, sometimes pinnately-parted; lobes filiform. Racemes terminal, few-flowered; pedicels very short, rising from the axillæ of the leaves. Flowers small, whitish-purple.

1 L. filifo'lium (D. C. syst. 2. p. 511.) some of the leaves are entire, others sparingly lobed; stem longer than the pods; pods rough from small down. ⊙. H. Native of Siberia at the river Kuma. Deless. icon. sel. 2. p. 68. Sisýmbrium filifòlium, Willd. spec. 3. p. 496. Pods axillary, erect or deflexed, covered with short hairs at the base, which are hooked at the point.

Thread-leaved Leptaleum. Fl. June, July. Clt. 1820. Pl. 1 or 2 inches.

2 L. pygmæ'um (D. C. syst. 2. p. 511.) leaves nearly all pinnate-parted; stem shorter than the pods, which are muricated and glabrous. ⊙. H. Native of Persia. Very like the first, but differs in hardly having any stem, and in the leaves being nearly all pinnate-parted, with linear distant lobes. Deless. icon. sel. 2. t. 68.

Pygmy Leptaleum. Pl. hardly an inch.

Cult. These are little annual plants, but are not worth culti-

vating. They only require to be sown in the open ground in any kind of soil.

LXI. STANLE'YA (in honour of Edward Lord Stanley, president L. S. and F.R.S. a profound ornithologist.) Nutt. gen. amer. no. 166. D. C. syst. 2. p. 511. prod. 1. p. 200.

LIN. SYST. *Tetradynàmia, Siliquòsa.* Silique roundish, stalked above the torus. Seeds oblong, terete. Calyx spreading. Smooth glaucous erect herbs. Cauline leaves alternate, pinnatifidly-lyrate or entire. Racemes elongated, terminal. Pedicels bractless, filiform. Flowers yellow. Habit nearly of *Brássica* on the one hand, and on the other to *Cleòme*.

1 S. PINNATI'FIDA (Nutt. gen. amer. 2. p. 71.) leaves interruptedly pinnatifid. ♃. H. Native of Upper Louisiana at the junction of Point-Creek and the Missouri among broken calcareous rocks. Cleòme pinnàta, Pursh. fl. amer. sept. 2. p. 739. Leaves thick, emulating those of a species of *Brássica*. Flowers yellow, nearly like those of a species of *Cleòme*. The leaves of this species, from their analogy with *Brássica*, have been tried as an aliment, but after it has been cooked it becomes powerfully emetic.

Pinnatifid-leaved Stanleya. Fl. May. Clt. 1812. Pl. 3 feet.

2 S. GRA'CILIS (D. C. syst. 2. p. 512.) upper leaves oblong, entire, sessile, narrowed at the base. ⊙. H. Native of North America between Wateree and Longaree. Cleòme lævigàta, Sol. mss. in herb. Banks. Stems solitary, slender, sparingly branched at the top. Flowers small, yellow, hexandrous.

Slender-stemmed Stanleya. Pl. 1 to 1½ foot.

3 S. AMPLEXICAU'LIS (Nutt. in Sillim. amer. journ. 5. ann. 1822. p. 297.) leaves entire? stem-clasping; flowers corymbose; pods nodding.—Native of Eastern Florida in pine woods. Plant smooth, glaucous. Pods 2 or 3 inches long. Flowers yellow.

Stem-clasping-leaved Stanleya. Pl. 1 to 1½ foot.

Cult. The genus *Stanleya* grows most freely in peat or vegetable soil. They will thrive in the open border in a rather shady situation. *S. pinnatifida* may be either increased by dividing the plant at the root or by seeds, and the other two species by seeds only.

Tribe VIII.

CAMELI'NEÆ (plant agreeing with *Camelìna* in important characters), or NOTORHI'ZEÆ (see sub-order II.)-LATISE'PTÆ (*latus* broad and *septum* a dissepiment; dissepiment broad.) D. C. syst. 2. p. 513. prod. 1. p. 201. Silicle with concave valves, and with an elliptical dissepiment in its greatest diameter (f. 46. *r.*). Seeds ovate. Cotyledons flat, incumbent, contrary to the dissepiment (f. 45. *i.*). The dissepiment in several of the genera is incomplete, sometimes wanting altogether.

LXII. STENOPE'TALUM (from στενος, *stenos*, narrow, and πεταλον, *petalon*, a petal; petals narrow.) R. Br. in D. C. syst. 2. p. 513.

LIN. SYST. *Tetradynámia, Siliculòsa.* Silicle elliptical, with concave or flat valves; cells many-seeded. Style none. Seeds small, somewhat ovate, in 2 rows in each cell. A slender annual smooth upright herb. Leaves scattered, linear, entire. Racemes terminal, elongating as they come to maturity. Pedicels bractless, filiform, erect, one-half shorter than the pods. Petals narrow.

1 S. LINEA'RE (R. Br. in D. C. syst. l. c.) ⊙. H. Native of south-west coast of New Holland. Herb very slender. Stem filiform, simple or sparingly branched. Leaves 7 or 8 lines long, and half a line broad. Pods 2 lines long and 1 line broad. Petals very narrow.

Linear-petalled Stenopetalum. Pl. 1 foot.

Cult. The seeds of this plant should be sown in a pot, filled with a mixture of sand loam and peat, which should be placed in a hot-bed until the month of May, when it may be planted out in front of a wall, or in any warm situation in the open border, where it will ripen its seed; but the plant is certainly not worth cultivating, except in botanic gardens.

LXIII. CAMELI'NA (χαμαι, *chamai*, on the ground, and λινον, flax; that is to say, dwarf-flax; resemblance.) Crantz. austr. 1. p. 17. Medik. gen. pl. 1. p. 67. t. 1. f. 11. D. C. syst. 2. p. 514. prod. 1. p. 201.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle obovate, or somewhat globose, with ventricose valves, opening with the part of the style (f. 46. *r.*); cells many-seeded. Style filiform. Seeds oblong, not margined. Erect usually branched herbs. Leaves stem-clasping or sagittate, oblong, entire, sinuately-toothed, pinnatifid or serrate. Racemes terminal, many-flowered, elongated after flowering. Pedicels filiform, bractless. Flowers yellow.

SECT. I. CHAMÆLI'NUM (same meaning as genus.) D. C. syst. 2. p. 514. prod. 1. p. 201. Silicle obovate, margined. Style conical. Stigma simple. Plants annual. Leaves sagittate.

1 C. ARMENI'ACA (Desv. journ. bot. 3. p. 182.) pods obconical at the base, elongated, terminated by the short style; leaves linear-lanceolate, quite entire. ⊙. H. Native of Armenia. Stems rough, with scattered hairs. Leaves villous.

Armenian Gold of Pleasure. Fl. June, July. Pl. ¾ foot.

2 C. SATI'VA (Crantz. austr. p. 10.) pods cuneated, pear-shaped, with 4 ribs, terminated by a longish style; leaves almost entire, lanceolate. ⊙. H. Native throughout the whole of Europe in cultivated fields, chiefly among flax, with whose seeds it is often introduced from one country to another. It does not long propagate itself in Britain spontaneously. It is also found in the island of Cyprus, Tauria, and Siberia, &c. Myàgrum satìvum, Lin. spec. 894. Cav. icon. 1. p. 47. t. 66. Schkuhr. handb. 2. no. 1755. t. 178. Fl. dan. 1038. Alýssum satìvum, Scop. carn. no. 794. Smith, engl. bot. t. 1254. Camelìna sagittàta, Mœnch. meth. 255. Mœ'nchia satìva, Roth. germ. 1. p. 274. Flowers golden-yellow. A very variable plant.

Var. α, pilòsa (D. C. syst. 2. p. 516.) leaves entire, pilose, Myàgrum satìvum, Berg. phyt. icon.—Chabr. sciagr. 283. f. 4.—Mor. oxon. 2. p. 315. sect. 3. t. 21. f. 2.

Var. β, glabràta (D. C. syst. l. c.) leaves entire, smoothish.—Lind. alsa. 94. t. 1. This is the plant that is cultivated.

This plant is cultivated in many parts of Europe for the seed, from which oil is obtained by expression, which is used for medicinal, culinary, and œconomical purposes. For the method of its culture see Parmentier in Roz. cours. d. agric. vol. xi. p. 291. Bosc. dict. d'agric. 3. p. 45. Galliz. bot. agr. 3. p. 170.

Cultivated Gold of Pleasure. Fl. June. Britain. Pl. 1 foot.

3 C. DENTA'TA (Pers. ench. 2. p. 191.) pods roundish, pear-shaped, with 4 ribs, terminated by a longish style; leaves repand-toothed. ⊙. H. Native of Alsace, Spain, Tauria, &c. in cultivated fields. Pods nearly globose.

Var. α, dentàta (D. C. syst. 2. p. 516.) leaves smoothish, grossly-toothed or sinuated. Myàgrum dentàtum, Willd. phyt. 1. p. 9. no. 13. Myàgrum Bauhìni, Gmel. fl. bad. 3. p. 7. Mœ'nchia arvénsis, Bernh. Cochleària fœ'tida, Schkuhr. handb. 2. no. 1805. Myàgrum Alýssum, Mill. dict. no. 2.—J. Bauh. hist. 2. p. 893. icon.

Var. β, pinnatífida (D. C. syst. l. c.) leaves sinuately-pinnatifid, scabrous from scattered hairs. Myàgrum pinnatífidum, Ehrh. dec. p. 16. Camelìna pinnatífida, Horn. hort. hafn. 2. p. 598. Cochleària heterophýlla, Cav. Both plants are very like *C. satìva*, but the leaves are deeply toothed, not entire.

Toothed-leaved Gold of Pleasure. Fl. June, July. Clt. 1806. Pl. 1 foot.

4 C. microca'rpa (Andrz. cruc. in D. C. syst. 2. p. 517.) pods pear-shaped, with 2 ribs, terminated by a longish style (f. 46. *r.*); leaves lanceolate, denticulated, hispid. ⊙. H. Native of Podolia. Allied to *C. satìva α pilosa*, but differs in the fruit being one-half shorter and with 2 not 4 ribs. Deless. icon. sel. 2. t. 69.

Small-fruited Gold of Pleasure. Fl. Ju. July. Pl. 1 foot.

Sect. II. Pseudoli'num (*ψευδης, pseudes*, false, and *λινον, linon*, flax.) D. C. syst. 2. p. 517. prod. 1. p. 201. Silicles globose, not margined. Style filiform. Stigma capitate. Plants perennial. Leaves stem-clasping, bluntly auricled.

5 C. Barbareæfo'lia (D. C. syst. 2. p. 517.) pods globose; leaves oblong, pinnatifid, bluntly auricled at the base; stem villous at the base. ♃. H. Native of eastern Siberia in the province of Irkoutsk near Doroninsk, also of Eschcholz's Bay on the north-west coast of America. Deless. icon. sel. 2. t. 70.

Barbarea-leaved Gold of Pleasure. Fl. May, July. Clt. 1818. Pl. 1 to 1½ foot.

6 C. Austri'acum (R. Br. in hort. kew. ed. 2. vol. 4. p. 93.) pods globose; leaves oblong, serrate-toothed, clasping the stem at the base; stem smooth. ♃. H. Native of Austria in humid meadows about Vienna, also in Silesia and Tauria at the Tanais and the Volga. Myàgrum Austrìacum, Jacq. fl. austr. 2. p. 111. Schkuhr. handb. 2. no. 1756. t. 158. Nastúrtium Austrìacum, Crantz. austr. 1. p. 15. t. 2. f. 1, 2, 3. Myàgrum Crántzii, Vittm. sumn. pl. 4. p. 9. Stem branched, in wet places weak and elongated, but in dry places firm and short.

Austrian Gold of Pleasure. Fl. May, Ju. Clt. 1795. Pl. 1 ft.

Cult. Notwithstanding the ridiculously pompous English name of *Gold of Pleasure* which these plants bear, and which seems a satire on the articles of which it is composed, as yielding nothing but disappointment, they are not worth cultivating except in general collections. Both perennial and annual species can only be increased by seeds. They require no care.

LXIV. EUDE'MA (in honour of Eudemus of Rhodes, a pupil of Aristotle). Humb. et Bonpl. pl. Æquin. 2. p. 133. t. 123 and 124. D. C. syst. 2. p. 518. prod. 1. p. 202.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle ovate, with many-seeded cells and concave valves, with the dissepiment perforated at the top. Style filiform. Seeds oval. Cotyledons (from the figure) incumbent. Small tufted perennial herbs, with crowded, ciliated, blunt small leaves, and axillary, stalked, solitary white flowers.

1 E. rupe'stris (H. et B. pl. æquin. 2. p. 133. t. 123.) leaves linear; calyx shorter than the corolla; cells of pods 8 or 10-seeded. ♃. G. Native of South America in mountains near Quito on high and cold rocks. Dràba Humbóldtii, Desv. jour. bot. 3. p. 171. Root woody, fusiform, branched. Flowers white. Leaves smooth, not ciliated.

Rock Eudema. Pl. 2 or 3 inches.

2 E. nubi'gena (H. et B. pl. æquin. 2. p. 136. t. 124.) leaves spatulate; calyx longer than the corolla; cells of pods 4-seeded. ♃. G. Native of the Andes about Quito on high rocks. Root elongated, fusiform, almost simple, much longer than the herb. Flowers white. Leaves ciliated.

Cloud Eudema. Pl. 1 inch.

Cult. As there has not yet been a species of *Eudèma* introduced into Britain, it is difficult to say what method of cultivation would suit them best, but we would recommend their being kept in pots which should be well drained with potsherds, and planted in a mixture of sand, loam and peat, and placed in a green-house or frame, so that they may be protected from the frost. It is evident from the nature of the plants that they must be either increased by seeds or cuttings; but they are not worth cultivating except in botanic gardens.

LXV. NE'SLIA (meaning not explained.) Desv. journ. 3. p. 162 and 163. D. C. syst. 2. p. 519. prod. 1. p. 202.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle almost globose, indehiscent, with concave valves, 1-seeded and 1-celled from the want of a dissepiment. Seeds somewhat globose, pendulous. Cotyledons ovate, thick, incumbent. An annual erect herb, with somewhat the habit of *Camelìna satìva*. Stems round, sparingly branched, whitish, pubescent, or a little hispid at the base. Cauline leaves alternate, sagittate, stem-clasping, oblong-lanceolate, entire. Racemes terminal, elongated. Pedicels filiform, bractless. Flowers small, yellow.

1 N. panicula'ta (Desv. l. c.) ⊙. H. Native of corn-fields and sandy places almost throughout the whole of Europe, from Turkey to Sweden, and from Spain to Petersburgh, also in Iberia about Tiflis; in the south of Tauria and in Siberia between Zmeof and the Irtish. Myàgrum paniculàtum, Lin. spec. 894. Œder. Fl. dan. t. 204. Schkuhr. handb. 2. no. 1757. t. 178. Cochleària sagittàta, Crantz. cruc. p. 99. Nastúrtium paniculàtum, Crantz. austr. p. 15. Crámbe paniculàta, All. ped. 1. p. 256. Vogèlia sagittàta, Medik. phl. gatt. t. 1. f. 6. Rapístrum paniculàtum, Gært. fruct. 2. p. 285. t. 141. Bùnias paniculàta, Lher. cak. diss. ined. p. 9. Alýssum paniculàtum, Willd. enum. 2. p. 671. Vogèlia paniculàta, Horn. hort. hafn. 2. p. 594.

Panicled Neslia. Fl. July, Aug. Clt. 1683. Pl. 1½ foot.

Cult. This plant is not worth cultivating except in botanic gardens. It only requires to be sown in the open border, and treated like other hardy annuals.

LXVI. EUTRE'MA (from *ευ, eu*, well; *τρημα, trema*, an orifice; dissepiment incomplete.) R. Br. in app. Parry's voy. append. p. 9. t. A.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle short, 2-edged, with keeled valves, an incomplete dissepiment, and many-seeded cells. Plant with the habit of *Bràya*. Root thick, fusiform, from which spring numerous simple few-leaved stems. Radical leaves stalked, ovate-lanceolate, quite entire or a little toothed, thickish, the uppermost cauline ones sessile. Corymbs dense, 7-8-flowered. Flowers white; anthers yellow. Dissepiment complete at the base and apex, but not so in the middle. Perhaps the genus *Bràya* ought to have been inserted here.

1 E. Edwa'rdsii (R. Br. l. c.) ♃. H. Native of Melville Island in the neighbourhood of Winter Harbour. Plant smooth.

Edwards's Eutrema. Fl. April, May. Pl. 2 to 3 inches.

Cult. This plant should be grown in small pots filled with a mixture of peat, loam and sand, well drained with potsherds at the bottom. It should be treated as other alpine plants. It can only be propagated by seeds.

LXVII. ORE'AS (from *ορειας, oreias*, nymph of the mountains, in allusion to the habitat of the plant.) Cham. et Schlecht. Linnæa 1. p. 29.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle lanceolate, compressed, 1-celled, from the dissepiment having vanished; valves flattish, with a nerve running through the middle. Seeds numerous, egg-shaped, hanging from the upper part of the placentarious nerve by long umbical funicles.—A small alpine perennial herb, with the habit of *Cardámine bellidifòlia*. Leaves radical, stalked, smooth. Bracteas crowded under the pedicels, appearing like an involucre. Flowers in short racemes, white, sometimes veined with dark-purple. Calyx loose, equal at the base. Petals entire, unquiculate, equal. Filaments equal, toothless. Style very short, crowned by a capitate stigma. This genus is sufficiently distinct, in the dissepiment being absent, as well as the glands.

1 O. involucra'ta (Cham. l. c. t. 1.) ♃. H. Native of the island of Unalaschka on the tops of the mountains among stones.

Involucrated Oreas. Pl. ½ to 1 inch.

Cult. This plant should be grown in small pots, in a mixture of peat and sand, and treated as other alpine plants; it can be propagated by dividing the plants at the roots or by seeds. Not worth cultivating except in general collections.

Tribe IX.

LEPIDI'NEÆ (plants agreeing in character with Lepídium,) or NOTORHI'ZEÆ (see sub-order II.) -ANGUSTISE'PTÆ (*Angustus* narrow *septum*, a partition; dissepiment narrow.) D. C. syst. 2. p. 521. prod. 1. p. 202. Silicle with a very narrow dissepiment, and with keeled (f. 47. *a. b.*) or very concave valves. Seeds few or solitary in each cells (f. 47. *a. b.*), ovate, not margined. Cotyledons flat, incumbent, parallel with the dissepiment (f. 45. *j. i.*).

LXVIII. CAPSE'LLA (a diminutive of *Capsula*, a capsule.) Vent. tabl. 3. p. 110. D. C. syst. 2. p. 383. prod. 1. p. 177.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle triangular, cuneated at the base, with navicular wingless valves; cells many-seeded. An annual herb, very variable in habit. Radical leaves rosulate, entire, toothed, cut or variously lobed. Stem leaves few, erect, oblong, sagittate at the base. Racemes terminal, elongated; pedicels filiform, bractless, much longer than the pods. Flowers small, white.

1 C. bu'rsa-pasto'ris (Mœnch. meth. 271.) ⊙. H. Native throughout the world in waste and cultivated land, and by way-sides every where; very common in Britain. Thláspi bùrsa-pastòris, Lin. spec. 903. Smith, eng. bot. t. 1485. Œder. fl. dan. t. 729. Curt. fl. lond. 1. t. 50. Schkuhr. handb. 2. no. 1797. t. 180.

The herb, according to De Candolle, is much less acrid than the rest of the order, and it is rather glutinous to the taste.

Var. β, mìnor (D. C. syst. 2. p. 384.) Bursa-pastòris mìnor, Tab. icon. 197. Plant small.

Var. γ, integrifòlia (D. C. l. c.) Mor. oxon. 2. p. 104. sect. 3. t. 20. f. 1. Leaves entire.

Var. δ, coronopifòlia (D. C. l. c.)—Bauh. pin. 108.

Var. ε, apétala (D. C. l. c.) Opiz. in bot. zeit. 1821. p. 440. Flowers petalless, decandrous. This plant is rather a monster than a variety.

Shepherd's-Purse. Fl. March, Nov. Britain. Pl. ½ to 1 ft.

Cult. The *Shepherd's-Purse* is well known as a very troublesome weed in gardens, but it is easily kept under by hoeing the ground in dry hot weather, at or before it comes into flower, but if suffered to seed it will become exceedingly troublesome.

LXIX. SENEBIE'RA (in honour of John de Senebier of Geneva, a vegetable physiologist.) Poir. dict. 7. p. 75. D. C. syst. 2. p. 521. prod. 1. p. 202.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle cuneated, didymous, with ventricose or somewhat keeled unopening 1-seeded valves. Seeds sub-globose, triquetrous. Cotyledons incumbent, linear. Annual or biennial, many-stemmed, smooth or somewhat villous, branched, usually trailing herbs. Leaves alternate, sometimes linear entire, sometimes deeply serrated, sometimes pinnate-lobed, with the lobes entire or toothed. Racemes short, opposite the leaves; pedicels bractless. Flowers small, white.

Sect. I. Nasturtio'lum (altered from Nastúrtium). D. C. syst. 2. p. 522. prod. 1. p. 202. Medik. gen. pl. p. 82. t. 2. f. 21. from Ust. new. ann. 2. p. 45. Silicles emarginate at the top. Dissepiment shorter than the globose valves.

1 S. integrifo'lia (D. C. soc. hist. nat. par. ann. 7. p. 144. t. 8.) leaves linear, entire, narrowed at the base; pods bi-globose, spongy, areolate. ⊙. H. Native of Madagascar. Corónopus integrifòlia, Spreng. syst. 2. p. 858. Seeds roundish, brown.

Entire-leaved Wart-Cress. Pl. ½ foot.

2 S. linoi'des (D. C. syst. 2. p. 522.) leaves linear, acute, entire; pods rather compressed, biscutate, very minutely areolate, dotted. ⊙. H. Native of the Cape of Good Hope. Lepídium linoìdes, Thunb. prod. 107.? Corónopus linoìdes, Spreng. syst. 2. p. 852. Having the leaves of *S. integrifòlia*, and the pods of *S. pinnatífida*. Plant branched, erect.

Flax-like Wart-Cress. Pl. ½ foot.

3 S. Helenia'na (D. C. syst. 2. p. 523.) lower leaves pinnate-parted; lobes cut; upper leaves linear or divided into few lobes; pods bi-globose, somewhat areolate. ⊙. H. Native of the island of St. Helena on calcareous mountains at Sandy Bay. Corónopus Heleniàna, Spreng. syst. 2. p. 885. Plant much branched, decumbent, somewhat tufted.

St. Helena Wart-Cress. Pl. 3 or 5 inches long.

4 S. pectina'ta (D. C. syst. 2. p. 523.) leaves pinnate-parted; lobes linear, acuminated, entire; pods compressed, twin, netted with transverse nerves. ⊙. H. Native of South America in Quito near Chillo, at the height of 4053 feet above the sea. A procumbent plant, with slender, rather hairy branches, very like *S. pinnatífida*. Pods emarginate at both ends.

Pectinate-leaved Wart-Cress. Pl. 1 foot long, procumbent.

5 S. pinnati'fida (D. C. mem. soc. hist. nat. par. ann. 7. p. 144. t. 9.) leaves pinnate-lobed; lobes oblong, toothed or somewhat cut; pods compressed, twin, reticulated. ⊙. H. Native nearly throughout the whole world in waste ground, and by way-sides, especially near the sea, plentiful in Britain. Lepídium A'nglicum, Huds. 280. Lepídium dídymum, Lin. mant. 92. Lepídium prostràtum, Savi. in Santi. viag. 2. p. 18. t. 1. Corónopus dídyma, Smith, fl. brit. 2. p. 691. engl. bot. 248. Senebièra supìna, Thor. chl. land. 275. Senebièra dídyma, Pers. ench. 2. p. 185. Corónopus pinnàtus, Horn. hafn. 599. Petals 4, oblong, sometimes wanting. Plant diffuse or procumbent.

Var. β, incìsa (D. C. syst. 2. p. 524.) lobes of leaves 3-4-parted. ⊙. H. Native of Pennsylvania and Carolina along the banks of the Mississipi and the Missouri. In Brazil about Monte Video, also of Buenos Ayres. Lepídium Bonariénse, Mill. dict. no. 13. Biscutélla apétala, Walt. car. 174. Cochleària humifùsa, Mich. fl. bor. amer. 2. p. 27. Corónopus dídyma, Nutt. gen. amer. 2. p. 64. Senebièra incìsa, Willd. enum. 2. p. 668. Corónopus incìsa, Horn. hafn. 599.

Pinnatifid-leaved Wart-Cress. Fl. Jul. Sept. Brit. Pl. 1 ft. long.

Sect. II. Cara'ra (probably from καρα, *kara*, the peak of a mountain; habitat of plants). D. C. syst. 2. p. 524. prod. 1. p. 203. Silicles not emarginate at the top, somewhat compressed on both sides, with compressed valves, which are crested or wrinkled on their back.

6 S. coro'nopus (Poir. dict. 7. p. 76.) leaves pinnate-lobed; lobes entire, toothed, or pinnatifid; pods acutish, compressed, with the valves crested on their back. ⊙. H. Native of waste ground, and by way-sides on calcareous and sandy soils, almost throughout the whole of Europe, Russia perhaps excepted; also in the Canary islands and North America. Cochleària Corónopus, Lin. spec. 904. Oed. fl. dan. t. 202. Schkuhr. handb. 2. no. 1802. t. 181. Corónopus Ruéllii, All. ped. no. 934. Gært. fruct. 2. p. 293. t. 242. Lam. ill. t. 558. Smith, engl. bot. t. 1660. Caràra Corónopus, Medik. in Ust. new. ann. 2. p. 38. This plant has got about 20 other synonymous names, but they have now become perfectly obsolete. Sepals roundish, with white membranous margins. Stems spreading, quite flat to the ground. This plant was formerly gathered and used as a salad; but has since been deservedly neglected, the whole herb being nauseously acrid and fetid, and must require much boiling to render it eatable.

Common or *Star* Wart-Cress. Fl. July, Sept. Britain. Pl. trailing.

7 S. serra'ta (Poir. dict. 7. p. 76.) leaves oblong, deeply serrated; pods compressed, rough. ⊙? H? Native of Brazil about Monte Video, where it flowers in November. Corónopus serràtus, Desv. journ. bot. 3. p. 163. Corónopus myricæfòlia, Smith, herb. Flowers very small. Pods compressed, somewhat orbicular at the base, with rough, glabrous reticulated valves. Stems branched, procumbent, pubescent, smooth at the top. Deless. icon. sel. 2. t. 71.

Saw-leaved Wart-Cress. Fl. Nov. Pl. 1 foot long.

Sect. III. Cotyli'scus (from κοτυλη, *kotyle*, a hollow; valves of silicles concave). D. C. syst. 2. p. 526. prod. 1. p. 203. Silicles not crested on the back, not emarginate at the top, hence they are concave or nearly flat.

8 S. Nilo'tica (D. C. syst. 2. p. 527.) radical leaves pinnate-parted; lobes deeply-serrated; upper leaves almost entire; pods compressed, rather boat-shaped. ⊙. H. Native of the islands in the Nile in Lower Egypt. Cochleària Nilótica, Delile ill. fl. ægyp. p. 19. descr. p. 101. t. 34. f. 2. Cotylíscus Niloticus, Desv. journ. bot. 3. p. 164. and 175. t. 25. f. 13. Corónopus Niloticus, Spreng. syst. 2. p. 853. Herb smooth. Stems erect, lower branches very long and spreading. Pods reniform, pointed with the sessile stigma. This plant is eaten as a salad in Egypt.

Nile Wart-Cress. Pl. 1 to 2 feet.

Cult. As these plants possess no beauty, they are not worth cultivating, except in botanical gardens. They only require to be sown in the open ground, in any kind of soil.

LXX. LEPI'DIUM (from λεπις λεπιδος, *lepis lepidos*, a scale; in allusion to the form of the pods, which resemble little scales). R. Br. in hort. kew. ed. 2. vol. 4. p. 85. D. C. syst. 2. p. 527. prod. 1. p. 203.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle ovate, or somewhat cordate, dehiscent, with keeled (f. 47. *a.*) or rarely ventricose valves, and 1-seeded cells. Seeds somewhat triquetrous or compressed. Herbs or small sub-shrubs. Stems round, branched. Leaves simple or variously cut. Racemes terminal, erect, elongating as they grow; pedicels filiform, bractless. Flowers small, white.

Sect. I. Carda'ria (from καρδια, *kardia*, the heart; shape of silicles). D. C. syst. 2. p. 528. prod. 1. p. 203. Cardiolèpis, Wallr. Sched. 340. Silicle ovate-cordate, with somewhat turgid, wingless valves. Style long, filiform.

1 L. Dra'ba (Lin. spec. ed. 1. p. 645.) pods somewhat turgid, cordate, entire at the top, terminated by the style; leaves stem-clasping, lanceolate, toothed. ⊙. H. Native in cultivated fields, especially in the south of Europe, from Spain to Tauria, and from Greece to Paris, &c. Cochleària Dràba, Lin. spec. ed. 2. p. 904. Jacq. austr. t. 315. Nastúrtium Dràba, Crantz. austr. 91. Cardària Dràba, Desv. journ. bot. 3. p. 163. Dràba ruderàlis, Baumg. transyl. 2. p. 233. Jundzíllia Dràba, Andrz. cruc. ined. Stem solitary, erect, pubescent, corymbosely-branched at the top. Leaves greyish from down, or smooth. Cotyledons obovate-oblong, thick.

Whitlow Pepperwort. Fl. May, Aug. Clt. 1596. Pl. 1 foot.

Sect. II. Ellipsa'ria (from *ellipsis*, an *ellipsis*; shape of silicles). D. C. syst. 2. p. 530. prod. 1. p. 203. Silicle elliptical, with keeled wingless valves. Style long, filiform.

2 L. Chalepe'nse (Lin. amœn. 4. p. 321. spec. ed. 2. p. 898.) pods elliptical, twice the length of pedicels; style filiform; leaves lanceolate, toothed, with acute, stem-clasping auricles. ⊙. H. Native of the Levant in fields about Aleppo.

Var. α, glabràtum (D. C. syst. 2. p. 530.) smooth; leaves acutely toothed, from the base to beyond the middle; racemes rather loose.—Mor. oxon. 2. p. 314. sect. 3. t. 25. the second figure in the lower range.

Var. β, pubéscens (D. C. syst. l. c.) pubescent; fructiferous racemes more loose and with longer pedicels. Native of Syria near Damascus.

Var. γ, canéscens (D. C. syst. l. c.) plant much more villous and grey than the last variety, and the racemes are shorter. Native of Mount Lebanon near Abra.

Aleppo Pepperwort. Fl. May, Jul. Clt. 1798. Pl. 1 foot.

3 L. oxy'otum (D. C. syst. 2. p. 530.) pods elliptical, puberulous, rather longer than the pedicels; style filiform; leaves oblong, somewhat toothed, sub-hastate, with acute auricles at the base. ⊙? H. Native of Syria. Stems pubescent. Leaves covered with scattered hairs. Petals length of calyx, with their claws filiform. Seeds ovate, brown.

Sharp-eared-leaved Pepperwort. Pl. $\frac{1}{4}$ foot.

4 L. glastifo'lium (Desf. atl. 2. p. 66. t. 147.) pods elliptical, smooth, shorter than the pedicels; style filiform; leaves oblong, bluntly toothed, with blunt, stem-clasping auricles. ⊙? H. Native of Algiers in shady parts of mountains. Thláspi glastifòlium, Poir. dict. 7. p. 538. Lèpia glastifòlia, Desv. jour. bot. 3. p. 166. Stems branched at the top, erect, pubescent from short hairs. Uppermost leaves quite entire. Petals obovate, double the length of the calyx.

Woad-leaved Pepperwort. Pl. 1 to 2 feet.

5 L. amplexicau'le (Willd. spec. 3. p. 436.) pods roundish, terminated by the short style; leaves undivided, oblong-lanceolate, sagittate, sessile, toothed at the top. ♃. H. Native of Siberia. Stems smooth, furnished with branches from the base, which rise the height of the stem. Flowers and silicles the same as those of *L. latifòlium.*

Stem-clasping-leaved Pepperwort. Pl. 1 foot.

Sect. III. Bradypi'ptum (from βραδυς, *bradys*, late, and πιπτω, *pipto*, to fall off; calyx almost permanent.) D. C. syst. 2. p. 531. prod. 1. p. 204. Silicle elliptical, with keeled valves. Style short. Calyx permanent. Stem leaves neither stem-clasping nor auricled.

6 L. cæspito'sum (Desv. journ. bot. 3. p. 165. and 178.) pods ovate, with a narrow notch at the apex; style very short; calyx permanent; leaves linear, entire, permanent. ♃. H. Native of Armenia. Stems pubescent, sparingly branched. Radical leaves tufted, pilose, glaucous. Sepals oval-oblong, with membranous margins, permanent, at length reflexed.

Tufted-leaved Pepperwort. Pl. $\frac{1}{4}$ foot.

7 L. coronopifo'lium (Fisch. in cat. hort. gor. 1808. p. 79.) pods elliptical, entire, somewhat puberulous; terminated by a very short style; calyx almost permanent; cauline leaves linear, very entire, radical ones pinnate-lobed. ♃. H. Native of Siberia near Sarepta at the south Volga. L. laciniàtum, Willd. herb. from Stev. obs. ined. The whole of the herb is very smooth, except the pods. Stem erect, much branched, flexuous.

Buck-horn-leaved Pepperwort. Fl. May, July. Clt. 1823. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

8 L.? Humbo'ldtii (D. C. syst. 2. p. 532.) pods ovate, emarginate, pointed by the short style; calyx permanent; radical leaves bipinnate, cauline ones pinnatifid. Native of arid places near Chillo in Quito, at the height of 4020 feet. Herb branched, erect, rarely procumbent. Flowers minute, pedicelled. Petals a little shorter than the calyx. Senebièra dùbia. H. B. et Kth. nov. spec. amer. 5. p. 76.

Humboldt's Pepperwort. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

Sect. IV. Ca'rdamon (καρδαμον, *kardamon*, water-cress; hot

taste of plants). D. C. syst. 2. p. 533. prod. 1. p. 204. Silicle somewhat orbicular, emarginate, with navicular valves, which are winged on their back (f. 47. *a*.) Cotyledons parted.

9 L. sati'vum (Lin. spec. 899.) pods orbicular, winged; leaves variously cut and divided; branches not spiny. ⊙. H. Native of Persia and the island of Cyprus, in corn-fields. Smith, fl. græc. t. 616. Bois. fl. eur. t. 440. f. 2. Schkuhr. handb. 2. no. 1782. t. 180. Thláspi satìvum, Crantz. austr. 1. p. 21. Lèpia satìva, Desv. journ. bot. 3. p. 165. Herb erect, branched, smooth, somewhat glaucous.

Var. β, críspum (D. C. syst. 2. p. 534.) leaves much cut and curled. Nastúrtium críspum, J. Bauh. hist. 2. p. 913. f. 1.—Mor. oxon. 2. p. 301. sect. 3. t. 19. f. 3.

Var. γ, latifòlium (D. C. l. c.) leaves flat, little divided.—Mor. oxon. 2. p. 300. sect. 3. t. 19. f. 2.

Garden-cress (Eng.), *Cresson* (Fr.), *Gemeine kresse* (Germ.), *Creseione* (Ital.).

"This is cultivated in gardens for the young leaves, which are used in salads, and have a peculiarly warm and grateful relish. It ranks among gardeners as the principal of small salads. The varieties are as follows, viz. 1. The common plain-leaved; principally cultivated. 2. The curled-leaved, var. β, above, is equally good as a salad, and preferable as a garnish. The broad-leaved var. γ above, is less cultivated as a salad, but grown in fields for rearing young turkeys, &c.

"All the varieties are raised from seed, of which one ounce, or one-eighth of a pint, will suffice for a bed four feet by four feet. Cress should be raised three or four times every month, as it may be in demand to have crops delicately young in succession. For culture in the open garden begin in the first, second, or third week in March, as a forward spring may bring mild weather or otherwise; allot some warm situation for the early spring sowings, and if the weather take a cold turn, either put on a spare frame or cover with matting between sunset and sunrise. When spring is confirmed, sow in any open compartment. At the beginning of summer the same; but in hot dry weather either sow in a shady border, or if the situation be open, shade with mats in the middle of the day. For autumn sowings, when cold weather is approaching, allot some warm border and give occasional protection. When crops are in demand throughout winter, either sow in a moderate hot-bed, or in cradles to be placed in a stove; pans filled with rotten tan are to be preferred to pots or boxes with mould. From the last fortnight of October till the 1st of March, it will be almost fruitless to sow in the open garden; but a terrace sloping south under a frame, may be used at the decline of the year and most early part of spring, as the intermediate step between the open garden and hot-bed, if more within the means at command. During this interval, some market-gardeners sow it just within the glasses which cover larger plants." "The cress is often raised on porous earthenware vessels of a conical form, having small gutters on the sides for retaining the seeds. These are called pyramids; they are somewhat ornamental in winter, and afford repeated gatherings.

"Having allotted a fine piece of mellow soil to receive the seed, dig the surface, and rake it finally preparatory to sowing, which mostly perform in small, flat, shallow drills, four, five, or six inches asunder. Sow the seed very thick, and earth over very lightly, or but just thinly cover. Give occasional waterings in dry seasons."

"To gather cress in perfection, cut them while moderately young, either clean to the root, or only the tops of advanced plants. These last will shoot again for future gatherings, but the leaves will be hotter, and not so mild or tender as those of younger plants."

To save seed.—Either sow a portion in the spring for that purpose, or leave some rows of any overgrown old crop in April or May. The plants will yield seed in autumn.

Cultivated or Common Garden Cress. Fl. June, July. Clt. 1548. Pl. 1 to 1½ foot.

10 L. spine'scens (D. C. syst. 2. p. 534.) pods oval, winged, emarginate (f. 47. *a*.); leaves cut at the top; racemes spinescent at the top. ⊙? H. Native of Syria about Damascus. A smooth, branched herb. Cotyledons as in *L. oleràceum* incumbent, 3-parted. Stems whitish. Deless. icon. sel. 2. t. 72. Fructiferous racemes spiny at the top.

Spinescent Cress. Fl. June, July. Clt. 1820. Pl. 1 to 1½ foot.

Sect. V. Le'pia (from λεπις, *lepis*, a scale; form of silicles). D. C. syst. 2. p. 534. prod. 1. p. 204. Silicle somewhat orbicular, emarginate, with navicular, winged valves; wings adhering to the style; style very short. Cotyledons entire.

11 L. campe'stre (R. Br. in hort. kew. ed. 2. vol. 4. p. 465.) pods ovate, winged, emarginate, scaly; cauline leaves sagittate, toothed. ⊙. H. Native of cultivated fields and by way-sides in Europe from Spain to Sweden, from England to Turkey, and in Tauria; plentiful in Britain. Thláspi campéstre, Lin. spec. 902. Vahl. fl. dan. t. 1221. Curt. lond. 5. t. 45. Smith, engl. bot. t. 1385. Schkuhr. handb. 2. no. 1793. t. 180. Thláspi hirsùtum, var. α. Lam. fl. fr. ed. 1. vol. 2. p. 465. Thláspi montànum, Poir. dict. 7. p. 536. Lèpia campéstris, Desv. journ. bot. 3. p. 165. The whole herb is grey from small, simple, crowded hairs. Stem erect, simple at the base and branched at the top.

Var. β, subglàbrum (D. C. syst. 2. p. 335.) leaves smooth; pods elliptical.—Mor. oxon. 2. p. 293. sect. 3. t. 17. f. 13. Pet. brit. t. 50. f. 8. Native of Spain in the mountains of Leon, also in England in cultivated fields near Warrington.

Var. γ, hírtum (Huds. ang. 281.) plant rather hairy. Native of England in corn-fields near Bath.

Field Mithridate Pepperwort. Fl. July. Britain. Pl. ½ to ¾ ft.

12 L. hi'rtum (Smith, compen. ed. 3. p. 98. engl. bot. t. 1803.) pods ovate, winged, emarginate, hairy; cauline leaves sagittate, villous, almost entire. ♃. or ♂. H. Native in fields and hilly ground in many parts of the south of Europe, particularly in Spain about Madrid, and in Valencia; in the olive region of France; in Italy, south of Austria, Transylvania, and Sicily; in Britain, in mountainous situations in Wales and elsewhere; Scotland, in Perthshire near the seat of the Earl of Kinnoul, and by the river Earn; in Angusshire between Brichen and Montrose; at Browston in Suffolk. Thláspi hírtum, Lin. spec. 901. Medik. nov. gen. t. 2. f. 18. Thláspi hirsùtum β, Lam. fl. fr. 2. p. 465. Lèpia hírta, Desv. journ. bot. 3. p. 166. Lèpia Bonnaniàna, Presl. ex Spreng. Very like the preceding species.

Hairy Mithridate Pepperwort. Fl. June, July. Britain. Pl. ½ to ¾ foot.

13 L. leioca'rpum (D. C. syst. 2. p. 536.) pods oval, winged, emarginate, smooth, boat-shaped. ⊙? H. Native of mount Lebanon. Flowers and cauline leaves unknown. Seed like those of *L. hírtum*. Radical leaves lanceolate.

Smooth-podded Mithridate Pepperwort. Pl. ½ to ¾ foot.

14 L. rotu'ndum (D. C. syst. 2. p. 537.) pods oval, winged, emarginate, smooth; cauline leaves lanceolate-linear, somewhat fleshy, smooth.—Native of New Holland at King George's Sound. Lèpia rotúnda, Desv. journ. bot. 3. p. 166 and 181. Stem slender, branched from the base. Flowers unknown. Seeds large, brown. Cotyledons thick.

Round Mithridate Pepperwort. Fl. June, July. Pl. ½ foot.

15 L. spino'sum (Lin. mant. 253.) pods oblong, winged, emarginate, somewhat 2-horned, smooth; radical leaves pinnate; lobes cut. ⊙. H. Native of the Levant. Ard. specim. 2. p. 34. t. 16. Capsélla spinòsa, Medik. in Ust. new. ann. 2. p. 46.

Thláspi spinòsum, Poir. dict. 7. p. 545. Thláspi bispinòsum, Horn. hort. hafn. 2. p. 604. Herb smooth, erect, branched; lower cauline leaves irregularly-lobed, upper ones linear-lanceolate, entire. Flowers small. Margins of sepals white.

Spiny-podded Mithridate Pepperwort. Fl. April, Sep. Clt. 1787. Pl. 1 ft.

SECT. VI. DILE'PTIUM (a name given by Rafinsque, the meaning of which is not explained by him.) D. C. syst. 2. p. 538. prod. 1. p. 205. Silicle almost elliptical, somewhat emarginate at the top, with keeled wingless valves. Style very short. Flowers very small, sometimes 2 or 4-androus, rarely apetalous.

16 L. VIRGI'NICUM (Lin. spec. 900.) pods orbicular, emarginate, shorter than the pedicels; flowers with 2 or 4 stamens; cauline leaves linear lanceolate, deeply serrated, smooth. ⊙. H. Native of waste land and gravelly places in North America, from New York to Carolina, also at Nootka Sound; in Monte Video, Cuba, Tobago, Jamaica, and St. Domingo. L. Ibèris, Schkuhr. handb. 2. p. 222. t. 180. Thláspi Virginiànum, Poir. dict. 7. p. 544. L. triándra, Stok. bot. mat. med. 3. p. 426. L. Pollíchii, Roth. fl. germ. 2. t. 91? Thláspi Virgínicum, Cav. præl. no. 935. Horn. hafn. 605. Herb smooth, branched; lower leaves pinnate-lobed. Petals obovate, blunt. Seeds oval, compressed. Cotyledons linear.

Virginian Pepperwort. Fl. June, July. Clt. 1713. Pl. 1 foot.

17 L. SPICA'TUM (Desv. journ. bot. 3. p. 164 and 178.) pods orbicular, emarginate, somewhat longer than the pedicels; leaves linear, entire, smooth. ⊙. H. Native of the Straits of Magellan. An erect smooth herb, very like *L. Virgínicum*. Leaves pressed to the stem. Pods as if they were imbricated.

Spicate-podded Pepperwort. Pl. ½ to 1 foot.

18 L. MENZI'ESII (D. C. syst. 2. p. 539.) pods orbicular, somewhat emarginate; leaves pubescent, radical ones pinnate-parted, lobes cut; upper leaves linear entire. ♃? H. Native of the western coast of North America. Allied to *L. Virgínicum*, but differing in the leaves being pubescent, not smooth. Stems erect, branched at the top.

Menzies's Pepperwort. Pl. 3 or 4 inches.

19 L. SUBULA'TUM (Lin. spec. 899.) pods ovate, somewhat emarginate; leaves subulate, entire; stem suffruticose. ♄. H. Native of Spain on gypsaceous hills. Asso syn. arrag. p. 83. t. 6. f. 3. Thláspi subulàtum, Cav. præl. no. 935. Stems many, branched, tufted, covered with fine down or smooth. Calyx white, spreading. Petals obovate.

Subulate-leaved Pepperwort. Fl. July, Aug. Clt. 1739. Pl. ½ to ¾ foot.

20 L. RUDERA'LE (Lin. spec. 900.) pods ovate, emarginate, spreading, shorter than the pedicels; leaves smooth, radical ones pinnate-lobed, those of the branches are linear and entire; flowers diandrous, petalless. ⊙. H. Native of waste grounds and by way-sides throughout the whole of Europe, also in Tauria, Siberia, and Dauria; in New Holland but probably introduced; in Brasil; in England, especially near the sea-side, in a muddy or calcareous soil. At Yarmouth, Cley, and Lynn, Norfolk, plentifully; at Truro, Cornwall, and Malden, Essex; below Bristol; by the side of the Severn above Worcester. Œder. fl. dan. t. 184. Schkuhr. handb. 2. no. 1786. t. 180. Smith, engl. bot. t. 1595. Nastúrtium ruderàle, Scop. carn. ed. 2. p. 801. Ibèris ruderàlis, Crantz. austr. 21. Thláspi ruderàle, All. ped. 917. Senckenbérgia ruderàlis, Fl. wett. 2. p. 213. Thláspi tenuifòlium, Lam. fl. fr. 2. p. 467. Herb smooth, erect, much branched, glaucous, fetid, and pungent when bruised.

Rubbish Pepperwort. Fl. June, July. Britain. Pl. ½ to 1 ft.

21 L. INCI'SUM (Roth. nov. cat. 1. p. 224.) pods orbiculate, deeply emarginate; flowers diandrous; lower leaves oblong, lyrately pinnate-lobed, middle ones broad-lanceolate, deeply-toothed, upper ones linear. ⊙. H. Native of waste land and by way-sides in Siberia, Caucasus, and Tauria. Thláspi apétalum, Poir. dict. 7. p. 547. Very like *L. ruderàle*, but differing in the upper leaves being linear-lanceolate, broader, and a little more glaucous, and in the pods being a little larger.

Cut-leaved Pepperwort. Fl. May, Ju. Clt. 1824. Pl. ⅙ to ¾ ft.

22 L. HUMIFU'SUM (Requien ex Spreng. syst. app. p. 241.) stem prostrate, pubescent at the top; lower leaves lyrate, upper ones sagittate, entire; petals thrice as long as calyx; silicles smooth. ⊙? H. Native of Corsica.

Trailing Pepperwort. Pl. trailing.

23 L. VESICA'RIUM (Lin. spec. 898.) pods elliptical, deeply emarginate; leaves pinnate; lobes linear; joints of stem inflated. ⊙. H. Native of arid, stony, or sterile places, and on old walls, in eastern Caucasus and Iberia, also of Persia; on old walls of the city of Casbin. Hill. veg. syst. 11. t. 41. f. 3.—Buxb. cent. 1. p. 17. t. 26. A smooth herb, with dichotomous branches. Seeds almost oblong-triquetrous.

Bladdery-jointed Pepperwort. Fl. April, Aug. Clt. 1820. Pl. 1 to 2 feet.

24 L. ANGULÒSUM (D. Urv. enum. no. 578.) pods ovate, somewhat emarginate; leaves all pinnate; segments deeply-toothed; stem very smooth, flexuous, angularly-furrowed. ⊙. H. Native of waste land about the city of Theodosia. Differs from *L. vesicàrium* in not having tumid joints, from *L. perfoliàtum* by the upper leaves not being perfoliate.

Angular-stemmed Pepperwort. Pl. ½ to 1 foot.

25 L. PERFOLIA'TUM (Lin. spec. 897.) pods elliptical, somewhat emarginate; lower leaves stalked, pinnate, with multifid lobes; upper leaves cordate, entire, stem-clasping. ⊙. H. Native of Spain, Austria, Transylvania, island of Scio, Syria, Persia, Tauria, &c. in uncultivated fields. Jacq. austr. t. 346. A variety of this plant, with larger fruit, was gathered near Tiflis in Tauria. A smooth herb, with the stems branched at the top, remarkable for the different forms of the leaves.

Perfoliate-leaved Pepperwort. Fl. April, June. Clt. 1640. Pl. ½ to ¾ foot.

26 L. CARDA'MINES (Lin. amœn. 4. p. 278.) pods oval, somewhat emarginate; leaves pinnate, with ovate, entire lobes, terminal lobe large and roundish. ♂. F. Native of Spain by way-sides about Madrid. Ard. specim. 1. p. 18. t. 19.—Lin. in act. stockh. 1755. t. 8 and 9. Thláspi Cardámines, Poir. dict. 7. p. 545. A smooth herb, with a woody root, somewhat pubescent in the racemes. Stems in the spontaneous plants diffuse, ascendant in the cultivated plants, erect. Petals obovate, hardly unquiculate. Pods and pedicels pubescent.

Cardamon Pepperwort or Spanish Cress. Fl. June, July. Clt. 1789. Pl. 1 to 2 feet.

27 L. DIVARICA'TUM (Hort. kew. ed. 1. vol. 2. p. 441.) pods oval, somewhat emarginate, approximate; lower leaves pinnate-parted, with divaricate acute lobes; those of the branches linear; stem much branched. ♄. G. Native of the Cape of Good Hope. Thláspi divaricàtum, Poir. dict. 7. p. 543. A smooth branched pale-green shrub.

Divaricated-branched Pepperwort. Fl. May, Aug. Clt. 1774. Pl. 1½ foot.

28 L. BONARIE'NSE (Lin. spec. 901.) pods orbicular, emarginate; flowers diandrous; leaves all pinnately-multifid, very minutely ciliated; stem smooth. ⊙. H. Native of Buenos Ayres and about Monte Video. Thláspi Bonariénse, Poir. dict. 7. p. 543. T. multífidum, Poir. dict. 7. p. 545. A smooth herb, with an acrid taste. Stem branched. Dill. elth. t. 286. f. 370.

Buenos Ayrean Pepperwort. Fl. May, Ju. Clt. 1732. Pl. 2 ft.

29 L. BIPINNATI'FIDUM (Desv. journ. bot. 3. p. 165 and 177.) pods oval, emarginate; leaves pinnate-parted, with the mid-rib

winged; lobes multifid; branches pubescent.—Native of South America, in Peru about Cheuchin. Stems branched. Leaves smooth. Pods smooth, one-half shorter than the pedicels.

Bipinnatifid-leaved Pepperwort. Pl. 1 to 2 feet.

30 L. CHICHICA'RA (Desv. journ. bot. 3. p. 165 and 179.) pods obovate, emarginate; leaves smooth, lower ones pinnatifid, with denticulated lobes; upper leaves ovate-oblong, equally toothed. ⊙. H. Native of Para in Brasil. Stems trailing, spreading, much branched. *Chichicara* is the name of the plant at Para.

Chichicara Pepperwort. Pl. trailing.

31 L. PUBE'SCENS (Desv. journ. bot. 3. p. 165 and 180.) pods retusely emarginate, winged; leaves smooth, pinnatifid; lobes linear, sparingly toothed; stem and pedicels villous.—Native of Para in Brazil. Stems prostrate, pubescent, branched. Leaves smooth. Margins of pods winged.

Pubescent-branched Pepperwort. Pl. prostrate.

32 L. IBEROI'DES (Desv. journ. bot. 3. p. 165 and 176.) pods elliptical, somewhat emarginate; leaves linear, lower ones toothed at the top. ⊙. H. Native of the Mauritius. Stems erect, smooth, branched; branches filiform. Pods rather shorter than the pedicels, with keeled wingless valves.

Candy-Tuft-like Pepperwort. Pl. 1 to 2 feet.

33 L. SUBDENTA'TUM (Burch. cat. geogr. pl. afri. austr. extra trop. no. 1299.) pods elliptical, bluntly emarginate; flowers diandrous; leaves oblong-lanceolate, narrowed at base and toothed at top, upper ones linear-entire. ♃. G. Native of the Cape of Good Hope on the bank of rivulets in Roggevelds-Karro. A smooth branched herb, somewhat shrubby at the base. Flowers probably apetalous.

Subdentate-leaved Pepperwort. Pl. 1 foot.

34 L. CUNEIFÒLIUM (D. C. syst. 2. p. 545.) pods oval-rhomboid, emarginate; leaves wedge-shaped, and entire at the base, obovate and acutely-serrated at the apex. ⊙. H. Native of New South Wales. Branches furnished with branchlets at the top. Sepals white. Racemes when in flower short.

Wedge-leaved Pepperwort. Fl. Ju. Aug. Clt. 1820. Pl. 1 ft.

35 L. HYSSOPIFÒLIUM (Desv. journ. bot. 3. p. 164 and 179.) pods oval, emarginate; stigma sessile, capitate; leaves linear-lanceolate, remotely-toothed, smooth. ⊙? H. Native of New Holland about Hawkesbury. Stem tall, smooth, branched; branches long, divaricate. Differing from *L. piscídium* in the leaves being toothed, and from *L. oleràceum* in the leaves being narrower, and not dilated at the top.

Hyssop-leaved Pepperwort. Fl. Ju.Jul. Clt.1820. Pl. 2 to 3 ft.

36 L. FOLIÒSUM (Desv. journ. bot. 3. p. 164 and 180.) pods oval-rhomboid, emarginate; style a little exserted; leaves oblong, blunt, crowded, coarsely toothed at the top. ⊙? H. Native of New Holland. A robust erect branched herb. Branches thickly beset with rather fleshy leaves. Pods double the size of those of *L. piscídium*.

Leafy Pepperwort. Fl.? Pl. 1 foot.

37 L. PISCI'DIUM (Forst. prod. no. 249.) pods oblong-obovate, emarginate; stigma exserted; leaves oval-oblong, toothed, backwards or very entire. ⊙. H. Native of the Society Islands and Sandwich islands. L. bidentàtum, Montin. nov. act. nat. cur. 6. p. 324. t. 5. *a*. Stems erect, smooth, branched at the top. This plant is used by the natives of the Society islands for the purpose of catching fish by inebriating them. It was used by the English voyagers as a salad, but it was found extremely pungent.

Fish-poison Pepperwort. Fl. Sept. Clt. 1779. Pl. 1 foot.

38 L. O-WAHIE'NSIS (Schlecht. et Cham. in Linnæa. 1. p. 32.) silicles orbicular, emarginate; stigma sessile, inclosed; leaves obovate, tapering into the petiole, coarsely serrated. ♃. H. Native of the Sandwich islands. This species differs from *L. piscídium* in the leaves being more serrated, and in the silicles being almost orbicular and profoundly emarginate, with the stigma inclosed, not elliptical, with the style exserted beyond the recess, as in that species. Flowers small, white.

O-Wahu Pepperwort. Pl. 1 foot.

39 L. NO'VÆ-HOLLA'NDIÆ (Desv. journ. bot. 3. p. 177.) pods oblong-rhomboid, truncate; leaves ovate-oblong, acute, entire or toothed at the top. ♄. G. Native of New Holland. Stems hard, woody at the base, much branched. Branches angular, smooth, or somewhat spiny. Leaves somewhat fleshy, smooth.

New Holland Pepperwort. Fl. Ju. Jul. Clt. 1819. Pl. 1 to 2 ft.

SECT. VII. LEPIDIA'STRUM (altered from *Lepídium*.) D. C. syst. 2. p. 547. prod. 1. p. 207. Pods somewhat elliptical, quite entire, with wingless keeled valves. Style very short.

40 L. OLERA'CEUM (Forst. prod. no. 248.) pods ovate, acutish; leaves smooth, elliptical-oblong, deeply serrated; upper ones entire, but rather serrated at the apex. ⊙. H. Native of New Zealand on the sea-shore. A smooth branched erectish herb. Stamens 4. This plant is a powerful anti-scorbutic, and is found of great service to the crews of ships visiting New Zealand. It resembles lettuce in taste, and acts as a moderate aperient.

Pot-herb Pepperwort. Fl. Sept. Clt. 1824. Pl. from 1 to 3 ft.

41 L. CRI'SPUM (Desv. journ. bot. 3. p. 165 and 176.) pods elliptically-rhomboid; stigma somewhat exserted; leaves obovate, toothed, with curled margins. ⊙? H. Native of New Holland at Bass Strait. Herb erect, branched, smooth. Branches angular. Leaves rather fleshy. Seeds rufous, about the size of those of *L. satìvum*.

Curled-leaved Pepperwort. Pl. 1 to 2 feet.

42 L. LYRA'TUM (Lin. spec. 899.) pods ovate, pointed with the style; lower leaves stalked, lyrately-pinnate; lobes deeply cut, terminal one large. ⊙. H. Native of Armenia near Mount Ararat. Stem erect, branched. Tourn. voy. 2. p. 339. icon.

Lyrate-leaved Pepperwort. Fl. June, July. Clt. 1759. Pl. 2 or 3 feet.

43 L. LATIFÒLIUM (Lin. spec. 899.) pods ovate, pointed with the stigma; leaves ovate-lanceolate, undivided, a little serrated, lower ones on long footstalks. ♃. H. Native of Europe, from Spain to Sweden, from England to Greece, also of Algiers; about Astracan; in Siberia in salt marshes and wet sandy shady places under cliffs, generally near the sea; in England in several parts of Essex and Yorkshire; below Sheringham cliffs, Norfolk. Fl. dan. t. 557. Smith, engl. bot. 182. The whole plant is very pungent, acrid, and ulcerating. Root creeping. Herb erect, smooth. Leaves broad, rather fleshy. The young leaves are sometimes eaten as a salad. It was formerly used in place of horse-radish. An infusion of it will vomit. Having a hot biting taste like pepper, and the leaves having been often used by country people to give a relish to their viands instead of pepper, it had the appellation of *Poor Man's Pepper*.

Broad-leaved Pepperwort. Fl. July. Britain. Pl. 2 to 3 feet.

44 L. CRASSIFÒLIUM (Walds. et Kit. hung. 1. p. 4. t. 4.) pods pointed by the stigma; leaves smooth, somewhat fleshy, entire, radical ones stalked, ovate, cauline ones sessile, sagittate. ♃. H. Native of salt-marshes, or dry and sterile places impregnated with salt, in Hungary near Eimstadt, &c.; in Tauria at the Bosphorus; in the island of Taman; in the Kuman steppe; near the rivers Volga and Kuma, &c. L. salìnum, Pall. ined. L. verrucòsum, D. C. mem. soc. hist. nat. par. an. vii. p. 145. L. Candólii, Desv. journ. bot. 3. p. 165. Herb glaucous, usually many-stemmed; these are clothed at the neck with the remnants of the old leaves. Flowers like those of *L. latifòlium*.

Thick-leaved Pepperwort. Fl. May, July. Clt. 1820. Pl. ¾ ft.

45 L. AFFI'NE (Ledeb. from Link. enum. hort. berl. 2. p. 152.) pods pointed with the style, at last smooth; leaves ovate-lanceolate, all serrated; serratures of the upper leaves acumi-

nated, spreading. ♃. H. Native of Siberia. Root creeping. Flowers larger and fewer than those of *L. latifòlium*, which the whole plant very much resembles.

Allied Pepperwort. Fl. July. Clt. 1819. Pl. 2 or 3 feet.

46 L. SUFFRUTICÒSUM (Lin. mant. 91.) pods elliptical, pointed with the style; stems fruticose; radical leaves obovate-oblong, toothed, cauline ones linear, entire. ♄. H. Native of Spain. L. graminifòlium, Cav. icon. 2. p. 41. t. 161. f. 2. Stem simple or hardly branched. Seeds rufous, compressed.

Suffruticose Pepperwort. Fl. Aug. Sept. Clt. 1683. Pl. 2 ft.

47 L. LINEA'RE (D. C. in dict. encycl. 5. p. 46.) pods ovate, somewhat pointed by the sessile stigma; stems suffruticose; radical leaves pinnate, with few distant lobes, the rest linear-subulate and entire. ♄. H. Native of Spain. Very like *L. subulàtum*, but differs from it in the pods not being emarginate, as well as in the lower leaves being pinnate. Stems smooth or greyish from minute down.

Linear-leaved Pepperwort. Fl. July. Aug. Clt. 1823. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ ft.

48 L. IBE'RIS (Lin. spec. 900. from the synonyms.) pods ovate, pointed with the stigma; radical leaves cut or pinnate; cauline ones linear, entire; stem much branched. ♃. H. Native of waste ground and by way-sides in middle and south Europe, also in Tauria and Siberia. Lepídium graminifòlium, Lin. spec. 900. L. gramíneum, Lam. fl. fr. 2. p. 469. L. miscellaneòrum, Schultz, obs. no. 940. L. diándrum, Medik. in Ust. new. ann. 2. p. 45. L. exiguiflòrum, Clairv. herb. val. 214.—Tabern. icon. 848.—Lob. icon. 223. f. 2.—Mor. oxon. 2. p. 311. sect. 3. t. 21. f. 1.—Sab. hort. rom. 4. t. 14. A very variable plant. Herb smooth, erect, branched, slender.

Candy-Tuft Pepperwort. Fl. July, Aug. Clt. 1793. Pl. $1\frac{1}{2}$ ft.

49 L. CAPE'NSE (Thunb. prod. 107.) pods ovate, pointed with the sessile stigma; flowers diandrous; lower leaves stalked, pinnate-parted, middle ones serrated, upper ones entire. ♃. G. Native of the Cape of Good Hope on the north side of mount Leone. Stems many, rising from the neck, decumbent, or ascendant, much branched, downy. Leaves smooth.

Cape Pepperwort. Fl. Ju. Jul. Clt. 1818. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ ft. long.

50 L. FLEXUÒSUM (Thunb. prod. 107.) pods ovate, pointed with the style; leaves oblong, entire, radical ones stalked, cauline ones half stem-clasping; stems decumbent, flexuous. ♃. G. Native of the Cape of Good Hope by the sea-side. Herb smooth, glaucous. Stems many, from the same root.

Flexuous-stemmed Pepperwort. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot long.

51 L. AFRICA'NUM (D. C. syst. 2. p. 552.) pods elliptical, pointed by the stigma; radical leaves lyrately-pinnate; lobes cut, terminal one large; middle leaves cut or pinnate, uppermost ones entire. ♃? ♄? G. Native of the Cape of Good Hope. Deless. icon. sel. 2. t. 73. Thláspi Africànum, Burm. fl. cap. p. 17. Caudex woody, with annual pubescent stems, which are erect or ascendant.

African Pepperwort. Fl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

52 L. BIPINNA'TUM (Thunb. prod. 107.) pods? radical leaves bipinnate-parted; lobes filiform. ♃. ♄. G. Native of the Cape of Good Hope. This species has at first sight the appearance of *Pimpinélla dioíca*. Stems suffruticose. Fruit unknown.

Bipinnate-leaved Pepperwort. Pl. 1 foot.

† *Species not sufficiently known.*

53 L. PINNA'TUM (Thunb. prod. 107.) stem shrubby, erect; leaves all pinnate. ♄. G. Native of the Cape of Good Hope.

Pinnate-leaved Pepperwort. Pl. 1 foot?

54 L. FRUTICULÒSUM (Desv. journ. bot. 3. p. 165 and 180.) ♄. G. Native of New Holland. Leaves smooth, somewhat fleshy, ovate-lanceolate. Pods oblong, narrowed at the top, blunt or somewhat truncate, shorter than the pedicels. Stem shrubby, tall. Branches divaricate, somewhat dichotomous, round, whitish, few-flowered.

Shrubby Pepperwort. Pl. 2 or 3 feet?

55 L. DECU MBENS (Desv. journ. bot. 3. p. 165 and 176.—Native? L. divaricàtum, Willd. hort. berl. Leaves as if they were stalked, deeply-toothed. Pods ovate-oblong, roundish at the top. Style scarcely exserted. Stems annual, much branched, elongated, decumbent, hardly pubescent.

Decumbent Pepperwort. Pl. decumbent.

56 L.? TUBERÒSUM (D. C. syst. 2. p. 554.) ♃. H. Native of Louisiana. Nastúrtium tuberòsum, Raf. fl. lud. p. 84. no. 271. Root tuberous, white. Stem erect, branched, smooth. Radical leaves pinnate; leaflets toothed, terminal one large, hastate; cauline leaves sessile, linear-lanceolate toothed. Racemes lax. Pods roundish, emarginate. Stigma sessile. Perhaps a species of *Thláspi*, allied to *Thláspi tuberòsum*.

Tuberous-rooted Pepperwort. Fl. Feb. Pl. 1 foot.

57 L. PRÆ'COX (D. C. syst. 2. p. 554.) ♃. H. Native of Louisiana. Diléptium præ'cox, Raf. fl. lud. p. 86. no. 273. Stem erect, branched. Radical leaves pinnate; cauline leaves pinnatifid. Petals equal in length to the calyx.

Early-flowering Pepperwort. Fl. Feb. Pl. 1 foot.

58 L. DIFFU'SUM (D. C. syst. 2. p. 554.)—Native of Louisiana. Diléptium diffùsum, Raf. fl. lud. p. 85. no. 272. Stems procumbent, diffuse, much branched. Leaves small, pinnatifid; lobes toothed. Racemes loose, axillary and terminal. Petals very minute, shorter than the calyx. Eatable as water-cress.

Diffuse Pepperwort. Fl. April. Pl. 1 foot long.

59 L. POLLI'CHII (Roth. fl. germ. 2. p. 91.) ⊙. H. Native of Germany. L. Ibèris, Poll. pal. no. 607. This plant is sometimes received under the name of *L. satìvum var. laciniàtum*.

Pollich's Pepperwort. Fl. June, July. Clt.? Pl. 1 foot.

60 L. CORDA'TUM (Willd. herb. from Stev. obs. inèd.)—Native of Siberia. Plant glaucous. Leaves cordate-oblong, quite entire, stem-clasping. L. amplexicaúle, Stev. herb. not Willd.

Heart-leaved Pepperwort. Pl. 1 foot.

61 L. PROCU'MBENS (Lin. spec. 898.) Thláspi procúmbens, Lapeyr. p. 191. no. 8. of this work, more properly belongs to this genus.

Cult. The green-house species will thrive well in any kind of light soil, and are readily increased by cuttings planted under a hand-glass, or by seeds. The hardy perennial kinds by dividing the plants at the root, or by seeds; they will thrive in any kind of soil. The hardy annual sorts only require to be sown in the open ground. None of the species are worth cultivating for ornament.

LXXI. BIVONÆ'A (in honour of Antonin Bivona-Bernardi, a celebrated Sicilian botanist, author of Sicularum Plantarum Centuria prima, 1 vol. 8vo. published at Palermo, 1806.) D. C. syst. 2. p. 554. prod. 1. p. 208.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle oval, emarginate, with keeled valves, which are winged on their back. Seeds 4-6 in each cell, pendulous, ovate. An annual smooth glaucous slender herb. Stem filiform, sparingly branched. Leaves alternate, lower ones stalked, the rest sessile, cordate, stem-clasping at the base, ovate, toothed, bluntish. Racemes terminal, elongating as they grow. Pedicels filiform, bractless, shorter than the pods. Flowers small, yellow.

1 B. LU'TEA (D. C. syst. 2. p. 555.) ⊙. H. Native of Sicily about Palermo, on dry mountains above St. Maria, called di Gesu, and elsewhere. Thláspi lùteum, Biv. cent. 1. p. 78.—Cup. panph. sicul. 2. t. 256.

Yellow-flowered Bivonæa. Fl. April, May. Clt. 1823. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. This pretty little annual plant is well adapted for orna-

menting rock-work or the front of flower borders. The seeds only require to be sown where the plants are intended to remain. A dry sandy soil will suit it best.

LXXII. EUNO'MIA (from *ευ, eu*, well, and *νομος, nomos*, order; because the leaves are opposite and the seeds are twin.) D. C. syst. 2. p. 555. prod. 1. p. 208.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle oval, with keeled valves, and with two oblong-triquetrous seeds in each cell. Funicles somewhat united. Suffrutescent branched or tufted smooth herbs. Leaves opposite, upper ones sometimes alternate, sessile, or stem-clasping, orbicular or cordate, entire, thickish. Racemes 10 or 12-flowered, short, terminal. Flowers whitish.

1 E. oppositifòlia (D. C. syst. 2. p. 556.) leaves opposite, almost orbicular, quite entire, smooth. ♃. ♄. H. Native on Mount Lebanon. Ibèris oppositifòlia, Pers. ench. 2. p. 186. Lepídium oppositifòlium, Lab. syr. dec. 5. p. 14. t. 9. f. 2. Thláspi oppositifòlium, Poir. suppl. 5. p. 277. Lèpia oppositifòlia, Desv. journ. bot. 3. p. 166. Stems decumbent, branched, and easily broken at the joints. Leaves rather glaucous. Flowers white. A pretty little plant.

Opposite-leaved Eunomia. Fl. Ju. Jul. Clt. 1827. Pl. ½ to 1 foot.

2 E. chloræfòlia (D. C. syst. 2. p. 556.) leaves opposite, almost orbicular, roughly crenulated on the margin. ♃. ♄. H. Native of Bithynia on Mount Olympus near the top. Ibèris chloræfòlia, Sibth. Smith, prod. fl. græc. 2. p. 10. Ibèris Olýmpica, Sibth. in herb. Banks. Lepídium chloræfòlium, Spreng, syst. 2. p. 865. Stems tufted, quadrangular. Leaves rather glaucous. Flowers unknown.

Chlora-leaved Eunomia. Pl. 2 inches.

3 E. corda'ta (D. C. syst. 2. p. 557.) lower leaves opposite, the rest alternate, all heart-shaped. ♄. H. Native of Armenia and Syria, on mount Lebanon and on the mountains about Erzerum. Myàgrum chloræfòlium, Willd. spec. 3. p. 407. Thláspi cordàtum, Desf. ann. mus. 11. p. 382. t. 39. Choix. cor. p. 68. t. 52. Lepídium Tournefórtii, Spreng. syst. 2. p. 866. —Buxb. cent. 1. p. 3. t. 3. f. 1. Stems erect, branched, smooth. Leaves glaucous. Flowers white. Perhaps a proper genus.

Cordate-leaved Eunomia. Fl. June. Pl. ¾ foot.

Cult. These pretty little plants will answer well for ornamenting rock-work, or to be kept in small pots and placed among other alpine plants. Those cultivated in the latter way should be grown in a mixture of sand, loam and peat, and the pots should be well drained with potsherds. They may either be increased by cuttings planted under a hand-glass in the same kind of soil, or by seeds.

LXXIII. ÆTHIONE'MA (from *αιθω, aitho*, to scorch, and *νημα, nema*, a filament; apparently in allusion to some tawny or burnt appearance in the stamens.) R. Br. in hort. kew. ed. 2. vol. 4. p. 80. D. C. syst. 2. p. 557. prod. 1. p. 208.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicles oval, usually emarginate, with navicular valves, which are winged on the back (f. 47. *b.*). Cells 1 (f. 47. *b.*) 2-seeded. Larger stamens connected, or each furnished with a tooth on the inside. Seeds ovate-oblong, appearing muricated under a microscope. Herbs or sub-shrubs, perennial or annual, branched from the base, diffuse or erect. Leaves rather fleshy, glaucous, sessile, entire, ovate-oblong, lower ones linear, and usually opposite. Stems round. Racemes crowded, terminal. Pedicels filiform, bractless. Flowers small, flesh-coloured or purplish.

1 Æ. saxa'tilis (R. Br. in hort. kew. ed. 2. vol. 4. p. 80.) pods 2-celled, many-seeded, obcordate; style very short; valves entire, winged on the back; fructiferous, racemes lax. ⊙. H. Native of many places in the south of Europe, on rocks, Spain, France, Italy, Sicily, Greece, Switzerland, &c. &c. Thláspi saxátilis, Lin. spec. 901. Jacq. aust. t. 236. Schkuhr. handb. 2. no. 1791. t. 180. Leaves lanceolate, acutish.

Var. β, obtusifòlium (D. C. syst. 2. p. 558.) Ibèris parviflòra, Lam. dict. 3. p. 221. Thláspi peregrìnum, Lin. spec. 442? Mor. hist. 2. p. 297. sect. 3. t. 18. f. 30.—Bauh. hist. 2. p. 927. f. 1. Leaves oblong, blunt. Larger stamens toothed.

Var. γ, ovalifòlium (D. C. syst. 2. p. 559.) Lepídium marginàtum, Lapeyr. abr. 365. Thláspi marginàtum, Lapeyr. suppl. p. 90. Leaves oval. According to Sibthorp these plants are shrubby in their native countries, but in gardens they are annual. Flowers of all pale-purple. Larger stamens toothed.

Rock Æthionema. Fl. May, July. Clt. 1759. Pl. 2 to 6 inch.

2 Æ. gra'cile (D. C. syst. 2. p. 559.) pods 2-celled, few-seeded, obcordate; style equal with the valves; valves winged at back and toothed; larger stamens toothed; racemes when in fruit lax. ♄. H. Native of sandy hills in Carniola, and perhaps on gravelly hills in Cappadocia. Thláspi peregrìnum, Scop. carn. ed. 2. no. 809?—Bocc. mus. p. 79. t. 70. Suffrutescent; branches and branchlets slender, elongated. Leaves lanceolate, pointed. Flowers like those of *Æ. saxátilis*.

Slender-branched Æthionema. Fl. June, July. Clt. 1820. Pl. ¾ foot.

3 Æ. crista'tum (D. C. syst. 2. p. 560.) pods 2-celled, 2-4-seeded, orbicular, emarginate both at the base and the top; valves winged at the back, and deeply crested and toothed. ⊙. H. Native of Syria, near Aleppo. Thláspi peregrìnum, Poir. dict. 7. p. 541. Stems erect, more or less branched from the base; axillary branches filiform, shorter than the stem. Leaves ovate-lanceolate, acute. Larger stamens connected together. Deless. icon. sel. 2. t. 74.

Var. β, Thláspi Arábicum (Desv. journ. bot. 3. p. 167.) ⊙. H. Lower leaves obovate, upper ones ovate, scarcely cordate at the base. Native of Syria, between Aleppo, and Mossul, Bagdad and Kermancha, Teheran and Hispahan.

Crested-podded Æthionema. Fl. June, July. Pl. ¼ foot.

4 Æ. Buxbau'mii (D. C. syst. 2. p. 560.) pods 2-celled, 2-seeded, orbicular, emarginate both at the base and the top; back of valves winged, quite entire; racemes crowded, aggregate. ⊙. H. Native of Cappadocia, in gravelly soil by the margins of rivulets; also in Iberia, near Tiflis, in sandy places which are sometimes inundated by torrents. Ibèris Arábica, Lin. amœn. acad. 4. p. 278. Thláspi Buxbaúmii, Fisch. in litt. Horn. hort. hafn. suppl. 71. Æthionèma Cappadócicum, Spreng. nov. prod. 1. no. 2. Thláspi Arábicum, Bieb. fl. taur. suppl. 430. Stems erect, branched; axillary branches filiform, exceeding the stems. Lower leaves ovate, blunt, narrowed at the base, upper ones cordate, stem-clasping, ovate or ovate-oblong, entire, acute. Flowers small, purplish.—Buxb. cent. 1. p. 2. t. 5. f. 1.

Buxbaum's Æthionema. Fl. Ju. Jul. Clt. 1823. Pl. 4 to 6 in.

5 Æ. coridifòlium (D. C. syst. 2. p. 561.) pods 2-celled, 2-seeded, obcordate, crowded; valves winged at the back, entire; leaves linear, crowded, lower ones spreading. ♄. H. Native on Mount Lebanon. Deless. icon. sel. 2. t. 76. A little shrubby plant with filiform branches. Flowers rose-purplish, largish.

Coris-leaved Æthionema. Fl. June, July. Pl. ¼ to ½ foot.

6 Æ. membrana'ceum (D. C. syst. 2. p. 561.) pods 2-celled, 2-seeded (f. 47. *b.*), obcordate, crowded; valves winged on the back, entire; leaves linear, distant, strictly appressed. ♄. H. Native of Persia, on Mount Elwend. Lèpia membranàcea, Desv. journ. bot. 3. p. 166 and 181. A little shrub with filiform branches. Flowers purplish. Leaves somewhat fleshy. Deless. icon. sel. 2. p. 75. Larger stamens toothed.

Membranous Æthionema. Fl. Ju. Jul. Clt. 1828. Pl. ¼ to ½ ft.

7 Æ. stylòsum (D. C. syst. 2. p. 562.) pods 2-celled? 2-seeded, disposed in loose racemes; valves winged on the back; style elongated; larger stamens connected; leaves ovate-lanceo-

late. ♄. H. Native on Mount Lebanon. Thláspi cárneum, Russel in Schrad. journ. 1. p. 426. A little shrub with filiform branches. Flowers flesh-coloured, larger than any other species of this genus.

Long-*styled* Æthionema. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

8 Æ. polygaloìdes (D. C. syst. 2. p. 562.) pods 1-celled, 1-seeded, opening, emarginate at each end; stem shrubby at the base; leaves oblong-linear. ♄. H. Native of the island of Scio. A very small shrub, branching from the base, with the habit of *Polýgala saxátilis*. Leaves somewhat fleshy. Flowers unknown, but perhaps purplish.

Polýgala-like Æthionema. Pl. 2 or 3 inches.

9 Æ. monospe'rmum (R. Br. in hort. kew. ed. 2. vol. 4. p. 80.) pods 1-celled, 1-seeded, indehiscent, emarginate at the top; stem herbaceous; leaves oval or obovate. ♂. H. Native of Spain. A little herb with hardish branches. Leaves blunt, coriaceous. Flowers purplish, a little larger than those of *Æthionèma saxátilis*. Larger stamens toothed.

One-seeded Æthionema. Fl. Jul. Aug. Clt. 1778. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

Cult. The shrubby kinds of this genus should be kept in pots, which should be well drained with potsherds and treated like other alpine plants. A mixture of sand, loam, and peat suits them best, and cuttings planted under a hand-glass in the same kind of soil will root readily, or they may be increased by seeds. Some of the more hardy species may be planted on rock-work, which by their dwarf growth they are well adapted for. The annual and biennial species may either be sown on rock-work or in the front of the flower-border. A light dry soil suits them best. All the species are worth cultivating.

LXXIV. REDO'WSKIA (to the honour of Redowski, a Russian botanical collector). Cham. et Schlecht. Linnæa. 1. p. 33. t. 2.

Lin. syst. *Tetradynàmia, Siliculòsa.* Calyx pilose, of 4 ovate obtuse sepals, with white margins. Petals equal, roundish-obovate, entire, twice the length of the calyx. Filaments toothless, smooth. Silicle smooth, inflated, globose; style half a line long, crowned by a 2-lobed stigma, 1-celled, from the dissepiment being wanting, 2-valved; valves with a nerve running through their middle. Seeds 8-12. Cotyledons unknown. A perennial plant with a thick root and pinnate radical leaves, with pinnatifid leaflets, which are white from short tomentum; cauline leaves pinnate with toothed leaflets, but becoming more simple as they ascend. Stem ascending, Flowers on pedicels white, at first in corymbs, but at length lengthening out into racemes.

1 R. sophiæfo'lia (Cham. l. c. t. 2.) ♃. H. Native of the north-eastern parts of Asia.

Sophia-leaved Redowskia. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

Cult. An inconspicuous plant, which will grow under any circumstance. Not worth cultivating, unless in botanic gardens.

Tribe X.

ISATI'DEÆ (plants agreeing with *Isàtis* in some characters) or NOTORHI'ZEÆ (see sub-order II.) NUCAMENTA'CEÆ (*nucamentum*, a catkin; shape of pods). D. C. syst. 2. p. 563. prod. 1. p. 209. Silicle with indistinct or indehiscent keeled valves (f. 47. *d.*) 1-celled, 1-seeded, from the dissepiment having vanished. Seeds ovate-oblong. Cotyledons flat, incumbent, apparently in the same direction as the dissepiment should be.

LXXV. APHRA'GMUS (from *α priv. φραγμος, phragmos*, a dissepiment; silicles without a dissepiment). Andrz. in litt. D. C. prod. 1. p. 209.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle lanceolate, acute, with flat, nerved valves, without a dissepiment. Seeds disposed in two rows, pendulous. Cotyledons incumbent, thick. Perhaps this genus belongs more properly to *Camelíneæ*.

1 A. Eschscholzia'nus (Andrz. in litt. D. C. prod. 1. p. 210.) Native of the Aleutian Islands.

Eschscholz's Aphragmus. Pl. 1 foot.

Cult. This plant is not worth cultivating, except in general collections. It only requires to be sown in the open ground.

LXXVI. TAUSCHE'RIA (Ignat. Fred. Tauscher, Professor of Botany at Prague, author of several botanical works). Fisch. in D.C. syst. 2. p. 563. prod. 1. p. 210.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle oval, almost boat-shaped, 1-celled, 1-seeded, with navicular, indehiscent valves. Seed pendulous, oblong. Annual, erect, smooth, branched, herbs, with filiform stems. Lower leaves oblong, narrowed at the base; cauline ones sessile, sagittate, entire, glaucous. Racemes opposite the leaves, or as if they were terminal upon the abortive branches, elongated, bractless. Flowers small, white.

1 T. lasioca'rpa (Fisch. in litt. icon. D. C. syst. 2. p. 563.) pods villous on the convex part. ⊙. H. Native of the Kirghisian steppe at Lake Inderskoe. The whole herb, except the fruit, is smooth, not unlike *Isàtis nàna*.

Woolly-podded Taucheria. Fl. Ju. Jul. Clt. 1824. Pl. $\frac{1}{4}$ ft.

2 T. gymnoca'rpa (Fisch. in litt. icon. D. C. syst. 2. p. 564.) pods smooth. ⊙. H. Native with the preceding. Very like *T. lasiocárpa*, but differing in the leaves being smaller, and the pods smooth.

Naked-podded Taucheria. Fl. May, June. Clt. 1820. Pl. $\frac{1}{4}$ ft.

Cult. These plants are not worth cultivating, except in botanic gardens. They only require to be sown in the open ground or on rock-work, for which, from their low growth, they are well adapted.

LXXVII. ISA'TIS (from *ισαζω, isazo*, to render equal; the plant was believed to destroy by its simple application, all roughness and inequalities of the skin). Bauh. pin. 113. Lin. gen. no. 824. Lam. ill. t. 554. D. C. syst. 2. p. 564. prod. 1. p. 210.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle elliptical, flat, 1-celled, 1-seeded, with keeled navicular valves, which are scarcely dehiscent. Seed pendulous, oblong. Tall, erect, branched, annual or biennial herbs. Stems round. Lower leaves stalked, ovate, or ovate-oblong; upper ones sessile, sagittate, with acute auricles, all more or less glaucous, entire, or a little toothed. Racemes terminal, many-flowered, disposed in lax panicles, erect, elongated; pedicels filiform, bractless, erect, at the time of flowering corymbose, afterwards deflexed, usually a little thickened under the pod. Flowers yellow. All the species of this genus furnishes a blue dye, which is used by dyers in various ways. This dye is perfectly like indigo, and is often used as a substitute for it, especially that obtained from *Isàtis tinctòria*.

Sect. I. Samera'ria (from *samera*, the seed of the elm; winged like it). D. C. syst. 2. p. 565. prod. 1. p. 210. Desv. jour. bot. 3. p. 161. t. 24. f. 6. Silicle oval or orbicular, indehiscent, girded by a broad, leafy, membranous wing.

1 I. Garci'ni (D. C. syst. 2. p. 565.) pods rather pedicellate, broadly marginate, obovate, cuneated at the base, very blunt at the top, with 2 tubercles. ♂. H. Native of Persia, Deless. icon. sel. 2. t. 77. Peltària Garcìni, Burm. fl. ind. 139. t. 46. f. 1. Perhaps a proper genus.

Garcin's Woad. Pl. 1 foot.

2 I. Arme'na (Lin. spec. 936.) pod orbicular, cordate at the base, broadly marginate, pointed with the style. ⊙. H. Native of Armenia in dry meadows on the margins of rivulets, and in

Iberia about Tiflis. Tratt. arch. 2. p. 41. t. 70. Samerària Armèna, Desv. jour. bot. 3. p. 161. t. 25. f. 6.—Buxb. cent. 1. p. 3. t. 4. Auricles of leaves blunt.

Armenian Woad. Fl. Ju. Jul. Clt. 1825. Pl. 1 to 1½ foot.

3 I. LATISI'LIQUA (Stev. mem. soc. nat. mosc. 1812. vol. 3. p. 263.) pods elliptical, blunt, sessile, broadly marginate; stigma sessile; auricles of leaves blunt. ♂. H. Native of Cappadocia, and in the Alps about Chinalug in Eastern Caucasus. I. Cappadócica, Desv. journ. bot. 1814. p. 174. Pods velvety, from short down.

Var. β, glàbra (Stev. ind. D. C. syst. 2. p. 566.) pods smooth, or nearly so.

Broad-podded Woad. Fl. Ju. Jul. Clt. 1821. Pl. 1 to 1½ ft.

4 I. LEIOCA'RPA (D. C. syst. 2. p. 567.) pods oval-oblong, sessile, somewhat truncate at the apex, with a sessile stigma; auricles of leaves acute. ⊙? H. Native on Mount Lebanon. Flowers a little larger than those of *I. tinctòria*.

Smooth-podded Woad. Fl. May, July. Pl. 1½ foot.

5 I. LUSITA'NICA (Brot. fl. lus. 1. p. 560. but not of others) pods obovate, wedge-shaped at the base, very blunt and emarginate at the apex, broadly marginate; stem and leaves smooth. ⊙. H. Native of Portugal, among rocks near Miranda do Doiro. I. glaúca, Willd. herb. from Stev. obs. ind.

Portugal Woad. Fl. May, Jul. Clt. 1739. Pl. 1½ foot.

SECT. II. GLA'STUM (from *glas*, the celtic word for blue; because of the plants yielding a blue dye like indigo). D. C. syst. 2. p. 568. prod. 1. p. 210. Silicle oval-oblong, or almost linear, with corky margins, scarcely dehiscent.

6 I. ALPI'NA (All. ped. no. 944. t. 86. f. 2.) pods oval-oblong, blunt at both ends, quite smooth, with somewhat leafy-winged margins, almost 3-times as long as broad. 2? ♂. H. Native of Piedmont on Mount Vesulo, and in the Apennines. A very distinct species, intermediate between the two sections.

Alpine Woad. Fl. April, May. Clt. 1800. Pl. ½ to 1 foot.

7 I. PRÆ'COX (Kit. from Tratt. arch. 2. p. 40. t. 68.) pods elliptical, blunt at both ends, with a coriaceous, winged margin, very smooth, almost 3-times as long as broad. ♂. H. Native of Hungary and about Astrakan. I. Dalmática, Mill. dict. no. 2.? Habit of plant very like *I. tinctòria*, but easily distinguished from it by the pods being scarcely narrower at the base, but truly elliptical.

Early-flowering Woad. Fl. Apr. May. Clt. 1820. Pl. 1½ ft.

8 I. LITTORA'LIS (D. C. syst. 2. p. 568.) pods oblong-cuneated, very blunt, truncately-emarginate at the apex, very smooth, narrowed at the base, 3-times as long as broad; cells exserted on both sides, and with the furrow distinct from the wing. ♂. H. Native of Tauria on the sea-shore about Sudak. I. littoràlis, α, Stev. in litt. Deless. icon. sel. 2. t. 78. Flowers like those of *I. tinctòria*.

Sea-shore Woad. Fl. May, Jul. Clt. 1816. Pl. 1 to 2 feet.

9 I. HEBECA'RPA (D. C. syst. 2. p. 569.) pods oblong-cuneated, very blunt, velvety, somewhat narrower at the base, hardly twice as long as broad; cells destitute of the lateral furrow. ♂. H. Native of Tauria on the sea-shore, about Sudak. Deless. icon. sel. 2. t. 79. I. littoràlis, var. β, Stev. in litt.

Blunt-podded Woad. Fl. May, June. Clt. 1627. Pl. 1½ ft.

10 I. TINCTO'RIA (Lin. spec. 936.) pods cuneated, acuminated at the base, somewhat spatulate at the end, very blunt, smooth, 3-times as long as broad; leaves biauriculate at the base. ⊙. H. Native of south and middle Europe in dry stony places from Spain and Sicily to the shores of the Baltic sea, also, but probably introduced, in the Canary Islands and Eastern Asia, in cultivated land. In England in cultivated fields and about their borders, but rare. At New Barnes near Ely, and near Durham. Smith, engl. bot. t. 97. Mart. fl. rust. t. 41. Schkuhr. handb. 2. no. 1921. t. 188. Tratt. arch. 2. p. 39. t. 67. I. heterocárpa, Andrz?

Var. β, satìva (D. C. syst. 2. p. 570.) leaves smooth, broad. I. satìva, Fusch. hist. 331. icon. Dod. pempt. 79. f. 2. Dalech. lugd. 499. f. 2. This is the variety which is cultivated for use.

Var. γ, hirsùta (D. C. l. c.) leaves narrow, hairy. I. alpìna, Vill. dauph. 3. p. 308, exclusive of the synonyms. Native of exposed rocky situations.

Var. δ, microcárpa (D. C. l. c.) leaves smooth, narrow; pods smaller. I. Dalmática, Mill. dict. no. 2.? Native on Mount Lebanon.

The common dyers' woad was formerly called *glástum*, from the Celtic *glas*, blue, whence Glastonbury derived its name. The ancient Britons are reported to have painted their bodies with the blue colour obtained from this plant, whence they received their appellation Britho, being the Celtic word for to paint, hence Britons. The Picts were so named by the Romans for the same reason. On account of the brightness of its manufactured colours, the Celts called it *gwed* (*guesde* in French to this day) whence the Anglo Saxons obtained their name of *waad* or *wad*, and the English the word *woad*. It is in occasional cultivation for its leaves, from which a dye, as a substitute for indigo, is obtained. The seeds are sown on well-prepared land in good heart. Fresh broken old pasture-land is preferred, and the great object is to have large leaves; for which purpose, as Miller observes, the culture given by the best gardeners to spinach should be imitated, that of sowing on a very rich well pulverised soil, thinning the plants so as they may not touch each other, keeping them perfectly clear of weeds, and frequently stirring the soil between the plants. The culture applied to the turnip in Northumberland would succeed well with woad. The seeds are sown in July, and the plants, when they come up, weeded and thinned; next July, or earlier, the first crop of leaves may be gathered, and two or three others will be obtained during the season. The end of the second year the plants may be ploughed down, as the third year they will run to seed, and yield but small leaves. The leaves are pressed, and the juice treated as in making indigo, but such is the cheapness of the latter article, that no British farmer can afford to raise any sort of substitute.

"The culture of woad, though not general, has been practised in Flanders. It was an object with the French government to spread the cultivation of it, and a considerable quantity of the seed was sent gratis into the country for that purpose. Woad thrives best on sandy and gravelly soils, which must be well pulverised, manured, and formed into beds as in the case of madder culture. It is sown in March or April in rows, or broad-cast, and harrowed or covered with a rake. All weeds are cleared, away and the plants thinned, if a careful culture is followed. The leaves are the part of the plant used by the indigo manufacturer. They should be gathered singly, like those of spinach, as soon as they begin to show signs of maturity, and the mature leaves taken off from time to time as they grow. This operation goes on from June to September in the first year, and from June to August in the second; when the plant, being a biennial, shoots into flower-stems. The leaves are fermented, and the dye precipitated from the liquor and dried, &c. in a manner analogous to what is practised in India with indigo, but with great improvements, made at the instigation of the French government, which in 1810 called forth the process described in a French work, and translated in the Appendix to Radcliff's Report. At present it is to be considered more as matter of curious historical information or of local adoption than of general utility; because no mode of cultivating or preparing *woad* could bring it into competition, either in the European or American market with indigo." (Loud. enc. agr. p. 81.)

Dyer's Woad. Fl. May, July. Britain. Pl. 2 to 4 feet.

11 I. CAMPE'STRIS (Stev. in D. C. syst. 2. p. 571.) pods oblong, narrowed at the base, smooth, bluntish at the apex, 4 times as long as broad, a little shorter than the pedicels. ♂. H. Native of southern Podolia in fields about Balta and near Odessa. Very like *I. tinctòria*.

Field Woad. Fl. May, July. Clt. 1820. Pl. 2 feet.

12 I. BANNA'TICA (Link. enum. 2. p. 149.) pods cuneated, acuminated at the base, somewhat spatulate and very blunt at the apex, smooth, 3 times as long as broad; upper leaves destitute of auricles. ⊙. H. Native of Bannat.

Bannatian Woad. Fl. June, July. Clt. 1819. Pl. 1½ foot.

13 I. MÆO'TICA (D. C. syst. 2. p. 571.) pods oblong, smooth, narrowed at the base, blunt and emarginate at the top, 4 or 5 times as long as broad. ♂. H. Native of marshes about the Azof Sea near Taganrog. Very like the preceding, but the pods at the apex in the adult state are emarginate, and before maturity they are perfectly linear, and almost double the length of those of *I. Bannática*. Perhaps *I. megacárpa*, Ledeb.

Mæotic Woad. Fl. May, June. Clt. 1828. Pl. 1½ foot.

14 I. TAU'RICA (D. C. syst. 2. p. 571.) pods oblong, narrowed at the base, bluntish at the apex, smooth, 5 times as long as broad. ♂. H. Native of Tauria on calcareous rocks about Bachtschisarai. Isatis e Tauria, Bieb. fl. taur. suppl. p. 422. Very near to *I. Mæótica*, but differing in the pods being emarginate at the top in all states.

Taurian Woad. Fl. May, June. Clt. 1820. Pl. 1½ foot.

15 I. OBLONGA'TA (D. C. syst. 2. p. 471.) pods elliptical-oblong, narrowed and somewhat acute at each end, smooth, 5 times as long as broad, with the cells flattened in the centre, and somewhat 3-nerved. ♂. H. Native of Siberia about Irkoutsk. A smooth herb, very much like *I. tinctòria*, but smaller in all its parts. Perhaps *I. dasycárpa*, Ledeb.

Oblong-podded Woad. Fl. May, June. Clt. 1820. Pl. 2 feet.

16 I. ORIENTA'LIS (Willd. enum. 2. p. 663.) pods oblong-linear, pointed with the sessile stigma, scarcely narrowed at the base, pubescent, 5 times as long as broad, but scarcely exceeding the length of the pedicel. ⊙. H. Native of the Levant. This species is often confused with *I. canéscens*, *I. Aléppica*, and *I. Lusitánica*, but is sufficiently distinct from all.

Eastern Woad. Fl. May, July. Clt. 1818. Pl. 1 to 1½ foot.

17 I. CANE'SCENS (D. C. fl. fr. suppl. p. 598.) pods elongated, cuneated, pubescent, narrowed at the base, somewhat spatulate at the top and blunt, 4 times as long as broad, twice the length of the pedicels, which are obconical at the top. ♂. H. Native of exposed situations on the sea-shore in Provence, and on the sea-shore at Fanar, not far from the Bosphorus. Allied to *I. orientàle* on the one side, and to *I. tinctòria var. γ hirsùta* on the other. Leaves with acute auricles.

Var. β, Ibérica (D. C. syst. 2. p. 572.) lower leaves grossly toothed; pods much more dilated at the top, and smoother. I. Ibérica, Stev. mem. mosc. 5. p. 267. Perhaps a proper species.

Canescent-podded Woad. Fl. May, June. Clt. 1823. Pl. ½ ft.

18 I. ALE'PPICA (Scop. del. insubr. 2. p. 31. t. 16.) pods linear, blunt, narrowed at the base, villous with reversed down, 8 times as long as broad, and 3 times as long as their pedicels. ⊙. H. Native on rocks by the sea-shore in Greece and Asia Minor, also about Aleppo. I. Lusitánica, Lin. spec. 936. exclusive of the synonyms. Lam. ill. t. 554. f. 2. Tratt. arch. 2. p. 41. t. 69. I. Ægyptìaca, Lin. spec. 937. but not of Forsk. I. mìnor, Mœnch. meth. ? 222. Auricles of leaves acute.

Var. β, dentàta (D. C. syst. 2. p. 573.) ⊙. H. Native of Africa near Tripoli. I. dentàta, Pers. ench. 2. p. 193. Leaves grossly toothed, not lyrate as in the species.

Aleppo Woad. Fl. June, July. Clt. 1739. Pl. 1 foot.

Cult. The hardy perennial kinds answer well for ornamenting rock-work or the front of flower-borders, as they flower very early. They may be either increased by cuttings or seeds, the former will root freely under a hand-glass. The annual and biennial kinds are only cultivated in botanic gardens, but as the latter flower very early in the season, they are worth introducing into flower-borders. They only require to be sown in the open ground, where they are intended to remain or they may be transplanted. A dry light soil suits them best, as in wet land they are very apt to damp off in the winter.

LXXVIII. MYA'GRUM (from *μυια, myia*, a fly, and *αγρα, agra*, capture. An ancient plant, so named from its properties of catching flies, which our modern plant does not possess.) Tourn. inst. 211. t. 99. D. C. syst. 2. p. 573. prod. 1. p. 212.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle compressed, almost cuneated, with 2 empty hollows at the top, and 1-celled and 1-seeded at the base. Seed pendulous, oblong. An annual smooth erect herb. Lower leaves, oblong, tapering into the stalk, upper ones sessile, sagittate, stem-clasping, with 2 acute auricles, all of which are entire or somewhat toothed. Racemes elongated, erect; pedicels short, filiform, erect, after flowering becoming obconical and hollow. Flowers small, pale-yellow.

1 M. PERFOLIA'TUM (Lin. spec. 893.) ⊙. H. Native of middle and south Europe in cultivated fields and sandy places, particularly in the south of France, Switzerland, Italy, Germany, Transylvania, and in Iberia about Tiflis. Schkuhr. handb. 2. p. 210. t. 178. M. littoràle, Scop. carn. ed. 2. vol. 2. p. 12. no. 799. t. 35. Rapístrum perfoliàtum, Berg. phyt. 3. t. 167. M. perfoliàtum var. *α*, Lam. dict. 1. p. 569. M. amplexicaúle, Mœnch. meth. 221. Cakìle perfoliàta, Lher. diss. cak. ined. p. 6.

Perfoliate-leaved Myagrum. Fl. June, July. Clt. 1648. Pl. ½ to ¾ foot.

Cult. The seeds of this plant only require to be sown in the open border, but it is hardly worth cultivating except in botanic gardens.

LXXIX. SOBOLE'WSKIA (in honour of Gregor. Sobolewski, a Russian botanist, author of Flora Petropolitana, 1 vol. 8vo. Petersburgh, 1799.) Bieb. fl. taur. suppl. p. 421. D. C. syst. 2. p. 575. prod. 1. p. 212.

LIN. SYST. *Tetradynàmia, Siliculòsa.* Silicle oblong, compressed, 1-celled, 1-seeded, valveless, membranous. Seed oblong, pendulous. Cotyledons linear, somewhat curved. A branched erect herb. Stems round, suffrutescent at the base. Cauline leaves stalked, cordate-kidney-shaped, toothed. Racemes elongated; pedicels bractless, filiform. Flowers white.

1 S. LITHO'PHILA (Bieb. cent. pl. rar. ross. 2. t. 59. fl. taur. suppl. p. 421.) ♂. H. Native of Tauria on rocks at the river Salgir and at the Black sea, also in Iberia. Deless. icon. sel. 2. t. 80. Cochleària Sibírica, Willd. spec. 3. p. 450. Ráphanus Taúricus Adami, Hoffm. hort. mosc. 1808. no. 2658. Crámbe macrocárpa, Bieb. fl. taur. 2. p. 90. Pods, many abortive, 3 lines long and 1 line broad. Root creeping.

Stone-loving Sobolewskia. Fl. May, Aug. Clt. 1823. Pl. ½ to ¾ foot.

Cult. This plant is well adapted for rock-work, where the seeds should be sown. Not worth cultivating, except in general collections

Tribe XI.

ANCHONIE'Æ (plants agreeing with *Anchònium* in some characters) or NOTORHI'ZEÆ (see sub-order II.) LOMENTA'CEÆ (from *lomentum*, a loment; shape of pods.) D. C. syst. 2. p. 576. prod. 1. p. 212. Silique or silicle separating trans-

versely into 1-seeded joints (f. 47. *e.*). Cotyledons flat, incumbent (f. 45. *i*). Seed ovate.

LXXX. GOLDBA'CHIA (in honour of G. L. Goldbach, a Russian botanist, who has communicated many observations upon cruciferous plants to De Candolle.) D. C. syst. 2. p. 576. prod. 1. p. 212.

Lin. syst. *Tetradynàmia, Siliquòsa.* Stamens free. Silique 2-jointed (f. 47. *e.*). Style almost none. Smooth branched annual herbs. Stems round or somewhat angular, leafy. Leaves alternate, oblong, almost entire, lower ones tapering to the base, upper ones sessile, a little stem-clasping, with two small auricles. Racemes opposite the leaves, elongated, slender. Pedicels filiform, bractless, erect at the time of flowering, afterwards deflexed. Flowers small, from white to lilac.

1 G. lævigà'ta (D. C. syst. 2. p. 577.) pods smooth, pendulous, 2-jointed. ⊙. H. Native in the sand about Astracan, rarer in the Kuman desert. Deless. icon. sel. 2. t. 81. Ráphanus lævigàtus, Bieb. fl. taur. 2. p. 129. Lower leaves rosulate. Flowers lilac.

Smoothed-podded Goldbachia. Fl. May, Ju. Clt. 1823. Pl. ½ ft.

2 G. torulòsa (D. C. syst. 2. p. 577.) pods somewhat cylindrical, transversely torulose, and somewhat ascendant. ⊙. H. Native of the Levant. Very like the preceding species.

Torulose-podded Goldbachia. Fl. May, Ju. Clt. 1820. Pl. 1 ft.

Cult. The seeds of these plants only require to be sown in the open ground. A light sandy soil suits them best.

LXXXI. ANCHO'NIUM (from αγχωνη, *anchone*, strangulation; form of silicles.) D. C. syst. 2. p. 578. prod. 1. p. 212.

Lin. syst. *Tetradynàmia, Siliquòsa.* Larger stamens joined. Silique 2-jointed, 2-celled. (f. 47. *e.*) Style compressed, beak-formed. Seeds 4, pendulous, oblong, solitary in the cells. An herb with a hard woody stem. Radical leaves oblong, tapering to the base, velvety with soft starry down. Floral leaves situated under the pedicels, and therefore the racemes are leafy. Flowers purple. The joints of the pods do not separate. Habit of *Alýssum.*

1 A. Billardie'rii (D. C. syst. 2. p. 578.) ♃. ♄. H. Native of Syria on mount Lebanon. Deless. icon. sel. 2. t. 82. Caudex woody. Flowers crowded. Sepals linear, villous on the outside. Stigma acute, somewhat 2-lobed.

La Billardier's Anchonium. Fl. May? Pl. ¼ to ½ foot.

Cult. This plant will answer well for ornamenting rock-work, or to be planted in pots and placed among other alpine plants; those cultivated by the latter mode should be planted in a mixture of sand loam and peat, and the pots should be well drained with potsherds. Cuttings planted under a hand-glass in the same kind of soil will root freely, but if the plant ripen seeds, this will be unnecessary.

LXXXII. STERI'GMA (from στηριγμα, *sterigma*, a fork; because the larger stamens are connected at the base, and forked at the top, f. 50. *a.*) D. C. syst. 2. p. 579. prod. 1. p. 212. Sterigmostèmon, Bieb. fl. taur. suppl. p. 444.

Lin. syst. *Tetradynàmia, Siliquòsa.* Larger stamens joined to the middle (f. 50. *a.*). Silique roundish, at length separating into many joints. Erect perennial herbs, clothed with soft starry wool. Roots hard, suffrutescent. Leaves alternate, oblong, tapering to the base, sometimes entire, sometimes sinuated or pinnatifid. Racemes elongating as they become old; pedicels filiform, bractless. Calyx covered with soft down. Flowers of a deep yellow. Siliques covered with short dense down, often interspersed with longer stiff glanduliferous hairs.

1 S. tomentòsum (D. C. syst. 2. p. 579.) leaves all sinuately-pinnatifid. ♂. H. Native of muddy fields towards the Caspian Sea, and about the Irtish. Frequent in rubbish about towns and villages on the Lower Volga; also in vineyards about Astracan, more rare in the Kuman desert. Cheiránthus Cáspicus, Lam. in Pall. itin. ed. gall. 2. p. 348. Cheiránthus tomentòsus, Willd. spec. 3. p. 523. Sterigmostèmon, Bieb. fl. taur. suppl. p. 444.—Pall. itin. 2. app. no. 115. t. K. f. 2. ed. gall. app. p. 437. no. 352. t. 103. f. 2. Stems much branched, many, rising from the same root. Larger stamens connected beyond the middle.

Woolly Sterigma. Fl. April, May. Clt. 1823. Pl. ½ foot.

2 S. sulfu'reum (D. C. syst. 2. p. 580.) lower leaves runcinately-pinnatifid, upper ones entire. ♂. H. Native of Syria near Aleppo, and between Aleppo and Mossul. Deless. icon. sel. 2. t. 83. Cheiránthus sulfùreus, Russel in Schrad. journ. 1. p. 426. Flower like those of *S. tomèntosum.* Stem branched at the base.

Sulphur-coloured-flowered Sterigma. Pl. 1 to 2 feet.

3 S. torulòsum (D. C. syst. 2. p. 580.) leaves oblong, radical ones sinuately-toothed, upper ones entire. ♂. H. Native of Iberia about Tiflis. Cheiránthus torulòsus, Bieb. fl. taur. 2. p. 121. Sterigmostèmon incànum, Bieb. fl. taur. suppl. p. 444. Leaves less woolly than those of the two preceding species, and the pods are shorter, thicker, arched, and more torulose.

Torulose-podded Sterigma. Fl. May. Clt. 1823. Pl. ½ ft.

4 S. elychrysifòlium (D. C. syst. 2. p. 581.) leaves all oblong-linear, entire. ♃. H. Native of Armenia, and in Persia in the province of Ghilan. Cheiránthus lanàtus, Gmel. from Fisch. in litt. with a drawing. Cheiránthus aùreus, Willd. herb. from Stev. obs. ined. This species has the leaves of *Anchònium*, with the fruit and flowers of *Sterígma.* Deless. icon. sel. 2. t. 84. (f. 50.)

FIG. 50.

Elychrysum-leaved Sterigma. Pl. ½ foot.

Cult. These plants are well adapted for ornamenting rock-work, but a few plants of each should be kept in pots, so that they may be placed in a frame during winter, and planted out in the beginning of summer in the border or on the rock-work; in fact they require the same treatment as other alpine plants. They can only be increased by seeds.

Sub-order III. ORTHOPLO'CEÆ (from ορθος, *orthos*, upright, and πλοκη, *ploce*, a folding together; cotyledons folded together, f. 45. *j. f.*) D. C. syst. 2. p. 581. prod. 1. p. 213. Cotyledons incumbent, folded together or plaited lengthwise through their middle, and enwrapping the radical in the recess (f. 45. *j. f.*). Style generally enlarged, with a cell and seed at its base. Seeds generally globose, never margined.

Tribe XII.

BRASSI'CEÆ (plant agreeing with *Brássica* in some characters,) or ORTHOPLO'CEÆ (see Sub-order III.) SILIQUO'SÆ (*siliqua*, a long pod; pods long.) D. C. syst. 2. p. 581. prod. 1. p. 213. Silique with the valves opening lengthwise (f. 47. *f. o. g.*), and a linear dissepiment. Seeds globose. Cotyledons folded together (f. 45. *j. f.*).

LXXXIII. BRA'SSICA (from the Celtic word *Bresic*, which signifies a cabbage.) Lin. gen. no. 820. exclusive of many species. D. C. syst. 2. p. 582. prod. 1. p. 113.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique rather terete, crowned by a small short blunt style (f. 47. *f.*). Seeds in one

row (f. 47. *f.*) globose. Calyx closed. Herbs usually biennial, rarely annual or perennial, or suffrutescent usually with a short caudex. Radical leaves usually stalked, lyrate or pinnatifid; cauline ones sessile or stem-clasping, entire. Racemes elongated; pedicels bractless, filiform. Flowers yellow, rarely white, but never purple nor veined. This genus contains the well known pot-herbs and roots, cabbage, cauliflower, turnips, rape, &c. &c.

Sect. I. Bra'ssica. (D. C. syst. 2. p. 582. prod. 1. p. 213.) Silique sessile, usually terminated by a conical seedless beak, or destitute of it.

1 B. olera'cea (Lin. spec. 932.) leaves covered with glaucous pollen, somewhat fleshy, repand or lobed, quite smooth, even in their younger state. ♂. H. Freeman, icon. t. 4, 5.

Potherbs, Borecoles, Cabbages, Cauliflowers, &c. &c.

There is scarcely an instance in the vegetable kingdom of a plant that produces varieties so different in appearance and qualities as the *B. oleràcea*. Comparing the original plant, as it is found on our shores, with very sea-green leaves, no appearance of a head, and flowering like *Wild Mustard* or *Charlock*, with the red cabbage or cauliflower, the difference is astonishing. A new arrangement of the cultivated species of *Brássica*, has been made by professor De Candolle, Hort. trans. vol. 5. and in his syst. vol. 2. which we here give without any variation.

§. 1. *Sea Colewort* or *Cabbage*, or *Wild Cabbage*.

1 A. sylve'stris (B. oleràcea, Huds. ang. 289. Smith, eng. bot. t. 637.) stem taller than in *B. capitàta*, more humble and more branched than in *B. acéphala*. Leaves not collected into a true head. Native of England on cliffs by the sea-side, particularly at Dover, on the Welsh and Cornish coasts; at Staiths, Yorkshire, abundantly; and at King's Cove, Devonshire.

§ 2. *Greens, Kale* or *Borecoles*.

2 B. ace'phala (D. C. syst. 2. p. 583.) stem round, elongated; leaves expanded; racemes panicled. Brássica oleràcea viridis, Lam. dict. 1. p. 743. no. 2. *Choux sans tete*, Audib. and Vilm. mss. *Choux verts*, cultivated in fields for the nourishment of cattle. Bosc. dict. agr. 4. p. 42.

Var. α, *ramòsa* (D. C. syst. 2. p. 583.) stem branched; leaves sinuately-pinnatifid. B. viridis procèrior, Lam. dict. 1. p. 743. no. 2. var. β. This variety is called *Chou cavalier branchu* in France, and in England Cavalier Cabbage and Thousand-headed Cabbage.

Var. β, *vulgàris* (D. C. syst. 2. p. 583.) stem almost simple; leaves sinuately-pinnatifid.

* *viridis* (D. C. l. c.)—Lob. icon. 243. f. 1.—J. Bauh. hist. 2. p. 429. f. 2.——*Chou Cavalier, Chou en arbre, Chou chèvre, Grand Chou vert* (Fr.) 100-leaved Cabbage (Eng.)

* * *purpuráscens* (D. C. l. c.)—J. Bauh. hist. 2. p. 831. f. 2.—Chabr. sciagr. 270. f. 6.—Mor. oxon. 2. p. 207. no. 7.—Open-headed Red Cabbage (Eng.)

Var. γ, *sabéllica* (D. C. syst. 2. p. 584.) stem almost simple; leaves sinuately-lobed; lobes multifid.—Ren. specim. 134. t. 133.—Lob. icon. 247. f. 1.—J. Bauh. hist. 2. p. 832. f. 1.—Lam. dict. 1. p. 743. no. 2. var. γ.——*Chou vert frisé, Chou frangé du Nord, Chou frisé non pommé, Chou frisé d'Allemagne*, (Fr.) Greens, Kale, Curles (Eng.)

* *pinnàta* (D. C. l. c.) B. tenuifòlia laciniàta, Lob. icon. 246. f. 2. obs. 123. f. 2.—*Chou aigrette, Chou plume* (Fr.)

* * *purpuráscens* or *versícolor* (D. C. l. c.) leaves either purple or variegated.

Var. δ, *palmifòlia* (D. C. syst. 2. p. 584.) stem simple; leaves sinuately-repand, a little blistered, pendant.——*Chou Palmier* (Fr.) *Palm Borecole* (Eng.)

Var. ε, *Cow Cabbage*. Stem branched, 12 feet high; leaves curled.

Var. ζ, *costàta* (D. C. syst. 2. p. 584.) stem humble, a little branched; leaves sinuately-repand, with the primary nerves very thick.—Lam. dict. 1. p. 743. no. 2. var. δ. *Chou blond à grosses côtes*, Bosc. dict. agr. 4. p. 43.—*Chou à grosses côtes, Chou à larges côtes, Chou de Beauvais.* (Fr.)

* *nepenthifórmis* (D. C. l. c.) nerves and nervules drawn out into filiform threads, terminating in leafy funnel-shaped appendages.

§ 3. *Savoy-Cabbages, and Brussels sprouts.*

3 C. bulla'ta (D. C. syst. 2. p. 584.) stem round, a little elongated; young leaves at first conniving into a head, but they are at length spreading, and all blistered or curled; racemes panicled.

Var. α, *vulgàris* (D. C. syst. 2. p. 584.) heads of leaves loose, thick, terminal, roundish.—Lob. icon. t. 244. f. 1.—Dalech. lugd. p. 520. f. 2.—B. oleràcea Sabaùda, Lin. spec. p. 932.—Lam. dict. 1. p. 743. no. 3. var. κ and λ.——*Chou pommé frisé, Chou de Milan, Chou de Savoie, Chou de Hollande, Chou cabu frisé, Chou Pancalier* (Fr.) Savoy-Cabbage (Eng.)

* *præ'cox* (D. C. syst. 2. p. 585.)—*Milan hatif, petit Milan* (Fr.) Small early Savoy-Cabbage (Eng.)

* * *hùmilis* (D. C. l. c.)—*Milan nain* (Fr.) Dwarf Savoy-Cabbage (Eng.)

* * * *Turionénsis* (D. C. l. c.)—*Pancalier de Touraine* (Fr.) Turaine Savoy-Cabbage (Eng.)

* * * * *aurìta* (D. C. l. c.)—*Milan doré* (Fr.) Eared Savoy-Cabbage (Eng.)

Var. β, *oblónga* (D. C. syst. 2. p. 585.) heads of leaves terminal, oblong.—Lob. icon. 244. f. 2.—Mor. oxon. sect. 3. t. 1. f. 4.——Winter Savoy-Cabbage (Eng.)

Var. γ, *màjor* (D. C. syst. 2. p. 585.) heads of leaves terminal, very large.—Lam. dict. 1. p. 743. no. 3. var. λ.——*Gros d'Ambervilliers, Pomme frisé d'Allemagne* (Fr.)—Great or Common Savoy-Cabbage (Eng.)

Var. δ, *gemmífera* (D. C. syst. 2. p. 585.) heads of leaves small, numerous, rising from the axils of the leaves along an elongated stem.—Delech. lugd. 521. f. 2 ?—Mor. oxon. sect. 3. t. 1. f. 3 ?——*Chou à jets, Chou à jets et rejets, Chou de Bruxelles, Chou à mille tetes, Chou vert à petites pommes le long du pied* (Fr.)—Brussels Sprouts (Eng.)

§. 4. *Cabbages red and white.*

4 D. capitata (D. C. syst. 2. p. 585.) stem round, short; leaves concave, not blistered, crowded into a head before flowering; racemes panicled.—Weinm. phyt. t. 259.—Dod. pempt. 623. f. 2.—Lob. icon. 243. f. 2.—Mor. oxon. 2. p. 206. sect. 3. t. 1. f. 1.—Lam. dict. 1. p. 743. no. 3.——*Choux cabus ou pommés*, Bosc. dict. agr. 4. p. 42.——*Chou pommé, Chou pommé à feuilles lisses, Chou en tete* (Fr.)—Cabbage (Eng.)

Var. α, *deprèssa* (D. C. syst. 2. p. 585.) heads of leaves spheroid, depressed.—Lam. dict. 1. p. 743. no 3. var. ζ.——*Chou pommé à tete aplatie*, Audib. mss. (Fr.)—Drumhead or Dutch Cabbage (Eng.)

Var. β, *sphæ'rica* (D. C. syst. 2. p. 585.) heads of leaves globose, not depressed.——*Chou cabus commun, Chou pommé commun* (Fr.)—Common Cabbage (Eng.)

* *álba* (D. C. l. c.) outer leaves green, inner ones white.——*Chou pommé blanc, Chou cabus blanc ou vert* (Fr.)—Common White Cabbage (Eng.)

* * *rùbra* (D. C. l. c.) leaves red or purple, always particularly so in the nerves.—Dod. pempt. 621. f. 2.—I. Bauh. hist. 2. p. 831. f. 1.—Lam. dict. 1. p. 743. no. 3, var. δ and ι.——*Chou à tete ronde rouge*, Audib. mss.—*Chou rouge* (Fr.)—*Red Cabbage*, Aberdeen Red Cabbage (Eng.)

Var. γ, *obovàta* (D. C. syst. 2. p. 586.) heads of leaves obovate.——*Chou à tete obovale*, Audib, mss.—Pentonville Cabbage? (Eng.)

Var. δ, *ellíptica* (D. C. syst. 2. p. 586.) heads of leaves elliptical.——*Chou a tete ovale*, *Chou d'Yorck* (Fr.)—Early York Cabbage, Small Early Dwarf Cabbage (Eng.)

Var. ε, *cónica* (D. C. syst. 2. p. 586.) heads of leaves ovate-conical.—Lam. dict. 1. p. 743. no. 3, var. δ and ε.——*Chou pain de sucre*, *Chou Chicon*, *Chou d'Ambervilliers*, *Chou de Battersea* (Fr.)—Sugar-loaf Cabbage, Antwerp Cabbage, and Battersea Cabbage (Eng.)

§. 5. *Chou rave, or Turnip-stemmed Cabbage.*

5 E. cau'lo-ra'pa (D. C. syst. 2. p. 586.) stem tumid and somewhat globose at the origin of the leaves.

Var. α, *cómmunis* (D. C. syst. 2. p. 586.) leaves plain.—Dod. pempt. 625. f. 1.—Lob. adv. app. 463. f. 2.—Bauh. hist. 2. p. 830. f. 1.——*Chou-rave* (Fr.) *Cape Cabbage* (Eng.)

* *álba* (D. C. l. c.) *Chou-rave blanc*, *Chou-rave commun*, *Chou de Siam*, *Kohl rübi* (Fr.) *Knol*, *Kohl* (Cape.)

* * *purpuráscens* (D. C. l. c.) *Chou-rave violet* (Fr.)

Var. β, *crispa* (D. C. syst. 2. p. 586.) leaves curled and fringed.——*Chou-rave crepu* (Fr.)—*Pavonazza* (Ital.)

§. 6. *Cauliflower and Brocoli.*

6 F. bo'trytis (D. C. syst. 2. p. 586.) peduncles of racemes corymbose, crowded very much before flowering, and very fleshy; flowers usually abortive.—Lob. obs. 125. f. 2.—Lam. dict. 1. p. 745. no. 4.

Var. α, *cauliflòra* (D. C. syst. 2. p. 586.) stem humble; leaves oblong, of a greyish-glaucous colour; heads of flower-buds thick, terminal.—Dod. pempt. 625. f. 2.—I. Bauh. hist. 2. p. 828 and 829. f. 1.—Lam. dict. 1. p. 745. no. 4. var. α, β, γ.——*Cavolo-fiore* Galliz. bot. agr. p. 191. no. 2,—*Chou fleur* (Fr.)—Cauliflower (Eng.)

Var. β, *asparagoìdes* (D. C. syst. 2. p. 587.) stem taller than in the Cauliflower; leaves greyish-glaucous, elongated; branchlets fleshy, bearing small flower-buds at the top; flowers abortive.—Dalech. lugd. 522. f. 2.—Mor. oxon. 2. p. 208. no. 11. sect. 3. t. 1. f. 11.—Lam. dict. 1. p. 745. no. 4. var. δ, ε, and ζ.——*Cavolo Romano seu Broccoli*, Galliz. bot. agr. p. 191. no. 2.—*Broccoli* (Fr.) Brocoli (Eng.)

* *cómmunis* (D. C. l. c.) heads of flower-buds white.——*Broccoli commun*, *Broccoli blanc* (Fr.)—White Brocoli (Eng.)

* * *violàcea* (D. C. l. c.) heads of flower-buds purple.——*Broccoli violet*, *Broccoli de Malte* (Fr.)—Purple, Red, or Maltese Brocoli (Eng.)

Cult. The varieties of *Brássica oleràcea* have been cultivated from the earliest period; they have therefore become numerous, and so distinct from each other, as to occasion a doubt in every beholder's mind whether it were possible that these numerous and distinct varieties could have originally sprung from the *Sea Colewort or Wild Cabbage* of the Dover Cliffs. Cabbages of some sort, White, in his *History of Selbourne*, says, must have been known to the Saxons, for they named the month of February *Sprout-kale*. Being a favourite with the Romans it is probable Italian cabbage would be introduced at an early period into South Britain. To the inhabitants of the north of Scotland *Cabbages* were first made known by the soldiers of Cromwell, when quartered at Inverness (Edin. encycl. art. hort.)

Having thus botanically traced the variations of *Brássica oleràcea* from the *Sea-Colewort* through *Borecoles*, *Savoys*, and *Cabbages* to the *Cauliflower* and *Brocoli*, we shall now proceed to give the cultivation and uses of these in the order we have followed above.

The space occupied by this tribe in most kitchen gardens may be estimated at one-eighth or one-fourth part of the open quarters, taking the whole year round, and in cottage-gardens the heading Cabbages and Borecoles generally occupy one-half of the whole space.

§ 1. *Sea Colewort, or Cabbage, or Wild Cabbage. Brássica oleràcea. A. sylvéstris, D. C. l. c.*

We have already said that the original Cabbage plant grows naturally on the Dover Clifts and several other parts of the English coast. It is a biennial plant, the stem-leaves are much waved and variously indented, the colour is glaucous or sea-green, with occasionally a tinge of purple, arising from the bleak situation in which it usually grows. Early in the spring the *Wild Cabbage* or *Colewort* from the sea coast is said to be excellent, but it must be boiled in two waters to remove the saltness. The roots may also be eaten but they are not very tender.

§. 2. The *Borecole, Winter Greens* (Eng.); *Chou vert* or *Chou vert non pommé*, *Caulet* (Fr.); *Kale* (Sax.); *Green Kale* (Scotch.); *Brassica oleràcea, B. acephala*, D. C.

This tribe is easily known by the leaves never conniving into a head, but the heart always open and spreading.

1 The Thousand-headed Cabbage, *Chou à mille tetes*, *Chou Cavalier branchu*, *Chou Moellier* (Fr.) (*Brássica oleracea, B. acephala* α *ramòsa*, D. C. l. c.) grows to the height of 4-feet and upwards, sending out from its main stem branches in the manner of a tree, from the ends and sides of which proceed shoots which appear as actually in growth the whole winter. The leaves are of a pale green, numerous, entire, or pinnatifid, narrower than those of any other green. It is chiefly extolled as an agricultural plant, but may be occasionally planted in gardens, because it will survive the severest frost, and be useful when every other plant of the Cabbage tribe has been destroyed. In flavour it is inferior to winter greens.

2 *Chou Cavalier*, *Chou en arbre*, *Chou à chevre*, *Grand chou vert commun* (Fr.) (*Brássica oleràcea, B. acephala*, β. *vulgaris*, * *víridis*, D. C. l. c.) This shoots up higher than the preceding variety; its stems remaining nearly single, but they are scarcely distinguishable from each other. This variety is very generally cultivated in the western part of Europe as food for cattle, and sometimes as a garden vegetable. It grows sometimes 5 feet high; this may be attributed to the stripping off the lower leaves to give them to cattle, as well as from being usually planted in rich soil.

3 Oak-leaved Borecole, *Chou à feuilles de chéne* (Fr.) This comes near to the next variety. The lobes of the leaves are deep, broad, and entire, or nearly so, and uniformly of a pale-green. This variety is not generally cultivated. Perhaps the *Chou de Milan*, p. 231. is a variety of this plant.

4 Green Borecole, Scotch Kale, Siberian Borecole (Eng.) *Chou vert frisé*, *Chou frangé du Nord*, *Chou frisé non pommé* (Fr.) (*Brássica oleràcea, B. acéphala, var.* γ, *Sabéllica, D. C. l. c.*) There are several sub-varieties under this head. The leaves are of a bright light green deeply lobed, and not very wide, curled on the edges, slightly wrinkled on the upper surface, with veins of a greenish-white colour. The margins of the leaves are plaited so closely as to widen so as to measure three times as much as if the plaits were not extended. The younger leaves in consequence look completely

fringed. The part used is the crown or centre of the plant, cut off with as much of the top of the stem as will keep the leaves together, which do not exceed 9 inches in length. It boils well and is most tender, sweet, and delicate, provided it has been duly exposed to the frost. Morgan says it is impossible to find a plant of more excellence for the table or more easily cultivated.

The following are sub-varieties of the same.

* *German Kale* (Eng.) *Chou d'Allemagne* (Fr.) (*Brássica oleràcea, B. acéphala, var. γ, Sabéllica, Germánica.*) This variety of the Green Borecole is known in Scotland under the names of German Greens, German Kale, Curled Kale, and Curlies. Morgan says this Green is of singular merit. Its leaves are more pointed and grow much longer than those of the others; their margins are not so much plaited, but being still considerably so, give them a curled or fringed appearance, but not so richly and beautifully so as the true Scotch Kale. The chief difference consists in its furnishing abundance of side shoots or sprouts for the table after the crown has been gathered. It grows tall, and this disposition ought to be encouraged by early planting, for the supply of shoots is nearly in proportion to the length of the stem. It is rather more hardy than the Scotch Kale, in taste it is the same, but when not mellowed by frost has something of a bitter flavour (Loud. encycl. gard.)

* * *Chou aigrette, Chou plume* (Fr.) (*Brássica oleràcea, B. acéphala, var. γ, Sabéllica, * pinnata, D. C. l. c.*) The leaves of this variety are thin, and very deeply jagged and curled, the indentations being so deep as to appear almost pinnated. It is not much cultivated, and it does not appear to possess any superior quality.

* * * *The Ragged Jack.* (*Brássica oleràcea, B. acéphala, var. γ, Sabellica, laciniàta.*) This variety grows short on the ground, and in the spring shoots up strongly from the crown and sides. The leaves are very glaucous, much cut and divided; the edges are marked with small blunt crenatures, and there arise from several points on the upper surface of each leaf, and particularly on the large ones, small leafy appendages similar in texture to the main leaf. This plant is almost entirely confined to cottage and farm gardens.

* * * * *The Jerusalem Kale.* (*Brássica oleràcea, B. acéphala, var. γ, Sabéllica, Judáica Delaware Cabbage.*) This variety agrees with the preceding in habit and growth. The leaves are long, with several deep indentations on each side; their edges are serrated but not deeply so, the upper surface having a purplish hue, the under surface being a pale green, and the veins are purple, inclining to a pink colour. The whole plant when growing appears of a dingy purple, and is extremely hardy; when the taller winter greens have ceased to be good by running to flower the shoots of this are ready to take their place at the table. This with the preceding and following are perhaps referable to *B. campéstris, Nàpo-Brássica.*

* * * * * *The Buda Kale, Russian Kale, Prussian Kale,* and by some called *Manchester Kale.* (*Brássica oleràcea, B. acéphala, var. γ, Sabéllica.—Ruthénica.*) Like the preceding. This is dwarf in its habit, but more close and compact; with leaves like the German Kale, and curled on the edges in the same way. Before the plant begins to shoot in the spring it appears purple, the back and edges of the leaves being tinged with that colour, which of course are more in view in their growing state than when expanded. It is equal in value to any variety of Borecole, sweet and well-flavoured, perfectly hardy, and remains till late in the spring before it comes to flower. As this variety is expected to furnish a supply much longer than any of the others, and until late in the spring, a greater breadth of ground should be allowed for it, and a second plantation made in August for the later gathering. A writer in Hort. Trans. Lond. has, by blanching *Buda-Kale*, very much improved it; and the process is performed nearly in the same manner as that for *Sea Kale.* It is blanched by inverting a large flower-pot over it, any other *Kale* may be rendered more delicate by this process, and it might be had at a time when Sea-Kale cannot be procured, and would be an excellent substitute for it.

* * * * * * *The Variegated Borecole* (*Brássica Oleràcea, B. acéphala, var. γ, Sabéllica * * versicolor, D. C. l. c.*) Of several of the sub-varieties of Borecole, there are varieties which are blotched or striped with white or red; these are chiefly cultivated for ornament or curiosity.

* * * * * * * *The Purple Borecole* or *Brown Kale* of the Germans (*Brassica Oleràcea, B. acéphala, var. γ, Sabéllica * * purpuráscens, D. C. l. c.*). This variety differs from the others in the leaves and entire plant being of a deep purple colour, becoming somewhat greenish as the leaves enlarge, but the veins and ribs still remaining purple. It is a more hardy plant than the green Borecole, but of less delicate flavour. When boiled the purple colour in a great degree disappears. (Loud. ency. gard.) *Chou rouge frisé* (Fr.).

5 The Palm Kale *Chou Palmier* (Fr.) (*Brássica Oleràcea, B. acéphala, var. ε, palmifòlia, D. C. l. c.*) This variety is described by Delaunay in "*Le bon Jardinier,*" as rising to the height of 6 or 12 feet, with a straight bare stem, the leaves displaying themselves only at the top, and thus producing the appearance of a little palm-tree; the leaves are much puckered, and so much rolled inwards at the edges, that they appear narrow, while at the same time they hang in a curved manner, thus aiding the illusion. It is almost peculiar to Italy, and not very hardy. The Palm Borecole is said to be cultivated to considerable extent in Jersey and Guernsey in orchards, the outer leaves for feeding cattle, and the heart is used for culinary purposes, and is said to be very good.

6 The Cow Cabbage (Loud. gard. mag. vol. 5. f. 14.) or Cesarean Kale (*Brássica Oleràcea, B. acéphala, var. ζ, arboréscens*). This plant is almost similar in habit to the preceding, but the stem rises to the height of from 10 to 16 feet, the leaves are not so puckered nor rolled inwards at the edges, nor do they hang down so much. The stem is naked and simple, crowned by a head of leaves like a palm-tree. Sixty plants of this variety are said to afford sufficient provender for one cow for a year, and as the side leaves are only to be used, it lasts four years without fresh planting. In La Vendee this plant is said to attain the height of 12 or 16 feet. In Jersey the plant is sufficiently hardy, and where it grows from 4 to 12 feet. The little farmers there feed their cows with the leaves, plucking them from the stem as they grow, leaving the crown at the top. The stems being strong are also used by them for roofing small outhouses. When the gathering of the leaves is finished, at the end of the year, the terminating bud or crown is boiled and is said to be particularly sweet. It is not sufficiently hardy to stand the climate of Britain, unless planted in a very sheltered situation.

7 The Ribbed Cabbage or Kale; *Chou blond à grosses cotes, Chou à grosses cotes, Chou à larges cotes* (Fr.). *Cove tronchuda* (Port.). (*Brássica Oleràcea, B. acéphala, var. ι, Costàta, D. C. l. c.*) The stem of this variety is humble and a little branched. The leaves are sinuately repand with the nerves very thick. It is much cultivated in France and Portugal.

8 The Nepenthes-like Borecole or Kale (*Brássica Oleràcea, B. acéphala, var. nepenthifórmis, D. C. l. c.*). The nerves of the leaves of this variety are drawn out like threads, and these threads are terminated by funnel-shaped appendages. This variety is only cultivated for curiosity, and it is seldom to be seen in the collections of this country. Hort. trans. 5. t. 1.

Propagation of Borecole. All the sorts are raised from seeds, and for a seed bed of 50 feet square half an ounce is sufficient.

Sow the last fortnight in March, and April, and in the beginning of May and in August. The first week in April for a principal crop of German kale, and the first week in August for the crop of Buda kale, and which will be ready to transplant in September.

Subsequent culture. When the plants have leaves one or two inches broad, take out some from the seed-bed, and prick them into other open beds six inches apart, giving water, in which let them have four or five weeks' growth. Those left in the seed-bed, as well as these will have all acquired proper strength for transplanting finally in May, or thence till August. Plant them in an open spot in rows two feet and a half asunder for the first forward planting in summer, the other two feet, allotting the whole similar distances in the rows, taking advantage of moist weather, but give occasional watering if the weather is dry until they have struck root. In their advancing growth hoe once or twice to cut down the weeds, and to draw earth about the bottom of their stems to encourage their growth, in the production of large full heads in proper season in September, October, &c. At the approach of winter the stems should be earthed up, especially the taller sorts. When the distances between the plants are such as have been recommended, the hills round each plant will be of such a size and breadth as to cherish the roots of the dwarf varieties, and serve as a protection to the tall sorts in stormy weather.

Gathering. The heart is to be gathered of all tall sorts, after which, with the exception of the *German kale*, and the *Chou de Milan*, the stalks should be pulled up and taken to the compost heap; but the stems of the two sorts excepted are to be left for the sake of their side shoots or sprouts. Of the dwarf sorts the heart may either be cut off, for which the *Buda kale* and *Coleworts* are well suited, or the leaves gathered when the plant begins to grow, which corresponds with the habits of the *Egyptian* and *Jerusalem kale*.

To save. Plant a few plants about twice the distance from each other, as they stood formerly, in an open space in the spring. The seeds will be ready to gather in autumn, when they may be threshed out, and the seed, after being dried, may be put up into bags. This cannot be done with more than one sort in the same garden, on account of promiscuous impregnation by bees, the wind, &c. &c.

§ 3. *Savoys. Chou pommé frisé, Chou de Savoie, Chou cabu frisé. Chou Pancalier, Chou de Holland, Chou de Milan, &c.* (*Brássica oleràcea, C. bullàta, D. C. l. c.*) These plants are easily known by the leaves being blistered, and growing into heads or cabbages.

The savoy is in use as a table vegetable from November till spring, unless destroyed by frost, in which case it is succeeded by the borecoles or winter greens. These two tribes usually supply the table from November till May.

The following are the varieties of Savoy :—

1 The Green Savoy ; *Milan vert.* (Fr.) *B. oler. bull. viridis.*)

2 The Dwarf Savoy ; *Milan nain.* (Fr. *B. oler. bull. húmilis, D. C. l. c.*)

3 The Yellow Savoy ; *Milan jaune.* (Fr.) (*B. oler. bull. lutea.*)

4 The Small Early Savoy ; *Milan hatif, petit Milan.* (Fr.) (*B. oler. bull. t. præcox, D. C. l. c.*)

5 The Eared Savoy ; *Milan dore.* (Fr.) (*B. oler. bull. aurita. D. C. l. c.*)

6 The Drumhead or Great Savoy ; *Chou gros d'Ambervilliers, Pommé frisé d'Allemagne.* (Fr.) (*B. oler. bull. var. γ, major, D. C. l. c.*)

7 The Oblong Savoy. (*B. oler. bull. var. β, oblónga, D. C. l. c.*)

8 Tourraine Savoy ; *Pancalier de Touraine.* (Fr.) (*B. oler. bull. vulg. Turionensis*).

There are several sub-varieties of the above with round, oblong, conical, or sugar-loaf heads, all of them are excellent autumnal greens. The Green Savoy should be first used, as it is less hardy than the Yellow, and the Dwarf is said to be the hardiest of them all. Any of them will, however, stand ordinary frosts, by which the delicacy of their flavour is much improved. The Savoy is always raised from seed, and for a seed-bed 4 feet and a half by 8 feet, half an ounce of seed will be sufficient. This esculent answers on a light rich soil, poor or exhausted ground should be manured according to the defects of it. Allot an open compartment in the full air, that the seedlings and advancing plants may grow stocky, and not draw up weak and long-stemmed, as they are liable to do in close situations or narrow borders under walls. As to the time of sowing the seeds a sufficient succession is obtained by three or at most four sowings. The first about the middle or latter end of February, these will be ready in August or September, and they will be finely cabbaged by October, and continue in good perfection all November, December, and perhaps January. The second about the middle or latter end of March ; these will be ready to serve from about Michaelmas to Christmas. The third both at the beginning and end of March, full crops should now be sown for the first considerable autumn and winter crop. The fourth in May. For the culture of the Savoy the ground should be previously trenched to a good depth. Four feet is a convenient width for the seed-beds. Sow broad-cast, and rake it in a quarter of an inch deep. As soon as the plants have two or three leaves, an inch or two in width, if they stand too crowded, thin the seed-beds by drawing out a quantity regularly, and prick them into other beds 4 inches asunder ; and should the weather be dry, water those left as well as those removed. Permit both divisions to remain three, four or five weeks to gain a good stocking size for final transplanting. When the plants are advanced with several leaves 2 or 3 inches broad or more, transplant them finally into the most open quarters of ground, where they will be less annoyed by caterpillars, that they may cabbage with large full heads, planting them at different times as ground becomes vacant. Remove the most forward in May or June for early autumn heading in August or September. But plant the principal crops in June or July, and from the beginning to the middle of August, taking all possible advantage of showery weather ; in drawing the plants observe if any are clubbed or knotty at the root, cut off the protuberances close. Plant those removed in May, June, or July in rows about two feet asunder, and by the same distance in the rows, others late planted in August or September two feet by eighteen inches. In scarcity of vacant ground, some Savoys may be occasionally planted between wide rows of previous standing crops, such as Beans, Cauliflowers, and early Cabbage, that are sufficiently forward to be gathered off by the time the Savoys will want the entire ground. Before and after planting in dry weather watering would be of essential service. As the plants of the different successions advance, keep them free from weeds by occasional draw-hoeing. At the same time loosen the surface of the earth, and draw some about the stems of the plants, let this be done twice or oftener, to forward them in a free enlarging growth. They will gradually heart, fully cabbaging in September, October, November, and December, &c. as they are the crops of the forward or the later sowings ; they may be cut for use accordingly, and during the winter. The Savoys left standing will continue good till the middle or end of February, when, or in the course of March they open and send up seed-stalks.

* *Brussels sprouts. Chou à jets, Chou à jets et rejets, Chou de Bruxelles, Chou à mille tetes, Chou vert à petites pommes le long du pied.* (*Fr.*) (*Brássica oleràcea, C. bullàta δ, gemmífera, D. C. l. c.*)

The Brussels sprouts is only considered a sub-variety of the

Savoy. It produces an elongated stem, often four feet high, beset with numerous green heads like Savoys in miniature, the whole ranged spirally along the stem, the main leaves of which drop off early. The top of the plant resembles that of a Savoy planted late in the season; it is small, with a green heart of little value. Van Mons says, Hort. trans. vol. 3. "If this vegetable be compared with any other that occupies as little space, lasts as long, and grows as well in situations generally considered unfavourable, such as between rows of potatoes, scarlet-runners or among young trees, it must be considered superior in utility to most others." Nicol considers it deserving more general culture in Scotland; and Morgan, Hort. trans. vol. 2. says it is an excellent sort of green for the winter, but not sufficiently hardy to last through the winter in England. The sprouts are used as winter greens, and at Brussels they are sometimes served at table with a sauce, composed of vinegar, butter, and nutmeg, poured upon them hot after they have been boiled. The top, Van Mons says, is very delicate when dressed, and quite different in flavour from the sprouts. The plants are raised from seed, of which an ounce may be requisite for a seed-bed 4 feet by 10. The first sowing of a full crop should be in April. The second in May. Van Mons, in a paper already referred to, says, "The seed is sown in spring under a frame, so as to bring the plants forward; they are then transplanted into an open border with a good aspect. By thus beginning early, and sowing successively till late in the season," he says, "we contrive to supply ourselves in Belgium with this delicious vegetable full ten months in the year, that is, from the end of July till the end of May. The plants need not be placed at more than 18 inches asunder, as the head never spreads wide, and the side leaves soon drop off. In this and every other respect, the cultivation is the same as the Borecole." As to gathering the crop, Morgan says, the sprouts must have some frost before they are gathered, but this, Van Mons says, is an erroneous opinion. In Belgium the small cabbages are not esteemed if of more than half an inch in diameter. It is usual to cut the tops off ten or fifteen days before gathering the sprouts from the stem. In spring, when the sprouts are disposed to run to flower, their growth is checked, by taking up the plants and laying them in the ground in a shaded spot. As to the saving of seeds, Van Mons says it is usual to save indiscriminately from topped or untopped plants, but that he intends to save them from the topped plants only, hoping thereby to improve the progeny. In order to procure genuine seed of the Brussels sprouts, it is necessary to have them sent direct from Brussels.

* * *Chou de Milan* is considered as a variety of the Brussels sprouts, and it grows with an elongated stem something like it as well as in general habit, except that the side shoots, instead of forming little close cabbages, are open like Borecoles. The principal leaves of this plant are not very large; they are wrinkled like the Savoy, and form a small crown on the top of the plant, which remains open and does not cabbage, the top may be cut off and used in February. Even if not wanted for use, the head should be taken off at that period to forward the growth of the sprouts, which come into full use early in March, when those of the German kale are too far advanced. When dressed they are particularly rich and delicate. Abercrombie says this plant, to admit of its full growth, requires a yard square, but that it continues the longest in spring of any of the tall greens without running to seed. The cultivation, in every other respect, is the same as the Borecoles or Brussels sprouts.

To save seed. The grand object is to place the plants where they will be in no danger of being impregnated with the farina of any other of the *Brássica* tribe. A few good plants should be selected and planted in an open spot by themselves in the spring, where the seeds will ripen in August. No more than one sort can be safely grown in the same garden, &c.

§ 4 *Cabbage. Chou pomme*, or *Cabus, Chou en tete, Chou pommé à feuilles lisses, Brassica Oleràcea, D. capitata*, D. C. l. c. *Kopfkohl*, (*Ger.*) *Cavolo, Capuccia.* (*Ital.*)

* White Cabbage.

The varieties of the White Cabbage are too well known, and their uses too universal, to require any description here. They produce firm compact heads, glaucous green, or greenish-yellow leaves externally, but blanched within; and varying in different sorts from 3 to 12 or 15 inches in diameter, and from 2 to 15 or twenty pounds weight. The varieties are numerous, but the sorts chiefly cultivated are as follow:—

* *Heads oblong, or elliptical.*

1. Small early dwarf
2. Early dwarf, York
3. Large early York
4. Large oblong hollow
5. Long-sided hollow

} *Brássica oleràcea, D. Capitàta, S. elliptica* D. C. l. c. *Chou à tete ovale, Chou d'York, &c.* (Fr.)

* * *Heads conical.*

1. Early dwarf sugar-loaf
2. Large sugar-loaf
3. East Ham
4. West Ham
5. Early Battersea
6. Late Battersea
7. Early Imperial
8. Wellington
9. Antwerp
10. Russian
11. Early London hollow
12. Large hollow sugar-loaf
13. Emperor
14. Early heart-shaped
15. Paington
16. Plaw's early Deptford

} *Brássica oleràcea, D. Capitàta, E. conica*, D. C. l. c. *Chou pain de sucre, Chou chicon, Chou d'Ambervilliers, Chou de Battersea, &c.*, (Fr.)

This last variety is excellent, both for early and late crops.

* * * *Heads large round.*

1. Large round winter white
2. Great round Scotch, or White Strasbourgh, from which the German sour krout is chiefly made.

} *Brássica oleràcea, D. Capitàta, B. sphæ'rica álba. Chou cabus commun, Chou pommé commun, &c.* (Fr.)

* * * * *Heads with flat tops.*

1. Great drum-head flat-topped
2. Bainbrige's flat Dutch

} *Brássica oleràcea, D. Capitàta, a depressa. Chou pomme à tete aplatie. Audib.*

* * * * * *Heads obovate.*

1. Obovate headed Cabbage, or Pentonville. This is a large obovate-headed kind; leaves white and fleshy, wrinkled like the savoy. Very delicate and fine, in perfection during the latter summer months, when other cabbages are of strong flavour.

} *Brássica oleràcea, D. Capitàta, γ obovàta* D. C. l. c. *Chou à tete obovale Audib.* It appears from the description that the *Pentonville Cabbage* is a variety of *Savoy*.

The first seven or eight sorts are suitable for the earliest and secondary crops; and the middle-sized and large kinds for the principal summer, autumn, and winter supplies. 1. For the earliest crops allot some of the small kinds, such as the Early dwarf York, East and West Ham, Early Imperial, Early Battersea, Wellington, Early London hollow, Early dwarf sugar-loaf, Plaw's early Deptford, &c., for cabbaging in April, May, and June. 2. Raise more considerable quantities of the middle-sized

sorts; particularly Large early York, Large hollow sugar-loaf, Early Battersea, Plaw s early Deptford, Penton, Early Imperial, Antwerp, Russian, Emperor, Wellington, Large oblong hollow, &c., for general summer crops. 3. Choose the larger later sorts, for succession, summer, and general autumn cabbages. The Large hollow sugar-loaf, Large oblong hollow, Long-sided hollow, Large round winter (white), Late Battersea, Large sugar-loaf, &c., are excellent for late cabbaging in August, September, or October, till Christmas; or any of the middle-sized varieties may be eligibly sown for latter succession-crops in summer and autumn, to cut in light young growth; also to cultivate for cabbage-colewort, either with small hearts, or as open greens for family and market supply, in autumn, winter, spring, and returning summer. 4. Large round winter cabbage, Great round Scotch, Great drum-head, Baimbridge's flat Dutch, and American kinds, all reaching a very expanded bulk in autumn and winter, are not usually so well fitted for family consumption as the foregoing, being more commonly adopted for field culture, to feed cattle in winter.

Propagation. All the kinds are raised from seed annually, of which, according to Abercrombie's seed-estimate, for a seed-bed to raise the Early York and similar varieties, 4 feet wide, by 20 in length, 2 ounces will be required. For a seed-bed to raise the Large sugar-loaf, and other luxuriant growers, 4 feet by 36 in length, 2 ounces. But according to Mac-Kintosh, one ounce of seed of the early sorts will sow a seed-bed of 40 feet square; and for the more luxuriant sorts, 1 ounce will sow a seed-bed of 60 feet square. Sow at four different seasons, covering the seed from an eighth to a quarter of an inch thick; that is, 1. In February, for use in July, August, or September; but if the winter has destroyed many of the plants which were sown the preceding August, it will be proper to sow some of the seed of the earlier sorts as the weather will permit; and if a few be forwarded by sowing them in a slight hot-bed, it will be a great advantage. 2. In April. Prefer for this sowing the Battersea, Antwerp, and Pentonville. 3. May. Sow the Sugar-loaf and any close quick hearting kinds for summer and autumn, colewort, and young autumn cabbages. 4. In August, in the first and second week, this time being most conducive to ultimate success. Some sow in the end of July, to have the plants stronger before the approach of winter; but of a crop so forward, many of them, and often all, run to seed. For this sowing prefer the Dwarf York, East Ham, Early Emperor, and Sugar-loaf, for the first crops; Large York, Large Sugar-loaf, Battersea, Penton, Imperial, Antwerp, Russian, &c. for the secondary spring crops.

Soil and situation. The soil for seedlings should be light, and, excepting for early sowing, not rich. Where market Gardeners raise great quantities of seedling cabbages, to stand the winter, and to be sold for transplanting in spring, they choose, in general, the poorest and stiffest piece of land they have got, more especially in Scotland, where large autumnal sowings of Winter drum-head and round Scotch are annually made, and where the stiffness of the soil gives a peculiar firmness of texture and hardness of constitution to the plants, and prevents their being thrown out of the soil during the thaws. Transplanted cabbages require a rich soil, rather clayey than sandy, and, as Mr. Neill and Mr. Nichol observe, it can scarcely be too much manured, as they are an exhausting crop. Autumnal plantations, intended to stand the winter, should have a dry soil, well dug and manured, and of a favorable aspect. The cabbage tribe, whether in the seed-bed or final plantation, ever require an open situation; for under the drip of trees, or in the shade, seedlings are drawn up weak, and grown crops are meagre, worm-eaten, and ill-flavoured.

Autumnal sown crop, or those sown in August. Sow each sort separately; give occasional watering if the weather is dry or hot, or sometimes shade with mats in hot sunny days, till the plants come up fully; after which continue necessary moderate watering, if a dry season, to forward and strengthen the crop. When the plants have two or three leaves, an inch or two broad, in September, or the beginning of October, lift some considerable portion from the seed-beds, and prick into beds of good earth, about 4 inches apart, giving water. All these are to remain in the intermediate beds during winter, to gain strength for transplanting in the spring. Those left in the seed-beds will thus have more room to advance equally for transplanting, the most forward of the early sorts in the same year, towards the end of October, or in November or December; and the principal in the spring, the last fortnight of February, or in March or April.

February, March, or April sown crop. It is requisite to sow in the spring, to raise plants to succeed the August-sown crop, for use the same year, partly as young summer cabbages, and partly for heading in the autumn and winter. For this purpose sow at the close of February or in March, or the beginning of April. A few for early summer use may be sown on a slight hot-bed, or on a warm border under glass. Sow the different kinds separately, and treat them in the same manner as recommended for the last sowing. When the plants are of sufficient size for final transplanting, in May, June, or July, taking advantage of moist weather if it occurs, plant them out in rows, from one to two feet asunder for the dwarf and middle-sized kinds, and for the large kinds from two feet and a half to a yard distant. Give water at planting, if the weather be dry. In their subsequent growth draw-hoe them occasionally, to kill weeds, and to draw earth round the stems.

May to July-sown crops. For late young summer and autumn cabbages, and winter plants, sow small portions at any time from May to July, principally of the quick-hearting kinds. Plant them out finally in summer and autumn, to produce young heads and small cabbage-hearted coleworts in August, September, October, and thence till midwinter. The large, late, family cabbages, which make returns for autumn, winter, and early spring; also the largest kinds usually adopted for field-culture, are to be excluded from this sowing, as they are properly raised as part of the principal crops sown in August, and early in spring. *Abercrombie.*

Kinds proper for Coleworts. The original variety of cabbage called colewort, is, or seems to be, lost; and is now succeeded by what are called cabbage-coleworts. These, Abercrombie says, are valuable family plants, useful in three stages; as young open greens, as greens with closing hearts, and as greens forming a cabbage growth. Procure seeds of some middle-sized early kind, quick-hearting, and of close growth, such as the early and large York, East Ham, Sugar-loaf, and Wellington. Occasionally for larger coleworts, you may adopt some Battersea, Imperial, Antwerp, and Early London hollow; but avoid the larger late kinds, which, in a colewort state, are too spreading and open; the others are close, stocky, and full of heart, and boil most tender and sweet for the table.

Times of sowing Cabbage for Coleworts. To have a good supply of coleworts for autumn, winter, or spring and returning summer, it is proper to make three or four sowings in summer and autumn; that is, one sowing towards the middle of June, a second at the same time in July, and the third in the last week of the same month. These crops are for transplanting in August, September, and October, and will amount to a continued provision for autumn, winter, and early spring coleworts, from September till March or April. At this time the plants of these sowings will start for flowering. To succeed these a considerable sowing should be made in the beginning, from the 3d to 6th of August. Having been transplanted in autumn, the for-

wardest of these plants will be fit for gathering in the course of winter, if the weather be mild; but the principal part should be set apart for a continuing spring crop, to increase in growth from March till June, without running to seed, as would generally be the case if sown before the time just specified. What are not used in their colewort state in spring, will advance to cabbaging, to be cut either with small hearts, or with middling or full heads, in the early part of summer and autumn; and if it be required to have coleworts in a younger state in summer and autumn, you may sow at the time of raising the spring-sown crop of cabbages.

Taking in the crop. After taking off the head, never neglect immediately to pull up the stalk, and carry it off, with all the refuse leaves, to the compost heap, in order that the stems may not push out shoots to exhaust the ground needlessly, as well as to promote neatness and order. Some, who instead of removing the roots and stems of the main summer crop, leave them in the ground, deprived of their injured leaves, and with the intervals between the rows stirred, and perhaps manured, allow them to stand till spring. Thus treated they push out in autumn; and in January or February abound in fine cabbage-sprouts, not much inferior to young cabbages. Sometimes this practice is applied to the earliest spring or summer sorts, in which case the sprout cabbages come into use the following autumn. *Cabbage Coleworts* are gathered when the leaves are as broad as a man's hand. The largest are drawn up by the root, which is usually allowed to remain attached to those taken to public market, as it retains the sap, and tends to preserve them succulent a longer period than if the root was taken off.

** *Red Cabbage. Chou pommé rouge* (Fr.) *Roth Kopfkohl* (Germ.) *Cavolo rosso (Ital.) Brássica oleràcea, D. Capitata.* ** *rubra*, D. C. l. c.

This variety is similar in form to the White Cabbage, but of a purple or brownish-red colour. The red cabbage is chiefly used for pickling or garnishing; and the dwarf red variety, Mr. Neill observes, certainly does make one of the most beautiful pickles that can be presented at table. Both the dwarf and large sorts are sometimes shredded down in winter salads, like beet-root; and the Germans prepare sour krout from all or any of the varieties.

The following are the principal varieties of Red Cabbage:

1 Large red, or Red Dutch, with a large firm round head, usually cultivated in market gardens.

2 Dwarf red, with a small round, firm, delicate head, less common than the other, chiefly cultivated in gentlemen's gardens.

3 Aberdeen red, with an open leafy head, chiefly found in cottage gardens in the north of Scotland, and is an ingredient in the national dish, the kale brose.

The propagation, sowing, and culture, are in all respects the same as for the winter cabbages, excepting that the heads are not used when imperfectly formed, or as coleworts, but the plants should in all cases be allowed to stand till they have formed close firm heads. Sow in August, for a crop to stand the winter, and to come in at the close of next summer, and thence till the end of autumn. Sow early in spring for returns in the following winter or spring.

To save seeds of the different kinds of Cabbages, says Mr. Neill, affords employment to many persons in various parts of England. No plant is more liable to be spoilt by cross-breeds than the cabbage tribe; therefore the kinds must be kept, when in flower, at a considerable distance from each other. Bees are extremely apt to carry the pollen of one to the other, and produce confusion in the progeny. Market gardeners, and some private individuals, raise seed for their own use. For this purpose some of the handsomest cabbages are dug up in autumn, and sunk in the ground to the head; early next summer the flowers appear, and abundance of seed is produced. When the seed has been well ripened, it will keep good for eight or ten years. It has been observed, that seed gathered from the entire plant produce better plants than those that are gathered from the sprouts of plants that the heads have been taken off.

§ 5. *Turnip-stemmed Cabbage. Chou-rave* (Fr.) *Rabi-kale or Cole or Kohl-rube* (Germ.) *Egyptian kale. Cape Cabbage.* (*Brássica oleràcea, E. caulo-ràpa, D. C. l. c.*)

These resemble the Swedish turnip, which has shot into a head. The stalk is very thick, and extends above ten inches above the ground, and this thick stem has the appearance of a turnip above ground. The principal varieties are the following:

1. *Egyptian Kale, Rabi-kale (D. C. l. c.)* The stalk of this variety is very thick, and extends about 10 inches above the ground; the leaves are narrow without crenatures, but generally have at the lower part a strong undulation on each side; they are of a glaucous-green, like those of the Swedish turnip. It is chiefly grown in cottage-gardens, but this is not the true Turnip Cabbage. This plant is probably a slight sub-variety of the following.

2 *White Turnip-stemmed Cabbage* (Engl.) *Chou-rave-blanc. Chou-rave-commun, Chou de Siam,* (Fr.) *Knol-kohl* (Cape.) *B. oleràcea, E. caulo-ràpa* * *álba,* (*D. C. l. c.*) *Kohl-rube,* or *Kohl-rabi* (Germ.) *Cabola* (Ital.) The stem is thick with a round or oval gibbosity in the middle like a turnip, two or three inches from the ground, from which the leaves proceed; they are glaucous-green. The heart is open and not cabbaged. The plant has not long been introduced, and has chiefly been cultivated as food for cattle. It is very common in the north of Europe, especially in Sweden and Poland, where it is to be found in every cottage-garden. The turnip part of the stem pared and sliced down, is used in soups like the turnip, and sometimes also served whole, but unless they are used when very young they soon become rank. The leaves are used like those of greens or coleworts, but as Abercrombie remarks, unless when very young, are disagreeable and rank tasted. This appears scarcely to be a variety of the last. *Knol-kohl* of the Cape and East Indies.

3 *Chou-rave-violet* (Fr.) *Purple Turnip-stemmed kale. Brássica oleràcea, E. Caulo-ràpa* ** *purpurascens,* (*D. C. l. c.*) This variety is distinguished from the last in having purplish leaves and stems. The turnip on the stem is nearly of the same shape, and the plant is cultivated for the same purposes.

4 *Chou-rave crepu* (Fr.) *Puvonazza* (Ital.) (*Brássica oleràcea, E. caulo-ràpa β, críspa D. C. l. c.*) This variety grows short on the ground, and in the spring shoots up strongly from the crown and sides, which are curled and fringed on the edges. The bulb on the stem is not so thick as in the two last varieties. The plant is chiefly cultivated at Naples.

The propagation, sowing, culture, and saving seed are in all respects the same as for the varieties of Borecole, which see.

§ 6. *Cauliflower and Brocoli.* (*Brássica oleràcea, F. botrytis, D. C. l. c.*) These are distinguished from the other varieties of *Brássica oleràcea,* by the peduncles and racemes being corymbose, very fleshy, and very much crowded before flowering.

* *Cauliflower, Chou-fleur* (Fr.) *Blumenkohl* (Germ.) *Cavolo fiori* (Ital.) This is one of the most delicate and curious of the whole of the *Brassica* tribe, the flower-buds forming a close firm cluster or head, white and delicate, and for the sake of which the plant is cultivated. These heads or flowers being boiled, wrapped generally in a clean linen cloth, are served up as a most delicate dish. Cauliflower is a particular favourite in this country. "Of all the flowers in the garden," Dr. Johnson used to say, "I like the cauliflower." Its culture, however, had been but little attended to till about the close of the 17th century; since that time it has been greatly improved, insomuch

that Cauliflower may now fairly be claimed as peculiarly an English product. Till the time of the French Revolution quantities of English cauliflower were regularly sent to Holland and the Low Countries, and even France depended on us for cauliflower seed. Even now, English seed is preferred to any other. For the early supply of the London market, very great quantities of Cauliflower are fostered under hand-glasses during winter and the first part of spring; and to behold some acres overspread with such glasses, gives a stranger a favourable idea of the richness and luxury of the capital. (*Neill.*)

The following are the names of the varieties most in cultivation:—

1 Early, for the first early crops.

2 Later or Large, for principal early and main crops.

3 Red Cauliflower, having the stalks or heads of reddish-purple colour, esteemed more hardy than the others, and good for an early crop.

Very little difference in quality has been discovered between these three varieties. Their distinctions are too trifling to merit the attention of practical horticulturists. Like the rest of the tribe they are apt to sport into degenerate varieties. "An action for damages was brought in Westminster Hall, against a poor but unfortunate gardener for selling cauliflower seed, which only produced long-leaved cabbages." This circumstance has been particularly noticed by Linnæus.

Propagation and Soil. The Cauliflower is raised from seed, of which half an ounce is sufficient for a seed-bed four feet and a half wide by ten in length, or a bed of 40 square feet. The soil for the seed-bed may be light, but for final transplanting it can hardly be too rich, the Cauliflower, like the vine, being reputed "a rough feeder." Cleanings of streets, stables, cess-pools, &c. ought therefore to be liberally supplied during the growth of the plants, when very large heads are desired.

Times of sowing. The early and main superior crop, brought to fruit by the longest nursery attendance; the late summer succession crop, raised by the shortest course, and the Michaelmas crop, obtained at the least expense, are sown respectively at three different periods. The principal sowing is made about the end of the third week in August, or about the middle of the month, to stand over the winter under frames, hand-glasses, or half sheltered in warm borders, for the early and main superior crops next summer. A secondary sowing in February or March, for succession and late inferior crops, but in order to bring the plants up early and to forward them twelve days or a fortnight in their growth, it will be well to sow them in a moderate hot-bed. Make the bed about twenty inches or two feet thick of dung, on which put a frame, then lay four or five inches in depth of rich earth over the bed. Sow the seed on the surface, cover it a quarter of an inch thick of like rich earth, and then set the glass on. As soon as the plants appear, let them have air every day by tilting the glass a considerable height, and in mild weather the lights may be taken quite off in the day-time, for if kept too close it would cause them to grow up weak. But where there is not the convenience of a frame, cover the bed at nights and in bad weather with Dutch mats over hoops or long sticks, sprinkle them with water occasionally if the weather be dry. Those sown in March require the same treatment as the February sowings. Cauliflower for a successional crop may be sown any time in the month of May on a sheltered border, about the end of this month a second sowing may be made for the last crop of the season, on a free open spot of light earth; these last will come into use the following autumn or winter.

Mr. W. Ball finds that if cauliflower-seed is not sown till the last week in August, and that if the seedlings are not transplanted till the middle or near the end of November, before the hard weather sets in, no sort of covering is necessary, nor any other protection than that afforded by a wall having a south aspect; in such a border, and without any covering, young cauliflower-plants have uniformly stood well for many successive winters, and have always proved better and sounder plants for spring planting than such as have had additional shelter. The seedlings protected with glass-frames generally grow too gross in the stems, which become partly blackened, and the plants being thus unhealthy are not fit for planting out. Late raised seedlings which spend the winter in the open border, uniformly become the largest and finest table cauliflowers during the summer, though they certainly do not come in quite so early. Cauliflower plants, it is probable, are often killed with too much attention. Seedlings raised in autumn seem to be very tenacious of life. (*Caled. hort. mem.* 3. *p.* 192.)

A method of producing Cauliflower pretty early and with great certainty is this; the plants are set in small pots in the winter season and kept in any convenient part of the floor of a vinery or other glazed house. In the beginning of March they are taken out of the pots with the ball of earth attached, and planted in the open ground. If they be here protected against severe frosts with bell-glass covers, they come into head in the course of April, if the weather prove favorable. (*Neill.*) The following method of obtaining a crop of early cauliflower is recommended by an anonymous correspondent in Loudon's Gardener's Magazine. From a seed-bed which has been sown two or three days after rather than before the customary period, select a score or two of healthy plants; pot them singly in the smallest sized garden-pots in rich loamy compost, water and plunge them in a cold frame, shading for a short time until they have taken root. Afterwards give them air daily, drawing on the lights at night and defending them from severe frost with mats, water frequently with tepid manured water, and keep clear from decayed leaves and weeds. Examine the state of the roots from time to time, and as they become in the least degree matted, immediately shift in forty-eight sized pots with the before-mentioned compost, and replace them carefully in the same frame and attending to them as before. When the roots have nearly filled these last pots, shift into thirty-twos, and in due time they will ultimately require twenty-fours, or if they have grown rapidly even eighteens. After being firmly established in these, they may be removed into a vinery, peach, or other forcing-house, there to remain till the end of March or beginning of April, when they may be turned out into the open air between the asparagus-beds or any other warm or sheltered spot. They will require to be put in very deep and protected by hand-glasses, or at least by boughs of trees, that they may not suffer from the sudden transition of weather or inclement skies. It is hardly necessary to add that the whole success of this method of culture depends entirely on the plants receiving no check in any stage of their growth, either from want of timely repotting, water, air, of sufficient protection from frost; while in the house if not supplied with water in pans they are very liable to button, and thereby wholly defeat the end in view.

Crop to stand the winter. For the early and general crops next summer, make considerable sowings from the middle till near the end of August, to stand the winter, some being finally planted out the same year in warm borders in October or November under hand-glasses, and the others pricked out into frames and warm borders for planting out finally in the spring into the open ground to succeed the hand-glass heads or for the general summer-crop. Sow in a bed of rich light mellow earth. After sowing give occasional light waterings in dry weather, and shade in hot sunny days till the plants come up, when these have leaves an inch or an inch and half broad in September, prick them into intermediate beds three or four inches apart,

watering and occasionally shading from the mid-day sun, till they have taken root; to remain in such beds till they have gained strength till October.

Hand-glass Division. "Towards the close of October, transplant a quantity finally into rich ground, which has been well dunged, under hand-glasses in rows three feet and a half or four feet asunder, with intervening alleys a foot wide, and three feet apart in a row. Set three, four or six plants centrally under each glass about four inches apart, with the design of retaining only two or three of the best plants in the spring. Give a moderate watering at planting, and put on the glasses close till the plants take root, discoverable in a week or ten days, by their shewing a renewed growth; then raise the glasses on the warmest side, one or two inches in mild days, to admit free air to the plants. Continue the glasses all winter, but in all temperate weather tilt up the south side daily two or three inches to give the requisite admission of free air. You may occasionally take the glasses off, especially if the plants appear to draw or get on too fast in growth, as they are sometimes apt to run into small button heads in their nursery state, useless for future culture; but put on the glasses early towards evening, and always keep them on at night and during cold rain, snow, and frosts, shutting them close down in all inclement weather, and during rigorous frosts it would be advisable to give some protection with long dry stable litter round the glasses, or to cover with mats, removing the covering when mild settled weather occurs. Thus conforming to the vicissitudes of the weather, continue the glasses till the close of April or beginning of May, giving larger admissions of free air as the warmer season of spring advances, and sometimes in fine mild weather admit a moderate warm shower of rain. Meanwhile in March, if all or most of the plants under the glasses have stood the winter, be careful to leave only one or two of the strongest under each glass, transplanting the superabundant into the open garden in a quarter of rich mellow earth, improved with rotten dung dug in a spade deep; setting the plants two feet and a half asunder, and giving water. In thinning the plants be careful in taking out those with black shanks, but do not take the trouble to transplant them, for they will prove abortive. At the same time, to assist those remaining under the glasses, draw a little earth about the stem of each. To these continue the glasses till the period mentioned above to forward them in full growth for the most early production; but as they expand in the herb raise each glass upon the props three or four inches high, to admit air freely, and to give a larger scope of room above, for the free growth of the plants, or when further advanced you may draw a small ledge of earth round the bottom of each glass, both to raise the props higher for an additional upward space, and to contain water when occasionally given in dry weather. Towards the end of April or the beginning of May, when the plants will in a manner have filled the glasses, remove these from the most forward, but continue the aid of glass as long as practicable, to accelerate the plants into early heading in May. Thus the most early crop will produce a supply of flower-heads for gatherings in succession in May and June."

Frame Division. "The other plants of the same sowing designed for wintering in frames, may in young growth, at the end of September or beginning of October, be either pricked at once into the winter beds, or be at that time removed into a preparatory bed in the open garden, to have a month's growth in order to be transplanted into the frame beds in the end of October or beginning of November in rows, crosswise, four or three inches apart in the bed, covering the surface with dry ashes or sharp sand. Give a light watering, and put on the lights close till the plants have taken root, then prop up the lights behind two or three inches, or draw them off occasionally to the back of the frames in mild dry days, but keep them on when very cold, and in rain, snow, frost, and always at night, and in severe frost cover the glasses and round the frames with dry long strawy litter and mats; but in all mild, dry weather admit the air fully as in managing the hand-glasses. Then in March or beginning of April, transplant the whole into the open garden in rows two feet and a half asunder, and they will come into full production in July and August."

Half-sheltered Portion. "In want of frames or hand-glasses, you may in October either prick some plants into a warm south border close under the fence, three inches apart to be protected in rigorous frosts with mats, dry litter or reed pannels; or you may prick some into a bed, arched over with hoops, to receive a covering of mats during cold nights or heavy rains, snow or frosts in the day-time in winter. Give the full air in all moderate weather till March or April, then all to be transplanted finally as above."

Secondary sowing or first spring-raised crop. "For late succession summer cauliflower to succeed the autumn-raised early and main summer crops, or if none were raised to stand the winter. Sow in February or beginning of March in a moderate hot-bed, or where that cannot be had, in a warm border under a frame or hand-glass, and when the young plants have leaves an inch broad, prick them into other beds of the same description, three inches apart, to gain strength by three or four weeks growth, in order to be planted out into the open garden at the end of April or beginning of May, where they will produce tolerable heads in July or August. Sow also in the open garden during the last fortnight in March and the first in April for a later succession with small heads in August and throughout autumn. Plants of the late crop removed as late as May for fruiting the same year should be planted in a shady border."

Second spring-raised crop. "The next and last sowing is for the late autumn and winter crop, commonly called the Michaelmas crop, to be made towards the 24th of May, in a bed of light earth. Prick out the young plants in June to remain in the intermediate bed till about the middle of July, then to be transplanted two-feet and a half asunder. Give occasional watering till they have taken good root. They will begin to produce heads in October, but they will be of superior size in November and December if temperate weather follows.

Final culture of the three crops. "With respect to the culture of the different crops, after being finally transplanted, it is to hoe the ground occasionally in order to cut down weeds, and as well to loosen the earth and draw some round the stems of the plants. When the early crops are nearly advanced to full growth in May and June, one or two good waterings to the roots will contribute to their producing large heads. In the dry weather of meridian summer water those not in flower twice a-week, and those in flower every second day. As the flower heads shew themselves turn down some of the larger leaves to defend them from sun and rain, and to preserve them white and close in perfection." *Abercrombie.*

Insects and Slugs. "Cauliflower plants when first planted out are frequently infested with flies or their larvæ, to attract which it is not uncommon to sow a little radish-seed on the Cauliflower ground a fortnight before transplanting, the flies preferring the tender leaves of the radish to those of the cauliflower, the latter are thus suffered to escape." *Loudon.*

Look carefully once a-week or oftener, if mild weather, over the cauliflower plants, as slugs will destroy many of them, the best way is to pick them carefully off with the hand. Laying a little chaff round the plants is said to keep off slugs. In severe weather mice and rats will be apt to destroy them; recourse must then be had to poison and traps. The plants should be kept clean from dead leaves and weeds.

Storing or Preserving during Winter. "Cauliflowers may be preserved for a considerable time by various methods. About the end of the month of October pick out all those that have close and well-shaped heads, lift them carefully with a spade, dress off most of the leaves above the flower, remove them to an open-shed, and lay them in by the heels, as it is called, among rotten tan or dry mould, place them closely together, but not so as to touch each other. In this state, if kept free of damp, they will continue good for some time after those in the open air are exhausted. They may also be carefully taken up, and stored in the same way in the borders of any peach-house or vinery, observing to shut up the lights during rain, and also on frosty nights. They may also be protected in deep garden-frames, or they may be taken up in a dry day and carried to an airy shed, and tied in pairs, and hung up on poles or strong nails with their heads downwards; or they may be cut over about six inches below the flower, and a few of their leaves left to be wrapped round them, and buried about eighteen inches below the surface, in a dry bank or among sand, in a cellar or out-house.

"The most successful method we have practised for preserving Cauliflower in perfection through the winter months is to cut them in dry weather, dress off all their leaves, put them in an airy place to dry for a day or two, then bury them in casks or boxes amongst bog-mould, composed of vegetable matter, such as is dry for fuel. This kind is antiseptic and capable of resisting putrefaction, particularly when excluded from atmospheric air. Cauliflower preserved in this way should be well washed previously to using, as they become black when buried any length of time; not that such blackness proceeds from any decomposition of the heads, but arises from the more subtile particles of the mould adhering to their surface." *Mackintosh.*

A method of preserving Cauliflower is mentioned, *Cal. hort. soc. mem. vol.* 1. *p.* 129, and which consists in burying the entire plant in a pit about eighteen inches deep, dug along the bottom of a wall. On a dry day the plants are taken up and the leaves are wrapped round the head or flower, they are then deposited in the trench, the heads sloping downwards and the roots extending upwards, so that the roots of one layer cover the tops of another. Next the whole are covered closely with earth, sloping it from the wall and beating it smooth with the back of the spade so that the rain may run off. In this way they are preserved from November to January.

To save Seed. "Mark and leave some prime plants of the thoroughly nursed early and main crops in May and June, when the flower heads are in highest perfection, as those of late production will not ripen seed effectually. The stools will afford ripe seed in September, when be careful to watch the chaffinches, green-birds, &c. to gather the branches as the seed upon them ripens. Lay them elevated from the ground in some sunny, airy situation, to dry and harden to full maturity; after which let the seed be beaten or rubbed out, cleaned and sifted from the husky parts, spread on a cloth to dry the whole equally, and then put up for sowing the following year." *Abercrombie.*

* * *Brocoli*, (Eng.) *Broccoli* (Fr.) *Italienesche Kohl* (Ger.) *Cavolo Romano*, or *Broccoli* (Ital.) (*Brássica oleràcea, F. botrytis.* * * *asparagoìdes*, D. C. l. c.)

Brocoli is scarcely distinguishable from *Cauliflower.* The stem is usually taller; the leaves are more elongated; the peduncles are fleshy at the top, bearing small flower-buds, and of a hardier constitution. The varieties are divided into the *White* and *Purple Brocoli;* there are numerous sub-varieties of each.

In Miller's Dictionary, under the article *Brassica*, the few *Brocolis* that were then known are supposed to have proceeded from the *Cauliflower*, which was originally imported from the Isle of Cyprus about the middle of the 16th century. Miller mentions the *White* and *Purple* or *Maltese Brocoli* as coming from Italy, and it is conjectured that from these two sorts all the subsequent kinds have arisen, either by accidental or premeditated impregnation. Miller mentions the *Roman Neapolitan* and *Black Brocoli* as being in use in his time, but he says of those the Roman is the best.

Mr. Neill observes, that no culinary plant is so liable to sport as *Brocoli;* so that new kinds, slightly different, are continually coming into notice or favour, and as speedily sinking into neglect. Maher observes (Hort. trans. 1. p. 116.) that as all plants of the *Brassica* tribe become less alkalescent and more palatable in proportion as they approach to a pale or white colour, such varieties of *Brocoli* will undoubtedly be preferable to purple ones if they turn out equally hardy. An able writer on this subject, H. Ronalds, of Brentford, has given (Hort. trans. 3.) a description of different varieties of *Brocoli*, with an account of the method of cultivating them; from this and any new additional information on this subject, in Loudon's encycl. gard., we shall chiefly compose this article.

§. *Varieties and their Culture.*

1 *Purple, Cape,* or *Autumnal Brocoli.* This has a close compact head, of a beautiful colour; the leaves are almost entire, erect, concave, lobed at the base, and much waved, short, and regularly surrounding the head; the veins and midrib are stained with purple, which stain is a test of its being true; the head is exposed to the view in growing; in general it is not very large, as it enlarges the projecting parts of the flower shew a greenish-white colour mixed with purple. When boiled the whole head becomes green. If the season is showery, and this variety is planted in good ground, it comes as large as *Cauliflower.*

Cult. Sown about the middle of May or beginning of June, it will produce in regular succession from August till December, or until the frost destroys the heads. When sown in July or August, if the winter is mild, it will bring good heads in spring. When sown in the beginning of September and then preserved in frames as *Cauliflowers*, fine heads may be expected in the months of June or July. Thus by good management this kind may be in use the greater part of the year, but it is not hardy enough to be depended on in the winter months. The plants grow from one foot to a foot and a half, and should be placed about two feet apart in every direction.

Maher's mode of treating the *Purple Brocoli* is as follows. Three crops are sown annually: the first between the 12th and 18th of April, a second between the 18th and 24th of May, the third between the 19th and 25th of August; these successive crops supply the family from September till the end of May. The seeds are sown very thinly on a border of very rich light earth. Not a weed is suffered to grow, and when the plants have from eight to ten leaves, which is in about a month, they are finally transplanted, two feet asunder every way, in a piece of sandy loam, which has been well prepared by digging, and enriched by a large proportion of very rotten dung, frequently turned over to pick out every sort of grub or insect. The ground is kept clean by frequent hoeing, and the loose surface is drawn round the stems into a heap. The second crop is treated exactly as the first, but the weaker plants are left in the seed-bed eight or ten days longer to gain strength. They are then transplanted from the bed into eighteen sized pots filled with rich earth, then placing them close to each other in the shade, and duly watering the plants till they begin to grow freely. After this the pots are plunged in the open ground two feet distance each way, and about three inches under the common level of the ground, by this means a basin is formed round each plant, to retain any water given to them when necessary until the autumnal rains commence, when the basins are filled up by drawing the earth round each plant, at the same time pressing it firmly down, to prevent the wind from shaking them. A few of these sometimes

shew flowers too soon, and to guard them from early frost, a leaf or two is broken down over them. On the approach of settled frost in December or January, all the pots are taken up and removed to a frame-pit or shed, where they can be sheltered from the severity of the weather, but they should have plenty of air when it is mild. By this method a supply is preserved for the table in the hardest winters. Brocoli always succeeds best if planted finally from the seed-bed; if planted oftener the head is less in size, and runs much sooner after it forms, and even general crops should never be pricked out. The seeds of the third crop are sown in a frame or under hand-glasses, and about the third week in October the plants become strong enough to remove as in the two former crops.

2 Green Cape or Autumnal Brocoli. This sort differs but little from the preceding except in the colour and in the heads, as well as the plant proving in general larger. The leaves are long and narrow, much like those of *Cauliflower*; they are little waved, and consequently have a smooth appearance. The veins and mid-rib are green. The head, which has some resemblance to a *Cauliflower*, is of a greenish-white colour, and is usually somewhat covered by the leaves. These two sorts are very sportive, running much into each other, and have a strong tendency to degenerate, yet are quite distinct, and when so are very beautiful. The greatest care should be taken in sowing the seeds from plants that are very true. This remark applies generally to all sorts.

3 Grange's Early Cauliflower Brocoli. If this sort is sown at three different times from the beginning of May until the end of June, it will bear heads in succession from Michaelmas to Christmas, if the weather is not severe. The leaves covering the head defend it from slight attacks of frost, they have long naked foot-stalks, are wider and shorter than those of the *Green Cape*, and lobed at the base, but not much waved; the veins and mid-rib are whitish-green; the head is large and quite white. The plants should be planted two feet asunder each way. This kind will amply repay the expence of cultivation.

4 Green Close-headed Winter Brocoli. This is a good sort, apparently a seedling from the *Green-Cape*, which it closely succeeds in coming into use. The plants are dwarf, with spreading leaves, which are moderately indented, numerous, much waved, and large; the veins and mid-rib are white; the flowers grow exposed, nearly resembling that of the *Green-Cape* in appearance, and does not attain a great size. The peculiarity of this sort is that it continues to bear during the whole of the winter, if the weather is mild. A single plantation made from seeds sown in May, Ronalds found to yield heads fit for use through the months of November, December, January, and February. Plant from one foot and a half to two feet distance.

5 Early Purple Brocoli. This is a very excellent kind, of a deep purple colour, if the true sort; it is close-headed at first, afterwards it branches, but it is apt to come green and too much branched, especially in rich ground. The plants are from 2 to 3 feet, high growing, strong; the leaves are much indented, of a purplish-green colour; they spread out wide, but not long, though the stalks are so; the head is quite open from the leaves; small leaves are sometimes intermixed with the head, the plants produce sprouts or flowers from the axils of the leaves. When this kind is sown in April it begins to produce heads in November, and continues bearing heads and sprouts throughout the winter; if sown in June, it produces abundance of sprouts in March and April.

6 Early White Brocoli. The heads of this sort are of a close texture, and of a pure white colour. It grows to about 3 feet in height, with erect, concave, light-green, and nearly entire leaves. To obtain fine early heads of this sort, the seed should be sown in February or beginning of March on a slight hot-bed. The plants when about 3 or 4 inches high, must be transplanted into beds of light rich earth 3 or 4 inches apart, and defended from the frosts and cold nights by a mat covering; they will be strong enough to plant out finally at 2 or 3 feet distance by the end of April; under this treatment they will produce beautiful heads in November, and continue to do so until Christmas, if the weather is tolerably mild. This sort, as well as several others, is sometimes cut in considerable quantities by the market-gardeners previous to an expected frost, and kept in sheds or cellars for the supply of the market.

7 Dwarf Brown Close-headed Brocoli. This sort, from its colour, is supposed to have sprung from the *sulphur-coloured* Brocoli, from which, however, it differs in coming in earlier, as well as in the shape and colour of the heads; the leaves are also broader and shorter; they are small, not much waved, dark-green, with white veins; they grow upright, and do not cover the head at all. Most of the heads are green on their first appearance, but soon change to large handsome brown heads. If this kind be sown about the middle of April, it is in use throughout March and April. Two feet distance every way is sufficient for the plants when put in.

8 Tall Large-headed Purple Brocoli. This sort grows from 2 to 3 feet in height, and produces large purple heads. If sown towards the end of March, it will prove a useful kind in March and April following. The plants require to be 3 feet asunder, in good ground.

9 Cream-coloured or Portsmouth Brocoli. This kind exceeds all the others in size; the heads are of a buff or cream-colour, very compact and firm; the leaves are large and broad, with white veins; they spread out widely, but the small centre leaves cover the flower. A head of this kind was sent by Mr. Oldacre to the Horticultural Society from Spring Grove, Brentford, that measured 2 feet in circumference, although it was quite close. If seeds of this sort are sown in April, they will produce heads in the following February, March, and April. It bears near the ground. The plants should be 3 feet asunder. This kind merits general cultivation.

10 Sulphur-coloured Brocoli. This is a hardy and valuable sort; if sown in April it produces in the following April and beginning of May, fine, compact, conical, sulphur-coloured heads, some of them slightly dotted with purple. The leaves have long footstalks, are much indented, of a bluish-grey-colour. Two feet asunder is sufficient for the plants.

11 Spring White or Cauliflower Brocoli. This sort grows very robust, with large flat narrow leaves, which have thick veins; the leaves encompass and compress the head, so as to render it generally invisible even when fit to cut, which is a great preservative from the frosty mornings common in the spring months. If the seeds of this kind are sown in March, and finally planted out at 3 feet asunder, these, if in good ground, will produce very fine heads perfectly white throughout the months of April and May of the following year.

12 Late Dwarf Close-headed Purple Brocoli. This is the latest purple Brocoli, being in perfection throughout April and the greater part of May. The plants seldom rise above a foot in height; the flower at first shews small and green, but soon enlarges, and changes to a close conical purple head; the leaves are short and small dark-green, with white veins, much sinuated, deeply indented, and forming a regular radius round the head, giving the whole plant a singular and beautiful appearance. The seeds of this kind should be sown in April. Plant finally from one and a half to two feet asunder.

13 Latest Green, or Siberian, or Danish Brocoli. This is the latest and hardiest of all the Brocolis, for the severest winters will not destroy it. The leaves are much waved and indented, long, and narrow, with a tinge of purple colour on the

stems. If this sort is sown towards the end of April, it will produce large compact green heads during the whole of May in the succeeding year. Two feet distance is sufficient for the plants.

14 Sprouting Brocoli. This is a hardy spring sort. If sown in April it will produce in the following spring. Two feet asunder is sufficient for this kind.

15 Belvidere Brocoli. The heads of this kind are very handsome and excellent. The plant is not very hardy. Sow in April, and plant finally two feet asunder.

General observations on the culture of Brocoli. All the sorts are raised from seed, and half an ounce is sufficient to sow a bed of 40 feet square. Ronalds directs the seed-beds to be prepared of rich mould well dug, and if dry watered the evening before sowing. The seeds should be thinly sown, and the beds should be covered with mats or litter till the plants appear; the covering may then be removed, and then watered occasionally as the state of the weather requires: the best method is to transplant when the plants are about 2 or 3 inches high into other beds about 4 inches apart. Being several times refreshed with water, if the weather is dry, they will in a fortnight or three weeks be sufficiently strong for a second planting. This mode offers some advantage in giving time to clear off many crops, such as peas, &c. thereby obtaining ground which could not otherwise be conveniently had at the first season of planting out. The four first sorts on the list, which Mr. Ronalds considers as congeners, should be only once transplanted, as the check their removal occasions is apt to produce the head prematurely, which in that case will be small, and indifferent in quality. If the season is showery, it will be requisite to cover the beds as soon as sown with netting, to keep off the birds, also to sprinkle the plants with lime-water when they appear, or to strew on them fresh slaked lime to destroy the slugs. In this case, when the plants are six or eight inches high, they may be planted finally at the distances recommended for each sort. Brocoli in general succeeds best in fresh loamy soil, where it is supposed they come more true to their kind and hardier, but if this situation cannot be had, deep digging with plenty of manure, or where the ground is exhausted with reiterated cropping, a good quantity of fresh loam obtained from a common, dug in, would materially improve the Brocoli, and be a lasting use to future crops, are the only remaining alternatives to procure good crops. Deep digging also buries the insect which causes all the *Brassica* tribe to club at the roots. Soap ashes dug into the ground is supposed to be a good preservative from the club, and if the roots of the plants, just previously to planting, are dipped and stirred well about in mud of soap ashes with water, its adherence will in a great measure preserve them from attack; perhaps a mixture of stronger ingredients, such as soot, sulphur-vivum, tobacco, &c. would be still better (Hort. trans. vol. 3.).

Mr. Wood, a writer in the Cal. Hort. Mem., has paid considerable attention to the cultivation of *Brocoli* for forty years. He finds that manuring with a compound of *sea-weed* and horse-dung produced the finest and largest heads he had seen during a practice of fifty-four years.

Preserving Brocoli during Winter. Ronalds says, that though *Brocolis* come larger and finer on the spot where they are planted, yet it is prudent to take up a part of the later sorts in November, disturbing the roots as little as possible, and lay them in slopingly, with their heads towards the north, only a few inches above the ground, and about eighteen inches asunder. By this means the crown of the plant, lying low, is soon covered and protected by the snow which generally falls previous to long and severe frosts. The plant is also rendered tougher in fibre, and hardier, by the check received in this last removal. Mr. A. Knight having practised laying in his *Brocoli* plants in November, in the usual way, found but small heads produced from them in the succeeding spring, till he tried trenching or laying them in September, and "so low as that the centre of the stem at the top of each plant was level with the surface of the ground." The plants are watered, roots are properly emitted, and the earth drawn round each plant, before snow is apprehended. The consequence of this treatment is, that the plants are fresh and vigorous in spring, and produce large heads. (Hort. Trans. I. p. 305.) Nicol takes up the most forward crops of Brocoli in the end of October, and lays them on their sides, so as the heads may not touch each other. In a dry soil, and open situation, the plants will thus resist the severest winter.

Gathering Brocoli. In gathering Brocoli, five or six inches of the stem are retained along with the heads; and in dressing, the stalks are peeled before boiling. Some of the kinds produce sprouts from the sides of the stems, with small heads; these should be gathered when ready, and are very good when boiled.

To save seed. The largest, finest, and best formed heads are selected for this purpose, taking particular care that no foliage appears on the surface of the heads. These are marked, and in April are laid in by the heels, in a compound of cleaning of ditches, tree-leaves, and dung. When the head begins to open, or expand, the centre is cut out, leaving only four or five of the outside shoots to come to seed. Lifting prevents them from producing proud-seed, as it is called, or degenerating. The above method produces seed the most genuine of all the methods that have been tried. The *Sulphur Brocoli* is the most difficult to procure seed from. (Nicol. in Cal. Hort. Mem. 2. p. 267). Abercrombie says that Brocoli seeds degenerate in this country, and that the best seed is obtained from Italy.

Insects which the Brássica tribe are liable to be attacked by.

The whole of this tribe are liable to the attacks of the larvæ of the *Tipula oleràcea*, Lin. on their roots, and of the caterpillars of butterflies and moths on their leaves, as well as *aphides*, or cabbage-lice, snails, and slugs. There is no remedy for the first, excepting that of taking up, cleaning, and transplanting in fresh soil, in a different part of the garden; and it is in general easier to plant afresh from the seed-bed. With respect to caterpillars, snails, and slugs, they can only be gathered by hand, and the way to do this effectually is to begin, as soon as they appear, to look them over daily, early in the morning. Poultry, and especially ducks and sea-gulls, are sometimes of use in keeping these and other insects under; a hen and chickens will devour caterpillars greedily, but are apt to scratch the soil afterwards if not timely removed; Turkey-fowls are better. Nature has furnished a remarkable quantity of eggs in the bodies of caterpillars or pupæ, which are there hatched; the larvæ have no feet; they are soft and cylindrical, and feed on the substance of the caterpillar, which never turns to a perfect insect; while the larvæ of the ichneumon spin themselves a silky web, and change into a *pupa incompleta*, and in a few days the fly appears. (*Entymologist's Companion*, p. 68.)

Field Culture of the Varieties of Brássica oleràcea.

The Cabbage tribe, for the common purposes of farming, will afford little profit; but near large towns or sea-ports they will answer the purpose of the farm-gardener. The varieties commonly cultivated in fields are the large field-cabbages, called Scotch, or Strasburgh, and the drum-head, &c. For the purposes of domestic economy all the varieties may be cultivated,—*Cabbages*, *Borecoles*, *Savoys*, *Brussels-sprouts*, *Brocolis*, and *Kohl-rübe*; for the time and manner of cultivating see Garden Culture. Any soil that is rich will suit all varieties. The best mode of preparing for field-culture is that for *Potatoes* or *Turnips*, the

plants being dibbled in along the centre of a ridgelet. For early crops no ridgelets are required, as the plants are inserted in rows by a line at much narrower distances. The season for planting a full crop of field-cabbages is in March; but cabbages may be planted as late as June, and produce a tolerable crop in November; and in this way they may be made to succeed an unsuccessful crop of turnips. The plants used in March should be the produce of seed sown in the preceding August; but those planted in May or June may be the produce of February or March sowings.

The after-culture consists in horse and hand-hoeing, and weeding; and the crop is taken by chopping off the heads with the spade, leaving an inch or two of stalk to each. They may be preserved by housing, but only for a short time. The produce is said to be from 35 to 40 tons per acre. Sir Humphrey Davey found 1000 parts of *cabbage* gave 73 of nutritive matter, of which 41 are mucilage, 24 saccharine, and 8 gluten.

The application of field-cabbage is generally for feeding milch cows, and sometimes to the fattening of oxen, and for sheep in the lamb-season.

The diseases of the varieties of *Brássica oleràcea* are the same as those of the *Turnip*, with the exception of the forked excrescences, and they neither admit of prevention or cure by art; but like the turnip, under favorable circumstances they do not occur.

Calendar of the work necessary to be done to the varieties of Brássica oleràcea.

1 *January.* Lay out ground for planting *Cabbages*, if the weather is mild, digging in some rotten dung a spade deep, properly mixed with the earth in the bottom of the trench. About the end of the month plant about three feet asunder, if large growing sorts. The *Sugar-loaf* and *Early York Cabbage*, are the best for this planting. Fill up the places of the plants that have died in the former plantations. On the same ground where *Cabbages* are planted, a thin crop of round-leaved *Spinach* may be sown, broad-cast, which will be fit to gather in April, or the beginning of May. Transplant *Cabbages* and *Savoys* for seed in the beginning of the month, if it has been neglected in November or December. Examine the frames in which young *Cauliflower* plants have stood the winter, and let the withered or damaged leaves be picked off, and stir the surface of the ground a little, if it can conveniently be done. In mild weather let the plants have plenty of free air, by tilting the glasses, or taking them entirely off, keeping them close down during night, and in frosty weather. If the weather is very severe, cover the glasses every night, and in the day-time if necessary, with mats, straw, or ferns; also lay some litter round the edges of the frames or hand-glasses, which will prevent the frost from penetrating at the sides. Look carefully over the *Cauliflower* plants, and pick the slugs, &c. off with the hand. In severe weather mice and rats will be apt to destroy many of the plants; recourse must then be had to traps.

Cape Brocoli managed exactly according to the directions given for Cauliflower plants. The crops of *Brocoli* may now be still further protected from the frosts by laying some bean-haulm and other litter on the ground amongst their stems, and then stick the ground full of pea-stakes and other branches, in imitation of natural coppice. The shade afforded by this process will greatly counteract the effects of sunshine succeeding severe frosts, which at this time, and in February, are so hurtful to all culinary vegetables.

2 *February.* *Early Sugar-loaf Cabbage*, and other *Cabbages*, should be transplanted finally, the strongest in the beginning, and the weakest in the latter end of the month. Sow *Cabbage* seeds about the middle or latter end of the month, for July, August, and September use. If the winter has destroyed many of the plants of the August sowing, some of the earlier sorts may be sown on a gentle hot-bed. Sow some *Red Cabbages* for next winter's supply. *Cabbages* and *Savoys* for seed may be planted if not done before. Savoy seed may now be sown for the first crop, about the middle or latter end of the month, for September, October, November, and December use. Stir the mould, and earth-up the *Cabbages* that were planted in October; this will invigorate the plants, and promote their growth.

Cauliflower plants in frames, and under hand-glasses, should have plenty of air every mild day, by entirely removing the glasses. About the end of the month some of the strongest plants should be finally transplanted, in a rich sheltered spot of ground, about a yard distant each way: these should be sheltered occasionally if required. Thin the *Cauliflower* plants under hand-glasses, if there be more than four under each glass: observe to draw the weakest, raise some earth round the stems of those that remain at the same time. The plants that have been drawn out should be planted in a sheltered situation, allowing them sufficient room to come to perfection. Sow *Cauliflower* seeds about the end of this month, to raise plants to succeed the early crop; if sown on a slight hot-bed they will be a fortnight earlier, giving plenty of air in mild weather.

3 *March.* Plant finally the *Cauliflower* plants which have been in frames or warm borders during winter, if not done in the former month, in a good spot of ground, well manured, and dug in rows about thirty inches apart, allowing the same space between the rows. Raise earth round the stems of the *Cauliflowers* under hand-glasses, the glasses to be removed in fine weather. Prick out those plants raised from seed sown the preceding month, into a bed of good earth, in a warm situation: a hot-bed is preferable, as it will forward them greatly. Sow *Cauliflower* seeds early in this month, if it was not done in February, in a moderate hot-bed, or in a bed of good earth, in a warm situation, for August use. Sow *Brocoli* about the middle or towards the end of the month, in a warm open situation. If sown earlier *Brocolis* are apt to start, or button. Transplant finally all sorts of *Cabbages*. Sow seeds of *Cabbages* in the beginning or middle of this month; the early kinds for successional and young summer *Cabbages*, the late kinds for autumn and winter *Cabbages*. *Red Cabbage* should now be sown for winter use. These will be well cabbaged about Michaelmas. Sow *Savoy* seed for a principal crop, to serve from about Michaelmas to Christmas. Sow *Brussels sprouts* any time this month.

4 *April.* Draw earth round the stems of those *Cauliflower* plants under hand-glasses; let them be fully exposed in mild weather, and when there are warm showers. Finish the planting out of *Cauliflower* plants in frames, warm borders, &c. if not done last month. Prick out those plants raised from seed sown last month. *Cauliflower* plants which were raised from seed early this spring should be finally planted about the end of the month in a piece of good open ground, well dunged, and dug about two feet asunder, water them as soon as they are planted. Sow *Cauliflower* seed for a successional crop on a sheltered border, and guard the seed well against birds at this season. The *Cauliflower* plants which were kept in pots during winter may now be finally planted out if the weather is fine. Make holes sufficiently large to admit a spade full of rotten dung, and upon this set the plants, one in each hole. They should be carefully turned out of the pots with balls; settle the mould about them by gentle watering, these will require to be sheltered during inclement weather until the month of May. The *Cape Brocoli* sown in autumn, and wintered with the *Cauliflowers*, may now be finally planted, and treated in the same manner as *Cauliflowers;* they should be protected by a few branches until the weather is set-

tled. Sow a moderate quantity of *Early Purple Brocoli, Portsmouth, Sulphur-coloured, Cauliflower-Brocoli, Late Dwarf Purple Brocoli,* and *Siberian* or *Danish,* in a rich sheltered border, covering them with mats if the weather is frosty, give plenty of water if the weather is mild and dry, and when the plants are two or three inches high prick them out two or three inches apart. Sow and plant all sorts of *Cabbages,* and earth up and clear from the crops already planted. Prefer for this sowing the *Battersea, Pentonville, Imperial,* and *Antwerp.* Sow full crops of *Savoys* both at the beginning and end of this month, as well as *Brussels Sprouts.* Sow sorts of *Borecole* and *Chou Raves* in borders of middling ground. The *Woburn Kale* is propagated by cuttings, these may be planted finally at once.

5 *May.* Sow *Cauliflower* about the end of this month for the last crop of the season for the winter supply, give plenty of water if the weather is dry, and occasional shading. Plant *Cauliflower* finally in a north or shaded border, the coldest and dampest situation in the garden is the best for this planting. Hoe and earth up the former planted crops. Pay proper attention to those under hand-glasses as regards air and water. If any are coming to flower on any of the crops, break a leaf or two down upon them. Sow a full crop of *Brocolis,* and water if the weather is dry. Prefer the kinds recommended last month, to which may be added, *Grange's Early Cauliflower Brocoli, Purple Cape,* and *Green Cape.* Plant finally those *Brocoli* plants which are fit, at two feet asunder, dung the ground well, and water freely if the weather is dry. Avoid ground that has been under the same crop the preceding year. Cape Brocoli is said to succeed best planted finally from the seed-bed, or the seeds are sown where the plants are intended to remain, for this purpose sow two or three seeds at two feet distance, and when the plants are grown up two or three inches remove all but the strongest; and the same mode is recommended to all spring sown *Brocolis, Cauliflowers, Lettuces,* and many other vegetables. Transplant spring sown *Cabbages* of all sorts for autumn and winter use, in an open situation; some may be planted between rows of *Early Cauliflowers* and wide rows of *French Beans.* Plant in moist weather if possible, give each a little water immediately after planted. Earth up the early and general crops of *Cabbages.* As the early crops will now be advancing to maturity, they may be forwarded into cabbaging by tying the leaves together with strings or matting, the best time for doing this is when the leaves begin to turn inwards. Sow *Sugar-loaf Cabbage* seed and any other quick hearting kinds, for summer and autumn, and young autumn *Cabbages.* Sow *Brocoli* of sorts for next autumn, winter, and spring use, if not done in March or April, which is the best time; and as soon as they have attained a moderate size prick out into beds four inches apart, that they may attain a proper size for final planting. Sow *Brussels Sprouts* and *Savoys,* and prick out the plants of the former sowing.

6 *June.* Prick out the *Cauliflowers* sown in May for an autumnal crop in a bed of rich earth in an open situation, water, and shelter them occasionally in the middle of the day if hot. Look over the plantation of early *Cauliflowers,* and if the heads are appearing, break down some of the large leaves over them, which will blanch them, and render them more delicate. Those *Cauliflowers* coming into flower or advancing in growth, should have plenty of water in dry weather. This is a proper time to select *Cauliflower* plants, from which the seed is to be obtained, and allow these to stand. Sow *Cabbages* for a successional crop, hoe and earth up the advancing crops, as they may occasionally require. To prevent aphides and worms from destroying *Cabbages,* give plenty of water at the roots if the weather is dry. Sow some *Coleworts* about the middle or end of the month. Plant full crops of *Brocoli* in well dunged and dry open situations, water if the weather is dry. Sow *Brocoli* for early spring use. Prick out those *Brocolis* sown in April or May, and if the weather is dry give occasional watering. Plant out finally sorts of *Brocoli* as the ground becomes vacant, or between the rows of crops, which will be soon cleared off the ground. Plant a considerable quantity, as they will be of great use in winter. Plant crops of *Brussels Sprouts* and *Savoys*; the directions given for *Brocoli* are applicable to these; if ground be scarce, plant them between rows of crops that will be soon cleared off the ground.

7 *July.* Plant out the *Cauliflowers,* which were sown in May and pricked out in June, in an exposed situation in a rich soil, about 18 or 20 inches apart each way, regularly watering them if the weather is dry; these will be ready for storing in October. Plant full crops of *Cabbages* for autumn and winter use; let the ground be well dug, and moderately dunged, water if the weather is dry; let the plants be about 2 feet asunder. Plant finally different sorts of *Borecole.* Let every piece of vacant ground which is not intended for any other crop be planted with *Borecoles, Brussels-sprouts, Savoys,* and *Brocolis.* Situations which are least exposed to the action of the sun are best, or high dry situations, avoiding situations under the shade of trees. Hoe and earth up the crops planted last month. Sow *Brocoli* seed for a late spring crop, and last sowing of the season; not later than the fifteenth of the month, in a bed of rich mellow earth, and if the weather is dry a moderate watering should be given. Plant finally a full crop of *Brocoli* in a rich well-dug and manured piece of ground at about 2 feet asunder, give water for two or three days regularly after planting. Slugs are now very common, therefore they should be carefully picked off every morning from all the *Brássica* tribe. Sow full crops of *Coleworts* for autumn and winter use, and also for plants to stand until the spring, when the *Savoys* and other greens have been consumed. Sow *Yorkshire* or *Sugar-loaf Cabbage* seed, *Battersea* and *Antwerp* kinds for *Coleworts.* If Coleworts are wanted for winter, sow in the last week in June; this will produce plants fit for use in November and December.

8 *August.* Sow *Cauliflower* seed for early crops next year, either in the middle of the second week or the middle of the third week, in a border of light earth, and give water if the weather require it. Sow sorts of *Cabbages* for next year's use, about the fifth, but not later than the twelfth of August; prefer for this sowing the *Early Dwarf York, East Ham, Early Emperor,* and *Sugar-loaf* for first crops; the *Large York, Large Sugar-loaf, Battersea, Penton, Imperial, Antwerp, Russian,* &c. for secondary spring crops. If a succession of *Coleworts* are required still plant as directed. Plant out *Savoys* for autumn and winter use in ground well dug up and manured, or on ground where early potatoes or such crops as have not much exhausted the ground have been. *Savoys* and all sorts of greens may with propriety be sown between rows of beans, peas, and such crops. At the beginning of the month prepare a piece of ground for *Brocoli* in an open spot; let it be well dug and dunged. Plant in rows three feet apart each way; give water immediately on planting. Those *Brocolis* transplanted last month should now have the earth drawn up round their stalks, at the same time giving them a liberal watering.

9 *September.* Prick out those *Cauliflowers* sown last month into a nursing-bed; for this purpose prepare a bed of light rich mould about the size of a frame, in order that a frame may be set over them as the weather becomes inclement, plant about three inches apart in rows each way, gently watering them, shading them from the sun, and sheltering them from heavy rains, for this purpose the lights should be put on. The plants having remained five or six weeks in this bed they will be ready to transplant. Hoe and earth up the Michaelmas crop, or those

sown in July, they will begin to shew their heads about the latter end of the month. If the weather is dry, make a hollow or basin round the roots of these plants, into which pour a quantity of water; by this means their growth will be accelerated, and the heads will become much larger. Plant those *Cabbage-Coleworts* which were sown about the end of July, about the middle or end of this month, in a sheltered part of the garden: plant in rows about seven or eight inches apart, the rows about a foot distant. Some of these will be fit for use about Christmas. Prick out those *Cabbage* plants which were sown about the middle or latter end of August in nursery-beds in a piece of good ground in a sheltered situation, well dug and divided into beds; plant four or five inches apart, give a moderate watering if the weather is dry three or four times for the first ten days. About the first or second week of this month the last crop of *Brocoli* should be finally transplanted into a warm situation, and they should be planted in rows about a foot and a half apart, and about the same distance from each other in the row. Hoe the ground and draw the earth round the stems of the former crops of *Brocoli*.

10 *October*. The *Cauliflowers* sown in August and beginning of September will now be fit to prick out in beds, where they are to remain during winter; prepare a piece of ground of the same size and form as recommended last month, in a sheltered but not in a shaded situation; plant about four inches apart each way, water and settle the mould about their roots, place a frame over them if such can be spared, exposing them as much as possible in good weather, covering them when frost or heavy cold rain is apprehended. Guard against the attacks of mice and slugs. If a frame cannot be had, prick them out in the same way under a wall or paling, sloping the ground in digging towards the sun, or they may be protected in beds on a warm spot, covered occasionally with mats, supported by hoops; in either case let them enjoy a free circulation of air, and to be kept as dry as possible. Store *Cauliflowers* as directed. Plant out finally towards the end of the month early *Cabbage* plants, for cabbaging early in the following summer, in a good spot of ground well manured and trenched, make ridges and plant between them, and in wet ground even on the top of the ridges. If both survive the winter, make the one row make good the other, preferring to leave the row at the bottom of the ridge, these last are most likely to be preserved, as they will be sheltered from the cutting winds. The *Brassica* tribe seldom succeed if planted twice in the same ground. Plant in rows about two feet apart each way. Some of the early *Cabbage* plants should be allowed to remain in the nursery-beds till January or February, for in many instances the plants that are planted out early are destroyed by the frost, should this take place, then have recourse to the nursery-beds to supply their places. If any *Cabbage* plants remain in the seed-beds, remove them into the nursery-beds in the beginning of the month, to gain strength to endure the ensuing frosts. Clear the crops of *Brocoli* from weeds, and mould them up for winter; prefer a dry day for this operation. The crops of *Brussels-sprouts* should be treated in the same manner.

11 *November*. Admit free air every fine day to the *Cauliflowers*, in fine dry weather during the day-time by wholly removing the glasses, tilting them only in wet weather; clear off the dead leaves and keep them free from weeds; those plants under bell or hand-glasses require the same treatment, draw a little earth round their stalks. Where *Cauliflower* plants were neglected to be pricked out last month, let it be done as early in this month as possible. Planting *Cabbages* for next spring use should be finished as early in this month as possible, that they may become sufficiently rooted before severe weather sets in; the weakest plants may remain in the seed-bed during winter, to make up vacancies in the plantations in spring.

12 *December*. Treat *Cauliflowers* as directed last month; keeping free from frost, damp, and slugs, admitting free air in good weather.

2 B. campe'stris (Lin. spec. 931.) leaves rather fleshy, covered with glaucous bloom; first ones rather hispid or ciliated, lyrate, toothed; the rest cordate, stem-clasping, acuminated, partly pinnatifid. ♂. H. Native of Britain, Lapland, Spain, Transylvania, and in the Crimea in fields.

* *A. oleífera* (D. C. syst. 2. p. 588.) root fusiform, slender; stem elongated. ⊙. H. Smith, eng. bot. 2224. Dalech. lugd. 523. Native of Britain, Lapland, &c. in fields, and about the banks of rivers and ditches. Wild navew. Pet. hort. brit. t. 45. f. 9. Stem 2 feet high. Flowers yellow, corymbose. *Colsat*, *Colsa*, or *Colza*, Pomet. hist. drog. p. 17. f. 2. *Chou de Champs Navette* (Fr.) Coleseed, Wild Navew or Navette (Eng.)

This plant is very extensively cultivated in Belgium, Switzerland, and Germany for food for sheep, and for the seed to be pressed for its oil. It is sometimes sown broad-cast, but it is alleged, that transplanting has many advantages; one is, that the seed-bed occupies but little room, whilst the land which is to carry the general crop is bearing corn. In the latter end of September, or second week of November, the plants are put in with the dibble or the plough without apprehending any miscarriage. The seed-bed is usually sown in July or August. In October, or sooner, the stubble is ploughed over, manured, and ploughed again. The plants are dibbled into the seams of the ploughing (each furrow being 12 inches broad) and are set out 12 inches distance in the rows. Instead of dibbling upon a second ploughing, in many cases they lay the plants at the proper distances across the furrow, and as the plough goes forward the roots are covered, and a woman follows to set them a little up, and give them a firmness in the ground where necessary. After the frost in spring, the intervals are weeded and hand-hoed, and the earth drawn up to the plants, which is the last operation till the harvest. It is pulled rather green but ripens in the stack; it is threshed in the common way, and the haulm is burned to ashes for manure, which is found to be more valuable than any other kind of manure, and it is considered that upon clover, a dressing of one-third less of it is amply sufficient. The seed is sold for crushing, or, as is frequently the case, crushed by the farmer himself.

There is a variety of this called *Colsa de Mars*, which may be sown in spring and harvested in the same year, but is less productive. The two varieties have a very different aspect. Some authors speak of the *White-flowered Colsa;* but this name appears to have arisen from some confusion in nomenclature.

** *B. pabulària* (D. C. syst. 2. p. 589.) root fusiform, slender; stem short. ⊙. H. Native of Europe; cultivated in fields for sheep fodder, but very rarely; it bears frequent cutting. *Chou à faucher*, Commerel in mem. soc. agr. par. 1789.

*** *C. Napo-Brássica* (D.C. syst. 2. p. 589.) root tumid, turnip-formed. ♂. H. Frequently cultivated in fields. Brássica oleràcea Napo-Brássica, Lin. spec. 932. Cavolo navone o Rutabàga, Galliz. bot. agr. 3. p. 192.

Var. α, commùnis (D. C. l. c.) root white or purplish; neck and petioles greenish or purplish. ♂. H. Cultivated in fields. *Chou-navet commun; Chou-navet blanc; Chou-navet rouge.* The Turnip-rooted Cabbage is little known in the English gardens, though not uncommon in French horticulture. Mr. Neill observes it has a root under ground as sweet as a Swedish Turnip. The root is either white or red.

Var. β, Rutabàga (D. C. syst. l. c.) root yellowish, rather globose. ♂. H. Cultivated in fields. *Rutabàga, Navet jaune, Chou de Laponie, Chou de Suede, Navet de Suede* (Fr.) Swedish Turnip (Eng.) *Navone di Laponia* (Ital.)

Swedish Turnip. This root is extensively cultivated in fields for cattle, on account of its large size and hardy nature; it is also occasionally raised in gardens for the table to use in young growth. The cultivation of this root is the same as that for common turnip both in agriculture and horticulture, which see.

Rave Navet (Fr.) *Sleckrübe* (Germ.) *Navone* (Ital.) Turnip (Engl.)

A. deprèssa (D. C. syst. 2. p. 590.) root tumid under the neck, globose depressed, ending abruptly in a slender tail. ♂. H. Cultivated. *Navet ronde* or *Rave plate. Rabioule Rave, Grosse Rave* (Fr.) Round Turnip (Eng.)—Mor. oxon. sect. 3. t. 2. f. 1.—Blackw. herb. t. 231.

* *álba* (D. C. l. c.) root white on the outside, or purplish at the neck.—White Turnip.

** *flavéscens* (D. C. l. c.) root yellowish both inside and outside.—Yellow Turnip.

*** *nígricans* (D. C. l. c.) root blackish on the outside.—Black Turnip. This is a very doubtful plant.

**** *punìcea* (D. C. l. c.) root with a scarlet or red skin. —Red Turnip.

***** *víridis* (D. C. l. c.) root green.—Green Turnip.

****** *præ'cox* (D. C. l. c.) Early Dutch Turnip.

B. oblónga (D. C. l. c.) root oblong, gradually tapering to a point.—Math. comm. 330. f. 1.—Lob. icon. t. 197. f. 2. &c. —Oblong, Tankard, or Decanter Turnip.

C. oleífera (D. C. l. c.) root slender.—B. napélla, Vill.—Math. comm. 330. f. 2.—Lob. icon. 298. f. 1.—Oil-bearing Turnip. Cultivated in Dauphiny, where it is called *Navette*, for the sake of its seed, from which an oil is obtained. It is less productive than the common *Rape* and *Colza*, but it is nevertheless useful as it grows in soil unfavourable to every other oleaginous plant. The seeds are sown after harvest, and ripen in the June following. See *B. nàpus oleífera* for the culture of the plant.

Turnip. Fl. April, July. Britain. Pl. 2 to 4 feet.

The *Turnip* is a biennial plant, growing in a wild state in some parts of England, but better known as an inhabitant of the gardens or the farm; the root leaves are large, of a deep green colour, very rough jagged, and gashed; in the second season it sends up a flower-stalk furnished with stem-clasping leaves, which are smooth.

Use. The use of the root, boiled and mashed as a dish, in broths, soups, and stews, or entire, is known all over Europe. The top shoots, from such as have stood the winter, are gathered whilst tender and dressed as spring-greens or spinach, under the name of *Turnip-tops*.

The following varieties are in general cultivation.

§. 1 *Round White Turnips. Brássica ràpa. A. deprèssa * álba, D. C. l. c.*

1 Early white Dutch.
2 Early stone.
3 Common round white.
4 Large round white.
5 Green topped, large round white, skin of the crown green.
6 Red topped, large white.
7 Small round French, petit Berlin (*Fr.*) Teltaw (*Ger.*)
8 Large Scotch.
9 White globe.

§ 2. *Round Yellow Turnips. Brássica ràpa ** flavéscens, D. C. l. c.*

1 Yellow Dutch.
2 Aberdeen yellow.
3 Maltese golden, an excellent and beautiful root.
4 Large yellow field.
5 Scarisbrook or Preston yellow.
6 Mouse-tail or six-week yellow.

§ 3. *Black Turnip. Brássica ràpa. A. deprèssa *** nígricans, D. C. l. c.*

1 Black Russian. This turnip appears to be lost.

§ 4. *Red Turnip. Brássica ràpa deprèssa **** punìcea, D. C. l. c.*

1 Large round red.
2 Red six-week or stone.

§ 5. *Green Turnip. Brássica ràpa deprèssa **** víridis, D. C. l. c.*

1 Green turnip.

§ 6. *Oblong Turnip. Brássica ràpa, B. oblónga, D. C. l. c.*

1 Tankard or Decanter Turnip, large oblong, white, red, and green.

§ 7. *Oil-bearing Turnip. Brássica ràpa, C. oleífera, D. C. l. c.*

1 Navette of Dauphiny.

Estimate of sorts. "The first three sorts are the fittest for early, first succession and main summer crops for the table. The early white Dutch is proper, both for the most early and first succession crops, as is also the early stone. The common round white is highly eligible for the main crop; and the large round white stands nearly on a par with that, and, if not sown to come in with it, should at least succeed it, as a late summer and autumn crop. In large grounds portions of the large white-green-topped, and the large white-red-topped, may be sown for autumn and winter, but the surest plant for winter consumption is the yellow Dutch; although constituted to stand the intense frost unhurt, it has a fine flavour, and is very nutritive. Small portions of any of the other sorts may be cultivated in secondary crops for variety, or to answer a particular demand."

Time of sowing. "This root can be obtained most part of the year by sowing every month in spring and summer. Make the first sowing in the last week of February or first week in March, on a slight hot-bed; by this means the plants will be more likely to bulb, than shew a disposition to run to seed, and will be an acceptable addition to spring vegetables. For the first early full crop sow about the middle or latter end of March in an open situation, and where the ground is light. For the second crop to succeed those sown last month, sow about the middle or end of April, either in drills an inch deep or broadcast thinly. They may be sown between crops of *Asparagus* or *Sea-kale*, provided the soil be light; the early Dutch and stone are best for this and the preceding sowings. For the third crop sow in May, and by the latter end of July they will be sufficiently large for use. Sow in a light soil in warm situations. The fourth and principal crop should be sown in June, about the middle or end of the month, for autumn and winter use, and considerable benefit will be derived in sowing in showery or rainy weather, or to retard the sowing if a prospect of such weather coming on, in all the sowings. Particular care should be taken in sowing the seed equally, and immediately afterwards tread it down and rake it evenly. The fifth crop should be sown in July in an open situation. This time may be considered a very favour-

able time for sowing *Turnips* for autumn use; the first of these will be fit for the kitchen in September, and will improve in growth from Michaelmas to Christmas, and should a moderate winter follow, they will continue in perfection until the following spring. Care must be taken to sow immediately after the ground is prepared. The sixth and last crops of the season should be sown at the beginning and towards the latter end of August, taking advantage of moist weather. The kinds best for this sowing are all the yellow *Turnips*, viz. Dutch, Aberdeen, and Maltese; however in families, where the colour of these may be objected to, the common round white may be substituted; but is not so hardy, nor so good a root for keeping."

Seed estimate. For a seed-bed four feet and a half by twenty-four feet, sown broad-cast, the plants to remain and be trimmed to seven inches distance from each other, half an ounce.

Process of sowing. Let the ground be well broken by well digging, and neatly levelled to receive the seed. Procure bright well dried seed; the seed may be then put into the ground either alone or mixed with sand.

Precautions against the fly. "It appears from a trial of Mr. Knight, at the suggestion of Sir Humphrey Davy, that lime slaked with urine, and mixed with a treble quantity of soot, if sprinkled in with the seed at the time of sowing, will protect the seeds and germs from the ravages of the fly, but this antidote cannot be applied unless the sowing be in drills. A simpler remedy, which has been found by Mr. Mean to be perfectly successful, is to steep the seed in sulphur-water, putting an ounce of sulphur to a pint of water, which will be sufficient for soaking three pounds of seed." *Abercrombie.* Arch. Gorrie, a gardener of merit, tried several methods without effect. At last he tried dusting the rows when the plants were in the seed-leaf, with quick-lime. He says, "a bushel of quick-lime is sufficient to dust over an acre of drilled *Turnips;* and a boy may soon be taught to lay it on almost as fast as he could walk along the drills. If the seed-leaves are powdered in the least degree, it is sufficient; but should rain wash the lime off before the *Turnips* are in the secondary leaves, it may be necessary to repeat the operation if the fly begin to make its appearance." *Cal. hort. mem. vol.* 1.

Mixing equal parts of old seed with new, and then dividing the mixture, and steeping one half of it twenty-four hours in water, has often been tried with effect and especially by farmers. By this means, four different times of vegetation are procured, and consequently four different chances of escaping the fly. *Radish*-seed is also frequently mixed with that of the *Turnip*, and the fly preferring the former, the latter is allowed to escape. *Loud. ency. gard.* One of the easiest methods, Mr. Neill observes, "is to sow thick, and thus ensure a sufficiency both for the fly and the crop." "But the most effectual preventive on a large scale is found in sowing late, where that can be done; the fly in its beetle state having fed on other herbage disappears before the *Turnip* comes into leaf." *Loud. l. c.* "In the heat of summer it is of great importance to wait for rain, if the ground be too extensive to be properly watered; for the fermentation, caused by copious rain, and heat, gives an extraordinary quick vegetation to the seed, which in a few days will be in the rough leaf and out of all danger from the fly. This insect is weakened or killed by drenching showers, and does no injury to the *Turnip* when much rain falls. When a crop is destroyed by the fly, the necessary reparation is immediately to dig, or stir the ground, and make another sowing, watering soon and occasionally afterwards, unless rain falls." *Loud. l. c.*

Subsequent culture. "As soon as the plants have leaves about an inch broad, hoe and thin them to six or eight square inches distance, cutting up weeds. As the *Turnips* increase in the root, a part may be drawn by progressive thinnings, so as to leave those designed to reach a full size ultimately ten or twelve square inches. Water garden crops sometimes in hot dry weather."

Taking in the crop and preserving it by housing. In successive crops begin to draw as directed above in a thinning order, that such others as are coming forward may have room to enlarge in succession, by which means a regular supply will be procured till March or April of the second season; specific sorts being sufficiently hardy to continue good through ordinary winters. But of the winter crops for the table, draw a portion occasionally in November, December, or whenever there is an appearance of the frost setting in severe. Cut the tops off close and house the roots in some lower shed or cellar, laid in sand ready for use while the ground is frozen. "Instead of cutting the top and roots close off, some prefer leaving about an inch of the top, and the whole of the root; and, when the bulbs are kept in a sufficiently cool store, this seems preferable, as more likely to retain the sap." *Abercrombie.*

Turnip-tops. These are to be gathered from the earlier spring-produced leaves, either from the crown or flower-stalk. They are equally good from any of the varieties, and less acrid from those of the *Swedish Turnip.* Sometimes very late sowings are made in September and October, which never bulb, but which are preserved entirely for their produce as greens in spring. *Loudon, l. c.*

Field Turnips. Where a family can be supplied from the field, the roots will always be found of a better flavour, and the same remark applies to all the culinary kinds of *Brassica, Cauliflower* and *Brocoli* excepted.

Varieties commonly cultivated in the fields. These may be arranged as whites and yellows.

1 *White Turnips.* By far the best and most generally cultivated, is the globe, but there are also the green-topped and purple-topped, which though they do not produce so large a crop as the globe or oval, stand the winter better, and the red-topped, it is said, will keep till February. The pudding or tankard *Turnip*, has a white bulb which rises from eight to twelve inches high, standing almost wholly above the ground. It is less prolific than any of the others, and more liable to be injured by frost.

2 *Yellow Turnips.* There is the yellow field *Turnip*, which is more hardy than the globe, and answers well for succeeding that variety in spring, as well as the *Swedish Turnip*, which may be preserved for consumption in June. See *B. Campéstris Rutabàga.* The *Siberian Turnip* has a bulb and a branching top, but both of inferior quality. It is said to be a hybrid between the *White Swedish Turnip* and field *Cabbage*, or between the *Rape* and the *Cabbage.* The sorts are limited by the best farmers to the white globe, yellow, and Swedish, according as early, middling, or late supplies are wanted.

Choice of seed. Farmers must rely on the integrity of the seed-dealer, as it is impossible to discover by the grains whether the sorts are true. Turnip seed requires to be frequently changed, and the best is generally procured from Norfolk and Northumberland. Those who wish to have *Turnips* in perfection should procure fresh seed from Norfolk every year, for after two years it degenerates. New seed is preferable to old, as it vegetates several days sooner, and more vigorously, and it is well known that the healthy and vigorous plants escape the fly, while the stunted or sickly seldom or never escape it. Hence it would seem that plants raised from fresh or new seed are more secure from the fly than those raised from old seeds.

Soil, should always be of a light description, as they can never be advantageously cultivated on wet tenacious soils, but are grown on all comparatively dry soils under all the variations of our climate, but even in clayey soils they are frequently cultivated, though on a smaller scale, to be eaten by cattle, for the

purpose of augmenting and enriching the manure into which the straw of corn is converted.

Climate. The climate most desirable for the *Turnip* is cool and temperate. *Turnips* in the south of Europe never grow large, and a rapid climate is disadvantageous to the *Turnip*, and they are accordingly found of no size in Russia, Sweden, and many parts of North America.

Preparing the soil. "The first ploughing is given with a deep furrow, soon after harvest, usually in the direction of the former ridges, though if the soil be dry it is of little consequence in what direction. As soon as the spring seed-time is over, a second ploughing is given across the former, and the harrows, and if necessary the rollers are set to work in order to clean and pulverise the soil, and the weed-roots are carefully burnt or carried off the field to form a compost, usually with lime. The land then generally undergoes a third ploughing, and weed-roots carried off as before, again harrowed well, sometimes also rolled. It is next laid up in ridgelets from 27 to 30 inches wide, either with the common swing plough, or one with two mould-boards which forms two sides of a ridgelet at once. Well rotted dung at the rate of 12 or 15 tons per acre, this is spread equally over the ground. The plough immediately follows, and reversing the ridgelets forms new ones over the dung, and the drill-barrow, commonly one that sows two drills at once, drawn by one horse, deposits the seeds as fast as the new drills are formed. This machine has usually two rollers, one that goes before the sowing apparatus and levels the pointed tops of the ridgelets, and another that follows, for the purpose of compressing the soil and covering the seed. Ground cannot be made too rich for the *Turnip*, for in fact the weight of the crop depends upon its condition in this respect."

Time of sowing. "The several varieties are somewhat different; the Swedish should be put in earliest, and then the yellow, both of them in the month of May. But as these kinds are much less extensively cultivated than the globe, the month of June is the principal seed-time. In the southern counties, *Turnips* are frequently sown in August after peas, wheat, or tares. The crop, however, is always light, and only fit to be eaten down by sheep in spring, or to send their tops to market as greens. After a crop of hotspur peas, sold green for the London market, the land is well cleansed with the horse-hoe, and upon once ploughing *Turnips* are sown, and when the plants first appear, the field receives a light top dressing of soot, ashes, &c.: this has a good effect in preserving the plants from the depredation of the fly."

Mode of sowing, in all the best cultivated districts is on raised drills, for sowing broad-cast, or even sowing in rows on a flat surface, is never found to answer.

After culture. The turnip farmer, as soon as the *Turnip* has put forth the rough leaf, runs a horse-hoe between the ridgelets, and cuts up the weeds on each side almost close to the ridgelets, clearing out the bottom of the interval at the same time. The hand-hoers are always set to work as soon as possible after, and the plants are left about 9 inches apart or more. A few days after this a small swing plough enters the intervals between the rows, and taking a furrow slice off each side, forms a smaller ridgelet in the middle. If the weeds still arise in great abundance, the horse-hoe may be employed again; otherwise, the next operation is to go over them a second time with the hand-hoe, when the intermediate ridge is levelled. When no more manual labour is necessary, a small plough with two mould-boards is employed to lay up the earth to the sides of the plants, leaving the ridgelet the same form as when sown, which finishes the process.

Use of Turnips. They are either eaten by sheep on the spot, lotted off by means of hurdles or nets that they may be regularly consumed in grass fields or fold-yards; when the weather is wet or the fields are moist, when the sheep ought not to be allowed to lie on the field. Eating *Turnips* on the spot is of great advantage both in manuring and consolidating the ground. *Turnips* are also used for feeding cattle and sometimes milch cows, but the far greater part, wherever they are extensively cultivated, by sheep. The Swedish and yellow *Turnip* are eaten greedily by horses, and affords a very nutritive and salutary food along with hay or straw for working stock. During severe frost *Turnips* become so hard that no animal can eat them; in this case lay them in running water, which effectually thaws them: or placed in close feeding-houses, the *Turnips* intended for next day's use may be stored up over night in one end of the building, and the warmth of the animals will thaw them sufficiently by morning. But in those months when frosts are severe, it is always advisable to have a few days' consumption in the turnip barn. It is necessary to slice with a spade or chopping-knife, or crush them by means of a heavy wooden mallet, for sheep and young cattle in their first year towards spring, when the loosening and shedding of their teeth render them unable to break the large roots. A wine is said to be made from the *Turnip* by the London manufacturers of imitations of foreign wine. A kind of bread is also said to be made of the *Turnip*.

Sir Humphrey Davy has proved that *Turnips* contain 42 parts in 1000 of nutritive matter, of which 7 were mucilage, 34 sugar, and 1 gluten. Swedish *Turnips* afforded 64 parts of nutritive matter in 1000, of which 9 were starch, 51 sugar, 2 gluten, and 2 extract.

"To raise plants for seed the usual mode is to select the most approved specimens at the season when they are full grown, and either remove all others from the field, and leave them to shoot into flower-stems next year, or transplant them to a place by themselves, where they will be secure from the farina of others of their genus. In either case, they must be protected by earthing up from winter's frost."

The diseases and injuries to which *Turnips* are liable are various. At their first appearance the leaves are liable to the attacks of the fly (*Aphis and Chrysomela*, Lin.) of the caterpillar (*Papilio noctua*, &c. Lin.) of the slug (*Limax*, Lin.) and of mildew. Their roots are attacked by worms of various kinds; by a singular tendency to monstrosity, known provincially by the names of fingers and toes; by the ambury; by canker, and by wasting or gangrene from water or frost. Of all or most of these injuries or diseases, it may be observed that they neither admit of prevention or cure by art, but under favorable circumstances of soil, climate, culture, and weather they seldom occur, and therefore all that the cultivator can do is to prepare and manure his land properly; and in the sowing season supply water when the weather is dry or the soil deficient in humidity.

4 B. NA'PUS (Lin. spec. 931.) leaves smooth, of a greyish-glaucous-hue, radical ones lyrate, stem ones pinnatifid and crenated, uppermost ones cordate-lanceolate, clasping the stem; siliques divaricate-spreading. ♂. H. Native country not known. Cultivated in fields. It is to be found almost naturalized in waste ground and on ditch banks in Britain. Smith, engl. bot. t. 2146. Schrank. fl. mon. 3. t. 218. Sinàpis Nàpus, Brot. fl. lus. 1. p. 586.

* *A. oleífera* (D. C. syst. 2. p. 592.) root slender ♂. H. B. oleífera, Mœnch. meth. 253. B. Nápus, Nestl.—*Navette d'hiver Navette, Rabette* (Fr.) *Rüben, Reps, Winter Reps*, (Germ.) *Rape, Navew, Coleseed, Winter Navette* (Eng.)—Lob. icon. t. 200. f. 2.

Rape. Navette, (Fr.) *Rubsamen*, (Germ.) *Naba Sylvestre*, (Ital.) This is the British Rape, or Colsat. It is distinguished from the Colsat or Colsai of the continent, by the smoothness of its leaves, the other being hispid. It would be desirable, De Candolle observes, if all cultivators would examine whether

the plant they cultivate is *Brássica Campéstris oleífera*, or the *Brássica Nàpus oleífera*, which can easily be ascertained by the roughness or smoothness of the leaves. Experiments made by Gaujac shew the produce of the first, compared to that of the second, to be 955 to 700, (Hort. trans. 5. p. 23.) "For its leaves, as food for sheep, and its seeds for the oil manufacturers, *Rape*, or *Coleseed*, has been cultivated from time immemorial. It may be grown by sowing broad-cast, or in rows, like the common turnip, or transplanted like the Swedish turnip. The culture of *Rape* for seed has been much objected to by some, on account of the great degree of exhaustion of the land that it is supposed to produce. But where it is grown on a suitable soil and preparation, with proper attention in the after-culture, and the straw and offal, instead of being burnt, as is the common practice, converted to the purpose of feeding or littering cattle, it may in many instances be as proper and advantageous a crop as can be employed by the farmer. The soils best suited for the culture of *Rape* are the deep, rich, dry and kindly soils. Young says that on open fen and peat soils, and bogs, it thrives well, and especially on pared and burned land, which is the best preparation for it; but it may be grown with success on fenny, marshy, and other coarse waste lands, that have been long under grass, after being broken, and reduced into a proper state of preparation. As a first crop, on such description of land, it is often the best that can be employed. The author of the *New Farmer's Calendar* thinks that this plant is not perhaps worth attention on any but rich and deep soils; for instance, those luxuriant slips that are found by the sea-side, fens, or newly broken up grounds, where vast crops of it may be raised." The land on which the *Rape* is to be sown needs nothing more than a deep ploughing, and sufficient harrowing to bring the surface to a fine mould, in February or March, immediately before sowing, or in July, or after the hay-crop if the sowing is deferred to that season. When sown on old tillage-land, the method of preparation is the same as that which is usually given for the common turnip. Wheat is considered the best crop to follow *Rape:* by its being taken off early there is sufficient time allowed for getting the land in order for sowing wheat. The time of sowing *Rape* is the same as that for the turnip, and the manner, either broad-cast or in rows. Where the object is the keep of sheep in autumn or winter, by eating it down, the broad-cast method, and thick sowing, is evidently the best, and is that generally resorted to in Lincolnshire and the fenny districts. The quantity of seed, when sown thick, may be a peck an acre; but when drilled, or sown thin, two or three pounds will suffice. Vacancies may always be filled up by transplanting. The season for transplanting is soon after harvest. One deep ploughing is sufficient, and a sufficient degree of harrowing: the plants are then dibbled in rows a foot apart, and the plants six inches asunder. These will not be so strong as those sown in June or July, where they are to run to seed. The seed-beds where the plants are to be obtained for transplanting, should be sown in June or July. The after-culture is the same as that for the turnip, which consists in hoeing and thinning. In poor soils they may be left at 6 or 8 inches apart, but in rich soil 12 or 15 inches. When *Rape* is grown purposely for feeding sheep, no hoeing nor thinning is necessary. The seeds begin to ripen about the last week of June, and must then be protected from birds. In harvesting *Rape* great care is necessary not to lose the seed by shaking, or by exposing it to high winds or rain. It is reaped with the hook, and the principal point is to make good use of fine weather, for it must be threshed as fast as reaped, or at least without being stacked like other crops. The use of *Rape-seed* for crushing for oil is well known: it is also employed as food for tame birds, and sometimes it is sown by gardeners in the same way as mustard or cress, for early salading. *Rape-cake*, and *Rape-dust*, the first adhering masses of seed-husks after the oil has been expressed, and the second loose dry husks, are used for top-dressings for crops of different sorts, but it has little or no effect if rain does not immediately follow after it has been scattered on the ground. The haulm is used as hay, and the tops are eaten with avidity nearly equal to cut straw. The green leaves, as food for sheep, are scarcely surpassed by any other vegetable, in so far as respects its nutritious properties; but in quantity it is inferior to both turnips and cabbages. The sheep are folded upon *Rape* in the same manner as practised with turnips, from November to April. *Rape* is cultivated in gardens as a small salad herb, to be gathered young in the seed-leaves, and used as cresses and mustard. Like these it has a warm flavour, and is recommended as a stomachic. This plant is very generally cultivated in the eastern parts of France.

"*Culture for small salading*. Sow at the same time with cresses *Lepídium Satìvum* mustard, *Sinàpis álba*, in spring and winter, or at any season when small salading is required. Sow in drills, and follow the culture directed for White Mustard."

* B. esculénta (D. C. l. c.) root fusiform, thickened under the neck. Lob. icon. 200. f. 1.—Bauh. hist. 2. p. 842. icon.—Mor. oxon. 2. p. 214. sect. 3. t. 2. f. 1. This plant is usually confused with the *Swedish turnip* and the *common turnip*.

Var. α, álba; (D.C. syst. 2. p. 593.) root white, esculent. Nàpus dúlcis. Blackw. herb. t. 410. This is the most common variety.

Var. β, flàva; (D. C. l. c.) root yellow, esculent.

Var. γ, nígricans; (D. C. l. c.) root with a black skin, esculent.

"The *Navew*, *Navet*, *Chou Navet*, or *French turnip*, Dickson observes, (Hort. trans. vol. I.) enriches all the foreign soups. Stewed in gravy it forms a most excellent dish, and being white, and of the shape of a carrot, when mixed alternately with those roots upon a dish, it is very ornamental. In France, as well as Germany, few great dinners are served up without it in one shape or other." "In using it there is no necessity to cut away the outer skin, or rind, in which, indeed, the flavour chiefly resides; scraping it will be quite sufficient." Justice observes, (Brit. gard. direct. p. 159.) that it is neither fit to be boiled alone, nor raw, but that two or three of them, in seasoning, will give a higher flavour than a dozen of any common turnips.

"The great advantage attending the cultivation of this root is, that it requires no manure whatever; any soil that is poor and light, especially if sandy, suits it, where it seldom exceeds the size of one's thumb or middle finger; in rich manured earth it grows much larger, but it is not so sweet, or good in quality." *Justice and Dickson.* Sowing broad-cast, in the way of *Turnips*, is the way of cultivating the *Navet*.

Rape or Coleseed. Fl. April, June. Clt.? Pl. 2 to 3 feet.

5 B. præcox, (Waldst. et Kit. ined. D. C. syst. 2. p. 593.) leaves smooth, covered with greyish-glaucous bloom; radical and lower stem-leaves lyrate, upper stem-ones cordate-lanceolate, stem-clasping, crenated; pods erect. ⊙. H. Cultivated throughout middle Europe, in fields in the mountains. *Navette d'été* (Fr.) *Kohl Reps*, *Summer Reps* (Germ.). Flowers sulphur-coloured. The summer *Navette* is less cultivated than the *Coleseed*, being less prolific, the seeds being much smaller. It is chiefly cultivated on hilly ground, where the winter *Navette* will not grow. Being an annual it is sown in the spring and reaped in the autumn.

Early Coleseed. Fl. Aug. Clt.? Pl. 2 feet.

6 B. Crética (Lam. dict. 1. p. 747.) stem shrubby at the base; leaves ovate-roundish, crenated, stalked, smooth. ♄. F. Native of Crete, as well as in all the islands of the Archipelago, in the fissures of rocks. Smith. fl. græc. t. 645. Flowers racemose. Similar to *B. oleràcea*. Stem a foot high, dividing into 2 or 3 short thick branches at the top.

Cretan Cabbage. Fl. April, May. Shrub 2 ft.

7 B. Chine'nsis (Lin. amœn. 4. p. 280.) herbaceous; leaves oval, almost quite entire, floral ones lanceolate, clasping the stem; calyx longer than the claws of the petals. ♂. H. Native of China. B. violàcea, Burm. fl. ind. p. 140? Stem tall, erect, branched; the whole plant rather glaucous. Flowers yellow or violet.

Chinese Cabbage. Fl. June, July. Clt. 1770. Pl. 3 to 4 ft.

8 B. viola'cea (Lin. spec. 932.). herbaceous; leaves ovate-lanceolate, glabrous, undivided, toothed; sepals and ovaries villous; pedicels furnished with bracteas. ♂. H. Native of China. Racemes terminal. Flowers whitish-purple, reticulated; petals twice the length of the calyx.

Violaceous-flowered Cabbage. Fl. May, June. Pl. 2 feet.

9 B. Magella'nica (Juss. ined. Pers. ench. 2. p. 207.) herbaceous; leaves glabrous, pectinately pinnate-parted; flowering racemes rather corymbose. ♂? H. Native of the Straits of Magellan. Petals obovate, apparently white, about the size of those of *B. Cheiranthos*. Deless. icon. sel. 2. t. 85.

Magellan Cabbage. Pl. 2 feet?

10 B. Helenia'na (Burch. fl. st. hel. ined. no. 128.) herbaceous; leaves lyrately-pinnate, rather scabrous, radical ones with 9 or 10 pairs of leaflets, stem-ones with 1 or 2 pair; terminal lobes very large. ♂. H. Native of the island of St. Helena, in moist situations in the valley called Arno's Vale, near Longwood. Root twisted, slender. Stem ascending, branched. Flowers white or purple, veined with black. Perhaps a species of *Ráphanus*.

St. Helena Cabbage. Pl. 2 feet.

11 B. villòsa (Biv. ex Spreng. syst. app. p. 243.) suffruticose, villous; leaves all stalked, lyrate, and toothed. Flowers paniçled; sepals erect; pods somewhat tetragonal. ♄. F. Native of Sicily.

Villous Cabbage. Pl. 2 foot.

12 B. inca'na (Tenor. app. hort. nap. cat. p. 59.) plant clothed with hoary soft down; lower leaves stalked, lyrate; terminal lobe large, toothed; stem suffruticose at the base; siliques smooth, 5-times longer than the beak. ♄. F. Native of Goat's Islands, and near Naples, and on the higher mountains of Sicily, on rocks. Flowers pale-yellow.

Hoary Cabbage. Fl. April, May. Clt. 1820. Shrub 2 ft.

13 B. Balea'rica (Pers. ench. 2. p. 206.) plant smooth; lower leaves stalked, sinuated, somewhat fiddle-shaped, rather fleshy; stem suffruticose at the base; siliques 5-times longer than the beak. ♄. H. Native of the Balearic islands, and on the red rock at Nice. Deless. icon. sel. 2. t. 86. B. sempervìrens, Schrank hort. mon. t. 10. Stem branched. Leaves resembling those of oak. Flowers pale yellow. Perhaps a species of *Erùca*.

Balearic Cabbage. Fl. May, July. Clt. 1820. Shrub 2 ft.

14 B. Gravìnæ (Tenor. app. prim. cat. hort. nap. p. 59. fl. neap. t. 62.) plant covered with hispid pubescence; lower leaves oblong, runcinate, with the teeth or lobes entire and acute; calyx spreading; siliques glabrous. ♃. H. Native of Naples, on the mountains in Abruzzo. Caudex radiciform, suffrutescent, short. Stem annual, erect, branched a little. Flowers yellow. Stigma capitate, 2-lobed.

Gravina's Cabbage. Fl. May, June. Clt. 1823. Pl. 2 ft.

15 B. hy'brida (Tenor. prod. fl. nap. p. 59.) stem shrubby at the base, smooth above, leafy; leaves smooth; lower ones lyrate, denticulated, upper ones somewhat hastate, sessile; pedicels very short; calyx coloured, closed. ♄. H. Native of Naples. Flowers yellow.

Hybrid Cabbage. Pl. 2 feet.

16 B. pinnati'fida (Desf. fl. atl. 2. p. 95. t. 166.) leaves pinnatifid, glabrous; lobes lanceolate, serrated; ribs and petioles rather hairy; siliques somewhat tetragonal. ♂. H. Native of Mauritania and Spain. Stem branched, hairy at the base. Flowers the size and colour of those of *B. oleràcea*.

Pinnatifid-leaved Cabbage. Fl. May, June. Clt. 1818. Pl. 2 to 3 feet.

17 B. lyra'ta (Desf. fl. atl. 2. p. 96. t. 166.) leaves hispid, radical ones lyrate, stem ones deeply toothed; calyx and siliques hispid; stem ascendant. ⊙? H. Native of the north of Africa, in sandy deserts. Stems numerous from the same tuft, simple or branched, hispid. Flowers small, violaceous, reticulated. Habit of *Diplotáxis erucoìdes*.

Lyrate-leaved Cabbage. Fl. in the water. Pl. ¾ foot.

18 B. hu'milis (D. C. syst. 2. p. 598.) leaves all radical, fleshy, pinnatifid; lobes entire, bearing hairs at their apex; scapes naked; siliques spreading, tapering to the base, terminated by a thickish style. ♃. H. Native near Montpelier. Sisýmbrium repándum β, D. C. cat. hort. monsp. 62. Root long, hard, with numerous naked scapes rising from it. Flowers yellow.

Humble Cabbage. Fl. May, June. Clt. 1820. Pl. ½ foot.

19 B. repa'nda (D. C. syst. 2. p. 598.) leaves all radical, fleshy, glabrous, repand-toothed; scapes naked; style slender, distinct from the silique. ♃. H. Native of Dauphiny, Piedmont, and Provence, on mountains in exposed situations. Sisýmbrium Monénse, Vill. dauph. 3. p. 350. t. 39. S. repándum, Willd. spec. 3. p. 497. Very like the preceding in habit.

Repand-leaved Cabbage. Fl. June, Aug. Clt. 1820. Pl. ½ ft.

Sect. II. Eruca'strum (altered from *Erùca*.) D. C. syst. 2. p. 598. prod. 1. p. 216. Siliques sessile, ending in a conical beak which contains 1-2 seeds at the base.

20 B. Riche'rii (Vill. dauph. 3. p. 331. t. 36.) leaves smooth, lower ones oblong, somewhat toothed, stalked, upper ones linear-lanceolate, few. ♃. H. Native of the Alps of Piedmont, Dauphiny, and Provence, in stony meadows. All. ped. no. 967. t. 58. f. 1 and 76. f. 2. Root hard, twisted, woody, with numerous annual stems rising from the neck. Flowers yellow, very like those of *B. oleràcea*.

Richer's Cabbage. Fl. July, Aug. Clt. 1820. Pl. 1 foot.

21 B. Mone'nsis (Huds. angl. 291.) leaves smooth, rather fleshy, and somewhat glaucous, pinnatifid; lobes linear, distant, toothed. ♃. H. Native on the sandy sea-coast, plentiful on the coast of Cumberland and in Walney Island. Anglesea but rare, also near Liverpool. In the isles of Bute, Arran, and Man, and several other parts of the western coast of Scotland, also between Dundee and Forfar. Sisýmbrium Monénse, Lin. spec. ed. 1. p. 658. Smith, engl. bot. 962. Lightf. fl. scot. 1. p. 352. t. 15. Lam. ill. t. 565. f. 2. Man Rocket, Pet. herb. brit. t. 46. f. 7. Root woody, thick, with numerous stems rising from the neck. Cauline leaves very few. Racemes corymbose, 7-8-flowered. Flowers large, yellow, veined.

Isle-of-*Man* Rocket or Cabbage. Fl. June, July. Britain. Pl. ½ to ¾ foot.

22 B. Eruca'strum (Lin. spec. 932.) leaves runcinate, smoothish; lobes unequal, bluntly sinuated; stem hispid at the base. ⊙. H. Native of France, Italy, Switzerland, &c. in sand and among rubbish. Bull. herb. t. 331. Sisýmbrium Erucástrum, Vill. dauph. 3. p. 342. Erùca sylvéstris, Lam. fl. fr. 2. p. 497. Erùca Erucástrum, Baumg. fl. trans. 2. p. 265. Erýsimum Erucástrum, Scop. carn. ed. 2. p. 27. The synonyms are very doubtful. Flowers yellow, veined. The beak of the pod is sometimes very small and 1-seeded, sometimes without seeds.

Eruca-like Rocket. Fl. June, Aug. Clt. 1790. Pl. 1 foot.

23 B. cheira'nthos (Vill. dauph. 3. p. 332. t. 36.) leaves stalked, hispid, pinnatifid; lobes sinuately-toothed, oval-oblong; stem hispid at the base; silique 4-times longer than the beak. ♂? H. Native of the south of France, Dauphiny, Piedmont,

Savoy, Switzerland, in sand on the banks of rivers and rivulets. Sinàpis Tournefórtii, All. ped. no. 692. exclusive of the synonyms. Sisýmbrium Monénse, Gilib. elem. 2. p. 184. Erýsimum arvénse, Thor. chlor. land. 284. Flowers yellow. This is a very polymorphous plant.

Var. β, *Sinàpis recurvàta* (All. ped. no. 963. t. 37.) Perhaps this plant is specifically distinct from the calyx, being more loose, and the beak of the pod rougher. Native of Piedmont and Mauritania on hills in exposed situations.

Var. γ, *B. montàna* (D. C. fl. fr. 4. p. 651.) Native of the Pyrenees on the higher mountains. This plant is humble, almost stemless, and tufted.

Wallflower Cabbage. Fl. Ju. Sep. Clt. 1819. Pl. 1 to 2 ft.

24 B. cheiranthiflòra (D. C. syst. 2. p. 601.) radical leaves stalked, lyrately-pinnatifid, rather hispid, cauline ones few, with entire acute lobes; root slender; siliques 3 times longer than the beaks. ⊙. H. Native of Spain, France, in sandy places. Sisýmbrium Burgundìacum, Hort. taur. Ráphanus cheiranthiflòrus, Willd. hort. berl. 19. t. 19. Root slender, perpendicular. Stem simple. Flowers yellow.

Stock-flowered Cabbage. Fl. Ju. Aug. Clt. 1806. Pl. 1 ft.

25 B. Tournefo'rtii (Gouan. ill. p. 44. t. 20. f. A.) radical leaves stalked, hairy, lyrately-pinnatifid; lobes ovate, crenated; siliques twice as long as the beak. ⊙. H. Native of Spain and Egypt on the margins of sub-humid fields. Erùca erécta, Lag. cat. hort. madr. 1815. p. 20. Root slender, perpendicular. Stem rather hispid at the base. Flowers pale-yellow.

Var. β, *B. sisýmbrioìdes* (Fisch. in litt.) ⊙. H. Native of Persia about Lencheran. This plant differs from the species, in the habit being smaller, as well as in the leaves being pinnate; the lobes are equal, and the terminal one is hardly larger than the lateral ones.

Tournefort's Cabbage. Fl. June, July. Clt. 1818. Pl. 1 ft.

26 B. lævigà'ta (Lag. varied. p. 40. no. 19.) radical leaves on short stalks, hairy, runcinately-pinnatifid; lobes acutely toothed; stem smooth, almost naked, siliques 4 times longer than the beak. ⊙? ♂. H. Native of Spain in sandy places. Root white, perpendicular. Leaves rather glaucous. Petals white, streaked with livid veins.

Smoothed Cabbage. Fl. June. Clt. 1820. Pl. 1 foot.

27 B. Valenti'na (D. C. syst. 2. p. 603.) lower leaves stalked, clothed with stiff hairs, pinnatifid; lobes a little toothed, upper leaves smooth, almost entire; pedicels shorter than the calyx; silique round, 3 times longer than the beak. ⊙. H. Native of Spain about Madrid, and in the province of Valencia. Sisýmbrium Valentìnum, Lin. spec. 920. Erùca híspida, Cav. mss.—Barrel. icon. t. 195. f. 1. Root hard, white, branched. Flowers white.

Valencia Cabbage. Fl. March, April. Clt. 1818. Pl. 1 foot.

28 B. erysimoi'des (Sieb. ex Spreng. syst. 2. p. 912.) hispid; stem branched; leaves lyrate; pods erect, beset with reflexed hairs, crowned by a long beak. ♂? H. Native of Egypt. Flowers pale-yellow.

Erysimum-like Cabbage. Pl. 2 feet?

29 B. strigòsa (D. C. syst. 2. p. 603.) lower leaves lyrately-pinnatifid, hispid; lobes ovate, toothed, terminal one large; stem hispid at the base, with retrograde hairs; silique 4 times longer than the beak. ⊙? H. Native of the Cape of Good Hope. Sisýmbrium strigòsum, Thunb. prod. 109. Ery'simum scabròsum, Banks, herb. Root long, perpendicular. Stem simple, a little furrowed. Flowers yellow?

Strigose Cabbage. Fl.? Pl. 1 foot.

30 B. fruticulòsa (Cyr. pl. rar. 2. p. 7. t. 1.) lower leaves rather pilose, lyrate; lobes blunt, toothed, terminal one very large; stem suffruticose at the base, and hispid, but glabrous at the apex; siliques torose, 4 times longer than the beak. ♄. H. Native of Naples, Spain, Sicily, Greece, &c. on arid hills and in cultivated places. Sinàpis radicàta, Desf. fl. atl. 2. p. 98. t. 167. Smith, fl. græc. t. 648. Flowers pale-yellow. This is a species apparently between *Brássica* and *Sinàpis*; it has a spreading calyx as in *Sinàpis*, but the habit and fruit is that of *Brássica*.

Shrubby Cabbage. Fl. May, July. Clt. 1818. Pl. 1½ foot.

31 B. Cyreni'aca (Spreng. syst. 2. p. 911.) smooth; upper leaves cordate-ovate, serrulated, stem-clasping; calyx smooth; pod torulose; beak tetragonal, 2-edged, obtuse. ♂. H. Native of Lybia or Cyreniaca. Ráphanus amplexicaúlis, Viv.

Cyrenian Cabbage. Pl. 2 feet.

32 B. pinna'ta (Spreng. syst. 2. p. 912.) smooth; leaves pinnate; leaflets linear, obtuse, almost entire; pods spreading, furfuraceous, torulose, crowned by a long beak. ♂. H. Native of the north of Africa in the great Syrtis. Ráphanus pinnàta, Viv. fl. lyb.

Pinnate-leaved Cabbage. Pl. 2 feet?

Sect. III. Micropòdium (from μικρος, *mikros*, small, and πους, *pous*, a foot; in allusion to the siliques being seated on short pedicels.) Silique elevated above the receptacle on a short pedicle, terminated by the short slender style, which is tipped by a capitate stigma. Allied to *Diplotáxis*, but there is only one row of seeds in each cell.

33 B. elonga'ta (Ehrh. beitr. 7. p. 159.) leaves stalked, lower ones sinuately-pinnatifid, hispid, upper ones smooth, toothed; stem smooth. ♂. H. Native of Transylvania, Hungary, Tauria, and Caucasus, on sandy hills, and by way-sides in sterile places. Waldst. et Kit. hung. 1. p. 26. t. 28. Sinàpis lævigàta, Pall. ined. taur. Habl. p. 164. This species is truly difficult to class as the calyx is not closed as in *Brássica*, nor is it loose as in *Sinàpis*. Flowers yellow. This species is cultivated in Hungary for the sake of expressed oil of the seeds. The cultivation of *Sinàpis nìgra* will answer well for this plant.

Elongated-racemed Cabbage. Fl. June, Oct. Clt. 1817. Pl. 2 to 4 feet.

34 B. sabula'ria (Brot. phyt. p. 97. t. 43.) radical leaves rather pilose, pinnatifid or runcinate, upper ones linear; stem hispid at the base. ⊙. H. Native of Portugal in sandy fields, especially about Coimbra and Lisbon, also of Sardinia. Sisýmbrium Párra, Lin. mant. 255. Calyx greenish-yellow; petals yellow. This plant was supposed to have originally come from Para in Brazil, whence the Linnæan name.

Sand Cabbage. Fl. June, July. Clt. 1818. Pl. 2 to 3 feet.

35 B. fra'gilis (Sieb. ex Spreng. syst. 2. p. 912.) smoothish; leaves oblong, running into the petiole, unequally toothed; racemes elongated; pedicels hispid; pods erect, stipitate, crowned by the shortish thick style. ♂. H. Native of Egypt.

Brittle Cabbage. Pl. 1 foot.

† *Species not sufficiently known.*

36 B. bu'nias (D. C. syst. 2. p. 606.) ♂? H. Native probably of the Levant. This plant has been confused with the true *Bùnias orientàle*, Lin. and is mixed with it in his herbarium, but it differs from that plant in the young pods being terete, slender, and smooth, terminated by a filiform style, adult ones oblong, crowned by a seedless conical beak. Bùnias foliis retrorsùm sinuatis, Lin. hort. ups. 186. The terminal lobe of the leaf is very large, and the lateral ones incline backwards; the cauline ones are small and entire. Racemes panicled and elongated.

Bunias-like Cabbage. Fl. June, July. Pl. 2 to 3 feet.

37 B. rectangula'ris (Viv. append. fl. cors. in Schlecht. Linnæa 1. p. 502.) leaves rectangularly-pinnate; outer pinnæ confluent; leaflets sessile, and are as well as the segments broad-linear, deeply serrated; claws of petals, as well as the stamens,

exceeding the length of the calyx; beak compressed, equal in length to the pod, which is smooth. Native of Corsica. Flowers yellow.

Rectangular-pinnate-leaved Cabbage. Pl. 1 foot?

38 B.? HI'RTA (Mœnch, suppl. p. 85.) ⊙. H. Native of? Leaves smooth, rather fleshy, lanceolate or linear-lanceolate, a little sinuated. Petals obcordate, emarginate, cream-coloured, with fuscous veins. Pods 4-6-seeded, hairy, crowned by a permanent pilose style, which is rather longer than the pod. This is perhaps a species of *Erùca*. Stem decumbent.

Hairy Cabbage. Fl. June, July. Pl. ½ to 1 foot long.

39? B. Forska'hlii (Schultz, obs. p. 131. no. 1012.) ⊙? H. Native of? Leaves all doubly pinnatifid, strigose. Stem and calyxes hispid. Siliques erect, smooth. Petals greenish-yellow.

Forskahl's Cabbage. Pl. 1 foot.

40? B. purpura'scens (Russ. in Schrad. journ. 1. p. 426.) ♂? H. Native about Aleppo. Leaves lanceolate, pinnatifid. Stem pilose. Pods jointed, smooth, crowned by an awl-shaped elongated beak. Perhaps a species of *Erucària* and is probably *E. Aléppica*.

Purplish Cabbage. Pl. 1 foot.

41? B. pseu'do-eruca'strum (Brot. fl. lus. 1. p. 581.) ⊙. or ♃. H. Native of Portugal in woods. Radical leaves half a foot long, lyrately-pinnatifid. Stem-leaves glaucous, uppermost ones of these linear-oblong, entire. Calyx erectly-closed, pilose at the apex. Pod smooth, brownish-green, an inch and a half long, crowned by the ensiform style. Seeds globose, black. Petals pale, streaked with brown. Perhaps a species of *Erùca*.

False-Erucastrum. Pl. trailing.

42 B. monta'na (Raf. specch. 2. p. 69.) ♄. H. Native of Sicily on the Nebrodes. Shrubby; leaves stalked, lyrately-pinnatifid, oblong, unequally toothed; petioles compressed. Perhaps the same as *B. oleràcea* and *B. crética*, Tinea.

Mountain Cabbage. Fl. June, Oct. Clt.? Pl. 2 feet.

43 B. cri'spa (Raf. specch. 2. p. 69.) ♄. H. Native of Sicily on the Nebrodes. Shrubby; leaves stalked, lyrately-pinnatifid, obovate, sinuated, curled, obtuse, smooth; petioles depressed. Racemes simple.

Curled Cabbage. Pl. 3 feet?

44 B. macroca'rpa (Gusson, fl. sic. prod. ex Schlecht. Linnæa 4. p. 34.) ♂. H. Native of Sicily. Habit and leaves of *B. Baleárica*, but the pod is almost as thick as a finger.

Long-podded Cabbage. Pl. 2 feet.

Cult. The culture of the common esculent species and varieties of this genus we have given under their proper species above, the rest require only common culture. Those species natives of the warmer parts of the world, require shelter in the winter. None of the species are worth cultivating for ornament.

LXXXIV. SINA'PIS (σιναπι is said to be derived from the Celtic word *nap*, a designation for all plants resembling the turnip or cabbage). Tourn. inst. 227. Lin. gen. no. 821. Gært. fruct. 2. p. 299. t. 143. D. C. syst. 2. p. 607. prod. 1. p. 217.

Lin. syst. *Tetradynàmia, Siliquòsa*. Silique rather terete, with nerved valves. Style small, short, acute. Seeds disposed in one row in each cell, subglobose. Calyx spreading. Herbs rarely suffrutescent, usually annual, branched, smooth, but usually pilose, sometimes their habit is referable to *Brássica*, sometimes to *Sisýmbrium*. Leaves of various forms, lyrate, or deeply toothed. Racemes terminal, bractless. Flowers yellow. Seeds of most of the species acrid, as in the white and black mustard. The English name mustard is a modernization of *mustum ardens*, hot must.

Sect. I. Melanosina'pis (from μελας, *melas*, *black*, and σιναπι, *sinapi*, mustard, that is to say, black-mustard). D. C. syst. 2. p. 607. prod. 1. p. 217. Silique terete, somewhat tetragonal. Style short, small, not beak-formed.

1 S. ni'gra (Lin. spec. 933.) siliques smooth, even, somewhat tetragonal, appressed to the peduncle; lower leaves lyrate, upper ones lanceolate, quite entire, stalked. ⊙. H. Native throughout Europe, Spain, France, Britain, Denmark, Germany, Italy, Transylvania, Greece, &c. in cultivated fields, waste grounds, and on banks by road sides. Mart. rust. t. 51. Smith eng. bot. t. 969. Woodv. med. bot. 3. p. 409. t. 151. Horn. fl. dan. 1582. This species is easily distinguished from the rest in the leaves being pendulous, as well as in the pods being closely pressed to the rachis.

Black mustard differs materially from *white mustard* in the flowers and seeds being smaller, the latter are black; they possess the same medicinal qualities, and the young plants are used for the same purpose. It is sometimes cultivated in gardens, and the tender leaves used as greens early in spring, but the grand purpose for which the plant is cultivated is for the seeds, which ground produce the well-known condiment mustard. "If the seeds," Mr. Neill observes, "be taken fresh from the plant, and ground, the powder has little pungency, but is very bitter; by steeping in vinegar, however, the essential oil is evolved, and the powder becomes extremely pungent. In moistening mustard powder for the table, it may be remarked that it makes the best appearance when rich milk is used; but the mixture in this case does not keep good for more than two days."

"To raise seed for flower of mustard and other officinal occasions, sow either in March or April, generally the black, or occasionally the white, in an open compartment, or large sowings in fields, where designed for public supply. Sow moderately thick either in drills six or twelve inches asunder, or broad-cast, after the ground has been properly ploughed and harrowed, and rake or harrow in the seed. When the plants are two or three inches high, hoe or thin them moderately, where too thick, and clear them from weeds. They will soon run up to stalks, and in July, August, or September, return a crop of seed ripe for gathering; being tied up into sheaves and left three or four days on the stubble. It is then stacked in the field. It is remarked that rain damages it. *Black mustard* is an exhausting crop, but profitable when the soil answers, and especially in breaking up rich loamy lands, as it comes off earlier than *white mustard*, and allows time for preparing the soil for wheat. This plant is cultivated to great extent in Durham. The seed of the *black mustard*, like the *charlock*, is difficult to extirpate, for it will remain in the ground if buried to the depth of 3 or 4 inches for ages without germinating until it is raised to the surface. The *black mustard* is exclusively used for grinding into flower of mustard, and the black husks of the seeds are separated by very delicate machinery. The French either do not attempt or do not succeed in separating the husks, as their mustard when brought to table is always black. It is, however, more pungent than ours, because the quality resides chiefly in the husk. The constituents of mustard appear to be chiefly starch, mucous, a bland fixed oil, an acrid volatile oil, and an ammoniacal salt.

Var. β, *torulòsa* (Pers. ench. 2. p. 207.) leaves broad, hastately-lobed, upper ones ovate, repand; silique torulose.

Var. γ, *túrgida* (Pers. ench. 2. p. 207.) leaves lobed, repand, auriculate at the base; pods turgid, veiny, appressed, with a conical striated beak.

Var. δ, *villòsa* (Merat. fl. par. p. 265.) lower leaves ovate, toothed, somewhat sinuated, smooth, upper ones lanceolate; pods villous. ⊙. H. Native of France. S. incàna, Thuil. fl. par. ed. 2. vol. 1. p. 343. but not of Lin.

Var. ε; *lævigàta* (Burm. prod. fl. cap. p. 18.) leaves and stem smooth.

Black Mustard. Fl. June, July. Britain. Pl. 1 to 2 feet.

2 S. GENICULA'TA (Desf. atl. 2. p. 98.) pods pubescent, striated, somewhat tetragonal, appressed to the rachis, each terminated by a jointed mucrone; lower leaves lyrate, upper ones lanceolate. ⊙. H. Native of Mauritania, in corn-fields. This plant differs from *S. nìgra*, which it is very like, in the pods being slenderer, and pubescent.

Jointed-podded Mustard. Fl. Ju. Jul. Clt. 1819. Pl. 1 to 2 ft.

3 S. RETRÓRSA (Burch. cat. geogr. afr. austr. no. 4215.) pods smooth, spreading; leaves lyrately-pinnatifid; lower lobes in the form of stipulas, and are, as well as the stem, pubescent from appressed and reflexed hairs. ♂. H. Native of the Cape of Good Hope. Stem erect, branched from the base, angular, purplish. Very like *S. nìgra*.

Bent-back-haired Mustard. Pl. 2 feet.

4 S. OLIVERIA'NA (D. C. syst. 2. p. 609.) pods smooth, erectish; leaves lyrately-pinnatifid; lobes acute, terminal lobe pinnatifid, in the upper ones linear. ♂. H. Native of Persia, between Teheran and Hispahan. Flowers white, the size of those of *Ráphanus*. Stem hispid at the base.

Oliver's Mustard. Pl. 2 feet.

5 S. LEPTOPE'TALA (D. C. syst. 2. p. 610.) pods smooth, spreading; petals linear; leaves runcinately-pinnatifid, hispid in the petiole; young branches hispid. ♃? G. Native of the Cape of Good Hope. Flowers yellow; petals hardly longer than the calyx. Deless. icon. sel. 2. t. 87. Root thick, perpendicular. Stem much branched.

Slender-petalled Mustard. Pl. 2 feet.

6 S. AMPLEXICAU'LIS (D. C. syst. 2. p. 610.) pods smooth, spreading, shorter than the pedicel; leaves stem-clasping, oblong, almost entire. ⊙. H. Native of Algiers, on hills. Sisýmbrium amplexicaúle, Desf. atl. 2. p. 81. t. 153. Seeds small, rufescent, ovate-globose. Stem rather hairy at the base.

Stem-clasping-leaved Mustard. Fl. Ju. July. Pl. 1 foot.

Sect. II. CERATOSINA'PIS (from κερας, *keras*, a horn, and σιναπι, *sinapi*, mustard; pods) D. C. syst. 2. p. 611. prod. 1. p. 218. Silique crowned by a seedless conical beak.

7 S. LANCÉOLA'TA (D. C. syst. 2. p. 611.) smooth; lower leaves rather lyrate; lower lobes small, tooth-like, terminal one large, and deeply toothed; upper leaves linear-lanceolate, entire. ⊙. H. Native of Santa Cruz, and Guadaloupe. Ráphanus lanceolàtus, Willd. spec. 3. p. 562. S. integrifòlia, Vest. ex Willd.

Lanceolate-leaved Mustard. Pl. 1½ foot.

8 S. LÆVIGA'TA (Lin. amœn. 4. p. 281.) smooth; leaves stalked, lyrately-pinnate-parted; lobes acutely-toothed, terminal one large ovate; petioles not auricled at the base; upper leaves linear, almost entire. ⊙. H. Native of Spain, Portugal, and Sicily. S. cérnua, Poir. dict. 4. p. 342. S. virgàta, Presl. del. prag. Erucástrum virgàtum and E. oleràceum, Presl. ex Spreng. Silique 3-times longer than the pedicel.

Smoothed Mustard. Fl. June, July. Clt. 1769. Pl. 1 to 2 ft.

9 S. AURICULA'TA (D. C. syst. 2. p. 611.) smooth; petioles auriculately stem-clasping at the base; leaves sublyrate, somewhat auricled; upper leaves linear, almost entire. ⊙. H. Native of? S. lævigàta, Poir. dict. 4. p. 344.

Eared-leaved Mustard. Fl. Ju. July. Clt. 1800. Pl. 2 feet.

10 S. INTEGRIFÒLIA (Willd. hort. berol. t. 14.) smooth; leaves ovate-lanceolate, undivided, acutely-toothed; siliques erectish, torose, tipped by the awl-shaped style. ⊙. H. Native of the East Indies and China. This plant is perhaps not sufficiently distinct from the following.

Entire-leaved Mustard. Fl. Ju. July. Clt. 1820. Pl. 1½ to 2 ft.

11 S. JU'NCEA (Lin. spec. 934.) smooth; lower leaves ovate-lanceolate, deeply serrated, upper ones lanceolate, entire; branches fascicled; pods erectish, pointed by the awl-shaped style. ⊙. H. Native of China and Egypt. Cultivated extensively in China and Cochin-China. Jacq. vind. t. 171. S. brassicàta, Lour. fl. coch. ed. Willd. 2. p. 485. S. nìgra of Forsk. ex Delil. ill. no. 604. Very like *S. brassicàta*, but the cauline leaves are not dilated into stem-clasping auricles at the base.

Rushy Mustard. Fl. June, July. Clt. 1782. Pl. 1 to 2 feet.

12 S. CHINE'NSIS (Lin. mant. 95.) leaves deeply pinnatifid; lobes toothed, with the nerves on the under surface rather hairy; pods erectish, acuminated with the style. ♂. ⊙. H. Native of China. Cultivated both in China and Cochin-China for the sake of its seed, which is ground into Mustard, as well as being made into a sinapism. Stem furrowed slightly.—Ard. specim. 1. p. 23. t. 10. Flowers very like those of *S. júncea*.

Chinese Mustard. Fl. June, July. Clt. 1782. Pl. 1 to 2 feet.

13 S. BRASSICA'TA (Lin. syst. nat. 3. p. 231.) smooth; cauline leaves cordate, stem-clasping, oblong, nearly entire, lower ones lyrately-pinnatifid; siliques spreading, terminated by a conical beak. ⊙. H. Native of China. Habit of *Brássica oleràcea*, glaucous. Perhaps the same as *S. Chinénsis* of Lour.

Brassica-like Mustard. Fl. Ju. July. Clt. 1801. Pl. 1 to 2 ft.

14 B. CE'RNUA (Thunb. fl. jap. 261.) smooth; radical leaf lyrate, with the terminal lobe very large-ovate and deeply toothed; flowering branches drooping. ⊙. H. Native of China, and cultivated in Japan. Flowers terminal, racemose, white. Stem branched at the top. The Japanese call this plant *Takana*; the ground seeds are used by them as mustard.

Drooping-branched Mustard. Fl. June, July. Clt. 1819. Pl. 1 to 2 feet.

15 S. JAPO'NICA (Thunb. fl. jap. 262.) smooth; leaves deeply pinnatifid, with round angles; pods erect, smooth. ⊙. H. Native of Japan. Flowers yellowish.

Japan Mustard. Fl. June, July. Pl. 1 to 2 feet.

16 S. PUBE'SCENS (Lin. mant. 95.) leaves villously-pubescent, lyrately-pinnate-parted, with the terminal lobe large and ovate; pods hairy. ♃.? H. Native of Sicily, Spain, and Naples. Arduin. specim. 1. p. 21. t. 9. Every part of the plant is covered with long soft villi. Pods erect, not torose.

Pubescent Mustard. Fl. June, July. Clt. 1789. Pl. 2 feet.

17 S. CIRCINNA'TA (Desf. atl. 2. p. 96.) leaves velvety-pubescent, lyrately-pinnate-parted, terminal lobe large, circinnate. ⊙. H. Native of Mauritania in corn-fields. This is very like the preceding species, and perhaps not distinct from it.

Circinnate-leaved Mustard. Fl. June, July. Pl. 2 feet.

18 S. ARVE'NSIS (Lin. spec. 935.) pods smooth, many-angled, torulose, thrice as long as the two-edged slender beak. ⊙. H. Native throughout the whole of Europe, a pest in corn-fields, abundant in ground newly disturbed. Oed. fl. dan. t. 783. Curt. lond. t. 321. Smith, engl. bot. t. 1748. Schkuhr. handb. 2. no. 1871. t. 186. There are several varieties of this plant. *Charlock* is a common annual weed in corn-fields. The young plant is eaten in the spring as turnip-tops, and is considered not inferior to that vegetable. The seeds of it have sometimes been sold for feeding birds instead of rape; but being hot in its nature, it often renders them diseased.

Corn Mustard or Charlock. Fl. Ju. July. Britain. Pl. 1 to 2 ft.

19 S. ORIENTA'LIS (Lin. amœn. 4. p. 280.) pods clothed with bent-back hairs, somewhat tetragonal, torulose, shorter than the slender beak. ⊙. H. Native of the Levant, south and middle Europe, in corn-fields. Schkuhr. handb. 1. p. 264. t. 186. Pods hispid, but nevertheless the beak is smooth. The specimen in the Linnean herbarium has the pods evidently furrowed.

Oriental Mustard. Fl. Ju. July. Clt. 1778. Pl. 1 to 2 feet.

20 S. TIMORIA'NA (D. C. syst. 2. p. 616.) pods smooth, many-angled, torulose, 4 times longer than the slender beak;

stem and leaves smooth. ⊙. H. Native of the island of Timor. Deless. icon. sel. 2. t. 88. This plant is very like *S. arvénsis*, but the whole herb is smooth, not hispid.

Timor Mustard. Fl. June, July. Pl. 1½ foot.

21 S. Tau'rica (Fisch. cat. hort. gor. 1812. p. 51.) pods smooth, tetragonal, with 3-nerved valves, twice the length of the 2-edged conical beak. ⊙. H. Native of the south of Tauria on dry mountains. Herb branched, diffuse. Leaves oblong, smooth, toothed; lower ones deeply lobed.

Taurian Mustard. Fl. June, July. Clt. 1818. Pl. 1 to 2 ft.

22 S. sub-bipinnati'fida (Lag. cat. hort. madr. 1816. p. 20.) pods smooth, somewhat tetragonal, 6 times longer than the somewhat conical beak; leaves pinnate-parted, with unequal lobes, larger ones oblong and deeply-cut. ⊙. H. Native of Spain, particularly in the mountains of Leon. Stem beset with bent-back hairs at the base. This species ought to form a distinct section. Beak of pod long, usually with one seed at its base.

Sub-bipinnatifid-leaved Mustard. Fl. June, July. Clt. 1820. Pl. 1 to 2 feet.

23 S. Ka'ber (D. C. hort. monsp. 1808. syst. 2. p. 617.) pods smooth, terete, double the length of the conical beak, with smooth valves. ⊙. H. Native of Persia. Stem erect, simple, more or less pubescent. Leaves smooth, oblong, cut, with the incisures deeply and regularly serrated. *Kaber* is probably the Persian name of the plant.

Kaber or Persian Mustard. Fl. Ju. July. Clt.? Pl. 1 foot.

24 S. Allìonii (Jacq. vind. 2. t. 168.) pods smooth, ovate-oblong, scarcely longer than the conical beak, with even valves. ⊙. H. Native of Egypt, very common in flax-fields. Delil. fl. egyp. p. 102. t. 35. f. 1. Ráphanus erucoìdes, Lin. fil. suppl. 299. Leaves smooth, pinnatifid, or cut down to the mid-rib; lobes entire or toothed. This plant differs from *S. túrgida* in the pods being even, not nerved, and from *S. Kàber* in the valves of the pod being one-half shorter, and from both in the pedicels being longer, and in the style being more slender.

Allioni's Mustard. Fl. June, July. Clt. 1789. Pl. 2 feet.

25 S. tu'rgida (Delile, ill. fl. egypt. no. 606.) pods smooth, ovate, with reticulately-nerved valves; the pods about equal in length to the conical beak. ⊙. H. Native of Egypt. Ráphanus túrgidus, Pers. ench. 2. p. 209. Leaves pinnatifid, not truly pinnate-parted. This plant is usually confused with *S. Allìonii* in gardens, but differs in the pedicels not being longer than the calyx, as well as in the valves of pod being nerved.

Turgid Mustard. Fl. June, July. Clt. 1819. Pl. 2 feet.

Sect. III. Hirschfe'ldia (Hirschfeld, evidently the name of some botanist.) D. C. syst. 2. p. 618. prod. 1. p. 220. Siliques terete, 2-celled; cells usually 4-seeded, crowned by an ovate, 1-seeded, indehiscent beak.

26 S. inca'na (Lin. amœn. 4. p. 281. spec. 934.) pods smooth, appressed to the rachis, somewhat torulose; stem branched, scabrous below; leaves lyrate, scabrous. ♂. H. Native of the south of Europe. Jacq. vind. t. 169. Myàgrum Hispánicum, Lin. spec. 893. Hirschféldia adpréssa, Mœnch. meth. 264. Cakìle Hispánica, Lher. diss. cak. ined. p. 7. Cordylocárpus pubéscens, Smith, prod. fl. græc. 2. p. 33.

Hoary Mustard. Fl. June, July. Clt. 1771. Pl. 1 to 3 feet.

27 S. Panormita'na (Spreng. syst. append. 8. p. 244.) pods smooth, torose, appressed, longer than the beak; stem branched, hispid at the base; leaves stalked, lanceolate, toothletted, scabrous. ⊙. H. Native of Sicily near Palermo. Hirschféldia integrifòlia, Presl. ex Spreng. l. c.

Palermo Mustard. Fl. June, July. Pl. 2 feet.

28 S. heterophy'lla (Lag. cat. hort. madr. 1816.) pods pubescent, appressed to the rachis, somewhat torose; stem branched, hispid at the base; leaves lyrately-pinnatifid, hispid on the nerves. ♂. H. Native of Spain among rubbish about Madrid. Hirschféldia infléxa, Presl. ex Spreng.

Variable-leaved Mustard. Fl. Ju. July. Clt. 1822. Pl. 1½ ft.

Sect. IV. Leucosina'pis (from λευκος, *leùcos*, white, and σινα-πι, *sinapi*, mustard, that is to say, White Mustard.) D. C. syst. 2. p. 619. prod. 1. p. 220. Siliques hispid or smooth, crowned by an ensiform beak, with the valves rather torulose. This section ought probably to be joined with *Erùca*, or perhaps rather to form a distinct genus both from *Erùca* and *Sinàpis*.

29 S. a'lba (Lin. spec. 933.) pods hispid, spreading, rather narrower than the ensiform beak; leaves lyrate, and are, as well as the stem, smoothish. ⊙. H. Native of the south of Europe, viz. Spain, Portugal, Sicily, Switzerland, south of Germany, Transylvania and Greece. In Britain in cultivated as well as waste ground, and by road-sides. Mart. rust. t. 70. Curt. lond. 5. t. 46. Smith engl. bot. 1677. Schkuhr. hand. 2. t. 186. Bonánnia officinàlis, Presl. ex Spreng. Seeds large, pale. It is called in French, *Moutarde blanche, Navette d'été*, or *Graine de Beurre*. There is an esculent oil obtained from the seeds of this plant.

White Mustard. *Senévé* (Fr.). *Senf* (Germ.). *Senapa* (Ital.) It is cultivated chiefly as a small salad, and is used like cresses, while in the seed-leaf; when these are newly expanded they are mild and tender; but when the plants have advanced into the rough leaves, they eat rank and disagreeable. The seeds are yellow, and are, as well as the flower, much larger than those of *Sinàpis nìgra*. The seeds have an acrid bitterish taste, and a pungent smell when reduced to powder; they impart their taste and smell to water, whilst rectified spirits extracts extremely little of either; the whole of the pungency arises with water in distillation. Committed to the press they yield a considerable quantity of bland insipid oil, perfectly void of acrimony; the cake left after the expression is more pungent than the mustard itself.

White-mustard seed is swallowed entire to the quantity of a table-spoonful or more, to stimulate the stomach in some cases of dyspepsia, and to excite the peristaltic motion of the intestines, especially when they are torpid, as in paralysis. The powder of the *Black* and *White Mustard* made into a paste, with water, is commonly used as a condiment with animal food; infused with water it proves emetic, when taken in considerable doses, and in smaller ones acts as a diuretic and aperient; but is more frequently applied externally, as a topical stimulus, made into a paste, or sinapism, with vinegar and bread-crumb, which may be made stronger by adding a little scraped *Horse-radish* root.

Culture. For spring or summer consumption of the young plants, sow once a week or fortnight, in dry warm situations, in February and March; and afterwards in any other compartment. "In summer sow in shady borders, if it be hot sunny weather, or have the bed shaded. Generally sow in shallow, flat drills, from three to six inches apart. Scatter the seed thick and regular, and cover it thinly with earth, about a quarter of an inch. To furnish gatherings in winter, or early in spring, sow in frames, or under hand-glasses; and when the weather is frosty, or very cold, in hot-beds and stoves, as directed for *Cress*." For the sake of seed either sow a portion in March or April to stand for that purpose; or, for small supplies, leave some rows of the spring sowing, grown too large for salads; they will ripen seed in autumn. In Kent, *White Mustard* is cultivated for the use of the seedsmen in London. In the tillage, the ploughed land is harrowed over, and then furrows are stricken about eleven or twelve inches apart, sowing the seeds in the proportion of about two or three gallons per acre, in March. The crop is afterwards hoed, and kept free from weeds.

White Mustard. Fl. June, July. Britain. Pl. 1 to 2 feet.

30 S. hí'spida (Schousb. moroc. p. 182. t. 4.) pods hispid,

spreading, narrower than the ensiform beak; leaves lyrate, scabrous; stem beset with bent-back stiff hairs. ⊙. H. Native of Morocco, Teneriffe, Portugal, &c., in mountainous places, about the edges of fields. S. flexuòsa, Lam. dict. 4. p. 341. This plant is very like *S. álba*, but is easily distinguished from it in the stem being beset with retrograde hairs, not smooth.

Hispid Mustard. Fl. June, July. Clt. 1804. Pl. 2 feet.

31 S. disse'cta (Lag. cat. hort. madr. 1816. p. 20.) pods rather erect, torulose, rather shorter than the ensiform beak; leaves pinnate-parted; lobes narrow, deeply toothed, or pinnatifid. ⊙. H. Native of Spain, in fields of flax. Bonànnia dissécta, Presl. ex Spreng. Stem with a few retrograde hairs. Pods smooth, but sometimes scabrous on the nerves.

Var. α, siliques smooth.

Var. β, siliques rather hispid.

Dissected-leaved Mustard. Fl. June, July. Clt. 1817. Pl. 1 to 1½ foot.

32 S. hasta'ta (Desf. cat. hort. par. ed. 2. p. 151.) pods erectish, smooth, linear, torulose, longer than the ensiform beak; leaves smooth, pinnate-lobed; lobes lanceolate. ⊙. H. Native of New Holland. Perhaps a separate section.

Hastate-leaved Mustard. Fl. June, July. Clt. 1817. Pl. 1 to 2 feet.

33 S. foliòsa (Willd. enum. 688.) beak of pod compressed, very scabrous, longer than the pod, which is also hispid; leaves lyrate, repandly-angular, smooth. ⊙. H. Native of the Levant. Stem simple, beset with long bent-back hairs. Terminal lobe of the leaf hardly larger than the lateral ones.

Leafy Mustard. Fl. June, July. Clt. 1820. Pl. 1 foot.

34 S. A'pula (Tenore app. prim. cat. hort. nap. p. 60.) pods even, smooth, spreading; style oblong, compressed; leaves runcinately-pinnatifid, smooth; segments all lanceolate, toothed and acute. ⊙. H. Native of Naples, in Abruzzo, in corn-fields.

Apulian Mustard. Fl. Ju. July. Clt. 1823. Pl. 1 to 1½ ft.

Sect. V. Disa'ccium, (from δις, *dis*, double, σακκιον, *saccion*, a little sack; calyx bisaccate at the base.) D. C. syst. 2. p. 623. prod. 1. p. 220. Calyx half-spreading, bisaccate at the base. Stigma capitate. Perhaps this section is sufficient to constitute a distinct genus.

35 S. frute'scens (Ait. hort. kew. ed. 1. vol. 2. p. 404. ed. 2. vol. 4. p. 127.) calyx bisaccate at the base; leaves coriaceous, lower ones oblong-lanceolate, tapering to the base, somewhat toothed, upper ones lanceolate, entire. ♄. G. Native of Madeira, among the rocks near Curral das Freiras. Hook. bot. misc. 2. p. 119. t. 28. Hésperis diffùsa, Spreng. syst. 24. Stem branched, twisted, and is, as well as the leaves, smooth. Flowers about the size of those of *Cheiránthus versícolor*, of a pale yellow colour. Pods erect, smooth.

Shrubby Mustard. Fl. Ju. Dec. Clt. 1777. Shrub, 2 feet.

36 S. angustifòlia (D. C. syst. 2. p. 220.) calyx bisaccate at the base; leaves linear, entire. ♄. G. Native of Madeira. Brássica frutéscens, Sol. in herb. Banks. Flowers about the size of those of the preceding.

Narrow-leaved Shrubby Mustard. Fl. Ju. Dec. Shrub, 1 ft.

† *Species not sufficiently known.*

37 S. Pekine'nsis (Lour. fl. coch. ed. Willd. 2. p. 485.) siliques linear, smooth, compressed; leaves obovate, entire, curled; petioles flattish, broad. ⊙. H. Native of China, about Pekin, and where it is cultivated. Perhaps the same as *S. Chinénsis brassicàta*, or *júncea*. Leaves entire, runcinately serrated.

Pekin Mustard. Pl. 2 feet.

38 S. polymo'rpha (Geners, in Schult. obs. no. 1021.) siliques spreading, smooth, crowned by a somewhat tetragonal compressed beak; leaves lyrately-pinnatifid, smooth, but scabrous on the nerves and margins; stem hispid at the base. ⊙. H. Native of? Stem furrowed. Flowers large, yellow.

Polymorphous Mustard. Pl. 2 feet.

39 S. procu'mbens (Poir. suppl. 4. p. 12.) stem procumbent; radical leaves lyrately-pinnate, expanded, nearly smooth, upper cauline ones simple, stalked; lower pedicels very long, capillary. ⊙. H. Native of Mauritania, in sandy fields. Flowers pale yellow. Leaves like those of *Brássica fruticulòsa*. Stem simple, weak, smooth. Silique unknown.

Procumbent Mustard. Pl. procumbent.

40 S. nudicau'lis (Lag. cat. hort. madr. 1816. p. 20.) scape naked; radical leaves hispid, pinnatifid; siliques erect, smooth, longer than the awl-shaped beak. ♃. H. Native of the south of Spain, in mountainous places, by way-sides. Sufficiently distinct from all the others.

Naked-stemmed Mustard. Fl. Ju. Jul. Clt. 1818. Pl. 1 foot.

41 S. Mesopota'mica (Spreng in Schrad. journ. 4. p. 199.) siliques somewhat tetragonal, terminating in a point; leaves lyrate, hispid. ⊙. H. Native of Syria.

Mesopotamia Mustard. Pl. 1 foot.

† *Species only known by name, from Roxburgh's Hortus Bengalensis*, p. 74.

1 *S. dichótoma.* Native of Bengal, where it is called *Surisha*, or *Surshupa.*

2 *S. glaúca.* Native of Bengal, where it is called *Shweetrace.*

3 *S. ramòsa.* Native of Bengal, where it is called *Joony-race*, or *Rajika.*

4 *S. triloculàris.* Native of Nepaul.

5 *S. cuneifòlia.* Native of Thibet.

6 *S. erysimoìdes.* Native of Malabar.

7 *S. divarìcata.* Native of Bengal, where it is called *Bun-race.*

8 *S. pàtens.* Native of the East Indies, where it is called *Beel-race.*

9 *S. pusílla.* Native of Coromandel.

10 *S. prostràta.* Native of China.

Cult. The species of this genus will grow under any circumstances. They are mostly annuals, and require common treatment. *S. frutéscens* and *S. angustifòlia*, will grow well in a mixture of sand, loam, and peat, and ripened cuttings of them will strike root freely if planted under a hand-glass, or they may be increased by seeds. None of the species are worth cultivating, except in general collections, or in botanic gardens.

LXXXV. MORICA'NDIA (in honour of Stephan Moricand, an Italian botanist, author of Floræ Venetæ). D. C. syst. 2. p. 626. prod. 1. p. 221.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique tetragonal, somewhat 2-edged. Seeds disposed in two rows in each cell; they are ovate, small, and a little margined. Annual or biennial herbs, rather ligneous at the base, smooth, rather glaucous. Stem round, whitish, erect, branched. Leaves thickish. Racemes terminal, loose; pedicels filiform, bractless, erect. Flowers large, beautiful purplish.

1 M. arve'nsis (D. C. syst. 2. p. 626.) pods somewhat tetragonal; cauline leaves cordate, stem-clasping, quite entire. ♂. H. Native of the south of Europe in humid gravelly places, Spain, Algiers, Greece, Naples, Piedmont, Provence, &c. Brássica arvénsis, Lin. mant. 95. Smith, fl. græc. t. 644. B. purpùrea, Mill. dict. no. 6. B. perfoliàta, var. β. Lam. fl. fr. 2. p. 487. Turrìtis arvénsis, R. Br. in hort. kew. ed. 2. vol. 4. p. 108.—Bocc. sic. p. 49. t. 25. f. 3. Flowers beautiful, violaceous.

Var. β, *Brássica suffruticòsa* (Desf. fl. atl. 2. p. 94.). Native

of Spain and Mauritania on dry hills. Stem ligneous at the base. Crántzia frutéscens, Lag. fl. hisp. ined.

Corn-field Moricandia. Fl. April, Aug. Clt. 1739. Pl. 1 ft.

2 M. HESPERIDIFLO'RA (D. C. syst. 2. p. 627.) siliques compressed, with flat valves, with a nerve running through the middle; cauline leaves ovate oblong, sinuately toothed. ⊙. H. Native of Egypt, frequent in valleys about Cairo, and at the ruins of Qouhbah and Mataryeh. Hésperis àcris, Forsk. fl. ægypt. arab. descrip. p. 118. Delil. ægypt. desc. p. 103. t. 35. f. 2. Flowers of a dirty-purplish colour. Stem branched, rather angular at the base.

Hesperis-flowered Moricandia. Pl. 1 to 1½ foot.

3 M. TERETIFO'LIA (D. C. syst. 2. p. 628.) siliques compressed, with nerveless valves; leaves multifid, with filiform lobes. ⊙. H. Native of the north of Africa about Cafsa, and in Egypt about the Saqqarah Pyramids. Brássica teretifòlia, Desf. fl. atl. 2. p. 94. t. 164. Habit of plant and shape of leaves nearly like that of *Erucària Aléppica*. Flowers violaceous, about the size of those of *M. arvénsis*.

Terete-leaved Moricandia. Fl. Dec. Pl. 1 foot.

Cult. These beautiful plants deserve to be cultivated in every collection; the seeds only require to be sown in the open ground early in the spring in a warm dry situation, in light soil. If kept in pots, as greenhouse plants they will endure several years, although said to be annuals; in this state they will flower very early in the spring. They are all propagated by seeds or cuttings.

LXXXVI. DIPLOTA'XIS (from *διπλοος, diploos*, double, and *ταξις, taxis*, a series; because of the seeds being disposed in two rows in each cell). D. C. syst. 2. p. 628. prod. 1. p. 221.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique compressed, linear. Seeds ovate, disposed in two rows in each cell. (f. 47. *g.*) Calyx equal at the base. Erect, branched, smooth, or hispid herbs. Leaves of various shapes, all rather fleshy. Racemes elongated; pedicels filiform, bractless. Flowers yellow, seldom white. Calyx usually covered with soft pubescence.

Sect. I. Catoca'rpum (from *κατω, kato*, downwards, and *καρπος, karpos*, a fruit; because the pods are pendulous.) D. C. syst. 2. p. 629. prod. 1. p. 221. Style almost wanting. Stigma 2-lobed, almost sessile. Siliques pendulous, sessile, but usually stalked.

1 D. CRASSIFO'LIA (D. C. syst. 2. p. 629.) pods pendulous, stalked; leaves toothed, nearly all smooth. ⊙. H. Native of Sicily about St. Cataldo and Delia. (Raf.) Sinàpis crassifòlia, Raf. car. nov. gen. p. 78. no. 192. Stem rather hispid towards the base, sparingly branched. Flowers yellow; petals double the length of the calyx. Seeds pale brown, small.

Thick-leaved Sand-Mustard. Fl. June, July. Clt. 1818. Pl. 3 to 4 feet.

2 D. Lagasca'na (D. C. syst. 2. p. 629.) siliques pendulous, stalked; leaves pinnate-parted, piliferous, with a few distant linear lobes. ⊙. H. Native of Spain on moist rocks as well as in dry sandy places in the mountains, frequent about Alona, &c. Sisýmbrium péndulum, Lag. in litt. Stem slender, pilose at the base. Flowers yellow.

Lagasca's Sand-Mustard. Pl. 1 foot.

3 D. PE'NDULA (D. C. syst. 2. p. 630.) siliques pendulous, stalked; cauline leaves oblong, hispid, coarsely toothed. ⊙.? H. Native of the north of Africa in the sand near Cafsa. Stem pilose at the base but smooth at the top. Leaves 2-3 inches long. Flowers yellow; petals longer than the calyx. Sisýmbrium péndulum, Desf. fl. atl. 2. p. 82. t. 156.

Pendulous-podded Sand-Mustard. Fl. Dec. Feb. March. Clt. 1823. Pl. 1 to 2 feet.

4 D. HI'SPIDA (D. C. syst. 2. p. 630.) siliques pendulous, sessile; leaves obovate, coarsely toothed, hispid. ⊙. H. Native of Egypt near Cairo. Deless. icon. sel. 2. t. 89. Sinàpis Hàra, Forsk. ægyp. descr. 118. Sisýmbrium híspidum, Vahl. symb. 2. p. 77. S. Ægýptium, Juss. herb. Stem branched, leafy at the base, and beset with long, stiff, white hairs, but rather naked and smooth at the apex. Flowers yellow, middle-sized, erect.

Var. β, subglàbra (D. C. l. c.). Native near Damascus, on a mountain called Dgebel-cher. Plant almost smooth.

Hispid Sand-Mustard. Fl. May, Jul. Clt. 1819. Pl. ½ to 1 ft.

Sect. II. Anoca'rpum (from *ανω, ano*, upwards, and *καρπος, karpos*, a fruit; because of the pods being erect, not pendulous, as in the preceding section). D. C. syst. 2. p. 630. prod. 1. p. 222. Style conical, compressed, containing 1 or 2 seeds, or it is sometimes empty, terminated by a 2-lobed stigma. Siliques erect, sessile, rarely stalked.

5 D. ERUCOI'DES (D. C. syst. 2. p. 631.) siliques sessile, erectish; style ensiform; leaves sessile, runcinately-lyrate, toothed. ⊙. H. Native of Spain, Sicily, Algiers, Mogodor, by way-sides, in vineyards and olive-grounds. Sinàpis erucoìdes, Lin. amœn. 4. p. 322, Jacq. vind. t. 170. Sisýmbrium erucoìdes, Desf. atl. 2. p. 83. Stem branched, rather angular and scabrous. Petals white, large, very blunt, purplish at the claws. Seeds pale, very small.

Eruca-like Sand-Mustard. Fl. Ju. Jul. Clt. 1736. Pl. 1. to 1½ foot.

6 D. VIRGA'TA (D. C. syst. 2. p. 631.) pods sessile, erectish, crowned by an ensiform style; leaves stalked, pinnatifid, with blunt toothed lobes. ⊙. H. Native of Spain, very common about Madrid and Tudela and elsewhere, in waste places. Sinàpis virgàta, Cav. præl. ex. Lag. Stems ascendant at the base, and beset with stiff bristles, but becoming gradually smooth towards the top. It differs from the preceding plant in the flowers being yellow, as well as in the leaves being stalked.

Whip Sand-Mustard. Fl. Ju. Jul. Clt. 1817. Pl. ½ to 4 ft.

7 D. CATHO'LICA (D. C. syst. 2. p. 632.) siliques sessile, erectish, crowned by a rather terete style, which contains 1 or 2 seeds at its base; leaves pinnate-parted, with dissected lobes and linear segments, which are sinuately toothed. ⊙. H. Native of Portugal about Lisbon and Coimbra, of Spain about Madrid, by way-sides and in waste places. Sisýmbrium cathólicum, Lin. mant. p. 93. Sinàpis Hispánica, Lag. fl. hisp. ined. Stems numerous, rather procumbent, glaucous, almost smooth. Petals yellow, with their claws shorter than the calyx. Style rarely seedless. Seeds small, brown.

Universal Sand-Mustard. Fl. Ap. June. Clt. 1822. Pl. 1 ft.

8 D. TENUIFO'LIA (D. C. syst. 2. p. 632.) pods on short pedicels, erect, crowned by a short, seedless style; upper leaves entire, lower ones pinnate-parted, with linear, entire, or pinnatifid lobes. ♃. H. Native throughout Europe from Britain to Turkey, in gravelly, stony, waste places. In Britain on old walls and heaps of rubbish, plentiful about London, Windsor, Chester, Yarmouth, and other old towns. Sisýmbrium tenuifòlium, Lin. spec. 917. Bull. herb. t. 335. Smith, engl. bot. 525. Schkuhr. handb. 2. no. 1894. Brássica muràlis, Huds. ang. 290. Sisýmbrium sylvéstre, Burm. prod. fl. cap. 17. S. àcre, Lam. fl. fr. 2. p. 250. Erùca tenuifòlia, Mœnch, meth. 357. Erýsimum tenuifòlium, Clairv. herb. val. 220. Sinàpis tenuifòlia, R. Br. in hort. kew. ed. 2. vol. 4. p. 128. Herb smooth all over. Calyx smooth, or only pilose at the top. Petals twice as long as calyx, yellow.

Fine-leaved or Narrow-leaved Wall-Mustard or Wall-Rocket. Fl. June, Oct. Britain. Pl. 1 to 2 feet.

9 D. MURA'LIS (D. C. syst. 2. p. 634.) pods sessile, erect, crowned by a rather filiform, short style; radical leaves toothed or lyrate, smooth. Stems almost naked, ascendant. ⊙. H.

Native of gravelly or sandy waste places in France, Italy, Germany, Austria, Transylvania, and Britain. In Britain in sandy barren ground near the sea, common throughout the isle of Thanet, particularly about Ramsgate ; and below Bristol. Sisýmbrium muràle, Lin. spec. 918. Smith, engl. bot. t. 1090. Schkuhr. handb. 2. no. 1988. t. 187. A'rabis Canadénsis, Mill. dict. no. 6. Erùca decúmbens, Mœnch. meth. 257. Sinàpis muràlis, R. Br. in hort. kew. ed. 2. vol. 4. p. 128. A very variable plant in habit. Flowers smaller and paler yellow than those of *D. tenuifòlia*.

Var. β ; lobes of leaves more profoundly and more acutely toothed. Sisýmbrium erucástrum, Gouan. ill. p. 42. t. 20.

Var. γ, mìnor (D. C. syst. 2. p. 634.) lobes of leaves blunt and more profound. Sisýmbrium Barrelièri, Thuil. fl. par. ed. 2. vol. 1. p. 334.

Var. δ, pygmæ'um (D. C. l. c.) Sisýmbrium Monénse, Thuil. fl. par. ed. 2. vol. 1. p. 333.

Wall or Sand-Mustard. Fl. July, Sept. Britain. Pl. 1 ft.

10 D. Barrelie'ri (D. C. syst. 2. p. 634.) pods sessile, erect, crowned by a short, somewhat filiform style ; radical leaves runcinate, toothed, hispid ; stem naked, erect, smooth at the top. ⊙. H. Native of Spain about Madrid, and perhaps of Italy. Sisýmbrium Barrelièri, Lin. spec. 919.—Barrel. obs. p. 44. t. 1016. Stem branched. Leaves rosulate. Flowers yellow, but when dry whitish.

Barrelier's Sand-Mustard. Fl. Ju. Jul. Clt. 1770. Pl. 1 ft.

11 D. scapo'sa (D. C. syst. 2. p. 635.) pods sessile, erect, crowned by a short somewhat filiform style ; radical leaves smooth, oblong, pinnatifid, with short entire lobes ; stems naked, very short. ⊙? H. Native of the island Lampedosa. A small, smooth, many-stemmed herb. Scapes sometimes shorter, sometimes longer than the leaves. Calyx smooth. Petals obovate, yellow. Seeds small, orbicular.

Scape-stemmed Sand-Mustard. Pl. ¼ foot.

12 D. vimi'nea (D. C. syst. 2. p. 635.) pods sessile, erect; style short, filiform ; radical leaves lyrate, very blunt, smooth ; stem naked, somewhat decumbent. ⊙. H. Native of vineyards, cultivated, and sandy places ; in France about Paris, Dauphiny, Montpelier, Provence ; Italy, Naples, and Sicily about Agrigentum. Sisýmbrium vimíneum, Lin. spec. 919. S. pùmilum, Lam. fl. fr. 2. p. 516. S. vineàle, Gat. fl. mont. 120.—Bocc. sic. 19. t. 10. A small, smooth herb, like *D. muràle*. Flowers small, yellow.—Mor. oxon. 2. p. 229. no. 8. sect. 3. t. 5. f. 8.

Twiggy Sand-Mustard. Fl. May, July. Clt.? Pl. decumb.

13 D. saxa'tilis (D. C. syst. 2. p. 636.) pods erect, sessile, tapering to the base ; style short, conical ; radical leaves pinnate-lobed, thickish, with entire lobes ; stems almost naked, erect. ♃. H. Native of Spain, Piedmont, and Tauria on rocks. Sisýmbrium Monénse, Lin. spec. ed. 2. p. 918. but not of his first edition. S. saxátile, Lam. fl. fr. 2. p. 517. S. repándum, Poir. dict. 7. p. 209. S. Monénse, var. Gerárdi, Smith, in Rees' cyclop. S. muràle and S. vimíneum, Bieb. fl. taur. ex suppl. p. 439. S. Valentìnum, Juss. herb. Root thick. Stem either naked or leafy at the base. Calyx smooth. Flowers yellow.

Rock Sand-Mustard. Fl. June, July. Clt. ? Pl. ¼ to ½ ft.

14 D. ramosi'ssima (Spreng. neu. entd. 3. p. 52.) pods erect, crowned by a short, terete style ; leaves all lanceolate, elongated, and nearly sessile, quite smooth and quite entire. ♃. H. Native of? Siliques terete, on long stalks.

Much-branched Sand-Mustard. Pl. 1 foot.

15 D. si'mplex (Spreng. syst. 2. p. 914.) stem almost naked, smooth ; radical leaves oblong-linear, remotely toothed ; cauline leaves few, linear, entire ; beak of pod filiform, crowned by a capitate stigma. ⊙. H. Native of the north of Africa. Sisýmbrium símplex, Viv. fl. lyb. Flowers yellow.

Simple-stemmed Sand-Mustard. Pl. 1 foot.

16 D. seto'sa (D. C. syst. 2. p. 699.) ♃. H. Native of the Pyrenees. Turrìtis setòsa, Lapeyr. abr. suppl. 93. Root perpendicular. Radical leaves numerous, erect, runcinate, others profoundly toothed, and others pinnatifid. Stem naked. Flowers capitate, crowded. Calyx erect, closed, purplish. Petals yellow, narrow, with long claws, nevertheless they are shorter than the stamens. Pods long, terete, smooth, truncate. The whole plant is clothed with white bristles, intermixed with white hairs.

Bristly Sand-Mustard. Pl. 1 foot.

Cult. None of these plants are worth cultivating except in general collections. The perennial species can be increased by dividing the plants at the root or by seeds. The seeds of the annual and biennial kinds only require to be sown in the open ground. They will all grow under any circumstances.

LXXXVII. ERU'CA (said to be from *uro*, to burn; because the seeds have an acrid burning taste, and when applied to the skin occasion blisters.) Tourn. inst. 227. t. 111. D. C. syst. 2. p. 636. prod. 1. p. 223.—Euzòmum, Link. enum. 2. p. 174.

Lin. syst. *Tetradynàmia, Siliquòsa.* Silique terete, crowned by a large ensiform or conical style. Seeds globose, disposed in a single row in each cell. Calyx erect, equal at the base. Annual erect branching herbs, with pinnate-lobed leaves, erect terminal racemes of flowers, which are white or yellow, and beautifully reticulated with brown veins.

1 E. sati'va (Lam. fl. fr. 2. p. 496.) leaves lyrately-pinnatifid, with toothed acute lobes; stem hairy ; pedicels shorter than the deciduous calyx. ⊙. H. Native of cultivated fields and by way-sides in the north of Africa, Spain, Portugal, France, Switzerland, Italy, and Greece. E. fœ'tida, Mœnch. meth. 256. E. grandiflòra, Cav. præl. p. 426. Sinàpis Erùca, Clairv. herb. val. 220. Brássica Erùca, Lin. spec. 932. Smith, fl. græc. t. 646 and t. 647.—Lob. icon. 204. f. 1.—Chabr. sciagr. 276. f. A very polymorphous plant ; it is sometimes smooth, sometimes hairy, from 3 inches in height to 2 feet, and the flowers are very variable in colour. Perhaps numerous species are confused under the head of varieties. The whole herb is acrid to the taste, and has a strong disagreeable smell when bruised. The seeds are very acrid, and blister when bruised and applied to the skin ; they are also reckoned sialagogue and aphrodisiacal.

Var. α ; flowers white ; pods smooth. Brássica Erùca, Blackw. herb. 242.

Var. β ; flowers white ; pods pilose.

Var. γ ; flowers yellow ; pods smooth. Brássica Erùca, Bull. herb. t. 313. Schkuhr. handb. 2. no. 1870. t. 186.

Var. δ ; flowers yellow ; pods pilose. Brássica Erùca, Var. β. Smith. fl. græc. t. 646, and 647.

Var. ε ; flowers pale ; pods smooth and turgid. Bràssica túrgida, Pers. ench. 2. p. 207.

Var. ζ ; stem smooth ; pods hispid. Brássica erucoìdes, Horn. hort. hafn. 2. p. 621.

Var. η ; stem and pods smooth. Sinàpis exótica. Hort.

Garden Rocket (Eng.) *Roquette cultivée. La Rocket des Jardins* (Fr.). *Raukette* (Germ.) *Ruccola* (Ital.).

This plant has been known in Britain since 1573. When in flower, in July, it has a strong peculiar smell, almost fetid. This plant is now neglected in Britain, but is still in use in several places on the continent, where the leaves and tender stalks are used as salad ingredients, and form an agreeable addition to *Mustard* and *Cress* early in spring. The seeds should be sown in a warm border, early in February, and again in March and April, for successive crops. Thin the plants after they have produced the first rough leaves, to 3 or 4 inches apart, and keep them clear of weeds. If a supply is desired throughout the year, monthly sowings may be made. They will produce abundance of seed in August : for this purpose allow a

few of the strongest plants of the spring sowing to come into flower. Any of the above varieties will answer.

Garden, or *Cultivated* Rocket. Fl. June, July. Clt. 1573. Pl. rambling, either erect or prostrate, from $\frac{1}{4}$ to 2 feet high.

2 E. HÍSPIDA (D. C. syst. 2. p. 638.) leaves lyrately-pinnate-parted, with toothed lobes, of which the terminal one is very blunt; stem hispid; pedicels longer than the deciduous calyx. ⊙. H. Native of Naples, in the fields of Lucania. Brássica híspida, Tenor. cat. app. hort. nap. p. 59. Stem beset with long, stiff, spreading hairs. Flowers white, veined with brown.

Hispid Garden Rocket. Fl. June, July. Clt. 1800. Pl. $\frac{1}{2}$ to 1 foot.

3 E. VESICA'RIA (Cav. ex Lag. D. C. syst. 2. p. 638.) leaves pinnatifid, with acute almost entire lobes; stem hairy; calyx permanent, somewhat bladdery. ⊙. H. Native of Spain, in corn-fields, and on the tops of the mountains of Leon. The leaves are more elongated than in *E. satìva*, and the terminal lobe is hardly larger than the lateral ones.

Var. α, albiflòra (D. C. l. c.) flowers white, lined with black. Brássica vesicària, Asso. syn. arrag. 88. t. 4. Native of Syria, about Aleppo, and of Spain, in Arragon.

Var. β, flaviflòra (D. C. l. c.) flowers yellow, lined with black. Brássica vesicària, Lin. spec. 933. Native nearly throughout the whole of Spain, in corn-fields.

Bladdery-calyxed Garden Rocket. Fl. Ju. Jul. Clt. 1820. Pl. $\frac{1}{2}$ to 1 foot.

Cult. The seeds of these plants only require to be sown in the open border, and the plants afterwards treated as other hardy annuals.

Tribe XIII.

VE'LLEÆ (plants agreeing with *Vélla* in important characters) or ORTHOPLO'CEÆ (see sub-order III.) LATISE'PTÆ (from *latus*, broad, and *septum*, a partition; dissepiment broad,) D. C. syst. 2. p. 639. prod. 1. p. 223. Silicle with concave valves opening longitudinally, and with an elliptical dissepiment (f. 47. *c.*). Seeds globose. Cotyledons folded together (f. 45. *j. f.*).

LXXXVIII. VE'LLA (latinized from *Velar*, the celtic name of the *Cress.*) D. C. syst. 2. p. 639. prod. 1. p. 223. Véllæ, spe. Lin.

Lin. syst. *Tetradynàmia, Siliculòsa.* Larger stamens connate. Style ovate, tongue-shaped, flat, at the end of the silicle. An erect branched hispid shrub. Leaves alternate, obovate, entire, rough with hairs. Racemes erect, elongated; pedicels very short, lower ones generally bracteate, the rest naked. Flowers yellow, and are as well as the pods erect.

1 V. PSEUDOCY'TISUS (Lin. spec. 895.) ♄. F. Native of Spain on gypsaceous hills about Aranjuez, Lam. ill. 555. f. 2. Cav. icon. 1. p. 32. t. 42. Vélla integrifòlia, Sal. prod. 265.—Lob. obs. 505. f. 1. icon. 2. p. 49. f. 1. I. Bauh. hist. 1. p. 374. f. 2. Petals yellow, with long dark purple claws. Larger stamens perfectly connate by pairs. Seeds 2 in each cell.

False-Cytisus or Cress-rocket. Fl. April, May. Clt. 1759. Shrub 2 to 3 feet.

Cult. This shrub, although generally kept as a green-house plant, is hardy enough to live through the winter in a dry warm south border. Young cuttings will strike root if planted in sand, under a hand-glass.

LXXXIX. BO'LEUM (from βωλος, *bolos*, a bowl; in allusion to the form of the valves of the pods?) Desv. journ. bot. 3. p. 163. t. 26. D. C. syst. 2. p. 640. prod. 1. p. 223.

Lin. syst. *Tetradynàmia, Siliculòsa.* Larger stamens connate by pairs. Style slender, beak-shaped, somewhat conical at the end of the silicle. A suffruticose, erect, branched plant, hispid from stiff hairs. Leaves alternate, oblong, linear; lower ones somewhat divided. Racemes erect, elongated; pedicels very short, lower ones bracteate. Flowers yellow, and are as well as the pods erect. Perhaps not sufficiently distinct from *vélla*.

1 B. A'SPERUM (Desv. journ. bot. 3. p. 163 and 175. t. 6.) ♄. H. Native of Spain in rugged places; in Arragon between Villa Franca and Lerida; in Granada on mount Sierra-Nevada. Vélla áspera, Pers. ench. 2. p. 185. Stems twisted. Petals cream-coloured or whitish. Seeds 1 or 2 in each cell.

Rough Boleum. Fl. April, May. Pl. $\frac{1}{2}$ to 1 foot.

Cult. This pretty little shrub will answer well for ornamenting rock-work. Cuttings will root freely if planted under a hand-glass, but if it ripen seed freely, this will be unnecessary.

XC. CARRICHTE'RA (probably without meaning.) D. C. syst. 2. p. 641. prod. 1. p. 224.

Lin. syst. *Tetradynàmia, Siliculòsa.* Stamens all free. Style ovate, flat, leafy (f. 47. *c.*). An annual erect, branched, smooth, or somewhat hairy herb. Stems round. Leaves pinnate-parted, with linear toothed or deeply pinnatifid lobes. Racemes opposite the leaves, erect, elongated; pedicels bractless, filiform. Flowers small, cream-coloured, streaked with purple. Pods pendulous from the inflexed pedicels.

1 C. VE'LLÆ (D. C. syst. 2. p. 642.) ⊙. H. Native in sandy and waste fields, and along way and wall sides, in Spain, Balearic Islands, Mauritania, Sicily, Greece, and Syria. It is also said to have been found in England on Salisbury plains near Stonehenge, but it has never been met with since. Vélla ánnua, Lin. spec. 895. Gært. fruct. 2. p. 886. t. 141. Lam. ill. t. 555. f. 1. Smith, engl. bot. t. 1442. Schkuhr. handb. 2. no. 1759. t. 178. Seeds 4 in each cell. M. De Candolle remarks, that the seeds become covered with a glutinous exudation on being immersed in warm water. The whole herb is acrid and pungent to the taste.

Annual *Cress*-rocket. Fl. Feb. March in gardens. Ju. July. Britain. Pl. $\frac{1}{2}$ foot.

Cult. The seeds of this plant only require to be sown in the open ground or on rock-work. A light sandy soil suits it best.

XCI. SUCCO'WIA (in honour of Professor Suckow, a botanist of Heidelberg.) Medik. gen. pl. 1. p. 64. t. 1. f. 9. D. C. syst. 2. p. 642. prod. 1. p. 224.

Lin. syst. *Tetradynàmia, Siliculòsa.* Stamens all free. Style slender, conical. Valves of silicle echinated. An annual erect, branched, smooth herb. Stems round. Leaves pinnate-parted, with linear-toothed or cut lobes. Racemes opposite the leaves, erect, elongated; pedicels bractless, filiform. Flowers yellow. Pods erect. Seeds solitary in the cells.

1 S. BALEA'RICA (Medik. in Ust. new. ann. 1. p. 41.) ⊙. H. Native of the Balearic Islands, Teneriffe, also in Sicily about Palermo. Bùnias Baleárica, Lin. mant. 429. Jacq. vind. 144. Gouan. ill. 45. t. 20. Schkuhr. handb. 2. no. 1919. t. 189. Myàgrum Baleáricum, Lam. dict. 1. p. 571. Biscutélla Baleárica, Lher. diss. cak. ined. p. 10. Seeds pendulous, globose, somewhat spotted, solitary in each cell.

Balearic Succowia. Fl. June, July. Clt. 1781. Pl. $\frac{3}{4}$ foot.

Cult. The seeds of this pretty little annual only require to be sown in the open ground or on rock-work. A light sandy soil suits it best.

XCII. SAVI'GNYA (in honour of M. Savigny, a profound entymologist, and who also collected numerous plants in Egypt.) D. C. syst. 2. p. 283, prod. 1. p. 157.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle sessile, elliptical, with flat valves. Funicles short, free. Calyx equal at the

base. Stamens free. Style short, tetragonal. Seeds numerous, very much compressed, with broad margins. An annual smooth branched herb, with oval bluntly-toothed radical leaves, which are narrowed out into the petiole, and narrow entire stem ones. Racemes opposite the leaves. Flowers small, pale-violet.

1 S. Ægyptìaca (D. C. syst. 2. p. 283.) ⊙. H. Native of Egypt in the sand about the Saqqarah Pyramids. Lunària parviflòra, Delile, ill. fl. ægyp. p. 19. desc. 104. t. 35. f. 3. Farsètia parviflòra, Spreng. syst. 2. p. 871. Root perpendicular. Petals entire.

Egyptian Savignya. Fl. in its native country in the winter. Pl. $\frac{3}{4}$ foot.

Cult. This pretty little annual is well adapted for ornamenting rock-work, where the seeds should be sown, or they may be sown in the open border in a light sandy soil.

Tribe XIV.

PSYCHI'NEÆ (plants agreeing with *Psychìne* in many important characters,) or ORTHOPLO'CEÆ (see sub-order III.) ANGUSTISE'PTÆ (*angustus*, narrow, and *septum*, a partition; dissepiment narrow.) D. C. syst. 2. p. 643. prod. 1. p. 224. Silicle with keeled (f. 47. *j.*) or navicular valves, and with a very narrow dissepiment. Seeds compressed. Cotyledons folded together (f. 45. *f. j.*). A very distinct tribe, bearing fruit almost like those of *Thláspi*, *Capsélla*, or *Æthionèma*, and with flowers and cotyledons like *Brássica*.

XCIII. SCHO'UWIA (in honour of J. Fred. Schouw, a Danish botanist.) D. C. syst. 2. p. 643. prod. 1. p. 224.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle oval; valves with a narrow wing running through the whole length of the back. A branched, annual, smooth herb. Leaves and flowers almost like those of *Moricándia arvénsis.* Silicles like those of *Thláspi.* Style and seeds like those of *Psychìne.*

1 S. Ara'bica (D. C. syst. 2. p. 644.) ⊙. H. Native of Arabia Felix, on argillaceous humid mountains near Mor. Subulària purpùrea, Forsk. fl. ægyp.-arab. p. 117. Psychìne Arábica, Spreng. syst. 2. p. 880. Thláspi Arábicum, Vahl. symb. 2. p. 76. Flowers rose-purplish, at first corymbose, but at length racemose. Leaves referable to those of *Moricándia arvénsis.*

Arabian Schouwia. Fl.? Pl. $\frac{1}{2}$ to $\frac{1}{4}$ foot.

Cult. The seed of this pretty annual will only require to be sown in the open ground. A light, sandy, moist soil will suit it best.

XCIV. PSYCHI'NE (from ψυχη, *psyche*, a butterfly; because of the pods being furnished with wings like the butterfly.) Desf. atl. 2. p. 69. t. 148. D. C. syst. 2. p. 645. prod. 1. p. 224.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle triangular, narrowed at the base, with the valves winged on the back, at the end (f. 47. *j.*). An annual, hispid, branched herb. Leaves oblong or obovate, toothed; cauline ones alternate, cordate, stem-clasping, with auricles; radical ones narrowed into the stalk. Racemes opposite the leaves, elongated. Bracteas leafy, situated under the pedicels. Flowers white, with dark veins.

1 P. stylòsa (Desf. atl. 2. p. 69. t. 148.) ⊙. H. Native of Mauritania, near Mayane, on the edges of fields. Thláspi Psychìne, Willd. spec. 3. p. 443. P. Numídica, Spreng. syst. 2. p. 880.—Shaw. specim. no. 91. icon. Pods large, 3 lines long without the style, and 7 or 8 lines broad.

Long-*styled* Psychìne. Fl. Apr. May. Clt. 1822. Pl. 1 foot.

Cult. This curious annual only requires to be sown in the open border. A light, sandy soil suits it best.

Tribe XV.

ZI'LLEÆ (plants agreeing with *Zílla* in important characters,) or ORTHOPLO'CEÆ (See Sub-Order III.) NUCAMENTA'CEÆ (*nucamentum*, a catkin; shape of pods.) D. C. syst. 2. p. 646. prod. 1. p. 224. Silicle indehiscent, ovate, or globose, 1-celled, 1-seeded (f. 47. *i.*), with indistinct valves (f. 47. *i.*). Seeds globose. Cotyledons folded together. (f. 45. *f. j.*)

XCV. ZI'LLA (the Arabic name of the plant) Forsk. desc. 121. D. C. syst. 2. p. 646. prod. 1. p. 224.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle 2-celled; cells 1-seeded. A smooth, somewhat glaucous plant; at length becoming suffruticose, much branched; branches whitish; younger ones leafy; older ones leafless, stiff, divaricate, spinescent. Leaves few, oblong, toothed. Racemes few-flowered, spinescent at the apex. Pedicels filiform, short, bractless. Flowers distant, violaceous, almost like those of *Moricándia arvénsis.*

1 Z. myagroìdes (Forsk. ægyp. descr. 121. no. 74 and 75. icon. t. 17. A.) ♄. F. or H. Native of Egypt, in the deserts.

Var. α, macrocárpa (D. C. syst. 2. p. 646.) pods smooth. Bùnias spinòsa, Lin. mant. 96. Gært. fruct. 2. p. 290. t. 142. f. 2. Vent. hort. malm. t. 16. Myàgrum spinòsum, Lam. dict. 1. p. 570. no. 13. Native of Lower Egypt, about Cairo.

Var. β, microcárpa (D. C. syst. 2. p. 647.) pods with rough ribs. Native of Upper Egypt. Perhaps a proper species. The leaves of this plant are boiled and eaten by the Arabs, like those of Cabbage.

Myagrum-like Zilla. Fl. March. Clt. 1816. Pl. 2 feet.

Cult. This is rather a curious plant, and although it is always treated as a frame shrub, it is nevertheless hardy enough to stand the winter in a dry, warm, south border. A light, dry, sandy soil suits it best. It may be either increased by young cuttings planted in sand under a hand-glass, or by seeds.

XCVI. MURICA'RIA (from *muricatus*, full of prickles; pods beset with prickles.) Desv. journ. bot. 3. p. 159. t. 25. f. 2. D. C. syst. 2. p. 647. prod. 1. p. 225.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle 1-celled, 1-seeded, beset with prickles (f. 47. *i.*). Seed inserted laterally. Petals equal. A procumbent, many-stemmed herb. Leaves pinnate-lobed, alternate. Racemes opposite the leaves or terminal. Flowers white.

1 M. prostra'ta (Desv. journ. l. c.) ⊙. H. Native of the north of Africa, in sandy places, and in the kingdom of Tunis, near Cafsa. Bùnias prostràta, Desf. atl. 2. p. 76. t. 150. Myàgrum prostràtum, Poir. suppl. 2. p. 48. Laèlia prostràta, Pers. ench. 2. p. 185. Calepìna prostràta, Spreng. syst. 2. p. 850. Petals double the length of calyx. Style very short and thickish.

Trailing Muricaria. Fl. Ju. Jul. Clt. 1821. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

Cult. This plant is not worth cultivating, except in botanic gardens. The seeds only require to be sown in the open ground. A light sandy soil suits it best.

XCVII. CALEPI'NA (meaning unknown.) Adans, fam. 2. p. 423. D. C. syst. 2. p. 648. prod. 1. p. 225.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle almost globose, 1-celled, 1-seeded. Seed pendulous from the top of the pod. Outer petals somewhat larger than the inner ones. Cotyledons incumbent, curved, truncate, somewhat folded together, with inflexed margins. A smooth, erect, annual herb. Radical leaves rosulate, on short stalks, pinnate-parted; lower lobes small, 2 or 3 on each side, terminal one large, oblong, or orbicular, blunt; cauline leaves sessile, oblong, entire, sagittate with acute auricles. Racemes opposite the leaves, elongated; pedicels bractless, filiform. Flowers white.

1 C. Corvìni (Desv. journ. bot. 3. p. 158.) ☉. H. Native of sandy fields and vineyards, in Arragon, south of France, Italy, Hungary, and Tauria. Bùnias cochlearioìdes, Murr. nov. comm. gœtt. 1. 1777. p. 42. t. 3. Waldst. et. Kit. hung. 2. p. 111. t. 107. Myàgrum irregulàre, Asso. Myàgrum rugòsum, Vill. Myàgrum perfoliàtum, β, Lam. Crámbe Corvìni, All. Myàgrum erucæfòlium, Vill. dauph. Rapístrum bursæfòlium, Berg. phyt. Cochleària auriculàta, Lam. dict. Crámbe amplexicaúlis, Russel. Myàgrum bursæfòlium, Thuil. Crámbe bursæfòlia, Lher. Laèlia cochlearioìdes, Pers. ench. 2. p. 185.

Var. β, *Myàgrum iberoìdes* (Brot. phyt. no. 43. p. 95. t. 42.) Native of Portugal.

Corvin's Calepina. Fl. Apr. June. Clt. 1816. Pl. 1 foot.

Cult. A rather curious annual plant. The seeds only require to be sown in the open border. A dry, sandy soil will suit it best.

Tribe XVI.

RAPHA'NEÆ (plants agreeing with *Ráphanus* in many important characters,) or ORTHOPLO'CEÆ (See Sub-Order III.) LOMENTA'CEÆ (*lomentum*, a loment; shape of pods.) D. C. syst. 2. p. 649. prod. 1. p. 225. Silicle or silique dividing across into one or few-seeded joints or cells (f. 47. *k. m.*). Seeds globose. Cotyledons folded together (f. 47. *j. f.*).

XCVIII. CRA'MBE (from κραμβη, the Greek name of *Sea-kale*, or *Sea-cabbage*, which is derived from κραμβος, *dry;* because the plants usually grow in sand.) Tourn. inst. 211. t. 100. —Gært. fruct. 2. p. 292. t. 142. Lin. gen. no. 825. D. C. syst. 2. p. 650. prod. 1. p. 225.

Lin. syst. *Tetradynàmia, Siliculòsa*. Silicle 2-jointed. Lower joint abortive, upper one globose, 1-seeded (f. 47. *h.*). Cotyledons thick, sòmewhat foliaceous, profoundly emarginate. Herbs or subshrubs. Leaves sometimes thick, sometimes membranous, hairy or smooth; cauline ones alternate, stalked, pinnately-toothed, cut, pinnatifid or lyrate. Racemes elongated, many-flowered, disposed into lax panicles; pedicels filiform, erect, bractless. Flowers white, smelling like honey.
